"For many years. It is thirteen since I came, and they have been put out yearly the last week in May. They stay out until October, and are housed in the winter in an old Camellia house. With regard to protection, blinds are used to shut out the glare of the sun, and, as to treatment, the stems are damped twice a day right up. Several varieties are represented, including Dicksonia antarctica. There are eight in all, and they certainly harmonise with the columns of the mansion."

The Banks of the Ornamental Water.

We next proceeded down the slopes to the stretch of ornamental water, the banks of which during the last three years have been clothed with great success.

"Here," said Mr. Brown, "is a quarter devoted to Heaths, Ericas carnea, mediterranea, vulgaris, and vagans; also the red Heath, vulgaris Alportii. Earlier in the year, the Azalea mollis was a grand sight. On a mound in the water is Hemerocallis (the Day Lily), and right into the water is the Flowering Rush. Later on, the Lilies in the water—auratum, speciosum, and tigrinum—will give a wealth of flowers, which, with the foliage of the Azaleas, will be very effective."

"I notice that your Lobelia cardinalis is almost in the water."

"Yes, it is in the right position, and grows to quite four feet in height. In the border beyond the Azaleas there are many varieties of Irises, such as siberica, aurea, Kæmpferi, Monnieri, monspur, and ochroleuca. The Irises begin to flower in March, starting with I. pumila, and ending with the Japanese varieties. These are followed by hybrid Tritomas. Amongst the plants in the water is Astilbe Davidi; and A. grandis, I think, is going to prove a fine water variety."

The Nymphæas.

"You appear to have a very good collection of Nymphæas."

"They embrace James Brydon, James Doogue, Gladstoniana, lucidæ, Marliacea alba, Frœbelli, Robinsonii, and odorata sulphurea. Along the banks, Crinum Powelli kept on flowering for two months, and one of the most natural plants, yielding masses of flower, is Lythrum roseum superbum. We have done nothing to it since it was put in. The Royal Ferns also find a natural home here."

"You have other attractions than the flowering plants on the banks. What is about the age of the glorious Willow facing a bed of Pernettya?"

"It is between three and four hundred years old. In contrast to that ancient tree, bound up and protected with chains, are the two young Willows planted on each side of it, to take its place when it dies. In this vicinity is the best Cedar on the estate."

How to Preserve Old Trees.

"How do you manage to keep your old trees in such good condition?"

"We manure them at the roots, two or three times every year, with good manure. In a dry season we also soak them well. This treatment has probably affected the fine old Tulip-tree, with its flowers now opening."

At this end of the ornamental water—where a Gunnera manicata, recently planted, is thriving—in close proximity to a pretty summer-house, is a sunk Rose garden, with a hedge of Penzance Briers.

"Are these Roses also planted to a scheme of colour?"

"Yes. The centre is scarlet (Gruss an Teplitz), the colours at each end are white and

Digitized by Google Original from CORNELL UNIVERSITY

yellow, and in the outside beds pink and red. The mixed beds are all Teas and Hybrid Teas. The pillar Roses used are Dorothy Perkins, Lady Gay, Blush Rambler, Electra, Ards Rover, Hiawatha, and Crimson Rambler."

Tritomas and Spiræas.

"What are the special beds on this side of the water?"

"Near the ancient Willow at the corner of the tennis-lawn is a bed of red Dogwood, with a Giant Buttercup in the water in front. Clumps of Pampas Grass and clumps of Tritomas (uvaria) are prominent in this locality. Last year there were five hundred spikes of bright scarlet flowers, each plant yielding from thirty to forty."

"You have a number of shrubby Spiræas in another bed?"

"They are grown as much for their foliage as for their flowers. The varieties include Aitchisonii, Anthony Waterer, ariæfolia, bumalda, and Lindleyana, with S. gigantea and elegans in the water. Then, there is a bed of early-flowering Pampas, with Eulalias zebrina or gracillima to fill up, and a large bed of Yuccas just throwing up flowers, with a bank of Bamboos in variety close by."

"Also a bank of Rhododendrons?"

"Yes, consisting exclusively of Pink Pearl. The steps down to the water are sheets of flower in May, Aubrietias and Saxifrages being prominent. At the head of the ornamental water are Wichuriana Roses, a bed of Rock Roses, and a little rockery. In early spring, Kingcups give a mass of flowers."

A Blue Garden.

The glasshouses at Castle Hill are near the mansion, but most of them are screened to some extent from view by a clump of Laurels, and approached through a pergola of Ivy. The two Peach houses and the Camellia house are apart from the range. In the early house are Duke of York Peach and Early Rivers' Nectarine, gathered early in June; and Hale's Early Peach and Violette Hative Nectarine, fruit picked on July 2nd.

"We start picking in the late house," said Mr. Brown, "at the end of July, the varieties being Hale's Early and Princess of Wales Peaches; and Stanwick Elruge and Pineapple Nectarines. The Figs in pots are Brown Turkey and Negro Largo. The Camellia house is approached through the 'Blue Garden.'"

"It deserves its name. How long do you manage to keep it up?"

"For three months. The blue flowers are chiefly Delphiniums in variety, Anchusas (both the Dropmore and Opal varieties), Salvias (patens), Erigerons, Veronicas (Royal Blue), Linums (Narbonense), Clematis in variety, Campanula pyramidalis, Nigella Miss Jekyll, Nemesia Blue Gem, Aconitum Wilsonii and autumnale (Fischeri), Ceanothus Gloire de Versailles, Agapanthus Moreani, and Violas (Blue King, Archibald Grant, and Maggie Mott)."

"The Camellias in the house are planted out?"

"Yes, and we cut hundreds of flowers in the season, wiring them to evergreens. Hydrangeas (hortensis) are used for fireplace work in the rooms. The plants outside carry hundreds of trusses of blooms."

Winter-flowering Orchids.

"Do you grow many Chrysanthemums?"

"A fair number; but we confine ourselves to the decorative varieties and the singles, which are more useful than the huge blooms. With regard to the other houses, we make a great feature of winter-flowering Orchids. At Christmas last year we had sixteen hundred flowers open, and some plants had thirty-five blooms. Cypripediums insigne are the principal, but we have also, as you see, in the Cypripedium house, a number of the summer-flowering varieties. In the Cattleya house are also several varieties, with several of our own seedlings. The Orchids include Oncidiums, Dendrobiums in variety, Lælia purpurata, and in the intermediate house are Epidendrums, all our own seedlings. In this house is a fine plant of Sobralia macrantha in flower. The Sobralia, which must be kept in a tub, is a bloom of a day, but as soon as one dies, another succeeds it; Odontoglossums are grown in a house facing north at the back of the Vineries. In the stove is a general collection of plants, amongst which Anthuriums are conspicuous, and in the next house are some sixty or seventy plants of Paul Crampel Geraniums, which we use as standards; they grow to quite six feet in height."

"How long have you been cutting your Malmaison Carnations?"

"Since May. These are all one-year-old plants, the varieties being chiefly Princess of Wales, Maggie Hodgson, Lord Rosebery, H. J. Jones, Mrs. Trelawney, and Dragut, a very fine new scarlet. We grow about four hundred Malmaisons, and two hundred Trees, but have no separate house for either. The Carnations are on the sunny side, and the Geraniums on the shady."

The Treatment of Malmaisons.

"When do you layer your Malmaisons?"

"In July, in a mixture of road sidings and garden soil. We pot up, when the plants are well rooted, into large 'sixties,' using a compost consisting of two parts loam, one leaf-soil, and road sand, with a little fine lime rubble. After potting, they are kept rather close for a week or so; then they are gradually allowed full air, with protection in the middle of the day from hot sun. It is a matter of opinion whether the final potting should be done in the autumn, or early in the following year."

"When is yours done?"

"We have potted them at both dates, and the results have been fairly equal. The pots for the final potting are 'thirty-twos,' carefully crocked, with a little broken charcoal sprinkled on the crocks. The same soil is used, with the addition of bonemeal and soot, a 6-in. potful of each to a barrowload of soil. A little broken charcoal is also mixed with the soil. We winter the plants in a cool, light house, and give abundance of air in favourable weather, taking care to keep them a little on the dry side during the dark months. Fire heat is only turned on in severe weather. For the prevention of disease, we syringe the plants occasionally with a solution of sulphide of potassium."

How to Grow Tree Carnations.

"How do you treat Tree Carnations?"

"Cuttings are taken at intervals from October to January, rooted in pans filled with road sand, and planted in a bottom heat of about sixty-five degrees. We pot off into small 'sixties,' in a mixture of loam, leaf-soil, and road sand, and place in a light position, with a night temperature of about fifty degrees. When sufficiently advanced in growth, the tops are pinched out, in order to get good, bushy plants. The next potting is into large 'sixties' or 'forty-eights,' according to the size and vigour of the plants. The plants are kept fairly close to the glass, as this helps to promote strong and vigorous growth. The final potting is into 'thirty-twos' or 'twenty-fours,' and the soil used is the same as in the case of Malmaisons. For the summer we usually erect a light framework where the plants are stood out. We can then put a few frame lights over them in wet weather, and also shade them from the hot sun. The plants are syringed morning and night in favourable weather. They are also syringed occasionally with weak soot-water. Staking and tying are attended to as soon as needed. About the first week in September we place the plants in their winter quarters, in a light and airy greenhouse."

"Which do you consider the best varieties of Trees?"

"Britannia, Enchantress, Mrs. Lawson, Winsor, and Robert Craig. In my opinion, Carnations require as much attention as Orchids. Our other features in the plant houses are Gloxinias and Coleus."

"The Gloxinias seem to fill one house?"

"Yes, a house is devoted to them and Maidenhair Ferns. They are various shades of colour, and some of the varieties are Her Majesty (white), Duke of York (blue), and Sutton's Scarlet. There are also a number of seedlings. They have been in flower since the beginning of May, and last until the end of July. I have another batch coming on in August and September."

"They make a wonderful display. How do you grow them?"

Gloxinias and Green-fly.

"We sow in March and April. After pricking off into pans, we keep the plants growing in a warm house. When large enough, they are potted off into small 'sixties' in a mixture of loam, leaf-soil, and a little fine peat, with plenty of silver sand. When the pots are well filled with roots, they are again shifted into either large 'sixties' or 'forty-eights.' These, if kept growing in a moist, warm house, soon make good plants. Care should be taken that they are free from green-fly, which soon cripples the

THE STONE WALK, CASTLE HILL.

Digitized by Google Original from CORNELL UNIVERSITY

leaves. We fumigate occasionally with vaporising compound. When the plants commence growth again in spring, they are brought into a warm house, and as soon as they have commenced to make root, they are potted into 6-in. and 7-in. pots. To enrich the soil, we use bonemeal and a little Canary Guano."

"More Orchids still?" I observed, as we entered a house devoted to Calanthes.

"These are very useful in winter. At Christmas we had a hundred and fifty spikes. On the other side of the stage are Begonias, Gloire de Lorraine. Then, in the next house are the Coleus, of which we have every conceivable shade of colour—yellowy-green; bright crimson; red, tipped with yellow; red, green and yellow; and crimson, black, and green. Crotons also are grown in this house."

"And Tomatoes?"

"Practically, this is the Tomato house. We only grow one variety, a seedling of medium size and good flavour, which does as well outside as under glass. Melons occupy a range of three houses. The best in flavour are Hero of Lockinge, Blenheim Orange, and Royal Jubilee."

"How long does your Grape season last?"

"We started in the early Vinery on June 14th, with Buckland's Sweetwater, and shall go on to March, winding up with Alicante, Black Hamburgh, and Foster's Seedling. We have had bunches of Alicantes weighing seven pounds and a quarter."

THE ORNAMENTAL WATER AT CASTLE HILL, ENGLEFIELD GREEN.

A Stone Garden.

Having been the round of the houses, we next went into what was originally the fruit garden, but is being gradually transformed into a very pretty part of the pleasure grounds.

"A great innovation was made in 1908," said Mr. Brown, "when we made the 'Stone Garden,' with a Yew hedge and sundial in the centre. Rock plants are used in between the stones, but the sixteen beds all differently made up are the principal attraction. They are as follows: Roses Grand Duke of Luxembourg; Heliotropes Lord Roberts, and Violas Maggie Mott; Antirrhinums Sutton's Carmine Pink; a bed of Gourds; Fuchsias Mrs. Marshall, and Geraniums Achievement; pink Carnations; Geraniums Paul Crampel, and Centaureas Tom Thumb; sweet-scented Verbenas and white Stocks; Sweet Williams Pink Beauty; Carnations Raby Castle; Geraniums Queen of the Whites, and Salvias Star of Zurich; mixed Verbenas; Rosemary and scented-leaved Geraniums; Calceolarias amplexicaulis and Salvia patens; Antirrhinums Orange King; dark blue Heliotropes and Violas Maggie Mott."

"You have a fine bed in three tiers on the centre of the lawn," I remarked, as we proceeded on our way to the kitchen garden.

"It consists of one tier of Fuchsia Mrs. Marshall and Geranium Madame Crousse, another of white Marguerites and red Salvias; and, on the bottom, Geraniums Paul Crampel and red Salvias. On this side of the lawn also are Bamboos (aurea), golden Retinospora, and groups of ornamental shrubs and Conifers."

Standard Roses and Polyanthas.

"Here," continued Mr. Brown, "we have a Rose avenue, consisting of standards, with Polyanthas at the foot. For example, we combine Charles Lefebvre as a standard with Madame L. Levavasseur underneath; Papa Gontier with Ænnchen Muller; Maman Cochet with Mignonette; Caroline Testout with Baby Dorothy; Mrs. E. Mawley with Cecile Brunner; Richmond with White Pet; Laurette Messimy with Leonie Lamesch; and Marquise Litta with Perle des Rouges. About a dozen different varieties of standards are used. Some of the Polyanthas match the standards, and others form a contrast. The result is a considerable prolongation of the flowering season."

"Facing the charming avenue, you have another herbaceous border?"

"In which we grow Dahlias in variety, and Sweet Peas in clumps, edged with Saxifraga Wallacei. The best Sweet Peas are George Herbert, Nora Unwin, Frank Dolby, Helen Lewis, Black Knight, Mrs. Hardcastle Sykes, and King Edward VII. Growing on the small pond is a Taxodium distichum of vast size, with its roots all along the water."

Hardy Fruit.

"What is the extent of the kitchen garden?"

"Four acres. The Peach wall covers three hundred feet, and we get big quantities of fruit, the varieties being Early Alexander, Hale's Early, Goshawk, Dymond, Early Grosse Mignonne, Nectarine Peach, Sea Eagle, Barrington, and Lady Palmerston; Nectarines, Lord Napier, Pineapple, Rivers' Orange, and Victoria. We have gathered fourteen hundred Peaches and Nectarines off the wall in a season. On the Apricot wall are Moor Park, Hemskirk, and Large Early. Several varieties of Plums are grown, but of Cherries we grow mainly Morellos. There is a long Pear wall."

"What varieties do you grow on it?"

"Williams's Bon Chretien, Louise Bonne of Jersey, Doyenne du Comice, Pitmaston Duchess, Beurre d'Amanlis, Beurre Superfin, and Marie Louise. The Apples on wires, horizontally trained, are Irish Peach, Allington Pippin, Cox's Orange Pippin, Ribston Pippin, Claygate Pearmain, Worcester Pearmain, Lady Sudeley, Sandringham, Bramley's Seedling, Peasgood's Nonsuch, Cox's Pomona, Newton Wonder, and Alfriston."

The Best Peas for Light Soils.

"Which do you consider your most important vegetable?"

"Peas are one of the most important, and we grow a quantity of them, picking from June 12th up to October. For our earliest crop we usually rely upon Ideal and Green Gem. These are sown as early in January as possible. A mixture of wood-ashes and soot is put in the trenches; and the seeds are thoroughly soaked in red-lead and paraffin. This is very necessary, as we are sorely troubled with mice and birds. Our second-early and maincrop varieties are sown in trenches six inches deep and a foot wide. In very dry weather they are flooded occasionally with weak liquid manure. For maincrop and late varieties, Duke of Albany, King Edward, Magnum, and Autocrat suit our soil best."

How to Get Early Potatoes.

"Do you grow Potatoes in frames in quantity?"

"Largely. The best variety for this purpose is May Queen. The tubers are placed in shallow boxes early in January, and put in a light position near the glass in a cool greenhouse, where they are safe from frost. As soon as the shoots are half an inch long, we reduce them to about three on a set, and having been kept near the glass, they are strong, sturdy shoots ready for planting. Then we gather together a large quantity of stable manure and leaves, mixing thoroughly and turning two or three times, so that it makes a good lasting heat. The pits are next filled with manure to a depth of two feet, well trodden down and left for two or three days, when the soil is put in about seven inches deep. As soon as this is sufficiently warm, the tubers are planted. Care is taken to keep the plants strong in growth, particular attention being devoted to the airing of the frames. In fine, mild weather, an abundance of air is given, though precautions are not neglected to afford protection from cold and cutting winds. By these means we can always rely upon an early supply of good Potatoes."

The Care of Celery.

"I see that you have large breadths of Brussels Sprouts, Broccoli, and Winter Greens."

"Yes, and the crops are satisfactory. We grow a quantity of Celery, the chief varieties being Sutton's A1, White Gem, and Superb White. We usually sow in the middle of February. The young plants are pricked out into pits in rich soil, and given plenty of room, in order to develop strength. When the plants are well established in the trenches, they are regularly supplied with liquid manure from the farmyard. The earthing is regularly attended to, so that good blanched plants may be secured. In very severe weather, protection is afforded with long litter."

"You have shown fruit successfully at the exhibitions of the Royal Horticultural Society?"

"I was awarded a prize for Grapes (Alicantes), last year; and I have shown Peaches, Nectarines, and Melons at Richmond and Reading, all grown under glass. The hardy fruit is not good enough to show. With regard to my experience, I began gardening in North Durham, was for two years at Osberton Hall Gardens, Worksop, and before I came here as head gardener thirteen years ago, I was for nine years foreman in the fruit houses at Gunnersbury House."

ALFRED WILCOX.

THE next interview will be with Mr. F. Dennison, of Cranford, Leamington, a famous amateur Rose grower.

Digitized by Google Original from CORNELL UNIVERSITY

rarely dug and never manured, a root being lifted as required—not such an easy matter as it might seem, owing to the difficulty of finding one fit for use. If it pays to export Horseradish to this country, it would surely pay to grow it here—that is, of course, to grow it properly. The whole crop should be lifted every year after the leaves wither and fall off. The best roots should then be trimmed and laid in the ground for use, or else stored in a shed. The smaller roots should also be trimmed into straight pieces, and they and the trimmings should be planted about a foot apart in deeply dug, well manured ground—those with crowns just below the surface, and those without an inch deeper. Every piece of root will grow, and for that reason any that is not wanted for planting should be carefully collected and burned.

LIVE HEDGES.

November 21st.—The cost of timber is now so high that not many new fences are likely to be put up in gardens. Live hedges will largely take their place. They have their advantages; but on the other hand they take time to grow; they demand a certain amount of care, and it is rarely that even the thickest of them will exclude cats or dogs or poultry. They should, therefore, be supplemented by wire netting, which, again, has increased enormously in price. Hornbeam or Beech makes a cheap and strong hedge, and as both carry their brown leaves through the winter, the Beech well into spring, they make as effective a screen as evergreens. Privet is popular mainly because it costs less than most other suitable plants, but it is weak, and generally associated with the Thorn. The Myrobalan Plum is quicker than the Thorn, and has such formidable spikes that it will stop almost any animal. The common Laurel has much to recommend it, but if neglected is liable to die back and become gappy. The Yew is excellent when well grown, but slow. The Holly is the best of all if good plants are obtained, but they are certainly not cheap.

CHOICE EVENING PRIMROSES.

November 22nd.—The common Evening Primrose, Œnothera Lamarckiana, is only a biennial, and as there are many fine perennial species, it is surprising that they are not more often seen in gardens. Œ. Fraseri and Œ. Youngii are admirable border plants, the former about a foot high, and the latter rather taller, both of them producing great quantities of clear yellow flowers for a long period, especially in moist soil. Œ. missouriensis is a good trailer, and Œ. speciosa has beautiful white flowers with a yellow centre. The long, white, trumpet-shaped flowers of Œ. taraxacifolia are very charming, but the close resemblance of the leaves to those of the dandelion renders the plant rather difficult to preserve. I have had a number of them, but they have been hoed down, or else, when the foliage withers in autumn, dug up and destroyed.

H. C. DAVIDSON.

A BEAUTIFUL COTONEASTER.

Those who desire to cover a cold, unsightly wall, or some steep bank, with an accommodating yet beautiful plant, should not overlook Cotoneaster horizontalis. I have grown this shrub, and observed it growing in all sorts of unpromising positions, but I have never known it to disappoint. Attractive at all times with is pretty leaves and dwarf, spreading habit, it is especially so during autumn and spring. Everyone admires the pretty pink flowers, which are so profusely produced as literally to stud the branches in spring; while in autumn they are followed with bright red berries.

If this enumeration of the merits of Cotoneaster horizontalis is not sufficient, it may be added that the foliage turns from its usual deep green to a glowing crimson in the autumn. Very free-growing, it will flourish in the poorest soil, and it is a thoroughly useful shrub for either town or country gardens.—F. W. MILES.

IN the class for Alicante Grapes at the exhibition of British-grown fruit on October 21st, Mr. H. H. Brown was an easy first from five other competitors. I was interested in this exhibit because, four days previous, the bunches were pointed out to me as they hung upon the Vine. This was at Castle Hill, Englefield Green—where Mr. Brown is head gardener—which I visited by the courtesy of Mrs. W. Raphael.

But at Castle Hill Grapes are a minor matter compared with the many attractions of the gardens and grounds, which are of considerable extent, comprising, with the farms, about fifty acres. A typical October morning mist had been followed by a glorious burst of sunshine, in which the majestic trees displayed their autumn glories to perfection. Standing on the south terrace, the eye took in a Rose garden immediately in front—where still many a plant was flowering bravely—and beyond that broad lawns, dotted here and there with magnificent specimen trees; while a belt of woods in the background closed in the scene. Off to the right, and running almost parallel with the west front of the house, is a sheet of water, which reflected back the colours of the shrubs on its banks. Concerning these shrubs Mr. Brown told me more later; but for the moment I was lost in admiration of the beautiful colour effects on all sides.

THE WEST FRONT OF CASTLE HILL, ENGLEFIELD GREEN.

HANDSOME TREES.

Walking round to the east front of the house, which was gay with the rich crimson of Ampelopsis Veitchii, green was predominant, for the lovely Beech across the lawn, with enormous, spreading branches, had not commenced to change colour, and would not do so before the end of the month. Here are some very fine Cedars, both C. atlantica and C. Libani being represented by specimens of great size, feathered down to the ground. More Beeches came next, and beyond them a Scotch Fir towered to an immense height. But before we reached the trees my attention had been drawn to a wide circle, marking the former site of a large clump of Rhododendron ponticum, which had been cut down to open up the view from the house. The space is grassed over, but the turf lacks the springiness of the rest of the lawn.

Under tall trees, mostly Conifers, we made our way until we came to a clearing looking on to Englefield Green. Hereabouts are a couple of grand specimens of Thuyopsis dolabrata, and not far off more finely-feathered Cedars, the glaucous foliage of C. atlantica argentea being especially noticeable.

"What is the nature of the soil?" I asked, as we turned and took a southward course through the trees.

"It is very poor and shallow," was the reply, "under two feet in depth. Below that we come to gravel, sand, and ironstone."

"The trees are, of course, very old?"

"Some are two hundred years old at least, if not more; but we also plant young trees here and there, to replace the others when they die."

"Whoever planned the grounds had a fine imagination," I remarked, as we came out upon the farther lawn, which was, up to a few years ago, a portion of the park, where cattle grazed. The golden tints of a wide-spreading Chestnut seemed to take on a brighter tone against the dark background of Conifers, whose outlines, however, were sufficiently varied to relieve the picture from monotony, and were interspersed with other trees. The Weymouth Pine, tall though it be, is exceeded in height by its neighbour, a Lombardy Poplar, which has on its other side a Black Austrian Pine.

Original from CORNELL UNIVERSITY

Looking through the trees, the house could be seen in the distance, the crimson of the creepers showing up finely on the grey stone walls. Still more Cedars—one with a girth of between twenty-one and twenty-two feet; another, a Cedar of Lebanon, with branches of a more vertical habit than usual, in consequence of which it shows the effects of snow and wind in sundry foreshortened limbs; and another, a noble specimen of Cedrus atlantica; and then we come upon a giant scarlet Chestnut, now glorious in gold and green as the sunlight plays through its leaves.

FINE AUTUMNAL FOLIAGE.

Oaks, too, are well represented. Quercus Cerris, the Turkey Oak, with its mossy acorn-cups; the Holm Oak, with its evergreen leaves; and the Knap Hill variety of Q. coccinea, are among the trees that skirt the lawns to the south. There is also a fine example of the Black Walnut, Juglans nigra.

Standing alone on the other side of the lawn is a wonderful old Tulip Tree, with a huge bole swelling out like an Onion in shape. It flowers, I was told, very freely; and on this afternoon was a mass of rich yellow, handsome leaves. Hollies seem to be everywhere; and it may interest those who believe that the nature of the coming winter can be forecasted from the quantity of the berries, if I mention that they seem unusually numerous and fine. The Liquid-ambar was just putting on its autumn colours, which would be at their best a little later.

Having crossed the lawn, we came now to the stretch of water which I mentioned ran along the west side of the grounds; and as we walked along the bank, towards the house, Mr. Brown indicated some of the most interesting features. Autumn colour had evidently been borne in mind when he planted the shrubs, and Berberis Thunbergii was a particularly fine patch, with B. Darwinii to keep it company. Vaccinium pennsylvaticum finds the moisture congenial; and Rhus Cotinus was already a brilliant crimson. With its "feet in the water," the Royal Fern, Osmunda regalis, has assumed imposing dimensions, and its foliage has become golden in colour. Nearer to the house are large plantings of Azalea mollis, pontica, and Ghent varieties, their leaves now changed to ruby and crimson.

"We get two fine shows from the Azaleas," said Mr. Brown. "The first is in spring, when they are a mass of bloom; the second is in autumn, when the leaves change colour."

"These Heaths are also very effective," I remarked, as we passed a large patch, some white, others purple.

"They are all the best hardy sorts, such as Erica carnea, ciliaris, mediterranea, vagans, and vagans alba, also Calluna vulgaris Alporti and Hammondii. There used to be a large plantation of Laurel here, but it was cleared away six years ago, as it screened the view from the house, and the Azaleas and other plants were not seen. At the top end the bank is clothed with all the best varieties of Japanese Maple, Acer palmatum, but, owing to the steepness of the slope, the ground gets too dry in summer, and it is intended to take them up and replant them where the conditions are more suitable."

AUTUMN-BLOOMING ROSES.

Before exploring the other side of the pond, with the gardens which stretch invitingly beyond, we turned to look at the Rose beds on the lawn in front of the house. These are seven in number, and each has one variety, to give a good block of colour. There were still many blooms open, with others coming on, but not, of course, in quantity such as would be earlier in the season.

"General MacArthur is the finest scarlet bedder," said Mr. Brown; "and I find it very little subject to mildew. Mrs. Wakefield Christie-Miller is a splendid doer, and is always good in autumn. Madame Ravary wants some beating as an orange-yellow. These plants are twelve years old, and have been replanted only once. The other varieties are Caroline Testout, Lady Pirrie, Madame Mélanie Soupert, and K. A. Victoria, which is one of the best of the cream whites."

We now passed to the head of the pond, which is a natural piece of water, and at one time little better than a broad ditch. The shrubs and plants have all been added since Mr. Brown took charge of the gardens; though a fine Weeping Willow, which casts its shadow on the water, is very old, for it is shown in a picture of the house, dated 1764.

PLANTS FOR THE WATER SIDE.

Standing at the head of this ornamental water, which runs north and south—and looking from its banks to the pavilion which crowns the farther end, rich and varied foliage is revealed, not, of course, always in bright colours, though these are sufficiently in evidence to impart a warm and cheerful touch to the autumn scene. Shrubs that revel in moist conditions are planted liberally, and nearer the water's edge are Spiræas, Primulas such as P. japonica, and many fine Irises, the varieties of Japanese Irises being especially choice. Right in the foreground are many large bushes of the best hybrid Rhododendrons, well set with buds for next season; a big bed of Crinum Powelli and its white variety was pointed out; Aralia chinensis makes a large bush; and there are thriving patches of Hypericums in a number of species. In the water, Nymphæas are represented by James Brydon, Robinsoni, Gladstoniana, alba, Marliacea chromatella, and other good varieties; Sagittarias, Sedges, Astilbes, Hemerocallis, the Flowering Rush—these are among the plants on the water's edge.

Some of the subjects on the left bank I have already mentioned; on the right are masses of Rhododendrons, and Cistus laurifolius and ladaniferus; and beyond these Yuccas, Phormium tenax (the New Zealand Flax), Eulalias with variegated foliage, Pampas Grass, Tamarisks, Bamboos, shrubby and herbaceous Spiræas, Purple Loosestrife, and many more, with Gunnera manicata in a sheltered corner, and the wonderful old Willow, whose leaves are reflected on the surface of the water.

"Is the Phormium tenax quite hardy with you?" I inquired.

"Quite," was the answer; "and it also flowers well. The Gunnera merely requires a covering of leaves over the crowns in winter."

And now we turned away from contemplating the plants on the banks of the water, and proceeded towards the flower gardens. Passing a border which two years ago was the site of a range of fruit houses, I noticed Bignonia grandiflora and Cydonia Maulei among the climbers that clothe the old Peach wall. Others that have stood the winter unharmed for several years are Cæsalpina sepiaria, Jasminum primulinum, and the blue Passion-flower. In the border in front are Antirrhinums of sorts, Verbena chamædrifolia—here quite hardy—and a very fine Pentstemon, George Horne, scarlet with a light throat, but of this cuttings have to be taken in autumn.

RHODODENDRONS BY THE WATER SIDE.

A BLUE GARDEN.

Passing through a gate we next looked at the Blue Garden, which maintains its name with a varied collection of blue-flowering plants, amongst them Delphiniums, annual Larkspurs, Anchusas, Cornflowers, Aconitums, Nigellas, Salvia patens, and Violas. Although at this time shorn of its greatest charms, it still gave a patch of colour here and there.

At the end of the Blue Garden is a remarkably fine Azalea, fully fifty years old. It occupies a space of at least twenty feet in diameter, with proportionate height, and as the sun lighted up the brilliantly tinted foliage, it made a highly decorative feature.

Another turn, and we came in view of the Rose garden, surrounded on three sides by a square-cut Yew hedge, through openings in which at one end we caught a glimpse of the next garden. On the left side runs a pergola, covered with handsome foliage and flowering plants. Before entering the Rose garden, however, we stopped at a border backed by a Clematis Lady Caroline Neville, Lord Neville, Nelly Moser, and Lady Northcliffe. In the foreground standard and dwarf Heliotropes, with the white Marguerite Mrs. F. Sander to give the necessary relief, had made a very effective bit of planting; and the same tone had been carried out a little farther on with Ceanothus Gloire de Versailles, which was now in bloom for the second time.

"This was formerly the kitchen garden," Mr. Brown explained, as we entered the Rose garden, "and had been so for probably a hundred years. It was the best cultivated soil on the estate, and was good for two to two and

a half feet down. The soil generally is very poor, and not suited for Roses—nor is it good for fruit trees, and consequently we cannot get the fruit to colour well. It we want to make a new Rose bed we have to buy new soil, though, fortunately, we can get sufficient cow manure."

GOOD AUTUMNAL ROSES.

There are six large beds, each containing a hundred Roses, planted with a separate variety, to give blocks of colour, and to flower as long as the weather remains open. Two of them are singles—Irish Elegance and Irish Fireflame; the others are Lady Battersea, Prince de Bulgarie, Lady Hillingdon, and Mrs. Wakefield Christie Miller. Herbaceous borders run round the sides of the garden, and the beds are edged with grass.

Through the Yew hedge we came into the Dutch garden, with broken stone paths, with dwarf plants between the stones. Radiating round the centre are twelve beds, which had been filled, as to three, with Antirrhinums, Sutton's Bright Pink, Carmine Pink, and Orange King; three others with Sutton's large-flowered Phlox Drummondii; two with Verbenas; two with Heliotropes Lord Roberts and President Garfield; two with Pentstemons Myddleton Gem and heterophyllus; and one with scented-leaved Geraniums and Delphiniums.

Among the plants in the paths are Sedums, Saxifrages, Campanulas, Violas, Thyme in variety, Gentians, Dianthus, and Verbena chamædrifolia.

Next to the Dutch garden is another Rose garden, also with six large beds. A magnificent Elm, with a girth of eighteen to nineteen feet at five feet from the ground, stands in one corner, and overshadows everything, while its roots travel far in search of food. In consequence, the Roses here are not so satisfactory, but the Elm itself is so ornamental that it compensates for this. The varieties here are Sunburst, Mons. Joseph Hill, Betty, Madame Edouard Herriot, Caroline Testout, and the polyantha Orleans, and, in spite of all drawbacks, they provide a quantity of cut blooms through the season.

PLANTS ON THE PERGOLA.

We now retraced our steps, in order to see the herbaceous borders and pergola, which run parallel with the gardens I have just mentioned. The borders, Mr. Brown said, have been very good this season. They contain all the usual run of herbaceous plants, in the best varieties; but just now the Michaelmas Daisies were in possession of the field, Climax, Beauty of Colwall, and Perry's Favourite being notable. Sedum spectabile atropurpureum makes a good edging.

Continuing the pergola to the south is a walk with shrubs on either side, which meet overhead and form a natural pergola, through which we emerge level with the far end of the ornamental water. Here a turn brings us to yet another Rose garden, at the end of a lawn. This garden is sunk, and the beds are planted with mixed varieties, while Dorothy Perkins, Hiawatha, Delight, Lady Gay, and American Pillar are trained on pillars. At the head of the steps it is intended to plant Irish Yews.

"This garden," said Mr. Brown, "had to be neglected during the war, owing to shortage of labour; and, of course, the lawns had to go, and we have not been able to get them into good condition again. They will be all right in the course of another season or two, I hope."

"What is the extent of the lawns?"

"The three together are about five acres."

Regaining the path, and standing on the high ground at the head of the water, the trees and shrubs were again to be seen to full advantage, while close at hand is a hedge of Penzance Briers and Rosa rugosa, ornamental with its profusion of hips.

By winding stone steps, whose interstices were filled with plants, we descended to a large rock and water garden, made between seven and eight years ago. The water from the pond has outlets here, and when turned on falls noisily over the boulders into the stream at the bottom. The rock is North Wales limestone, which is now nicely weathered. As to the plants—they are of the usual type, all the best varieties being represented. Different forms of Spiræa, the Royal Fern, Saxifraga peltata, Funkias of all sorts, Eulalias, and Primula japonica show their appreciation of the site by making handsome clumps. Artemisia lactiflora was carrying its creamy white blooms; Geranium plantagineum and other wild-garden plants are in profusion; and lower down Irises, Senecios, and Epimediums were seen. Nor must I omit to mention the fine effect produced by Cotoneaster horizontalis, hugging the rock, and now taking on a rich colour. Across the stream Spiræa palmata had assumed a bright orange-yellow colour; Bocconia cordata had been good. The Rhododendrons, whose appearance betokens a

A UTILITARIAN PEAR—BEURRE HARDY IN BLOOM.

ravishing display in spring, are a host in themselves, and there are many other interesting subjects hereabouts.

A HANDSOME DECIDUOUS CYPRESS.

At the other end of the bog garden we mount by natural-looking steps to the higher ground again, and bearing to the left, come to another pond. A feature on its banks is an old and very fine deciduous Cypress, Taxodium distichum, said to be one of the finest in the country. That it is in a congenial spot is evident by its great height and flourishing appearance, while for some little distance from the thick trunk "knees" arise from the roots. The foliage has now assumed a golden tint, lighting up the scene and reflecting itself on the water. This tree is at the end of a row, and so is fully exposed; a little way off are two others, in which the foliage is still green. I may mention that on the lawn, some distance away from the water, a Taxodium shows by its comparatively stunted growth how little it appreciates the dry conditions.

From this pond we made our way across the lawns, already described, to the greenhouses. The scarcity of fuel has made itself felt, and, combined with labour shortage, has led to the giving up of many of the Orchids. Thus, in one house, they have been entirely done away with, and Heliotropes take their place. Another, run at an intermediate temperature, has Cypripediums such as Leeanum, insigne, and nitens, to give flowers in winter, with Palms and Ferns for house decoration.

From the houses we proceeded to the kitchen garden, which is about three acres within the walls. On the south wall Peaches do well, with Strawberries in the border in front of them; while on the other side of the wall, facing north, are Morello Cherries. Apricots had been tried on the east wall, but last year they were taken out, and replaced by Plums. Pears and Plums are on the west wall.

The paths in the kitchen garden are planted with espalier Apples and Pears, and in reply to my questions Mr. Brown said:

"This has been a good year for Apples, Pears, and Plums; but we do not get colour, and the fruit does not keep so well as on a heavier soil. We have all the leading varieties. One of the best-flavoured Pears I know is Thompson's—a small fruit, but worth everyone's growing. It is in season in November and December."

"What is your best Strawberry?"

"I have not found anything half so good as Royal Sovereign."

"Do you get good crops of Potatoes?"

"Yes; this is a good Potato soil, though deficient in lime. We have to lime every four or five years, and could not grow a Cabbage unless we did."

Many other interesting things I saw, and brought my visit to a conclusion after going through the fruit room, where the fine crops of Apples and Pears are stored. Mr. Brown, I may add, was for some years in charge of the fruit at Gunnersbury House, Acton. He came from that place to take up his present position twenty-two years ago, and during the time he has been here has entirely made the gardens, including the rockery and the water garden.

W. J. CHITTENDEN.

A UTILITARIAN PEAR.

Of first-rate flavour, and a great cropper, Beurré Hardy Pear should be in every collection, and should especially commend itself to the owner of the small garden who cannot afford to give up his limited space to choice varieties, not always vigorous in growth, and often far from being reliable croppers.

In Beurré Hardy is combined the qualities of first-rate flavour, ideal size for the table, consistent cropping, and vigorous and healthy growth. Here, in Gloucestershire, it has been grown for a great many years, and has never failed to yield a heavy crop of splendid fruit. This Pear makes a splendid bush tree on the Quince stock, or it will succeed admirably as an espalier, or as a cordon for a south or west wall. If particularly fine fruit is desired, I would recommend the espalier or cordon method of training, and a south aspect.

A PEAR FOR SMALL GARDENS.

For flavour, Beurré Hardy is in the front rank, although perhaps it is not quite so exquisitely aromatic as Doyenné du Comice, Thompson's, or Winter Nelis. It is in season from mid-October to mid-November, perhaps lasting till the end of November, if kept in a good store.

The tree is practically immune to fungoid pests, but wasps have a great predilection for the fruits, far more so than for most other varieties, and it is well to protect the finest fruits, when nearing maturity, by enclosing them in muslin bags. If the bags are secured correctly, not to the fruit stalks, but to the wood beyond the stalks, this will also prevent the Pears from falling, and so being badly bruised.

The tree bears well in a young state, and is successful as a standard for orchard planting. It is the ideal Pear for the small garden, and I would like to see it planted extensively, for it is sure to give far greater satisfaction than the coarse and third-rate varieties which somehow invariably find their way there.

RALPH E. ARNOLD.

Famous Gardeners at Home.

No. 237.—Mr. HENRY BROWN, at THE GARDENS, CLOUDS, WILTSHIRE.

THERE is no seat in Wiltshire more finely situated than Clouds, the residence of the Hon. Percy Wyndham. Some idea of its charm may be gathered from the fact that the terrace in front of the mansion is as high as the top of the spire of Salisbury Cathedral, but only those who have climbed the ascent from the village of East Knoyle can realise its beauties. As to the gardens, which it was my privilege to visit towards the end of April, when they were in their spring loveliness, they are in keeping with the house and surroundings. If I had to describe them in a sentence, I should say that they constitute a succession of delightful surprises. They certainly attest, in a remarkable manner, the knowledge and the taste of Mrs. Wyndham, by whom they were planned and planted twenty years ago, when her husband purchased Clouds; and they also reflect credit on the skill and proficiency of Mr. Henry Brown, the head gardener, who assisted Mrs. Wyndham, and carried out her instructions. Mr. Brown is one of the veterans of the horticultural world. Just over three score and ten years of age, he has been with Mr. Wyndham for thirty-four of them, and was previously at Wilbury House, in the same county. Apart from his long experience in garden life, he has been a great prize-winner at horticultural shows. For example, since 1899 he has taken at Salisbury nine first prizes, eleven second, and five third, for fruit, flowers, and vegetables, and at Winterbourne Earls, since 1901, no fewer than eighteen first and six second prizes. He is still very active and vigorous, but he thinks that, so far as showing is concerned, the time has come for him to rest upon his laurels. Mr. Brown's own cottage stands near a quaint garden, whose background (the stables) is covered with green, and has a pergola in front.

Mr. Henry Brown.

The Walled Garden.

"On this pergola," he said, "there are Roses, Jasminum, and Vines, and, in the garden itself, plants of many varieties, including Roses and herbaceous sorts."

"I see that you have some very good specimens of Lilium auratum."

"Yes, they are considered rather fine. Crown Imperials also flourish here. We merely plant them in common soil. There is a clump of Rhododendrons of the best kinds at the corners, and Magnolias opposite. In this garden, as all over the pleasure ground, everything is grown in masses."

"That is the principle which you follow?"

"It is always kept in view," he rejoined, as we noted an archway of Crimson Ramblers and Jasminum, and proceeded to the walled garden beyond, which, except a few Plum trees on the walls, and four flourishing Mulberry trees, is devoted to flowers.

"Magnolias appear to be a great feature here."

"There are six trees, the varieties being grandiflora and conspicua, which are in flower for a fortnight or six weeks. Daphne is another plant which does remarkably well, and Choisya ternata flourishes on the south wall. One of the most notable things in this garden is the collection of Cyclamen (white and pink), which flower twice a year under the east wall. Then we have three beds of Dog's-tooth Violets, and amongst varieties of Crinum we find Powellii exceedingly good. Lilies of the Valley are grown in quantity, and sent to London, when the family are in town, two or three times a week. Here, as in other parts, are masses of Daffodils, Narcissi, and Tulips."

The East Garden.

Next we went into the east garden, with the spring flowers again conspicuous, and a Sweet Brier hedge all round the circle of beds.

"How many beds are there?" I enquired.

"Sixteen, four consisting of Carnations and Roses, four of Roses and Narcissi, four of Tulips and Irises, and four of Tulips alone. Outside the circle are two beds of Roses and Lilies, with Tomentosas in the corner. Roses and Jasminum are planted all along the walk, and on the wall at the side are Myrtles, Clematis, Pyrus, Figs, and Honeysuckles. At the bottom are flowering Crabs, Cherries, and Almonds."

"Then there are the six square beds, and the long bed at the top."

"As you see, they are at present filled with spring flowers, and they will be succeeded by herbaceous plants and Roses in all the beds."

"Roses, I gather, are one of the leading features of the gardens?"

"We grow about two thousand five hundred, of which Hybrid Teas, I think, are the most prominent. They include Augustine Guinnoiseau, Captain Christy, Camoens, Caroline Testout, Cheshunt Hybrid, Gruss an Teplitz, Gustave Regis, Kaiserin Augusta Victoria, La France, Killarney, Longworth Rambler, Mrs. W. J. Grant, Papa Gontier, Reine Marie Henriette, Reine Olga de Wurtemburg, and Viscountess Folkestone. The Teas are chiefly Amazon, Bouquet d'Or, Dr. Grill, Gloire de Dijon, Gabrielle Nabonnand, Madame Eugene Verdier, Madame Pierre Cochet, Maman Cochet, Marie Van Houtte, Mrs. Edward Mawley, Niphetos, Papillon, Souvenir d'un Ami, and Wichuriana."

"What about Hybrid Perpetuals?"

"We have not many of these, but the principal are General Jacqueminot, John Hopper, Madame Victor Verdier, Mrs. John Laing, Mrs. Sharman Crawford, and Tom Wood. Among Noisettes, we grow Aimée Vibert, Alister Stella Gray, Celine Forestier, Lamarque, L'Ideal, and William Allen Richardson. The Chinas include Irene Watts, Laurette Messimy, Madame Eugene Resal, and Queen Mab. In this garden we have a bed of Penzance Briers, Crimson Ramblers, and Honeysuckle, which is rather effective when in flower. But the Rosery itself is behind the kitchen garden."

"How often do you clip your Yew hedges?"

"Only once a year. They are considered quite a feature of this garden, which is much brightened by the spring flowers in the grass under the trees. Flags, as you may have observed, are placed all round as a protection to the feet in wet weather."

"There are more Magnolias on the front of the mansion."

"Yes, on the south front, with Roses and Myrtles on the border below. Some of the latter grow to nine feet high, and six feet in diameter; they are kept, during the winter, in the Myrtle house, and put on the terrace in the spring. Here is a little combination which you may like to mention, consisting of a seat on a grass mound, with Pyrus japonica on each side, Roses and Jasminum behind, and Rosemary below. Again, west of the mansion is another combination, consisting of a bed of Rosemary and Lavender, while close by is the biggest single Rhododendron I have seen. I do not know the variety, but the colour is pale blue."

A Decorated Tennis Court.

Passing away from the mansion, we ascended what is called the River Walk, because it winds like a river to the top. On each side are flowering shrubs, Magnolias, and spring bulbs, with fine Cedars in the background. In another direction is the water tower, with a remarkably well laid out tennis court, decorated by an archway of Roses.

"Those Roses," continued Mr. Brown, "make a fine show in July and August, when they are quite eight feet high. In the beds below are more Roses and herbaceous plants."

"Of course, you have a great number of herbaceous plants, but you might name a few which you grow in greater quantity."

"Montbretias, Phloxes, Delphiniums, Pæonies, Gladioli, Spiræas, and Yuccas are amongst the favourites. In the rear of the tennis lawn are the extensive golf links, and behind the seats and tea table is a rock garden with numerous varieties."

Having observed a number of Roses on the path to the water tower, we walked down the slopes towards the kitchen garden, staying for a few minutes at the frame ground, where Watercress, Cucumbers, Melons, Carrots, Potatoes, and Violets are forced, the Violets being the Czar, California, Neapolitan, Princess Alice, and Princess of Wales. Close to these frames is the Rosery, which is a hundred and forty-six yards long. In spite of its name, it includes many other flowers, and on the wall, which runs the whole length of the kitchen garden, are Wistarias and Pomegranates, which flower but do not fruit.

The Kitchen Garden.

"How large is the kitchen garden?" I asked, as we entered the wooden gates.

"About three acres. This is the Nut walk, with Filberts and Cobs, spring flowers growing in the grass beneath. You may like to know that I have lately adopted a new system of tying down Apples. Sticks are put round the tree, and form a circle, the boughs being tied on to them. The system occupies a good deal of time, but I find that it answers, particularly in the case of Bramley's Seedling."

"How old are the Black Currants growing away from the wall?"

"Twenty years, and they still fruit very well. Below, we have quite a plantation of them. Strawberries we also go in for largely, but we do not force any. The varieties are All the Year Round, Royal Sovereign, Princess Alice, and Laxton's Latest of All. I ought to have mentioned, when we were at the frames, that the Melons are Ne Plus Ultra, Sutton's Green Flesh, Windsor Castle, Netted Kincaird, and Mr. Jones. We have cut as many as a hundred and eighty Melons in one season."

"Do you go in largely for Cherries?"

"They are grown in the Cherry walk, alternately with Apples, and the chief variety is Emperor Francis. As to other fruit, on the east wall Plums are chiefly grown, the varieties including Diamond, Orleans, White Magnum Bonum, Pond's Seedling, July Greengage, Coe's Golden Drop, Victoria, Jefferson's, and Kirke's. Two varieties of Pears are also grown on that wall, viz., Williams's Bon Chrétien and Duchesse d'Angouleme. On the south wall we grow Beurré Diel, President, d'Osmanville, and one or two other varieties. Also Figs—Brown Turkey, White Marseilles, and Black Ischias."

The Favourite Vegetables.

"Do you find that fruit or vegetables do better in this garden?"

"Vegetables, on the whole. They are very good, but late; the soil suits most of them. We pick Peas, in the open, within a month of Christmas."

"What are your varieties of Peas?"

"Ameer, Sutton's Bountiful, Early Sunrise, William Hurst, John Bull, Sutton's Prize-Winner, The Daisy, Kingfisher, Alderman, Autocrat, Ne Plus Ultra, Duke of Albany, and Sutton's Magnum Bonum."

"How many varieties of Broad Beans do you go in for?"

"Five, and four varieties of French Beans, as well as four of Runners. Beet is another feature, of which we have five varieties. Then we have about the same number of varieties of Kale, and about a dozen of Broccoli. The single variety of Brussels Sprouts is Aigburth, but of Cabbages and Savoys we grow about eight varieties. Our favourite Cauliflowers are Early London, Mammoth, and Veitch's Autumn Giant. We grow four varieties of Carrots, seven of Celery, and about the same number of Onions."

"Which do you consider the best Cucumbers?"

"Lockie's Perfection, Hunt's Marvel, Worthing Favourite, Telegraph, and Her Majesty. The Turnips are Early Snowball, Early White Star, Jersey Navet, Model White, and Orange Jelly."

"Do you grow many varieties of Potatoes?"

"Only Early Frame, Ninetyfold, Sir John Llewellyn, Duke of York, Dunbar's, and Up-to-Date. As to other vegetables, we grow Endive of sorts, Corn Salad, Dandelions, Leeks, Radishes, Spinach, Salsify, and Chicory."

The Wild Garden.

Leaving the kitchen garden, we proceeded to the wild garden, with Roses and Berberis on the walls, and the grass full of Bluebells and Primroses.

"Here," said Mr. Brown, "I grow Watercress in trenches, but a more ornamental the bed of Japanese Iris in variety. sorts of things are grown in the wi Thus, in one direction there is a ver of Azalea mollis, and in another a B while, in beds, there are quantities of Seal and Myosotis."

"Are there named Lilies in the fi

"Yes, but the chief adornment here is the magnificent crimson Rhododend

"It is, indeed, a wealth of bloom. to have Rhododendrons and Yews all pond."

"They were all planted by us t years ago, when the pond was made the Bamboos, which do well. I ne say that the Laurel, with a wonderful not planted then; both the Laurel Hollies are of considerable age. This be emptied into another by means o necting ditch, which is planted wit bog plants, and looks its best from September."

"How large is your Apple orchard

"About four acres. The trees bl but we do not usually get much fruit smaller trees were planted within t years, and they include several of varieties."

Returning to the entrance to the Mr. Brown mentioned that last year Lilacs, grafted on Privet stocks, and to see how they will turn out.

"Facing the porch," he continued, Yew hedge behind Roses, trained in of peacock's tails, with Hydrangeas The large tubs will be filled in May niums, quite eight feet high, and Or which are kept in the Orange hou winter. The feature in the greenhous is the show of Arum Lilies. We use largely for grouping in the corners o sion, there being no conservatory eighty are grown in pots. Last ye three hundred and twenty-six flowers obconica and stellata and Freesias grown largely, and in spite of the the obconicas being poisonous, no has suffered from them. In the ot Hydrangeas, Salvias, Geraniums, F few Carnations (Malmaisons), and (yellow and white) are grown. But, now understand, the interest at Clou in the outside features, and, I think, in what may be called the more n wilder parts of the gardens."

Alfred

The Gardener's Cottage at Clouds.

J.W. Buckingham

The Gardens of Florence, Viscountess of Massereene and Ferrard, at Milland Place, Liphook.

IN splendid September weather, I visited the lovely gardens at Milland Place, now in the occupation of Florence, Viscountess Massereene and Ferrard, and the property of Mr. Cecil Quinton. Milland Place is not only beautiful itself, but is surrounded by the most charming of Sussex and Hampshire scenery. The nearest railway station is Liphook, but the Sussex boundary is passed about a mile from the entrance to the park, and the commanding mansion overlooks the South Downs. The approach is through a picturesque and circuitous drive. Mr. J. W. Buckingham, who is in charge of the gardens, has been at Milland for eleven and a half years, and he has remodelled the whole of the extensive pleasure grounds. Lady Massereene has occupied the place for the last eight years. Though extensive they have, however, the advantage of compactness, and Mr. Buckingham was able to show me all the leading features, though my time was far too short for a tour of inspection pursued in the most favourable conditions.

ONE OF THE GREENHOUSES AT MILLAND PLACE, WITH MR. BUCKINGHAM.

Part of the mansion, a portion of which dates back eight hundred years, was at one period a Royal residence, and among the sights to be seen is the bathing pond used by King Charles I. Other silent witnesses to its age are several noble Chestnuts, including, on the left of the house, a spreading Cedar (C. deodara), said to be eight hundred years old, eighteen feet in circumference four feet from the ground. The decoration of the Mosaic Terrace first claimed attention.

THE MOSAIC TERRACE.

"Since the end of June," said Mr. Buckingham, "Ceanothus Veitchii and Gloire de Versailles have been magnificent—I have the latter hard pruned back each year—and the combination with Escallonia is pleasing. The favourite colours of Lady Massereene are blue, scarlet, pink, yellow, and white; and these are called into requisition in all parts of the garden as much as possible. On the south front of the house are Ampelopsis Veitchii and Hendersonii, Ram, Clematis, Euonymus, Wistarias, and Vitis in variety; Ivy is only on the north side. The Masonic wall on the south side is covered by Azara microphylla, and the whole of the vases—upwards of twenty—are filled with Salvias Pride of Zurich, which have been a blaze of scarlet since June, when we began to bed out. There are three plants in each vase. The edging consists of variegated grass and Mesembryanthemum. The six beds on the top terrace form a combination of scarlet and blue. Four are filled with Salvias, and two with Heliotrope Lord Roberts. They flower from June until the frost cuts them down in October, when we throw them away. Cuttings are struck in the autumn, and, in fact, we have a fine batch now ready for next year."

"Is this the first year you have tried the combination of Salvias and Heliotropes?"

"No; we tried it last year. This is the first time a design has been repeated, but it was so successful that we thought it worth while to try it a second time. You will notice that the border round the house embraces Geranium Paul Crampel, edged with variegated Geraniums, while the edging of the beds of Salvias is Pyrethrum aureum, and for the Heliotropes, Dactyllis glomerata. The spring bedding on the terrace this year was red and white Daisies, red and yellow Wallflowers, and Myosotis Royal Blue. We go in for large quantities, both in bedding and for decoration, and in the spring bedding a thousand Wallflowers, five hundred Forget-me-nots, and four hundred Daisies were used. We never have less than a hundred of any plant."

THE DECORATION OF THE CONSERVATORY.

"One of the chief features is the decoration of the conservatory. The only permanent contents of this building, which is paved with tiles from Ostend, are eight fine Palms, and the creepers on the walls, chiefly Ficus repens and Cobœa scandens; the rest of the contents are entirely in pots. Of course, they are constantly changed, but at the present time, they are in seven groups, two of the best, I think, being a mixture of Coleus, Browallias, blue and white Campanulas, Begonias, Statice, Adiantum, and blue Lobelias. For the rest, there are conspicuously variegated Coleus; Begonias semperflorens and Firefly, Browallias speciosum, Heliotropes Lord Roberts, Maidenhair Ferns, Lobelias Sapphire Blue and Kathleen Mallard, Statice sinuata and imbricata, Abutilons, Dracænas, Acalyphas, and Aspidistras, all placed to the best advantage.

"On the lawn below the terrace, there is another fine Cedar, and a natural fountain, which plays night and day, with an overflow from a stream penetrating to the lake. There are eight beds, four of mixed Roses, two of Paul Crampel Geraniums, edged with variegated grass, and two of Viola Cliveden, purple, edged with Primrose Dame. From

THE GARDENS AT MILLAND PLACE, LIPHOOK.

Digitized by Google Original from CORNELL UNIVERSITY

here we get a good view of the Rhododendrons, which are edged with hybrid Azalea mollis and Heaths in variety. The Rhododendrons are seedlings, some quite equal to the newest named kinds; there are between four and five hundred, and they were planted ten years ago. At that time, this was all uncultivated ground, and as you can imagine, a great deal had to be done before anything could be attempted.

THE ROSE BORDER.

"Then there is the Rose border, a hundred yards long, all Hybrid Perpetuals. The varieties were selected by the late Dean Hole, and are called the Dean's Selection. They do extremely well; they are edged with Mrs. Sinkins Pink. I find that soot and guano are capital fertilisers. A mulching of spent cow manure is also given towards the end of May; this keeps the roots cool in summer. Copious supplies of water are given during a hot season.

"The four beds overlooking the stream of rockwork, two hundred yards long, are filled with Pentstemon Newbury Gem, intermixed with Lobelia Queen Victoria, Chrysanthemum Princess Henry, and Aster acris, which has a beautiful effect from early in the summer to late in the autumn. The collection of rock plants is very representative, and embraces all the best known sorts."

"You have also a fine collection of shrubs."

"Yes; the belt of shrubs which runs from the racquet court close to the mansion, as far as the lake, is over two hundred yards long. This was planted by me and involved a considerable amount of preparation before planting could be done. About two thousand five hundred drain-pipes had to be laid down, and two hundred cartloads of new soil were added. To raise the plants from the boggy ground in some places, large stones, weighing from one hundredweight and upwards, were placed on the verge to prevent displacement of the bog; and most of the shrubs in these moist positions have stones and rubble under them. The soil is now in fair working order. The shrubs were planted eight years ago.

"Subsequently the wild garden was constructed with a stream in the centre, and seven rustic bridges over it. The features are chiefly the Bamboos and Ferns, with half a dozen trees of the Crabs John Downey and Dartmouth, which make excellent jelly. Just outside the wild garden is an acre of space devoted entirely to vegetables; it was trenched three feet deep from the top to the bottom. I am a strong believer in trenching; it promotes better root action and growth. All vegetable crops, both here and in the kitchen garden, are looking remarkably well this season."

THE BLUE GARDEN.

At this point we entered the blue garden, which Mr. Buckingham says looks at its best in spring. It is much prized by Lady Massereene, and I asked for the names of the favourite flowers.

"Anchusa Dropmore variety, Lupinus polyphyllus, Veronica spicata, Salvia Blue Beard and patens, Delphiniums and Lavender, Aquilegia cœrulea, Aubrietia, Myosotis, Lobelia Kathleen Mallard, Ageratum, blue Primroses, Aconitum, Asters Thomsonii, Amellus, and cœrulea, Linum sibericum, Campanulas pyramidalis, grandis, glomerata, and Canterbury Bell, Catananche cœrulea, Brachycome Little Blue Star, Commelina cœlestis and Sellowiana, Cornflower, Exacum affine and macranthum, Lisianthus Russellianus, Nemesia Blue Gem, and Nigella Miss Jekyll."

CHRYSANTHEMUMS AND DAHLIAS.

Proceeding to the kitchen garden, of which the feature is the arch in the central walk, we spent some time in the plant and fruit houses. There are two Vineries, in which I saw several fine bunches of Grapes; two Peach houses, one of them yielding a crop this year of seven hundred fruits; and two houses ready for the reception of Chrysanthemums. As we made our way through these, Mr. Buckingham gave me some interesting figures concerning the plants grown for decorative purposes.

"Chrysanthemums," he said, "are a very important feature; we grow seven hundred in pots; four hundred for specimen blooms, made up of eighty varieties; three hundred decorative and singles, in 6-in. and 8-in. pots, forty varieties; and one hundred and fifty for Christmas decoration. Four hundred early-flowering plants for September and October are grown in eighteen varieties; three hundred Malmaison Carnations are grown in eight varieties; and one hundred and fifty Perpetuals in twelve varieties. Cyclamen, Primulas, Zonal Geraniums, Regal Pelargoniums, Canterbury Bells, Campanulas, and many others, varying in quantity from twenty to four hundred, are used during the season. Hardy shrubs are also largely employed for decorative purposes. Also two hundred Hydrangea hortensis, which were in a mass of flower, and of a beautiful blue."

"You have not mentioned Dahlias."

"There are forty varieties, which are grown for massing in colour."

"How many kinds of herbaceous perennials do you cultivate?"

"About sixty, which include a great number of Asters, Phlox, Helianthus, Rudbeckias, Lupins, and Anchusas. For massing purposes, nearly a thousand Pentstemons are used. We have also quite a thousand Violas. There is a herbaceous border each side, twelve feet wide, one hundred yards long, with about sixty varieties of herbaceous plants. It has been trenched three feet deep three times. This is Lady Massereene's favourite walk."

CROPS OF HARDY FRUIT.

"The Asters are a beautiful sight. And your hardy fruit, which seems to be in a flourishing condition, notably the Pears in the delightful arched walk, which alternate with the Roses.

"The best of these, and well up to the standard size this year, are Beurre Easter, Beurre Hardy, Beurre Rance, and Beurre Superfin; Pitmaston Duchess, which has been immense in size; Doyenne du Comice, Williams' Bon Chretien, Fondante de Therriot, and Josephine de Malines. The crop of Apples has been splendid; kitchen varieties are more in demand than dessert, especially Alfriston, Bismarck, Bramley's Seedling, Ecklinville Seedling, Edward VII., Lane's Prince Albert, Lord Derby, Newtown Wonder, Sandringham, Peasgood Nonsuch, Royal Jubilee, and Hambledon's Deux Aus. These have borne remarkable crops, and will keep in a suitable storehouse for twelve months. My system is to place a double thickness of paper on the brick floor of the fruit room, arranging the fruit in single layers. Cox's Orange Pippin is the principal dessert Apple grown.

"As to other fruit, Apricots, of which we have four varieties, have yielded immense crops, and Peaches seem likely to go on bearing until the middle of October. Some of the fruit gathered from Goshawk weighed ten ounces. Cherries, Plums, and Figs have done well, and also small fruit, with the exception of Strawberries. As you see, the Plums, Coe's Golden Drop, are still hanging well on the trees, and promise to last till the middle of next month."

Congratulating Mr. Buckingham on the appearance of the gardens, particularly in view of the fact that several of his assistants, including the foreman, have joined the Army, I enquired as to his previous experience.

MR. BUCKINGHAM'S EXPERIENCES.

"I started at Brockhampton, Herefordshire, and then proceeded to Forthampton Court, Tewkesbury; my subsequent experience was gained in succession at Langley Manor, Wiltshire; Chute Lodge, Wiltshire; Hatherton House, Hampshire; Paulton Park, Romsey; Welford Park, Newbury; Yattendon Court, Newbury; Taplow Court, Bucks, where I was for two years general foreman; and Englemere, Ascot, where I was head gardener and bailiff to the executors of the late Sir Robert Meade for four years and a half—Lord Roberts bought the property. Then I came here, and in addition to the garden, I have charge of the farm, the whole estate being about sixty acres. Everything is done by Lady Massereene for the comfort of the gardening staff, and the bothy, which has accommodation for five, is suitably furnished. Just now, of course, the work is very hard, but is always most interesting, and I only regret that I am not able in the time at our disposal to give you more information respecting it."

ALFRED WILCOX.

Where the soil is of a heavy character, it is an excellent plan to burn some of it, as it is thereby rendered lighter, sweeter, and more adaptable to the needs of various plants. Make a ring of lumps of clay, and inside this light a fire of wood and small coal. When burning well, cover it with smaller lumps of clay and plenty of small coal. When this burns through, repeat the process.

Peaches and Nectarines, like other deciduous trees, require a period of rest, and those grown under glass should be kept very cool during the winter months, until the time for starting them into growth comes round again. If it is necessary to have heat on to protect other subjects in the same house, give plenty of air on all suitable occasions. The night temperature should not exceed forty-five degrees.

Digitized by Google Original from CORNELL UNIVERSITY

gardens might be greatly improved, and that is the number of paths. There are almost invariably too many of them—in some cases far too many. The general impression seems to be that wherever people are likely to walk, gravel must be laid down. But surely it is far pleasanter to walk on grass, and, if it be objected that grass is liable to get damp, the obvious reply is that people do not walk—much, at any rate—in their gardens in wet weather. If a certain narrow track is likely

MR. F. G. BULL.

to be much frequented, as from the gate to the front door, there may be an advantage in using gravel, because the perpetual tread of feet would wear the grass away, and along such tracks the gardener must go with his barrow to reach the beds. Gravel must often be preferred. But it seems to be overlooked that, when a garden is cut up into, say, rectangular sections, with a gravel path on each side of each section, that only one is necessary, and that the other, if wanted for walking, may, with advantage to appearances, be laid down in grass, or, if the lawn is alongside, thrown into it. If it is not wanted for walking, it may be broken up and planted. If owners of gardens were to calculate how many of their paths were really unnecessary, they would be astonished to find how much land was wasted. In my own garden, though it is only about an acre, and does not contain as many paths as is often the case, I find that another hundred and twenty square yards, or enough to make a fine border, can, with advantage, be planted next autumn. One does not want to look out from the windows on stretches of gravel. Flowers and grass are infinitely preferable, and by a little management they can be substituted for it in all but a few places.

H. C. DAVIDSON.

THE best species of Banana (Musa) for fruiting in this country, under glass, is M. Cavendishii.

WE have received from Miss M. Williams, Killucan, Co. Westmeath, Ireland, a boxful of a very fine strain of the St. Brigid Anemones. The flowers were large, finely formed, and of rich and varied colouring, some of those with white centres being especially beautiful. They arrived in splendid condition after the long journey, and have lasted in water for some days since.

The Evolution of a Modern Garden.

INTERVIEW WITH MR. F. G. BULL, AT THE GARDENS, WESTON FAVELL HOUSE, NORTHAMPTON.

WHEN I had spent some time, during my visit in the second week of June, in the gardens at Weston Favell House, the residence of Mr. J. Manfield, J.P., between two and three miles from Northampton, I came to the conclusion that they supply a remarkable object-lesson in the astounding progress of scientific horticulture. Under the auspices of Mr. Manfield himself, who is familiar with every detail of the work, and knows the name of every shrub and plant, and of his head gardener, Mr. F. G. Bull, the process of converting stubble and grass fields into pleasure grounds was commenced eight or nine years ago. The natural advantages were few when Mr. Manfield, having purchased the estate, decided to erect a house on the brow of the hill. But there was one of great importance. In and near the meadows were many fine trees, and these, it was recognised, could be turned to splendid account. But the history of the evolution of what is now one of the most delightful of modern gardens will be best gathered from the information supplied to me by Mr. Bull as we pursued our way. Incidentally it may be said that the process of development is still going on. Mr. Manfield has lately acquired an adjoining farm, and of this land six acres have been added to the gardens. They were only laid out in the spring, but they already give promise of being a very pleasing extension.

Groups of Conifers.

"The aim in view here," said Mr. Bull, "is to have a series of groups of choice Conifers, with Austrian Pines and ornamental Crabs at the back, with Silver Birch to lighten them. There are several clumps of Cedrus deodara, C. atlantica, and C. atlantica glauca, and Abies pinsapo and A. pungens glauca. In one clump there are fifty Abies pinsapo, which will make a fine show when they are fifteen feet high."

"Judging by the growth most of them have made in such a short time, the soil must be congenial?"

"Yes, it is limestone, and suits trees, though, as you know, there are other things to which it is not congenial. But now we are entering the original gardens, and here are clumps of Cedrus atlantica, which were planted at the outset. The clumps of Abies Nordmanniana, which are doing equally well, were only planted six years ago."

"Then, your plan was to have Pines and Cedars in the background, close to the public road?"

"Yes, and to get them to form a high belt as quickly as possible. In the front we planted clumps of Hollies, with Lavender, which also likes the limestone. We do nothing to it, except cut it hard back, so as to prevent it from smothering other plants. Among the clumps of Cedars and Pines are dotted flowering shrubs, such as the Crab, the Cherry, and the Almond; also Mahonias."

"You appear to have an enormous number of beds on your very extensive lawns?"

"They have all been planted with a view to masses and effective combinations of colour."

"Flowers and shrubs being freely grown together?"

"Yes. Here, for instance, is a bed of Golden Queen Hollies and China Roses, the latter only put in this spring, dotted with a few flowering Cherries. Earlier in the season we had bulbs in this bed. Next to it is a bed consisting entirely of double-flowering Gorse."

"How long does the Gorse last in flower?"

"Quite six weeks. I wonder that, as it is so effective, and gives so little trouble, it is not grown more in pleasure grounds. We have only to keep it from encroaching on the lawns. A combination of white and red in another bed consists of Arundo conspicua and Kniphofia uvaria, the Arundo being succeeded later in the year by Pampas Grass. There is almost a companion bed to this a little further on."

"What are the chief contents of the large bed of mixed flowering shrubs?"

"Almonds, Pyrus, Bird Cherries, ornamental

THE BEAUTIFUL ROCK GARDEN AT WESTON FAVELL HOUSE.

Crabs, Thorns (scarlet, red, and pink), Berberis in variety, Hollies (Silver Queen), Osmanthus ilicifolius, Phillyreas, and Rhamnus californica, which makes a lovely back."

"You have a bed of Thorns?"

"The Thorn used in that bed is Cratægus tenacetifolia, with Roses Dorothy Perkins and Iceland Poppies, which we grow to cut."

"The Roses are looking well."

"Considering that they were only planted two years ago, I think that they are satisfactory. Here is a bed composed of Hollies (Silver Queen), and Solomon's Seal. Near by is one consisting exclusively of Berberis purpurea; and just coming into flower is a bed of Ivy, with a big tree in the centre."

The Rose Banks.

"Then, there are Rose banks?"

"One of the best of Roses for banks is Alberic Barbier, but Dorothy Perkins is equally a favourite. But the Roses here are only temporary, to hide the bank. Abies are planted at intervals. Now we turn into the shrubbery walk, which leads to the wood."

"What an excellent effect is produced by the contrast between the vivid green of the Ivy and the gravel path."

"The variety is Helix dentata, and the border is the same on both sides for the full length of the walk—a quarter of a mile. On either side are chiefly flowering shrubs, such as Lilacs, Guelder Roses, Philadelphus, Deutzias, Forsythias, Berberis purpurea, Pyrus aria, Cotoneasters in variety, Olearia Haastii, Berberis Thunbergii, Berberis Wallichiana (a yellow flower, larger than the ordinary), Laburnums, Golden Privet, Portugal Laurels, and Box."

"But you have not mentioned the Roses, which are a charming picture."

"They do particularly well here, because we are away from the limestone. Crimson Ramblers, Mrs. Anthony Waterer (another lovely crimson), Antoine Rivoire, and the white Rugosa thrive especially, and the growth of Crimson Rambler in five years has been most remarkable. As to blooms, you can see for yourself the enormous quantity.

"The walk between here and the lawns," continued Mr. Bull, "is planted with double Gorse, and Cedrus atlantica glauca interspersed. Next year we are going to try Spiræa argentea multiflora, and we think the contrast of the white with the yellow Gorse will be very pleasing. The two large beds of Laurustinus at the corner were only planted two years ago."

"What are the bulk of the trees you have planted on the lawns?"

"There are single specimens of Cedars, Walnuts, Silver Birch, Copper Beech, Fern-leaf Beech, Weeping Elm, and Acer Prince Hedgeri. One of the features in trees is the group of scarlet Thorns, the centre tree of the ten being the most ornamental. Facing the group of Thorns is a belt of Hollies, which was only planted three years ago. The varieties are Silver Queen, Golden Queen, Hodginsii, Shepherdii, maculata aurea, madeirensis, and Perry's Weeping. Lavender is planted in front, but not allowed to smother the Hollies. What may be called the terrace bedding, close to the house, will be made up for summer entirely of Begonias. At present there are four beds of purple Pansies, two of yellow, and two of white. It is perhaps worth noticing that the white flower earliest."

THE ROSE GARDEN AT WESTON FAVELL HOUSE.

THE KITCHEN GARDEN AT WESTON FAVELL HOUSE.

Strolling past the house and carriage drive, which is planted with Cedars on either side, I was struck by the mass of white flowers which completely covered the wall of the handsome stables.

"The length of that wall," said Mr. Bull, "is betwen sixty and seventy yards, and the Pyracantha Lælandii is a splendid plant for the purpose of covering it. After it ceases flowering, we get a great profusion of lovely scarlet berries. The border underneath the wall is planted with Saxifraga oppositifolia Wallaceii."

Beautiful Climbers.

"On the house itself you have more of the Pyracantha; what are the other climbers?"

"Golden Ivy, Ampelopsis, Cotoneaster microphylla and C. horizontalis, Wistaria sinensis, Escallonia macrantha, Choisya ternata, Jasminum officinalis, Ceanothus Gloire de Versailles and C. Veitchiana. The latter is one of the finest of creepers."

Proceeding in another direction on the lawns, Mr. Bull pointed out a bed containing Chestnuts Briota as dot plants, with Dorothy Perkins Roses as groundwork; five round beds of Begonias (three scarlet and two white), and a clump of Pyrus aria chrysophylla. Beyond these is a magnificent bull-ring of old Limes, twenty-six in number, with a beautifully-trimmed lawn in the centre, and a statue representing a wild boar hunter.

"The Limes," said Mr. Bull, "like the grand Elm just beyond, protecting the croquet lawn, were, of course, here when we commenced making the gardens, so that at this spot you get an idea of the old and the new. Further on is another border, consisting of Berberis Knightii, with ornamental Crabs, Laburnums, Clerodendrons trichotomum, at the back. Near to this border is a clump of China Roses in flower, and behind these are Laurustinus and Portugal Laurels. A recent addition here is a grass walk, with an Irish Juniper hedge on either side, the number planted being between

seven and eight hundred. At the back of the hedge is a reserved plantation of Silver Birches, which will be planted out next autumn, and a batch of evergreen Oaks. Also, you might make a note of a bed combining Arundos, Kniphofias, and Pampas Grass. The Kniphofias give between twenty and thirty spikes of flowers. Nearer the tennis court is a bed of Weigelas in variety, Hibiscus, Golden Larch, Prunus Pissardi, and Hollies. On the banks of the tennis court itself are more Hollies, Berberis, Elæagnus aurea, E. aurea variegata, Olearia Haastii, and several trees of Magnolia Soulangeana."

"How do you fill the large beds in the little garden surrounded by a clipped Yew hedge, with the fountain in the centre?"

"With mixed Begonias, edged by Dactylis glomerata variegata. The fountain garden leads into the Rose garden, which is about three-quarters of an acre in extent, and has a grass lawn between the beds."

"Are the beds in one variety?"

"Yes, and chiefly Hybrid Perpetuals. The pillar Roses are all Alberic Barbier, thirty in number. On the alcove we are trying the Vitis Coignetiæ."

Best Roses of All Classes.

As we stood in the summer-house, elevated some distance from the ground, at the end of the Rose garden, I inquired the names of the Rambler Roses.

"They are, chiefly, Aglaia, Bennett's Seedling, Crimson Rambler, Dorothy Perkins, Dundee Rambler, Electra, Francois Foucard, Leuchtstern, Longworth Rambler, Paul Transon, Elisha Robichon, Psyche, Thalia, René André, Queen Alexandra, and Waltham Rambler. I may say that we find the Ramblers, of which we grow fifteen hundred, not particular as to the soil they are planted in; they do as well in the stony ground and clay as in what is known as good Rose soil, providing they have a little of the latter given round the roots at planting-time. When they have done flowering, we cut away a quantity of the old growths which have flowered, in order to allow them room to develop and get thoroughly ripened. Then we are sure of a fine show of bloom the following season."

"What are the best of your Hybrid Perpetuals?"

"A. K. Williams, Captain Christy, Captain Hayward, Countess of Oxford, Duke of Edinburgh, Earl of Dufferin, Frau Karl Druschki, General Jacqueminot, Her Majesty, Louis van Houtte, Margaret Dickson, Marie Baumann, Mrs. J. Laing, Paul Néron, Prince Arthur, Ulrich Brunner, and Victor Hugo, many of which are grown in this garden."

"Then there are the Hybrid Teas and Tea Roses?"

"The former include Bessie Brown, Caroline Testout, Gloire Lyonnaise, Kaiserin Augusta Victoria, Killarney, La France, Liberty, Marquis Litta, Mildred Grant, Mrs. W. J. Grant, Souvenir du President Carnot, W. F. Bennet, Souvenir de Catherine Guillot, Souvenir de Pierre Notting, and Souvenir de S. A. Prince. Here are the pick of the Tea Roses:—Anna Olivier, Catherine Mermet, Etoile de Lyon, Francisca Kruger, Grace Darling, Hon. Edith Gifford, Innocente Pirola, Madame Charles, Madame de Watteville, Madame Eugene Verdier, Madame Falcot, Madame Hoste, Madame Lambard, Maman Cochet, Miss Ethel Brownlow, Papa Gontier, Rubens, and The Bride."

We next strolled to the rock garden, in which Rambler Roses are a great feature, and I asked Mr. Bull to name some of the various plants in flower.

"Primula japonica, Veronica alpestris, Heuchera sanguinea, Trollius europæa, Saxifrage pyramidalis, Azalea mollis, Iris germanica, Alpine Phloxes, Cheddar Pinks, Ramondia pyrenaica, Ranunculus cortusæfolius, Thymus in variety, Aubrietias in variety, Hemerocallis, and Cheiranthus alpinus. A number of Water Lilies in the pond will flower later."

WESTON FAVELL HOUSE FROM THE LAWN.

The Wall Fruit.

On the way from the rock garden to the kitchen garden are several Rose pergolas, which are also conspicuous in other parts of the pleasure grounds. The kitchen garden itself is two acres and a half in extent, and is surrounded by high walls. It combines the ornamental with the useful, and I inquired first about the fruit grown on the walls.

"The east wall and part of the west wall are devoted to Pears," replied Mr. Bull, "of which the best varieties are Beurré de Capiaumont, Beurré Diel, Beur é Easter, Beurré Superfin, Williams's Bon Chrétien, Charles Ernest, Conference, Doyenné du Comice, Durondeau, Emile d'Heyst, Glou Morceau, Jargonelle, Josephine de Malines, Le Lectier, Marie Louise, Olivier de Serres, and Pitmaston Duchess. On part of the west wall we grow Plums; on the south wall, Apricots, Peaches, and dessert Cherries; and on the north wall, Morella Cherries and Victoria Plums, with a few Gooseberries and Currants. The Plums include Coe's Golden Drop, Denniston's Superb, Jefferson, Kirkes, Pond's Seedling, and Reine Claude de Bavay. The Peaches on the walls are Alexandra, Noblesse, Royal George, and Waterloo."

"And Apples?"

"They are trained horizontally all round, with two rows of bushes up the centre. We obtain the largest fruit from the bush trees, and the most choice from the horizontally-trained. As to crops, Apples, Pears, and Plums all promise well."

"Do you grow many varieties of Strawberries?"

"Royal Sovereign, Sir Joseph Paxton, which is a better keeper, and The Laxton."

"You have Roses at intervals in this garden?"

"Yes, we have Roses everywhere. Other flowers here include Border Carnations Raby Castle and Old Clove, and in the two herbaceous borders, each twelve feet wide, we have a great number of varieties. Those now in bloom are chiefly Dictamnus, Aquilegias, Pyrethrums, Delphiniums, Hemerocallis flavum, Arnebia echiodes, and Pæonies. They are all in masses, and are all more or less used for house decoration."

"I see you have a nice lot of Sweet Peas coming on."

"We sow them in pots, four seeds in a pot, and plant out, setting them eighteen inches apart from pot to pot, and getting varieties together in rows. Some of the best are Dorothy Eckford, Miss Willmott, Hon. Mrs. Kenyon, Scarlet Gem, John Ingman, Janet Scott, King Edward VII., Henry Eckford, and Bolton's Pink. Henry Eckford should be grown in the shade."

The Glasshouses.

"Which do you consider your best Peas?"

"Edwin Beckett, Autocrat, Chelsea Gem, Sutton's Century, Peerless Marrowfat, and Lord Roberts. As to other vegetables, of Celery we grow Sutton's Solid White and Major Clarke (pink), always in trenches. Ailsa Craig Onions are grown for exhibiting. The Potatoes are Factor, Sutton's Ringleader, Scottish Triumph, and a seedling of our own, an early Potato. In a frame sixty feet long we grow one variety of Tomato. It is called Kirby's Sensation, and was raised by a local man, Mr. Kirby, who was an amateur, but now runs a small nursery."

The first of the houses we inspected was the greenhouse, and I remarked on some very fine trusses of a Pelargonium, asking the name of the variety.

"Mrs. Hill. The others are, mainly, John Hill, Rosy Morn, Barbara Hope, Paul Crampel, Pride of Edinburgh, Raspail Improved, Cannell's Favourite, and Marquis of Dufferin. Heliotropes are grown on the wall."

"Your Vine borders are inside?"

"Yes, and I prefer them so. In the early Vinery we have Muscat of Alexandria and Madresfield Court. The latter do not split. Alicante, Black Hamburgh, Lady Downe's Seedling, and Foster's Seedling are grown in the late Vinery, with Tomatoes on the shelf."

"You have such a good collection of Farleyense Ferns in the stove that I should like to know how you treat them."

"We split them up into single crowns, pot them in loam and sand, and grow them on. They are very useful to decorate with. We have a few Crotons, Dracænas, Abutilons, Eulalias, and Palms; and in the Orchid house, beyond the lobby, Cattleyas and Cœlogynè cristata. I think we shall go in for Schizanthus next year."

"Then there are the Peaches?"

"In the early house we have Hale's Early

and Crimson Galande. A net is put up to catch any falling fruit. The Nectarines on the wall are Early Rivers and Early Alfred. In the late Peach house we grow Goshawk, Sea Eagle, Princess of Wales, Dymond, Rivers' Orange Nectarine, and Elruge."

There remained what is called the orchard, though all the land, four acres in extent, is cultivated, and here is grown, in addition to all sorts of hardy fruit on standards and bushes, the greater part of the plants for cut flowers. Walking back to the pleasant farmhouse, where Mr. Bull, who is now in charge of the farm, as well as the gardens, lives, I inquired about showing and his own experience.

"We only show at Northampton," he rejoined, "staging Chrysanthemums in groups, and fruit. As to my own experience, I was for some six and a half years at Flore, before going to Birmingham, under Mr. Latham, at the Botanical Gardens there; and then with Sir Edmund Loder at Flore, near Weedon. Seventeen years ago I was engaged by Mr. Manfield as head gardener. It has been a great pleasure to me to take an active part in the making and development of these gardens."

ALFRED WILCOX.

Letters from a Lady Gardener.

No. 310.—A SUMMER OUTING FOR PLANTS.

DEAR KATE,—This is the time of year in which we all long for the open air and a change of scene, if possible. It is the same with our plants, and they must now be put out of doors, with the exception of Ferns and a few hothouse flowers (such as Gloxinias, Gesneras, Tydæas, etc.), which need more moisture in the atmosphere than they can get in our summer climate, and, consequently, must remain indoors. But ordinary plants of many kinds will be the better for an outing, especially if they have been closely shut up, or in a shady place, and a few weeks in the open air will make as great a change in their appearance as it does in the case of human beings. Instead of being anæmic, they will become robust, and will stand the winter cold much better than those unfortunate beings who never take an open-air cure at all.

Discrimination Necessary.

But you should carefully choose the positions in the garden for your plants. Many of them will be the better for the full sunshine, but a few must have slight shade, especially from the afternoon rays of the sun, although all of them enjoy the morning sunshine. Azaleas, Camellias, Rhododendrons, and Heaths must not have great heat; a south-east or east-south-east position will please them, and their pots should be sunk to the rim in a bed of ashes, both to protect their fine, hair-like roots from being baked by the heat, and also to preserve the moisture about them, for, if once these roots shrivel for want of water, they will never thoroughly recover.

BOUVARDIA—BOCKI.

Libonias, too, Fuchsias, Hydrangeas, Spiræas, and Cytisus racemosus are all very thirsty plants, and will suffer severely from any sort of neglect in their water supply, so that it is not wise to place them in the hottest position, where Geraniums, Roses, Deutzias, and the rest will do well, for they need plenty of sunshine to ripen their growths. Shrubs, too (in pots), such as we use in the window-boxes in winter (Laurustinus, Choisya, Mahonia aquifolia, and berried shrubs of various kinds), all stand out of doors in the full sunshine throughout the summer, and are then well set with buds again in the autumn. Chrysanthemums must, of course, be out of doors, and should have plenty of sunshine, but they need careful watering in a dry, hot season, as they should never be allowed to droop.

Watering and Rain Supply.

But "careful watering" is by no means common. If left to a boy, or anyone else who does not love the plants, mischief is sure to take place, for the watering-pot will just skim over the top soil in the pots, making them look damp, of course, for the moment; but no more deadly proceeding than this could be carried out. Just consider the effects of this surface watering to the unlucky plants. The coil of strong roots at the bottom of the pot will never receive a drop, and soon must shrivel away, whilst the fine roots near the surface become daily more rotten, until the whole suddenly collapses, and your plant is dead.

Then, if there should be a shower of rain, your careless gardener will depend upon its making the plants look all right, and excuse himself the trouble of giving them a proper soaking; or he will give them a douche of cold water in hot weather, which will chill them through.

The fact with regard to the rain supply of plants in pots is that, as a rule, very little rain reaches their roots at all, for the circumference of the pot is more or less sheltered by the foliage of the plant, and it will take a lot of rain to moisten the top soil below the first inch. Another common danger for pot plants in the open air is that they are not always placed upright, and a very slight slant in the pot will drain away every drop of water given to the plant before it has had time to soak the lower soil.

Nothing but the vigilant eye of the owner can save the plants from all these dangers, unless you are so fortunate as to possess that most valuable helper—a gardener who really loves flowers, and takes a pride in their health and beauty. Too many gardeners are so engrossed by their Cabbages (and the rest of the kitchen garden) that they have no time or trouble to spare for flowers, except the Stocks and Asters which they admire in the borders, perhaps.

Treatment of Bouvardias.

A good many of our plants are put out of their pots into a border of good soil in the kitchen garden, for their summer outing, and are potted up again in September or October. These are Arum Lilies, Cyclamens, Eupatoriums, Salvias of the winter-flowering varieties (splendens, Bethelli, rutilans, etc.), Spiræa japonica (which needs a moist spot, however), and Bouvardias. We have tried both plans with the Bouvardias (*i.e.*, keeping them in pots throughout the year, and planting them out in summer, from June till the middle of September), and certainly they become stronger and flower better when they have free root-room at this time of year.

BOUVARDIA—DOUBLE WHITE.

Bouvardias are not to be seen in every conservatory in the winter, but they are so lovely that they ought to be grown by everyone who can keep up a minimum temperature of fifty degrees in the cold weather, for they like a little more warmth than some other plants need. After flowering, we let them get rather dry, and then prune the plants back to within two or three eyes of the older wood. They then go into the warm Vinery (being syringed there daily, but not over-watered), when fresh shoots quickly appear. The next thing to do is to shake out the soil from the roots, prune these, if necessary (cutting off one or two of the older, woody roots), and repot them in smaller pots, with a compost of loam, leaf-mould, peat, and a little charcoal and soot. They are still kept in a moist, warm atmosphere, and constantly syringed, until the end of May, when they go out into the border, after being hardened a little. You should pinch out the points of the shoots several times as they grow, when the shoot is about four inches long, so as to induce plenty of sideshoots to start, and make the plants bushy.

Towards the middle or end of September the plants should be profusely watered, and then raised and potted up (without any undue disturbance of the ball of soil and roots), keeping them in a cool, shady, and moist atmosphere for ten days, until all danger of their drooping is over. After that time they should have all the warmth and sunshine you can give them, and they will open their buds in November

to get dry before the plants begin to come through, when, of course, the shade round must be removed.

Unwelcome Attention.

April 20th.—It may be heresy to say so, but I am not at all sure that our plants appreciate all the trouble we spend upon them. If they had voices, I fancy they would often ask, "Why can't you leave us alone?" It is customary, for

Mr. A. Bullock.

example, first to sow the seeds of many plants in boxes under glass, then to prick out the seedlings, then to move them again—perhaps into small pots—and so on. Is so much disturbance good for them? I had some Pansies sown in two boxes in autumn. Those in one box were afterwards pricked out, the result being that many died; those in the other were left alone, in spite of their being rather crowded. In early spring, when all were planted outside, the latter were, almost without exception, the stronger, and although it was necessary to disturb them more than the others, they have continued to be the stronger. It is only fair to say, however, that the seed was sown rather thinly in the first instance. There is sometimes a reason for repeated disturbance—the prevention of the formation of strong, thick roots—but where this does not apply, the most satisfactory method of cultivation is to sow the seeds thinly, and not to disturb the plants until it becomes necessary to transfer them to their permanent quarters.

Perennial Sunflowers.

April 21st.—Among the plants that are seldom thinned as they ought to be are the perennial Sunflowers. The two commonest species are Helianthus multiflorus and H. rigidus. The former makes great clumps in the course of three or four years, and unless these are divided and replanted in rich soil the flowers deteriorate, for all the Sunflowers rapidly exhaust the ground. H. rigidus, on the other hand, extends by means of underground runners or stolons, and if these are not kept in check, it spreads all over the borders. That, however, is not enough. The stems which it sends up in great numbers must be thinned if it is to have a chance of flowering properly. This may be done now if it has not yet been done.

April 22nd.—The photograph shows a delightful old English garden, full of charming nooks, yet so arranged that the view is never confined to the few yards immediately around. Trees and shrubs and flowering plants combine to produce a series of beautiful pictures, each perfect in itself, all harmonising with one another.

H. C. Davidson.

Famous Gardeners at Home.

No. 234.—Mr. A. BULLOCK, at THE GARDENS, COPPED HALL, EPPING.

Although it was early in March that I visited the gardens at Copped Hall, the weather was brilliantly fine, and I was therefore able to see the place under the most favourable auspices at a period of the year when flowers are scarce and fruit is not visible. The situation of the historic seat, which was once the occasional residence of Henry VIII., is on the brow of a hill, and commanding views of a picturesque stretch of country, including a mile of park, are obtained from the front of the mansion. Some idea of the manifold attractions of the gardens was speedily afforded me, on my arrival, by Mr. Bullock, who conducted me to a delightful little Dutch garden adjoining the famous corridor.

A Blend of Colours.

"How are the beds planted?" I inquired.

"Anemone fulgens in the centre. As a blend of colours, white Crocuses, Scillas, and Chionodoxas are used. Last summer the same beds were planted with Cupid Sweet Peas, standard Heliotropes, and scented Verbenas. These were carefully taken out, and the bulbs left undisturbed. I consider that gold, pure white, blue, and scarlet form one of the prettiest combinations that can be imagined. If you can give Anemone fulgens a south-west aspect, it will always do well, and the colour come out satisfactorily."

"Have you anything special on the walls of the mansion?"

"Yes, Jasminum primulinum, which is now throwing up spikes of flower, does remarkably well. It is one of the Chinese introductions by Mr. Wilson, of Messrs. Veitch, and makes a fine specimen plant for forcing. As you see, it has no protection on the south wall, and, in any case, a light covering would be sufficient; it flowers in April and May."

The Corridor and its Charms.

"Your corridor is one of great beauty and elegance."

"We think it one of our features, and we try to have it very gay all through the winter. With regard to the plants growing alongside the walls, you will notice that Daphne indica promises to make a good specimen."

"Is it difficult to cultivate?"

"Very. It is necessary to put in some good soil, but I think that its proximity to the Cassia counteracts the excessive moisture. It blooms from October to December, and the perfume of the Daphne is very agreeable in the corridor. There are two or three Limes planted here, which fruit very nicely and look very well when they are bearing fruit."

"I see you have a Camellia reticulata which appears to be thriving?"

"It flowers freely each year, the colour being scarlet. It was some time in making a good start, but it is now doing exceedingly well. The large size of the single bloom and the rigid stamens make it very effective, the stiffness being natural without formality. We aim at keeping the corridor in the best of condition from October to February, putting on successive batches of plants to keep it bright."

"What did you start with in October?"

"Chrysanthemums, which we manage to keep going until the end of February. We grow from fifteen thousand to eighteen thousand specimen and bush varieties. Then come the sections of Begonias (Gloire de Lorraine and Gloire de Sceaux), Primula Kewensis, distinct shades of Cinerarias, batches of Tulips, Hyacinths, Mignonette, and Arum Lilies. When the Chrysanthemums are at their best, we bank each side of the corridor with them. We always arrange everything in batches with colours to blend, but not mixing the flowers."

"What is the height of the building which you use as a winter garden?"

"Over thirty feet. The Nymphæas in the pond are very good varieties; this pond used to be a bed of Bamboos, but I thought that Lilies would be an improvement."

"When did you plant the wall?"

The Gardener's Cottage at Copped Hall, Epping.

"About three years ago. Ferns do exceedingly well on it, also Anthuriums, Philodendrons, Rubus phœnicolasius, and Begonia Rex. A feature on the wall is Begonia Haageana, which, from August until the end of November, is one blaze of white flower with a pink shade. Tillandsias and Cypripediums also flourish on the wall. Then the creepers are rather a feature. For instance, Vitis Voinercana makes a splendid creeper for a large building like this. The foliage is so much more vigorous than that of other varieties of Vitis, and the green is also of a better colour."

Pretty Creepers.

"You might, please, tell me the names of some other specially good creepers."

"A very nice thing, with a pretty flower hanging down in trusses, the prevailing colour being orange, is Hexacentrii mysorensis. It flowers luxuriantly from February to the end of March. Another creeper most suitable for a building like this is Passiflora quadrangularis, and Schubertia graveolens is a fine creeper, growing very freely, with a flower very much like a glorified Stephanotis. Another favourite creeper is Ipomœa Thompsonii, and the same may be said of Tacsonia Buchannii, the scarlet-flowering variety. During the winter months we have a number of flowering plants here, such as Poinsettias, Euphorbias, and Begonias. The Palms are all planted out, and their quarters seem to suit them."

"How do you manage to water the plants on the wall?"

"It is watered from the top, the water travelling from one end of the wall to the other. The pipe always remains full, so that directly the water is discharged it travels the whole distance with an equal distribution. The tank is merely pumped full of water."

Bedding on the Terrace.

"What is your scheme of bedding on the terrace in front?" I asked, after I had inspected a fine piece of statuary.

"In spring there is a display of Tulips and Wallflowers, and in summer the system is to blend flowers that are sweet in perfume and well defined in colour. Thus we use the Tobacco plant very freely, the deep crimson Ivy-leaved Geranium, Heliotropes, and Alyssums. To relieve the groundwork we have standards of Abutilons, Aloysias, and Fuchsias, and the effect generally is very satisfactory. Of course, it is a formal garden, but the style in which the bedding is done takes away its stiffness. You might mention that standard Portugal Laurels are planted in two rows the whole length of the terrace. There are also specimens of Junipers and Irish Yews."

"Speaking of style, I notice that the beds are raised in an unusual manner."

"Yes, they are designed on turf; the outside borders are raised first with a row of Box edging, then a margin of dwarf Euonymus, then a second tier of Box edging, and, finally, the flowering plants. Veronicas and Ivies are used in the same way as Euonymus in some of the beds."

Flowering and Foliage Shrubs.

Proceeding to the lower terraces, Mr. Bullock pointed out the great variety of flowering and foliage shrubs, commencing with Carpenteria californica growing under the terrace in a very vigorous, happy condition.

"It flowers here," he said, "very profusely during July. Among other varieties in vigorous health are Ceanothus indigo, C. Veitchianus, Cæsalpino japonica, Cistus lusitanicus, C. nillosus, C. florentinus, C. sahræfolius, and others. If you care to have the names of more of the best flowering shrubs, I think it may be said that Olearia stellata, Magnolia stellata, Veronica Halkeana, Abelia rupestris, Pentstemon Scouleri, ornamental Cherries, Deutzias in variety, Daphnes, and Hibiscus do remarkably well. It has often struck me that if on this hard, cold soil we can do so well with flowering and foliage shrubs, much more ought to be sometimes done with them on warm, congenial soil."

"What do you grow chiefly in the herbaceous borders underneath the terrace walls?"

"They contain a large variety of subjects, chief among which are Eremurus robustus, Irises in great variety, Phloxes, Asclepias, Asters, Astrantias, Campanulas, Delphiniums, Eryngiums, Hemerocallis, Incarvilleas, Pæonies, Platycodons, Pyrethrums, Senecios, Statices, and Veronicas. Each side of the lower terraces is so planted that the same effect is given."

Rock Garden and Rosery.

Quite one of the features of the pleasure grounds is the main centre walk leading to the Rosery and the rock garden, and even more interesting, perhaps, is the famous Yew walk, along which Henry VIII. is said to have been promenading at the time of Anne Boleyn's execution. Bamboos are a feature of the rock garden, where also is a varied collection of plants, including the choicest Water Lilies. Advantage is taken of some old Scotch Firs to grow Clematis, Vitis, Wistaria, and Polygonums up their stems. When I had noticed the old Elm avenue at the border of the park, which, by the way, forms a small portion only of an estate of six thousand acres, I inquired when the Rosery was made.

New Carnation—Nana.
A white-ground Fancy, flaked purple.

"About three years ago," rejoined Mr. Bullock. "Two varieties of two well-defined colours are planted in the large beds, and one in the smaller, the idea being to get a mass of colour at one time. The varieties are Tea and Hybrid Tea, and we find that among the best are Madame Abel Chatenay, Clara Watson, Caroline Testout, Viscountess Folkestone, Lady Battersea, White Maman Cochet, Killarney, President Carnot, Anna Olivier, Antoine Rivoire, Grand Duke, A. de Luxembourg, and Enchantress. We select the vigorous doers—those, I mean, that tend to give a quantity of colour from June until December."

Some Notable Borders.

On our way to the kitchen garden, we passed, on the right, an Azalea garden, with Tree Pæonies on the bank, which, although only recently planted, are already showing signs of vigorous growth, and, on the left, Mr. Bullock called my attention to a fine, irregular border. "This," he said, "has been enclosed from the park in order to extend the pleasure grounds, and, as you see, scarlet Oaks, Acers, Acacias, Pyrus molus floribunda, Cotoneaster frigida, Prunus Pissardi, and standard Golden Privets form a background for a large collection of flowering and foliage shrubs, with other plants."

"What do you grow in the opposite border, underneath the walls of the kitchen garden?"

"In summer we have a very showy display of annuals, massed for effect, at the back of the flowers being standard Currants and Gooseberries, which are in fruit the same time as the flowers, producing a very pleasing effect."

"How long is the border?"

"A hundred yards. Besides the display of annuals, we have a number of the Darwin Tulips, late-flowering Tulips, and Wallflowers, the groundwork being double Arabis, Alyssums, and Myosotis. In fact, there is no period of the year when the border looks uninteresting. A little garden is specially set aside here for all the types of the early-flowering Iris, Crocus, and Anemone. Beyond the first wall, at the back of this little garden, is a fine specimen of Chimonanthus fragrans."

A New Fruit Garden.

"Beyond the recent extension of the pleasure ground," continued Mr. Bullock, "we are just planting a new fruit garden of about two acres. Gooseberries in bush, standard, and cordon form, Red and White Currants in the same way, and Black Currants and Raspberries are grown under a permanent covering. An occasional inspection for caterpillars is necessary, but, beyond this, no further trouble is taken. Cordon fruit trees are extensively grown, both on walls or in rows across a piece of ground which has been set aside for cultivating a large quantity of cut flowers, and the system is one that finds great favour."

"Shall we take the glasshouses next?"

"Yes, but I do not think we shall have time to go through the whole of them. Recently, a number of new houses have been erected, with new heating arrangements, etc. Malmaison Carnations are one of our features."

"How long have you been cutting them in these houses?"

"Since Christmas. This month we are cutting about two dozen a week. As to varieties, I have the greatest regard for the old Souvenir and Princess of Wales. Although the constitution of these leaves a good deal to be desired, they are two of the most delightful flowers, and none of the new varieties do better. In the next house are pot fruit trees—Peaches and Nectarines are a feature. Here, also, we force Strawberries in pots plunged in the leaves."

"How long will they remain here?"

"Until after they fruit. They get all the benefit of light and air. I am trying this system for the first time here this year, but I have carried it out elsewhere with great success. The variety is Royal Sovereign. On the shelves above are some recently-propagated Tree Carnations, which will furnish a supply of flower from October this year to January, 1907."

"Do you grow many Crotons in your flowering stove?"

Ixoras and Isolomas.

"We have done away with them, and have substituted a nice collection of stove flowering plants. Ixoras, in pots, are grown. In cultivating them, watering has to be done very carefully, and neither too much or too little given. Other flowering stove plants are Glomeria jasminiflora, Burchellia capensis grandiflora, Medinilla magnifica, and Isoloma Horbutes, which hardly ever go out of flower."

"Do they require much looking after?"

"No, only a little brisk heat, to keep them healthy. In the way of Orchids, we have a few Cypripediums, and on the south side, in one of several houses for retarding plants which are too forward, we have a number of Cœlogyne cristata. Here, too, is a miscellaneous collection of useful flowering plants. In another

house are Cinerarias, Arum Lilies, Narcissi, and a small quantity of the Himalayan Rhododendrons."

"What about Amaryllis?"

"I have some seedlings of my own, from which I select those of good form, and hybridise carefully. The results are good, and sometimes astonishing."

The Cultivation of Violets.

"Before I ask you about the kitchen garden, you might, please, tell me something about your Violets, which seem to be on a considerable scale."

"They are a very special feature, and every attention is given them in order to ensure success. One important point is the careful selection of suitable runners towards the middle of April. These are thoroughly cleansed in a solution of quassia extract, as a safeguard before being inserted in the ground. The ground is measured off for wooden frames to cover plants in the autumn. The plants are not lifted in the autumn, but simply have frames placed over them. This applies to the single varieties only. I find Princess of Wales, Luxonne, and La France three of the best varieties."

"Do you syringe the plants often?"

"Every night and morning throughout the summer."

Vegetables and Outdoor Fruit.

"Are there any notable characteristics of the admirably-walled-in and well-laid-out kitchen garden?"

"An extensive supply of vegetables is necessary all the year round, but clean, medium growth is the order rather than for exhibition. Recently, from time to time, the old fruit trees on the walls have been eradicated, and young trees planted; great pains have been taken in the selection of the latter to exclude all but the best varieties."

"What do you grow on the walls?"

"Figs, Plums, Cherries, Peaches, Nectarines, Apricots, Pears, and Morella Cherries. The range at the top, which formerly consisted of Vineries, now comprises Peach houses, a Fig house, a pot Cherry house, and a pot Plum house. In the centre walk of the kitchen garden, leading from the houses to the pond, is an arched fruit walk, with cordon Pears trained over arches, with pyramids on either side. Below the pond, leading to the plant houses and Vineries, are pyramid Apple trees. Of Vineries, there are four, including Hambros, Madresfield Court, Muscat of Alexandria, the one variety in a house in the order named, and one house of late varieties, such as Black Alicante, Appley Towers, Alnwick Seedling, Lady Hutt, and Gros Colmar."

"You have a very pretty house to reside in, Mr. Bullock."

"My employer studies the comfort of everyone. The gardening staff numbers twenty-eight, and the bothy, which was erected for the young men, of whom seven live there, contains every possible accommodation, including bath-rooms."

"How long have you been at Copped Hall?"

"Four years. I started in my native county, Cornwall, where I served an apprenticeship of five years in the gardens of the late Colonel Tremayne. I served two years further in good gardens, including Lockinge, Hatton, and Margam Abbey. For seven years I was with the late Lady Howard de Walden at Malvern, where I gained, under Mr. C. R. Fielder (who was responsible for the making and planting of a wonderful garden), a useful practical knowledge of the laying out of grounds. On the death of Lady Howard de Walden, and upon the retirement of Mr. Fielder, I took charge of the gardens for two years previous to my appointment here." ALFRED WILCOX.

In the letter on "Pea Sticks," appearing in our issue of April 14th, the word *wire* was inserted instead of *coir*, in describing the rope used.

Letters from a Lady Gardener.

No. 194.—A GARDEN ON THE LEADS.

DEAR KATE,—The country is now most beautiful, Primroses embroidering every bank, Bluebells and Ferns pushing up, and a green lace mantle appearing over the trees, varied with pink and white where there are orchards.

How anybody can choose to live in a town instead of the country is incomprehensible to me; but then, unfortunately, many of us are obliged to do so, and those who cannot get into the lanes and fields must do the best they can without them. And, really, that "best" is not to be despised. Even in the heart of London there may be found green vases, most delightful to their possessors, and, fortunately, a garden, however small, which we plant and tend ourselves, has a wonderful charm, which many a rich man, who owns broad acres, and employs a dozen gardeners, can never enjoy.

A VASE OF GLADIOLI.

Boxes and Tubs.

On the leads of a city house, and in the strips of ground behind the suburban cottage, gardening is probably as difficult as it can be anywhere, yet even here we can do a great deal to make a little paradise of our own, if we spend a little time daily in caring for our plants. The lack of soil on the leads can easily be got over, by growing everything in boxes, or tubs, which are cheaper than pots, and much lighter to move, although, unless there is a strong arm at hand, I don't advise you to go in for very large boxes, but rather for plenty of smaller ones, with some lard tubs from the grocers, and, perhaps, a few small barrels, which you can saw in two for larger plants.

Rather long boxes, about fifteen inches deep and broad, will be useful for the climbers which are to cover up every bit of masonry, and stand against the walls, and it is best to have rather large square boxes for such tall plants as you wish to grow (Lilacs, Laurestinus, Choisya ternata, etc.), as they need plenty of room for their roots, and annuals (such as Mignonette, blue Lobelia, dwarf Tropæolums, etc.) will do very well in shallower boxes of good soil. You should make a few holes for drainage at the sides of the tubs or boxes, near the bottom, and, if you can raise them on strips of wood, so as to allow a free course for the drainage, it will be all the better. Coal ashes, and a few crocks, should be laid at the bottom, but very shallow boxes want but little drainage.

The "Hanging" Garden.

If I were you, before arranging your "hanging garden"—which sounds quite Babylonish—I should make a little plan of the space you have to fill (putting in the aspect of the walls, too, because different climbers should be grown on a sunny wall from those which like the shade), and arranging your tubs and boxes to the best advantage before you fill them with soil, so that you won't have to drag them about afterwards. And be sure that you get good soil to fill them with. Rich, kitchen-garden loam, that has been well manured last season, is what you want, and if you have a friend in the country who can send you a sack or two of leaf-mould, you will find it very useful for some of your plants.

Soot as a Fertiliser.

Then you should store all the soot you can get out of your chimneys, and, if necessary, give the sweep an extra sixpence to leave all the soot behind which he brushes down at "spring-cleaning" time. This seems a weak thing to do, because, of course, it is your own soot, and he has no right to it, but then it has become a

in Europe. All of them might have been saved by the exercise of a little common sense. If the expert had been consulted first, there would have been no need to destroy these plants. All that they required was syringing with a suitable fungicide. There are many, no doubt, who cannot afford to pay an expert, and cannot themselves distinguish between the two forms of disease, but if they will write a letter to the Secretary to the Board of Agriculture, the question will be settled for them at no expense to themselves. Not, perhaps, with the speed they might desire, for all Boards are notoriously slow, but at least the decision is conclusive.

The Scotch Climate.

September 25th.—If the Scotch climate is not remarkably mild, many of our plants must be much hardier than we think. "I was once in a garden in about the hottest corner of the Isle of Wight, in June," said Mr. Osgood Mackenzie, in a lecture before the Royal Horticultural Society, "and, walking round with my hostess, we came upon the gardener carrying big plants of Agapanthus in tubs from under glass to be placed out of doors. His remark as we passed him was, 'I think, my lady, we may venture them out now'; and I could not refrain from answering the old man back, 'If so, then I don't think much of your climate, for in the far North of Scotland we never house them, nor protect them in winter.'" I have had great clumps of Agapanthus in the open for thirty years and more, and the white, as well as the blue, flowers magnificently every year.

H. C. DAVIDSON.

A Notable Sussex Garden.

INTERVIEW WITH MR. J. BUNNEY, AT DANNY, HURSTPIERPOINT.

THE mansion known as Danny, within a short distance of Hurstpierpoint, sheltered below the South Downs, is rich in historic associations. It has been in continuous occupation from the time of Queen Elizabeth until now. Erected in 1595, it is a fine specimen of Elizabethan architecture, though since it was built one of its owners removed the old gables, and put a Queen Anne front on the south wing. My concern, however, is with the gardens which form the setting, and which, by the courtesy of Mrs. Campion, I visited towards the end of August. In approaching them—in company with Mr. Bunney, the head gardener, who met me at the cricket ground in the park—I was much struck with the fact that, as Miss Mary Campion, in a charming sketch of her beautiful home, says, Danny is guarded by its Elms, "those green-robed sentinels of mighty woods." The Elms are, indeed, a feature, but so are the Oaks and Planes. Yet even these warriors must give place to the amazing specimen of a Carolina Poplar which monopolised my attention on reaching the lawn.

DANNY, HURSTPIERPOINT.

An Ancient Poplar.

"Yes, there is but one trunk," said Mr. Bunney, as we stood under its tremendous spread of branches, "and the tree is about four hundred years old."

"Do you interfere with its offspring?"

"No, we never touch any branches, and, as you see, five or six of them have rooted, developing, in their turn, into fine trees. The thickness of the outside coat of the parent tree is tremendous."

"Is there another such specimen in the country?"

"Only one more, I believe; and though this occupies a large amount of space on the lawn, as everyone who comes here says, it merits all it takes up."

In contrast to the ancient and mighty Carolina Poplar is the rock garden in close proximity, which was made two years ago.

"Here," continued Mr. Bunney, "we try to combine the old with the new, in order to render the garden more decorative. Thus, besides all the Alpines and herbaceous plants, there are Roses on stumps of old trees, Crimson Ramblers growing on one Elm, and Alberic Barbier on another. The garden itself was originally a part of the adjoining field."

"You have a pretty herbaceous border on one side, with Sweet Peas, I conclude, planted for colour?"

"Yes, and chiefly of the Spencer family. The herbaceous plants which suit the stiff, heavy soil, include Polygonum Rosy Queen, the White Swan Poppy, Asters in variety, Chrysanthemum maximum, Rudbeckia Golden Glow (which, by the way, must not be exposed to the wind), Nigella Miss Jekyll, Anchusas (including the Dropmore variety), Phlox, and Tree Lupins."

MR. J. BUNNEY.

"Then, there are Mallows?"

"They are intended to make a break only; the slugs like them too much. The soil also suits German Iris remarkably well. Mauve Queen is a fine variety, quite worth growing for the foliage alone. We have only had a few single Hollyhocks for trial, so far, but they seem to thrive."

"To some extent, I conclude, the rock plants are experimental, but you seem to have a very varied collection."

A List of Rockery Plants.

"Among the most thriving are Aubrietias in variety, Saxifrages in variety, Alpine Phlox, Sedum spectabile, Veronica incana, Phlox amœna (a very free-blooming species), Ranunculus aconitifolius (or white Bachelors' Buttons), Statice latifolia (a fine blue), Campanula alpinus, Gentiana acaulis (which does not like being moved), Plumbago larpentæ (a pretty blue), and Alpine Dianthus (white and pink)."

"What is the sheet of white which stands out so well?"

"Arenaria balearica, a capital variety for carpeting stony places in a cool aspect. As a contrast in colour, the Indian Strawberry is a brilliant red. The Lithospermum prostratum flowers twice, and we find Fuchsia corallina (which flowers from August to October) very useful. Another useful variety, grown from seed, is Commelina cœlestis, which is put in during January, and yields a mass of blue flowers. Veronica repens is exceptionally good for creeping over stones, and one of the best white flowers is Tunica saxifraga, which does well on stony places. Other varieties worth naming are the Mexican Calceolarias and Agathæa cœlestis (the blue Daisy)."

Terrace Combinations.

Retracing our steps, we passed the Carolina Poplar again, and proceeded to the terrace, where the beds looked very bright and effective.

I commented on the appearance of the Fuchsias, which were conspicuous.

"Four beds consist of Fuchsias Rose of Castile, with Madame Crousse and Ivy-leaf Geraniums. In the beds on the other side the Salvias are rather conspicuous; the variety is patens. Here, Miss Nightingale Heliotropes are mixed with Hyacinthus candicans, and white Violas with scarlet Salvias. One bed is made of Cannas in variety, with scarlet Lobelias and Antirrhinums, and another of Marguerites, which corresponds in size and shape with a bed of Pentstemons and Candytuft. On the terrace are five tubs of Agapanthus umbellatus."

The Gardener's Cottage, Danny.

"And the pretty Fuchsias in the border under the wall?"

"The variety is Madame Cornellissen, and it has a red and white corolla. The Lantanas are Chelsea Gem. We lift the latter in the autumn, and protect them, bringing them out again later."

"You use a good deal of Phlox Drummondii just here."

"Yes, the variety (splendens—crimson, with white eye) is particularly good; also the white and scarlet varieties. Behind the Phlox are scented Geraniums."

The Yew Hedge Garden.

The Rose garden is approached through the "Yew Hedge Garden," and in the latter I noted a large bed with Hyacinthus candicans in the centre, with a bed of mixed Cannas on one side, while at the corners were tuberous Begonias (mixed).

"On the other side," said Mr. Bunney, "is a similar bed of Hyacinthus candicans, with Fuchsias and a white variety of variegated Geraniums—Mrs. Mappin, a very good doer."

"You have four fine beds of Antirrhinums. How do you raise them?"

"From seed in January. We save the separate colours, and mix as we plant, with an eye to harmonious arrangement. The colours are light and dark pink, crimson, white, and yellow. They begin to flower in the middle of June, and go on through September. Both inexpensive and easily grown, they are very suitable for amateurs. There are sixteen Golden Yews in round balls, which add to the effect of the garden."

"What is the plan of your Rose garden?"

"One variety in each bed, Roses being grown in masses for cutting. Under the hedge is a row of Penzance Briers. Nearly all the Roses are on the Manetti stock, and many of the best Hybrid Teas and Teas are represented. We have also, in beds, Fellenberg and other Noisettes, which are doing well."

"There are some houses in this garden?"

"Yes, Peach houses. The varieties are Rivers' Early, Royal George, and Nectarine Lord Napier, in one house; and in the other, in addition to these, there are Bellegarde and Princess of Wales Peaches, and Pineapple Nectarine. Tomatoes are grown in pots in one of the houses, the varieties being Victor and Earliest of All. Here, too, are grown pot-Strawberries on the shelves in a gallery above the Peaches. The double white Pelargoniums are Cynthia, an excellent variety to use for altar vases. The houses are of considerable age, and the mode of ventilation, though ancient, is admirable."

White Flowers for Church Work.

"Do you grow many other white flowers for church work?"

A Carolina Poplar and its Offspring at Danny.

"A considerable number, including Lilium candidum, Ostrich Feather Asters, and the herbaceous hardy white Pea. Late-flowering Chrysanthemums, Salpiglossis, and Montbretias are also grown for cutting."

Leaving the Rose garden, we returned to the lawn, noting a Rose pergola, on which Thalia, Dorothy Perkins, Crimson Rambler, Carmine Pillar, and Hiawatha are grown alternately.

"What is supposed to be the shape of the large bed facing the Tulip-tree on the lawn?"

"It is called the 'Wheel Bed,' and consists almost entirely of Geraniums, the varieties including Henry Jacoby, Paul Crampel, and Souvenir de Charles Turner. On the other side of the Tulip-tree are Lilies, Verbena venosa, Montbretias in clumps between the Rhododendrons, with Phlox in front. Some of the Lilies now in flower are longifolium, gigantea, and auratum. There is always something in this bed. When the Rhododendrons, for which we used peat mixed with manure, are in flower, there are also Pansies. Beyond the pergola in the corner is a block of Guiding Star Dahlias (white), and Glare of the Garden (scarlet). Now we pass into the wild garden."

Features of the Wild Garden.

"In which, I observe, you do not maintain any particular order?"

"On the contrary, we allow everything to grow as it likes. For instance, we have made use of some old Apple standards in rustic form, and planted climbing Roses with Honeysuckles, all hanging carelessly together. They not only have a fine effect, but throw out a beautiful scent morning and evening. This garden was only taken in three years ago, but rapid growth has been made. Here is a water-loving plant which I strongly recommend for a wild garden, Inula Elecampane. Then a pretty effect of scarlet and green is produced by the Tropæolum speciosum growing up the Cupressus Lawsoniana. Clumps of large-flowering varieties of Honeysuckle are a feature, and Bamboos do remarkably well. In October a corner planted with Sumachs, scarlet-leaved Oaks, Golden Elms, and Liquidambars is quite a picture."

"You appear to have a good many Roses?" I remarked, as we proceeded along the walk with its numerous lovely vistas.

"Several were only planted last winter, such as Lady Gay and Felicite Perpetue. Then we have Ards Rover also in combination with Honeysuckle and the Rambler Roses Euphrosyne and Philadelphia. The latter variety flowers twice, the first blooms being deformed, but the second are all right; the colour is rather darker than that of the Crimson Rambler. Lilacs and Laurels, above them towering Horse Chestnuts and giant Oaks, add to the charms of 'The Walk,' from which are obtained glimpses of the Devil's Dyke, Cowfold Monastery, and Chanctonbury Ring."

Grapes and Figs.

Emerging into the open country, with surrounding hills, we arrived at Mr. Bunney's pretty cottage, commanding a full view of the

glass ranges, kitchen garden, and orchard; and, as a storm of tropical violence came on at that moment, we made for the Vineries.

"How old are the Vines in the early Vinery?"

"Nearly fifty years. They are planted inside, and the roots run out. In this house Black Hamburgh and Muscats are grown, and in the late Vinery are Alicantes and Black Hamburgh, the best of the blacks."

"When do you begin to pick your second crop of Figs?"

"We began this month, and shall continue into September. The varieties are Violette Sepor and St. John. The first crop ripens at the end of May, and goes on until the end of July. When the Fig trees have finished fruiting, we take them out of doors, and do not bring them back until severe frosts begin. Tomatoes are grown inside and out, the varieties inside being Barcombe Champion and Winter Beauty. Both do well, and we have been picking since the first week in June. On the walls outside we grow Earliest of All and Victor, taking care to get the young plants strong."

"How large is the kitchen garden?" I asked, as we went outside.

"Within the walls, two acres and three-quarters. With regard to flowers in this garden, Sweet Peas are grown in rows for cutting, only the best varieties being used. Chrysanthemums are grown extensively, the bush varieties in pots, some of the Japanese, and a large number of early-flowering. The earliest in bloom are the Masse family, and for late use in January we have Winter Cheer, White Perrin, and Tuxedo. The Border Carnations include Duchess of Fife, Mrs. Nicholson, Raby Castle, Sir Walter Scott, and a dark seedling I raised a few years ago."

Wall Pears.

"You have a fine show of Plums and Pears on the walls."

"The Plums include Transparent Gage, Early Gage, Cox's Emperor, and The Denby, a crimson Plum."

"Which Pears do you recommend for flavour?"

"The best varieties, I think, are Beurre Diel, Beurre Hardy, Beurre d'Amanlis, Clapp's Favourite, Durondeau, Nouvelle Fulvie, Marguerite Marillat, Doyenne du Comice, Souvenir du Congres, Catillac, Thompson's, Conference, Marie Louise, Le Lectier (a fine late Pear), and Seckle (a Pear not much grown, but a good dessert variety which comes in during October). I ought to mention Pitmaston Duchess, because of the size to which we grow them, some weighing nearly two pounds each. I may say that we use burnt clay for planting, and find it very efficacious."

Apples on Bushes and Espaliers.

"How are most of the Apples grown?"

"As bushes. We have also Apples on espaliers, and also on standards, but we are replacing the standards with bushes by slow degrees. The best varieties are Allington Pippin, Blenheim Orange, Beauty of Bath, Charles Ross, Ecklinville Seedling, Lady Sudeley, Tower of Glamis, Cox's Orange Pippin, Annie Elizabeth, American Mother, Golden Noble, Wellington, Peasgood's Nonsuch, Baumann's Reinette, Worcester Pearmain, Mère de Menage, Red Astrachan, Lane's Prince Albert, Irish Peach, Mannington Pearmain, and Beauty of Kent."

"What about Strawberries?"

"We only grow Royal Sovereign, which do well on the slopes facing south. Gooseberries and Currants are grown both as bushes, and trained on wires on a north wall. We gather Gooseberries on the wall up to the end of September, and frequently have them in October. Warrington is a particularly good variety for this purpose. Raby Castle is an excellent Red Currant for growing on the wall. Although we had a few mites on the Black Currant trees, they did not injure the crops, because we picked them out the minute we saw them."

"Have you anything special to say about vegetables?"

"Peas are a feature, and we get very good crops. By far the best variety, in my opinion, is Ne Plus Ultra. You can judge how well they do, when I say that they have never had a drop of water since they were sown, fourteen weeks ago, until last week. We do not use cans. There is nothing else to mention, except, perhaps, the imposing breadth of Scarlet Runners, which are quite twelve feet high. The varieties are Neal's Ne Plus Ultra and Sutton's Best of All."

"And about yourself, Mr. Bunney?"

"There is little to say on that subject. My father held this post for sixteen years, and I followed him. I have been here twenty-seven years."

Alfred Wilcox.

Letters from a Lady Gardener.

No. 322.—FLOWERING SHRUBS FOR THE YEAR.

Dear Kate,—With October the time for planting shrubs, climbers, and Roses begins. Those who have quite small gardens can make them much larger (so far as concerns the amount of flowers to be got out of them) by judicious planting, for just consider the masses of bloom which cover your house (or should do so), and add to them the wreaths of Roses, Clematis, Wistaria, Honeysuckle, and Jasmine that hang from the arches (if not the pergola); also the quantities of flowering shrubs which take no more room than the Euonymus, Box, and such-like flowerless things (so to speak), which, unfortunately, fill so many British shrubberies, to the exclusion of really valuable plants.

Choisya ternata—The Mexican Orange.

Dangerous Subjects.

Laurels and Privet, too (although they bloom), should not be tolerated in the garden, except as a hedge to shelter a broad walk, in which case they will not be able to do much harm, as their roots will only extend below the walk. But both of these shrubs are so dangerous as neighbours to all other plants that they should not be allowed to grow within six feet of them; for their roots extend on all sides, and seize upon all the nourishment in the soil, so that no other plant has any chance with them, but must starve to death.

If you have any such shrubs as these (or Portugal Laurel, which is just as hungry a plant), I strongly advise you to root them up, and fill their places with shrubs which will provide you with a great bouquet of blossom once or twice in the year, which you will not only enjoy in the garden, but can use for decorative purposes in the house with much advantage.

I think it quite possible to arrange a series of flowering shrubs to supply the whole year with flowers or bright berries; and the following selection will go far towards it. Their arrangement depends partly, however, on the position and climate of the garden concerned; for we cannot expect early blossoms (or, indeed, many of them) in a sunless garden, or one which is exposed to the bitter north-east winds of our spring, which are specially severely felt by those shrubs which are then trying to open their blossoms. But with the shelter of a wall or a hedge at a little distance behind them, and an abundance of sunshine to ripen their growths and make them woody, there are many exquisite flowering shrubs which should be far more often seen than they are in our gardens.

The Mexican Orange.

Just now the Choisya (Mexican Orange) is in bloom for the second time this year. This is perhaps the most desirable of all shrubs, for it is only out of bloom during the late summer months, and resting (although a mass of embryo blossoms) during the coldest part of the winter, though even at that time it is not uncommon to find a few sheltered blossoms amongst its thick foliage. With the advent of spring it becomes a mass of snow-white Orange-blossom, which lasts until the middle of June, after which it proceeds to the formation of fresh buds, so that by September the whole plant is again a mass of them. But of these buds only those which are on the sunniest side open in the autumn, whilst the rest go to sleep as soon

not a favourable season for it, precautions must be taken which would not otherwise be necessary. The plants must be lifted with as much soil adhering to their roots as possible, placed in holes previously prepared for them, thoroughly soaked with water, the ground not being made really firm until it has had some time to dry, and shaded from the sunlight for at least a week. In the case of a very choice plant, I also protect it from the air by erecting a sort of tent over it,

MR. EDWARD BURRELL.

with three sticks and a piece of matting or brown paper. If these precautions are observed, transplanting may be successfully done at any time. The abundant supply of water helps the roots to get to work again very quickly, while the leaves, protected from sun and air, are not forced to perform their functions at high pressure, and though they may sometimes flag slightly, are equal to their task.

June 23rd.—This is the season for observing the effects of our autumn or winter planting. Then we had to imagine what the result would be; now we can see. Further changes are sure to suggest themselves. Defects, unsuspected while the plan was merely on paper, or in our own minds, are sure to crop up—some faulty arrangement or clashing of colour; much that is good will urge us to something still better, for no true gardener is ever really content. It is a good practice to wander round occasionally, notebook in hand, ready to write down anything that may seem worthy of comment, and to outline future improvements. No garden should disclose all its beauties to the eye at once. It should draw the spectator on from picture to picture, each in its own setting, each framed so as to enhance its merits. It is here—in the use of trees and shrubs, arches and other devices—that the hand of the artist is seen. He continues to show each of his pictures in turn, and the person who comes on them suddenly experiences the same delight as he does in spring, when Nature unexpectedly discloses her treasures, unfolding lovely flowers where yesterday there were only green leaves. Keep the centre open by all means, but arrange the views around so as to give glimpses of the fairyland beyond.

June 24th.—There is, perhaps, no question more frequently asked than: "Should I be likely to make money out of growing this or that?" From one source or another, I am perpetually receiving such questions. It is impossible to answer them satisfactorily without an intimate knowledge of those who put them, for the answer depends far less upon horticultural data than upon business capacity and personal character. I believe that anyone who devotes himself to a speciality—whether Mushrooms, Seakale, Asparagus, or anything else—can make money out of it if he goes the right way to work. He may have poor soil to contend with, he may be badly situated as regards a market, he may be handicapped in other ways; but if he has the root of the matter in him he will surmount all obstacles and eventually emerge on top. I assume, of course, that he has some capital, sufficient to tide him over the inevitable period of probation. In most cases, however, he should secure—at any rate, until he is able to assume the full control himself—the services of a first-class foreman, thoroughly accustomed to market-garden work. The business details he may keep in his own hands, and should be under his direct supervision, but the horticultural details he must, for a time, leave to others. That is the only safe way for an amateur to proceed, unless he prefers to begin more gently, paying for his experience as he goes along. The latter is also sound in principle, but slow; the former is quicker, but requires more capital. A really good foreman is not easy to find. Besides possessing the necessary knowledge, he must be thoroughly honest, intelligent, and energetic, able to utilise every inch of ground, and ready to put in a second crop the moment the first is cleared off. It is seldom out of main crops that profits are made—these are generally grown to cover expenses; it is out of what may be called by-products—catch-crops and subsidiary crops of various kinds—that the successful cultivator usually reaps his reward.

H. C. DAVIDSON.

Famous Gardeners at Home.

No. 143.—MR. EDWARD BURRELL, AT CLAREMONT PALACE GARDENS.

WITH the permission of Her Royal Highness the Duchess of Albany, I had the opportunity, at the beginning of June, of visiting the gardens at Claremont Palace, one of the loveliest places within a radius of thirty miles from London.

For more than half a century the King of the Belgians was the owner, and for nearly twenty years before the late Duke of Albany entered into possession it was unoccupied. Therefore, as may be imagined, a great deal required to be done when Mr. Edward Burrell, whose service at Claremont dates from 1882, was appointed head gardener.

The glass has never been a feature, and the houses and pits are much the same as they were half a century ago. As, however, little forcing is done, they answer the purpose. Fruit and vegetables seem to be grown in the most admirable manner, but the great charm of the gardens at Claremont lies in the long, grassy glades, the American plants and Rhododendrons, the rare trees, shrubs, and old-fashioned flowers, in all of which the Duchess of Albany takes the keenest interest. One of the most remarkable of the trees faces Mr. Burrell's pretty house, and at once attracted my attention.

"That Pterocarya," said Mr. Burrell, in reply to my inquiries, "is much the finest in England, and, in comparison, the specimen at Kew is an infant to it. In circumference the tree is one hundred and ten yards, and this year it has a splendid show of catkins. The worst of it is that it is a gross feeder, goes into the Vine border and under the bottom of the wall into the kitchen garden, necessitating the frequent digging of trenches to keep it within bounds."

Having observed a fine Maidenhair tree, I asked the age of another extraordinary specimen close by.

"I have no idea as to the age of that tree," rejoined Mr. Burrell, "but it is a Laurus sassafras, and is extremely rare."

"What other rare trees are there here?"

THE GARDENER'S HOUSE AT CLAREMONT.

"There is the Kentucky Coffee tree (which is the latest to come out, and the earliest to shed its leaves), the Cucumber tree, and the North American Custard Apple, which is very rare. The latter has a dark brown flower with an objectionable scent, which I think is poisonous, as we often

find dead flies on the flowers. The Magnolia flourishes here, and the Wistaria covers the whole wall, some fifteen hundred feet square."

"Can you tell me the diameter of the plant of Aimée Vibert Rose filling the large bed?"

"Between fifteen and twenty feet. Another Rose bed is devoted to Papa Gontier. We follow the principle of one variety in each bed. Crimson Ramblers grown over an old tree-stump fill one."

As the houses adjoin the flower garden, we went into the two houses containing Peaches and Nectarines, the varieties being similar to those grown on the walls. Royal Sovereign and Leader Strawberries are forced, fruit being picked from about the middle of April. Near the houses is an intermediate house with seedling Gloxinias and Begonias, and facing this is a long stretch of Border Carnations.

"How many varieties?" I inquired.

"About two dozen, of which Countess of Paris, Diamond, Hayes Scarlet, Boadicea, Miss Audrey Campbell, and some seedlings of my own, do the best."

"What do you grow in the pits and frames?"

"Cucumbers, of which Rochford's Market is the favourite; Melons, Blenheim Orange and Ganton Orange; French Beans, and Potatoes. Also Violets in season. Here, too, are about five hundred Chrysanthemums in pots, chiefly the Japanese varieties."

"The frame Potato," continued Mr. Burrell, "is worth mentioning. It is Sutton's May Queen, and we have been digging since the 3rd of May. We only grow this variety in frames."

"Have you had it for many seasons?"

"For three. The crop is heavy, and the Potato itself is large, and of a very nice flavour. I do not know a better."

In the kitchen garden itself, which is about five acres in extent, Gooseberries, grown on the trellis system, first claimed notice.

"How long have you had that system in operation?" I inquired.

"I started it about two years after I came to Claremont. The bushes are cut as hard as we can cut them, and the success of that principle here is a practical reply to the contention that Gooseberry bushes must be extended, and not cut hard. The varieties are all old, but good, and of the dessert kind. A great advantage of the system is that the fruit is so handy to pick."

"What varieties of dessert Cherries do you grow on the walls?"

"Frogmore, Napoleon Bigarreau, Black Eagle, and Elton."

"I should like the names of a few of the plants in the effective herbaceous border which runs through the kitchen garden?"

"They include Aquilegias, Michaelmas Daisies, Phloxes, Hemerocallis, Gaillardias, Coreopsis, Campanulas, Pinks, Violas, Pyrethrums, and Delphiniums."

"You seem to go in considerably for Onions?"

"We grow about a ton. The varieties are Giant Zittau, White Spanish, and Bonne Globe."

"I see that Raspberries are also grown on the trellis system?"

"Yes, they were started about the same time as the Gooseberries. They are all Superlatives, and face the north-east wall."

"Have you had a large quantity of Polyanthas?"

"About five hundred plants of different colours, mostly the dark shade. I am sowing some seed this year."

"I suppose that the garden itself was laid out a great many years ago?"

"In 1704. From that date, I believe, the south-east wall has been always devoted to Peaches. The principal varieties are Waterloo, Hale's Early, Noblesse, Royal George, Dymond, and Barrington. The flower border at this point consists chiefly of Sweet Williams, of which the Duchess is very fond."

"The season appears to suit your Cauliflowers?"

"There has happily been no break this year between the late Broccoli and the early Cauliflowers. Peas of the latest sowing are just beginning to show. We keep them cropping as long as we can. There are not many varieties, but I think everybody should grow Carter's Daisy. It is a splendid Pea, and does not require much staking."

"Your cordon Pear wall could not look better."

"A very fine crop is, I think, assured. As you see, we have cordons on the left and old fan-trained trees on the right. Among the best of the varieties are Williams's Bon Chrétien, Doyenné du Comice, Thompson's, Beurré Alexander Lucas, Marie Louise, and Glou Morceau. There is a tree of Marie Louise with a stem nearly a foot round. The old Bergamotte, which is rarely seen on a wall, also flourishes here."

"Which do you consider the most satisfactory system of growing Pears?"

"The cordon, because you get a greater variety of fruit in a given space."

In addition to the kitchen garden there is a slip garden. The wall, one hundred and fifty yards long, is covered with Plums. Here, too, are a quantity of herbs. We have some sixteen varieties," said Mr. Burrell, "and find them useful. For instance, one cook may prefer Chervil and Basil, while another wants Chives and Tarragon. Brown Turkey Figs, dessert and cooking Apples are grown here. For once I hope to have a fine crop of Gravenstein."

"Have you many trees of Gravenstein?"

"No, only two. It is an Apple very little known, a second-early dessert variety. The fruit is of fair size, juicy, and very digestible."

Between the flower and kitchen gardens, and the Palace and pleasure grounds, which are some distance apart, is an orchard which also contains a quantity of Apple trees with fruit well set. In the pleasure grounds and close to the Palace is a fine specimen of Cedrus atlantica glaucus. The late Queen Victoria and the late Prince Consort planted three trees, a Wellingtonia, an Araucaria, and a Cupressus. Reaching the perfectly-kept sloping lawn in front of the Palace, where are more Cedars and a venerable Ash tree, the full glory of the Rhododendrons began to dawn upon me. Huge masses of Ponticums were all the more beautiful because of their differing tints. The banks of the ascent to the Observatory, clothed at an earlier period with Hyacinths and Hypericums, are very pretty, and from the top of the tower (which was erected in the time of the Duke of Newcastle, in 1714), seventy feet high, may be seen the whole of the Surrey hills. But the prospect from the Camellia house caught my fancy more than that from the Observatory tower. In the distance is the lake, and the Rhododendrons and Azaleas in flower on the afternoon of my visit were a feast for the eye.

Turning into the Camellia house, which was put up a century ago, I asked about the varieties.

"They are all old," replied Mr. Burrell, "and one is a veteran nearly a foot in diameter through the stem. The names of the varieties are alba plena, Marchioness of Exeter, Lady Hume's Blush, Donckelarii, and conspicua. We get the Camellias in flower from the end of November until the middle of May. One of the conspicua trees was brought from the garden in Corsica, the birthplace of Napoleon Bonaparte. The Magnolia fuscata in this house, with dark chocolate flowers, is very remarkable for its perfume."

"How do you warm the house?"

"It is heated by the oldest boiler in England, Sylvester's Cog, which is still in excellent working order. We only just keep the frost out of the house—nothing more is necessary."

As we proceeded to the Mausoleum, put up in memory of Princess Charlotte nearly a hundred years ago, and containing her bust in the interior, I noticed a magnificent isolated specimen of a Rhododendron; and then, before we arrived at the lake, of four acres in dimension, we paused to look at the little gardens in which the young Duke of Saxe-Coburg and the Princess Alice used to amuse themselves as children.

"Have the Rhododendrons and Azaleas always been such a feature?" I inquired.

"The Rhododendrons have. The pleasure grounds were formed about one hundred and fifty years ago as they now are by Lord Clive, and the Rhododendrons date from between fifty and one hundred years. The Azaleas have been planted much more recently—many in my time. In the season we have several big Daffodil colonies. There were ten thousand in one place, mostly of the Incomparabilis sections."

"You have two fine specimens of Silver Firs. Do you know their height?"

"They are upwards of a hundred feet high. I think that the Abies brachyphylla, planted by Princess Beatrice in 1883, will make a very fine specimen."

"Do the beds of Roses, and Roses on poles close to the lake and boat-house, consist of the old varieties?"

PART OF THE CORDON PEAR WALL AT CLAREMONT.

"Mainly. They thrive by the water. So do the Bamboos, especially the Metake variety. Some of the newer varieties of Bamboo flourish under an interesting tree, the Sugar Maple, from Canada. The Rhododendrons covering the banks along the waterside are generally admired."

Returning to the Palace, Mr. Burrell mentioned that in front are used for decoration Japanese Honeysuckles, Sweet Peas (in boxes), Hydrangeas, and Zonal Pelargoniums.

We had still to explore the Rosery, near the kitchen garden. It is a house of considerable size, with one tree of Reve d'Or very conspicuous.

"How long does it flower?" I asked.

"About three weeks. It is at its best the latter end of April. That tree was planted over twenty years ago, and also one of Homere. In those days climbing Roses were not so plentiful as they are now. On the shelves are some seedling Begonias."

"You have Cannas in the show-house, with the back wall covered by a Cobæa?"

"The summer bedding is almost limited to Cannas, Hydrangeas, and Fuchsias."

"What varieties of Grapes do you grow in the three Vineries?"

"In the early house, Black Hamburgh and Foster's Seedling; in the second, all Hamburgh; and in the third, Mrs. Pince, Gros Colmar, and Alicante."

"Lastly, will you give me a few details of your own career?"

"I commenced rather over forty years ago, in the gardens of Stopham House, in Sussex, continuing my experiences at Coate's Castle, Coolhurst, and Petworth, in the same county. Two years in the plant and Orchid houses of Messrs. Veitch and Co. followed. I was then for a short time at Caldwell Hall, in Derbyshire; for four years at Castle Ashby; and after that for a couple of years in a large market place, where Cucumbers, Tomatoes, Grapes, and Melons were extensively grown. In the spring of 1882 I came to Claremont, and have spent twenty-two very happy years here." ALFRED WILCOX.

Letters from a Lady Gardener.

No. 100.—MADONNA LILIES, HALF-HARDY CLIMBERS, AND POT ROSES.

DEAR KATE,—The Madonna Lilies are very fine just now, forming stately groups, which should be more often seen in our gardens than they are, for they only need to be left alone (except for a mulch of rich stuff in March) to do well. Unfortunately, it is one of the crazes of the jobbing gardener to dig things up, and divide them every year or so; in the case of this Lily this is disastrous, for it does nothing for at least a year after replanting, and likes to be left severely alone for about ten years, after which the clump of bulbs will be so close together that they should be divided, putting in five or six together, however. Another difficulty which afflicts this, the loveliest of our hardy Lilies, is the fungoid disease which in some parts of the country attacks its roots, and, being highly infectious, soon ruins a whole group of bulbs. Where this is present, it is better to burn the plants, every scrap of them, and to get fresh bulbs from a pure source, planting these in a different part of the garden, with special precautions. This horrid disease was probably set up, in the first place, by the plan of forcing these hardy things for early work, which they specially hate, and the bulbs, weakened and made sickly by being forced to bloom when they didn't want to, soon fall a prey to any horrid little microbe that comes along. Another cause of disease in Lily bulbs is the fact that the bulbs sent from abroad are generally deprived of their thick, fleshy roots, a barbarous practice, which weakens them seriously, especially in the case of the Madonna Lily (L. candidum), which has no fibrous roots springing from its stem as some others have. These wrongly-treated bulbs may recover in a few years, however, if carefully planted. You should choose a well-drained, raised border, or, failing that, make a hole two feet deep, and drain six inches of it with broken crocks, then cover these with ashes, and lay on the top of them lumps of dried turves or peat, quite in the rough, roots upwards. Over these turves you should place a little fine soil (good loam, with sand and crushed charcoal), and in this you may plant your bulbs, covering them with two inches of soil above the bulbs. But Madonna Lilies always have green growths on them, for they form leaves directly after flowering; they should be transplanted, therefore, in July, as soon as the flowering stem (which must not be cut down until it has become brown) has ripened. Light, sandy or gravel soil suits Liliums much better than a heavy clay. If your soil is heavy, you must add plenty of gravel and burnt material (prunings of shrubs or any garden rubbish) to the soil for Lilies, and be sure to have plenty of drainage. If you have had diseased bulbs in the garden, it will be best to dust the new ones with powdered sulphur before planting them.

The fine flowers of the Crown Imperials are usually reckoned amongst our garden Lilies, although they are Fritillarias (Fritillaria imperialis); they bloom in April, their red and yellow bell-shaped flowers making a fine show at that time. They only need good garden loam to do well, and no Lilies should have fresh manure added to the soil in planting them, though they all like a mulch of old hotbed stuff, mixed with

LILIUM CANDIDUM AND BRAKE FERNS.

soot, above their roots in spring. The other Fritillarias, I am sorry to say, I don't like. They have flowers so hideously like a snake's head, in dull colours, marbled exactly like the skin of the special enemy of women, that they look horribly uncanny to me, and I won't have them in my garden. I suppose we ought to admire all the flowers, but one must be allowed a few cranks in this direction, and we all have our favourites, as well as our special aversions—so Fritillaria meleagris is mine.

This is a good time to sow biennial half-hardy climbers, such as Lophospermum scandens (with handsome pink trumpet-shaped flowers), Maurandya Barclayana and alba (purple and white flowers like a Snapdragon in shape, with delicate trails of foliage), Eccremocarpus scaber (a small fire-coloured Bignonia which climbs all over the pergola here, but, perhaps, is not hardy enough for the open air in winter in colder districts), Cobæa scandens (with bell-shaped blossoms, in dull purple, a very rapid climber), Tropæolum Lobbi, and some of the more delicate Ipomæas. The seeds of these plants can, of course, be put in during the early spring, but the plants thus raised do not make much growth after planting them out in the garden, until the frost comes and cuts them off, which is disappointing; so we find it the best way to sow them without fire heat, in the Vinery, now, and pot up as many of the seedlings as we want before the winter sets in, keeping them free from frost, but as cool as possible, until the spring, when they have a shift in February or March, and then start into growth, which is covered with buds when we plant them out at the end of May; and they are very useful for the sides of window-boxes, for sunny walls, and for climbing (in the case of the Cobæa and Eccremocarpus) all over the arches, etc. Of course, they can also be grown under glass very well; in fact, they are usually treated as greenhouse climbers, and they do well in a cool porch, or conservatory, where their lives are longer than in the garden, for the winter usually kills them, unless you pot up their roots in autumn, and replant them in May. When grown under glass, they need to be pruned back rather severely in spring, top-dressing them at the same time with rich soil, if in a border, when they will make clean, strong growths. They can be grown in well-drained boxes of rich soil, and can then be either top-dressed, or (if the box be small) replanted, but they should then have a little fire-heat to start them into growth. In pots they do not make much headway, needing more room; in your balcony-boxes they would be charming, climbing in and out of the ironwork, and draping it so prettily, for they will climb up, or hang down, as they are trained.

The pot Roses are now over, and as they go out of bloom they are placed in the open air, in a position where they get the sunshine of the morning hours, but are not too much burned up by the hot afternoon sun. They are now repotted, too, only removing a little of the soil, and giving them each a shift into a pot two inches broader at the top than the last, with good, strong, turfy loam, a little leaf-mould, soot, and Clay's fertiliser or bonemeal, but no fresh stable manure, as the roots of Roses object to any impurity, and are apt to become cankered if placed in such material. They should have wire crocks below their drainage, to prevent worms from getting in and destroying their roots, and the soil should be made very firm. After you have repotted your Roses, place them in the shade of a north wall for a few days, until they have got over the shock; they must not be allowed to droop, nor yet be soaked with water whilst already wet, but you should syringe them every evening, when the weather is dry, so as to refresh their foliage, and prevent green-fly from attacking them. Some growers do not repot their Roses until January, just before they start them into growth; but in this case no soil must be shaken off the roots, and the ball of these must be kept intact, or the result will be weak growths and poor blossoms. If you try the late-potting plan, you must only remove the drainage, and the inch of surface soil, and surround the ball of roots (in a clean pot, well drained) with the compost mentioned above, packed firmly round them in the larger pot. In either way you may succeed, if you carry out the operation carefully.

Your friend,

I.L.R.

Two printer's errors crept into the interview with Mr. H. R. Saunders, of Rendcomb Park, recently. In reference to the Oaks, Mr. Saunders said the soil is too "stony," not too "strong"; and with reference to the Strawberries he said we get as good "flavour" out of doors, not "flowers."

with seedlings. Migration in this manner is a comparatively slow process. In the Botanic Garden at Singapore there is a specimen of another tree with winged seeds, Shorea leprosula, and though it is a hundred feet in height, and in an open situation, its seeds are never found at a greater distance than a hundred yards, and seldom more than fifty. Mr. Ridley, who made this observation, calculated that, under the most favourable circumstances, the species would only migrate three hundred yards in a hundred years. Plants with plumed seeds extend much more rapidly, but even they are checked by belts of forest. But those that rely on birds for the dissemination of their seeds are in the best position of all, for there are few obstacles which can stop their progress.

A Garden of Spices.

July 25th.—Most enthusiastic gardeners are perpetually on the alert for some good idea to carry out in their grounds. Here is one which I have just come across in the pages of "Flora." "One of the loveliest garden fancies I have met was what its author called a Garden of Spices, in which every plant was grown for its perfume, massed in great clusters, among which the bees held carnival—clusters the odour of which often greeted one at a distance of yards. The sweetest plants, both in flower and leaf, from the whole temperate world, were gathered into a small area. Clusters of sweet Roses, Jasmine, Honeysuckle, or Lemon Verbena, stretched forward each from its own place, while bunches of blue Wistaria, fragrant Bignonia, and other less-known climbers, swung down in profusion from overhead. The whole was so beautifully graded that one passed by unseen stages from tender exotics, through a long array of plants becoming increasingly hardy, until one wandered out at last among fragrant Pines and Myrtles, with a natural carpet of Wild Thyme, Rosemary, Lavender, and native herbs, with nothing foreign intermixed but seemed as much at home as the wildest of them. True, the spot was in itself unique—a long strip of undulating shore overhanging the Mediterranean, in a climate famed for its perfumes; but the idea might be adapted nearer home with plants that enjoy our clime, and any scheme which gets us away from the stereotyped garden and wearisome monotony of the ordinary bedding and shrubbery is worth attempting." The name, a Garden of Spices, is perhaps rather too suggestive of the herb garden of old English days, but the idea is charming. If it were well carried out, such a garden would, indeed, be an ideal place in summer.

Rock Gardening.

In a recently-published book on "Rock and Alpine Gardening," I find the following passage, which will explain many failures in rock gardening: "If we were to examine the roots of most of the plants flourishing in the rocky uplands, we should find that they have not much soil in which to grow, but that they are so firmly embedded between the stones that they keep striking deeper and deeper, sometimes to the depth of several feet, which has, over and over again, been proved by removing the debris from them. One would think that plants with such remarkable root action would inevitably give a larger amount of surface growth, seeing that most of the plants under our consideration only grow two or three inches above the ground at most. Of course, it is their nature not to be tall. Climatic conditions account for this, the plants not being allowed a long growing period; they have, in fact, only a few hours given them during the day for two or three months of the year in which to grow and bloom, and are, in most instances, frozen up every night all the year round. It will be seen, then, that the roots penetrating such a distance down is one of the chief reasons why they are able to withstand the rays of a scorching sun or a dying wind; their roots are out of harm's way, being always kept moist, and the drainage is so perfect that there is not the least fear of their perishing through the accumulation of too much water." If, then, a rockery is to be a success, these are the conditions which are essential. The roots must be able to penetrate deep, and the drainage must be perfect. Shallow pockets, from which the roots cannot escape, and in which the water accumulates, are death-traps to these Alpine plants. Many, of course, have their special requirements; but these things are common to all.

H. C. Davidson.

Famous Gardeners at Home.

No. 265.—Mr. George Burrows, at the Gardens, Shendish, Hemel Hempstead.

Among the most notable and charming gardens in Hertfordshire, those at Shendish are entitled to a first place. Shendish was built, between sixty and seventy years ago, by the late Mr. Charles Longman, father of the present owner. The estate covers between fifteen and sixteen hundred acres, the greater part of it being farmed by Mr. A. H. Longman, who for many years was a famous breeder of pedigree Shorthorns and master of the old Berkeley Hunt. The gardens are about thirty acres in extent, and Mr. Longman, who is a Fellow of the Royal Horticultural Society, naturally takes the utmost interest in them. Mrs. Longman is herself a practical authority on gardening, and, when I visited Shendish on the 6th of July, Mr. George Burrows, the head gardener, spoke in the warmest terms of the kindly help and encouragement afforded to him by his employers. He enjoys the advantage of residing in a charming house in the fine Elm avenue, and his own garden, with its pretty summer-house and flower beds, designed by Mrs. Burrows, is admirably kept. Proceeding along the Elm avenue, we came first of all to an old Rose garden, made half a century ago, and still practically unaltered, containing twenty-four beds filled with Hybrid Perpetuals and some of the stronger Teas. Surrounding it are some nice shrubs, including a good specimen of Garrya elliptica. At the extreme west end of the pleasure gardens is a Sweet Brier hedge, in which every variety of the section is represented. But at this point we turned aside, in order to inspect The Dell, which Mr. Burrows only remodelled last winter.

Mr. George Burrows.

The Dell.

"It was originally," he said, "a disused chalk pit, and I thought that the natural beauty of the spot might be made even more attractive by a judicious arrangement of walks and banks, and when my ideas are completed it will be an ideal spot for a summer retreat. As you see, there is an octagon summer-house, with a look-out on to it, and the view from it is charming. Mr. Longman has kindly given me permission to use this dell for an *al fresco* concert on behalf of the Hemel Hempstead Horticultural Society on August 14th, when I hope to illuminate the various banks with fairy lights. We have many hundreds of Ferns here, and I planted last winter fourteen thousand Primroses. I hope in the future to introduce many of the rougher kinds of herbaceous plants. The banks right and left of the serpentine grass walks are planted with Berberis, and I am utilising the space at the top of the banks for Cactus Dahlias and ornamental gourds. Of Dahlias, by the way, we grow Pink Pearl, Sweetheart, Mermaid, Reballe, Princess, Sweet Nell, Perle de la Tete d'Or, Eva, Nelson, Lancaster, Mont Blanc, Miss Grace Ash, and W. Seagrave."

"I think that the position is an ideal one for a rockery."

"Yes, I agree with you. But, meanwhile, we have above a number of what I may call rock beds—that is to say, the plants are growing on Derbyshire stone."

"What varieties do you use for this purpose?"

"The larger quantities include five hundred each of Alyssum saxatile, Aubrietias (græca, purpurea and Leichtlini), and double white Arabis; and one hundred Heuchera sanguinea. These are used for massing, and we have also many plants of Saxifrages in variety, Primula denticulata, Ramondias, Lithospermums, Trollius, Campanulas, Phlox divaricata, P. Nelsoni, P. amœna, P. lilacina, Sedums in variety, Gentiana acaulis, G. asclepiadea, Veronicas, Alliums, Epimediums, Androsace, Ajuga reptans, Polygonum Brunoni, Achillea tomentosa, Hutchinsia, Silenes, Sempervivums, Arenarias, Waldsteinias, Cheiranthus, Ericas, and other plants of great interest and beauty."

Eighty Flower Beds.

"These beds," continued Mr. Burrows, "and all the beds in the rough garden, of which the rock beds form a part, were made and planted since last year—many since Christmas."

"You have a large number of fine beds and combinations?"

"About eighty. The principle is to have a succession of flowers from spring until October. Everything is raised from seed or from cuttings."

"Can you tell me how the whole of the beds in the rough garden are made up?"

"Some of them contain a single variety, and others a combination. There is one bed of Erigeron speciosum, and one each of Heuchera brizoides, Sweet William, Bocconia, Chelone barbata, Helianthus rigidus, early-flowering Kniphofia Tuckii, Lobelia cardinalis, Nicotiana

affinis, and Pæonies. Of combinations there is a bed of Helenium pumilum and Tropæolum; a bed of Phlox Etna, with a groundwork of Dianthus laciniata; a bed of Phygelius and dark Violas; a bed of Scilla siberica, Sweet Williams and Hyacinthus candicans; and a bed of Roses Cramoisie Superieure, and dark blue Violas. There are two beds of Clematis of sorts, with a groundwork of Tropæolum; four of Delphiniums and white Violas; two of hardy Azaleas, Darwin Tulips, Lilium melpomene, and Montbretias; two of Pyrethrums and Pentstemons; two of Lilacs and Heuchera sanguinea, with Van Thol Tulips; and two of Sweet Peas, Nepetu, and Geranium Andrewsii. The others are three beds containing only Chrysanthemum maximum; two of Pentstemons only; two of Lavender; two of Roses; two of Himalayan Roses; and two of Lupins. The intention is to have the whole length of the west end made into flower beds."

The System with Sweet Peas.

"Your Sweet Peas are so exceptionally good that I should like to know more about them."

"We sow the earliest batch in November in 3-in. pots. They are kept in frames, afterwards potted on until they get into 8-in. pots, in which they flower. We then use what we require for the conservatory, and plant out the remainder, so that we get them in flower in the open by the middle of May. More are sown in the spring, to flower later on."

"Which varieties do you specially recommend?"

"King Edward VII., Lady Nina Balfour, Picotee edge, Duke of York, Princess May, Prima Donna, Mrs. J. Chamberlain, Countess of Powis, Countess of Paris, Venus, Countess of Cadogan, Black Knight, Princess Beatrice, Dorothy Tennant, Sadie Burpee, Countess of Radnor, Scarlet Gem, Butterfly, Duchess of Westminster, Henry Eckford, Miss Willmott, and Mrs. W. Wright. But we have many others. We generally plant a clump of one variety, using three pots for a clump, and six seeds in a pot."

In a corner of the rough garden is a little pond, with a peninsula projecting into it, which is planted with Bamboos, Kniphofia, Eremurus, and Sweet Brier Roses, while along the sides of the water are six Gunneras, Iris germanica, and Funkias.

"In the spring," said Mr. Burrows, "the grass was a mass of Daffodils. I planted five barrow-loads. The varieties which do best here are Emperor, Golden Spur, Empress, Grandis, Horsfieldii, Victoria, Cynosure, Princess Mary, Sir Watkin, Barrii conspicuus, Campernelle, Jonquils, and ornatus."

Passing some Roses grown on stones and stumps of trees, including Maharajah, one of the newest varieties, and a striking collection of Rhododendrons, we made our way on to the glorious croquet lawn, which is two acres in extent. This is exclusive of the other lawns.

"You must devote a great deal of attention to this lawn, to keep it in such splendid order?"

"Yes, during the winter we gave it, in the earlier part, three hundredweight of muriate of potash, three hundredweight of bonemeal, and one ton of sifted wood ashes. Subsequently, this year, we put on five hundredweight of soot, one ton of slaked lime, two tons of wood ashes, and twelve hundredweight of basic slag. In April the lawn has a good hard raking, and we continue rolling every week until the surface gets hard. All weeds are taken out by hand, and spaces are filled in with silver sand. Shendish has a noted croquet club, and the members meet here every Monday during the season. While we are speaking of the croquet lawn, I may mention that the fine specimen of Wellingtonia gigantea was produced from seed taken from the famous tree at the Crystal Palace, now destroyed."

Shendish Park, West Front.

"I notice that in the handsome conservatory Schizanthus occupies a prominent place."

"We grow four batches of sixty pots, which are sown in September for early spring flowering, and in February, April, and June for succession. They are flowered in 6-in., 7-in., and 8-in. pots. The centre just now contains chiefly Pelargoniums of ten varieties, intermixed with Ferns and Grasses. Of course, the contents of the conservatory change according to the season."

"Can you tell me what plants you use for conservatory decoration?"

"Yes, according to their order, we use 100 Cineraria stellata; 100 Primulas; 60 Calceolarias, usually two feet through; 100 Pelargoniums, often more than two feet through: 100 tuberous Begonias, named sorts; 100 Fuchsias, Mrs. Marshall and Charming; 100 Gloxinias; 150 Zonal Pelargoniums, best named sorts; 100 Petunias; 100 Salvia splendens; 50 Tropæolum Lobbianum; 50 fancy Coleus, of sorts; 25 Streptosolen Jamesonii; 100 pots of Lachenalias; 50 pots of Gesneras; 50 pots of Achimenes; 150 Poinsettias; 25 Eulalia japonicas; 20 Genistas; 25 Swainsonia alba; 10 Arum Lilies; 50 Carex variegata; 30 Coleus thyrsoides; 50 Asparagus Sprengerii; 50 Libonias; 150 Begonias, Gloire de Lorraine; 50 Eupatoriums; 50 Marguerites; 100 Campanula pyramidalis; 50 Linum tigrinum; 20 Imantophyllums; 50 Cyperus alternifolia; 20 Hibiscus Cooperii; and last, but not least, 350 Chrysanthemums, chiefly Japanese singles and for cutting."

"Which varieties of Chrysanthemums do you specially recommend?"

"For August and September, Horace Martin, Goacher's Crimson, Market White, Ryecroft Glory, Sœur Melaine, Madame Desgrange, George Wermig, Comtesse and Foucher Carel. For October and November, The Lion, Pride of Madford, W. R. Church, F. W. Vallis, Godfrey's King, Madame Paola Radaelli, Edith Smith, George Carpenter, George Penford, George Lawrence, Lady Hopetoun, G. Davis, Hooper Pearson, Sunstone, and Guy Hamilton. The best singles include Ladysmith, Edith Pagram, Annie Farina, Earlswood Beauty, Jessie Dean, Elsie Neville, G. W. Forbes, Star of Honour, A. Holden, Kate Williams, Rosalind, Mary Anderson, and Eureka. Of late varieties I prefer Niveus, W. H. Lincoln, Princess Victoria, White Thompsoni, Yellow Thompsoni, Latest of All, and Filkins for table decoration.

"Speaking of table decorations," continued Mr. Burrows, "we make up a great many button-holes. Perhaps it might interest you to know the flowers we use?"

"I shall be very pleased to have the names."

"Euphorbia jacquinæflora, Manettia bicolor, Strobilanthus Dyeriana, Tabina montana, Gardenias, Orchids, Dendrobiums of sorts, Epidendrums, Odontoglossums, Cœlogyne cristata, Stephanotis, Browallia speciosa, Ixora Fraserii, Bouvardia (especially scarlet), Pæonies, Hoya carnosa, Sparmannia africana, Salvia Henryi, Roses in bud, Carnations (Tree, Border, and Malmaison), Violets (Marie Louise and Princess of Wales), and small interesting rock flowers."

The Formal Bedding.

Just outside the conservatory, and west of the mansion, is the Dutch garden, which contains upwards of four thousand plants, made up of Coleus, Lobelia, and Pelargoniums (chiefly those with variegated leaves, and the scarlet-flowering varieties), the whole, when planted, representing a carpet. It is very effective in the spring, with Wallflowers, scarlet Tulips, white and blue Hyacinths, with Myosotis, Aubrietias, and double Arabis for groundwork.

"This," said Mr. Burrows, "we call Mr. Longman's garden, while the twenty beds on the other side of the conservatory, and facing Mrs. Longman's rooms, are planted as follows:—The centre bed, which is a round one, contains in the middle a plant of Solanum laciniatum, surrounded with the red-leaved Ricinus, Zea japonica variegata, Tropæolum Lobbiana, Nicotiana affinis, Salvia patens, the bed being edged with Dactylis glomerata. The two diamond beds have in the centre plants of Ivy-leaved Geranium Madame Crousse, filled up with Souvenir de Charles Turner, dotted with standard Heliotropes and Zea japonica. Four of the round beds contain Geranium Henry Jacoby, edged with Lobelias, and the centre planted with Fuchsia Mrs. Marshall; two other round beds are filled with Geranium Vesuvius, edged with Lobelias, and dotted with Grevillea robusta; and the remaining two consist of the double scarlet Geranium Raspail, edged with Lobelias."

"Then there are the horseshoe beds."

"Two of these have in the centre scarlet tuberous Begonias, with a groundwork of white Violas, edged with yellow Violas, and dotted with standard Heliotropes and Grevillea robusta. The centre horseshoe bed contains mixed Verbenas, edged with Centaurea candidissima, dotted with standard Heliotropes and Swainsonia alba. In the two large oval beds there are cream and rose-flowered Stocks, and golden-leaf Pelargoniums Palace Gem, edged with Pyrethrum, and dotted with standard Heliotropes and Swainsonia. The two other oval beds consist of standard and dwarf dark Heliotropes, and double, pink-flowered, silver-leaved Pelargoniums

Mrs. Parker, edged with Cerastium tomentosum. The two small round beds are filled with Verbena Miss Willmott, edged with Dactylis glomerata, and dotted with Agave americana."

The Rose Beds.

"Now we come to the Rose beds."

"These were made last Christmas twelve months. Each of the large beds contains fifty-six plants of one individual variety. The varieties used are La France, Gruss an Teplitz (which in my opinion has yet to be beaten for massing), Caroline Testout (a good companion to La France), and Madame Abel Chatenay, an ideal Rose for cutting purposes. Another bed contains young plants of Marquis of Salisbury. This bed previously was filled with Mrs. W. Byass, but it proved to be such a poor companion to Gruss an Teplitz that we have now discarded it."

"What are the varieties in the round beds?"

"They are half-standards and dwarfs, the varieties being Frau Karl Druschki, which grows to an enormous size, and is the best and purest of whites, although very liable to mildew; Antoine Rivoire, a Rose I always recommend for its graceful beauty, and form, and scent; Viscountess Folkestone, another charming variety; and Madame Hoste, also one of the very best for any purpose."

"Do you grow many climbing varieties?"

"Yes, you will see them on the pergola in the kitchen garden. Both yellow Banksian and the white variety have flowered this season; Crimson Rambler, which is literally smothered with blossom; Carmine Pillar, The Garland, Dorothy Perkins, Longworth Rambler, Waltham Climber, and Psyche. Other climbing Roses in the gardens are Fortune's Yellow, which made a lovely picture in May and June; Rosa macrantha, which was brought here from Mentone; Madame Bérard, Climbing Pet, Pink Rover, Gardenia, Lady Gay, Maharajah, and Aglaia.

"Roses elsewhere in the gardens," continued Mr. Burrows, "are Victor Hugo, Liberty, Countess Roberts, Bridesmaid, The Bride, Reynolds Hole, Ulrich Brunner, L'Ideal, Rene Andre, Bardou Job, Madame Alfred Carriére, Maman Cochet, Marie Finger, Jersey Beauty, Reine Olga de Wurtemburg, Blairii No. 2, Madame Bravy, as well as numerous beds of China and Polyantha Roses, which are a constant joy from early June to well into November. I hope to include in the wild garden in the future, Philadelphia Rambler, Madame Isaac Periere, Liberty, Billiard et Barre, The Lion, Madame George Bruant, Soleil d'Or, Old Tuscany, York and Lancaster, Sancta, Damascena, Cabbage, Burgundian, Una, Arvensis, Irish Glory, Grace Molyneaux, Paul Lede, and Duc Adolph de Luxemburg. All these are lovely varieties for such a spot, and well adapted for isolated treatment."

A Fine Border.

At the end of the Rose beds is the "Temple of the Wind," and facing the former, under the south wall, is a remarkably fine border, its effectiveness being enhanced by the spacious gravel walks, which are fourteen feet wide, while the whole of the walks are two miles in extent. The climbers on the wall are Ampelopsis quinquefolia, Pyrus japonica, Rose Fortune's Yellow, Jasminum nudiflorum, Escallonias, Honeysuckles, Chimonanthus fragrans, Berberis nepalensis, Pomegranates, Euonymus radicans variegata, Magnolias, Choisya ternata, Kerria japonica, Hedera helix arboreanus, H. h. digitalis, H. h. canariensis, and H. h. Rægneriana.

"How many annuals and biennials," I asked, "are planted in front of the border?"

"Between three and four thousand. The varieties include Stocks, Asters, Coreopsis in variety, Gaillardias, Zinnias, Sweet Sultans, Scabious, Petunias, Nemesias, Pentstemons, Antirrhinums, Phlox Drummondii, Heliotropes, Tropæolums, Nicotianas, Centaureas, Chrysanthemums, Agathæas, Pansies, and Violas. At the back are many choice Irises, Spanish, Japanese, English, and German."

"And the herbaceous varieties?"

"They include Anchusa italica, Delphiniums, Phlox Coquelicot, P. William Robinson, P. Captain Whiteman, Camassia esculenta, C. Fraseri, Aquilegia cœrulea, Acanthus latifolia, Mallows, Geranium tuberosa, Pæony, Pyrethrums, Daphnes, Ajuga, Incarvillea, Verbascums, Hepaticas, Achillea, Campanulas, Eryngiums, Erigerons, Lupins, Montbretias, Bergamot, and Anemone japonica. We also plant the front each autumn with two thousand bulbs, which is carpeted with Myosotis alpestris, Aubrietias, and double white Arabis."

"You must use, altogether, a vast number of bedding plants?"

"This year we have bedded 1,000 Antirrhinums, 500 Asters, 1,000 Coleus, 3,000 Pelargoniums, 250 Calceolarias, 500 Dianthus, 200 Delphiniums, 1,000 Pyrethrums, 1,000 Violas, 1,500 Lobelias, 300 Heliotrope, 150 Cineraria maritima, 50 Cannas, 200 Begonias, 100 Beet, 50 Hollyhocks, 200 Nicotiana, 300 Nemesia, 500

The Gardener's House at Shendish Park.

Phlox Drummondii, 400 Pentstemons, 500 Scabious, 300 Sweet Sultans, 400 Stocks, 200 Coreopsis, 200 Verbenas, 150 Gaillardias, 1,000 Pansies, 200 Tropæolums, 50 Zea japonica variegata, 50 Ricinus, 30 Swainsonias, 50 Plumbago capensis, 100 Petunias, 250 Zinnias, 50 Fuchsias, 50 Gladioli, 100 Lobelia cardinalis, 150 Centaureas, 200 Cornflowers, 150 Chrysanthemums, 150 Cheloné barbata, 50 Chamæpeuce, 300 Agera tum, 500 Sweet Williams, etc. We also planted in the winter, 6,000 Wallflowers, 2,000 Myosotis, 1,000 Aubrietia, 1,000 Polyanthus, 500 Daisies, 4,000 Tulips, and 2,000 Hyacinths, as well as the five barrow-loads of Daffodils and 14,000 Primroses I mentioned just now."

The Houses.

The kitchen gardens run parallel with the pleasure grounds, and after noticing at the entrance to the mansion Daturas and Agapanthus in the tubs, as well as a number of fine trees and Conifers, we went into the greenhouse, from which the conservatory is fed. Here were Malmaisons, and Mr. Burrows said:—"We grow Iolanthe, Calypso, Nautilus, Lady Rose, Princess of Wales, Lady Ulrica, Margot, Mrs. Martin Smith, Lord Welby, Nora, and Madame de Satge. In the same house as the Carnations are Azalea mollis, of which the best to grow are Hugo Koster, Aida, Apollos, Vergile, Fanny, Meteor, Unique, Antony Koster, Betsy de Bruin, and J. C. van Thol. With regard to other houses, we only grow the useful varieties of Orchids, several of which I have mentioned; in the stove are a number of Acalypha hispida, Dracænas in variety, Pandanus Veitchii, Caladiums, and a nice collection of Crotons, the roof being covered with Gloriosa superba, and Allamandas at the back."

"You go in considerably for Melons."

"Yes, the varieties are Superlative, Invicta, Royal George, Latest of All, Eastnor Castle, Windsor Castle, Cantaloupe, and one of my own raising. The last is a cross between Blenheim Orange and Buscott Park Hero. The features of it are that it carries the flavour of Blenheim Orange, and only takes between eight and nine weeks to grow, instead of the twelve or thirteen required by some varieties. Of Tomatoes we grow Winter Beauty, The Cropper, Up-to-Date, Abundance, and Red Currant; and of Cucumbers, Rochford's Improved and Lockie's Perfection."

"What about Peaches?"

"All the Peaches are grown out of doors, and we have only two Vineries—very good of their kind, but rather old."

"Yes, the glass department strikes me as rather small, considering the extraordinary quantity of plants you have to supply for conservatory work and bedding outside. How many varieties of Grapes do you grow in the Vineries?"

"Six, Black Hamburgh, Muscat of Alexandria, Muscat Hamburgh, Alicante, Buckland's Sweetwater, and Shendish Seedling. Most of the Vines are upwards of fifty years old, but, by careful treatment, I hope to get much superior fruit from them yet. At present we have about two hundred and sixty bunches, and the flavour this year is considered superior to what it has been for fifteen years. Unfortunately, we have to use the Vineries all the year round for plant culture, which makes it impossible to do as we would wish for the welfare of the Vines. For instance, Strawberries are forced in them; and there are also Tomatoes, Ferns, and bedding Geraniums, while the back wall is utilised for growing Smilax for table decoration."

"I notice you have a large bed of Christmas Roses."

"We have two very good varieties, each with long stems; if the weather is open, they begin flowering before Christmas, and continue until the end of February. Near the pergola, with its rockery and pond, is a fine Yew hedge, bordered with many herbaceous plants, the inner circle being filled with Border Carnations. To the left, and at the east end of the garden, is another fine Yew hedge, twenty feet high, and, at the foot of it, a border of golden Calceolarias."

Hardy Fruits.

"How about fruit outside?"

"Strawberries are our weakest this season. The plants were laden with fruit, but the constant cold weather, and the cold, retentive nature of the soil, hindered the fruit from swelling, and consequently damping and rot have been the result. Raspberries, Gooseberries, and Currants are a heavy crop, also Cherries, Pears, Apples, Peaches, and Plums. The best of the Pears are Doyenné du Comice, Beurré Clairgeau, Beurré Superfin, Marie Louise, Jargonelle, Williams's Bon Chrétien, Beurré d'Aremberg, Pitmaston Duchess, Uvedale's St. Germain, Beurré Diel, Beurré Bosc, Beurré Easter, and Winter Nelis. The best Plums include Transparent Gage, Coe's Golden Drop, Czar, Greengage, Jefferson's, McLaughlin, The Sultan, Reine Claud de Bavay, Magnum Bonum, Victoria, Late Gage, Purple Gage, Monarch, Late Rivers, Comte de Athens, and Culvert's Gage."

"Which Apples do you recommend?"

"Cox's Orange Pippin, Worcester Pearmain, King of the Pippins, Mannington's Pearmain,

Beauty of Bath, Blenheim Orange, Scarlet Pearmain, Cellini Pippin, Mère de Menage, Lane's Prince Albert, Keswick Codlin, Northern Greening, Peasgood's Nonsuch, Lord Burghley, and Court Pendu Plat."

"Do you grow many Peaches on the walls?"

"Less than a dozen varieties, namely: Walburton Admirable, Royal George, Noblesse, Early Rivers, Late Admiral, Barrington, Bellegarde, Louise, Grosse Mignonne, Lady Alexander and Violet Hative. The Nectarines are Lord Napier, Early Rivers, Pineapple, Dryden, and Elruge."

"Would you like to mention any special vegetables?"

"Potatoes, the rougher kind, are grown on an outside piece of land. We cut Asparagus before Easter, and have just finished. About fifteen hundred head of Celery are grown, about one thousand Cauliflowers, and the same number of Broccoli. The varieties of Peas are Earliest of All, William I., Gradus, Daisy, Stratagem, Duke of Albany, and Ne Plus Ultra. We grow Giant Rocca Onions for autumn sowing, and Ailsa Craig and James's Keeping for spring. Lettuces are grown all the year round, and the salads include fifteen hundred Endive."

Then, having looked into the comfortable bothy, and the new potting room, we strolled towards the little model village, which has recently been planned and laid out under the auspices of Mr. Burrows. It forms an object-lesson for the locality. The houses, built on park land and old allotments, vary in style, and are of a very up-to-date appearance, being, in fact, quite handsome modern villas. Twelve poles of garden are attached to each, and the inside accommodation is excellent. The occupants are men working on the estate, or pensioners, and the rent charged is only half a crown a week. Finally, I inquired of Mr. Burrows where he started his career.

"I served in the gardens at Shipley Hall, Derbyshire, for nearly four years, and at Clumber for the same period. I then went in succession to Thoresby Gardens, where I had a good insight into fruit cultivation; to Otterspool Gardens, Liverpool, where I had a good deal to do with Orchids; to Fetcham Park, Leatherhead, where Chrysanthemums are always a success; to Nash Court, Faversham, famous for its magnificent conservatories and Ferneries; and to Canford Manor, Wimborne, where I was floral decorator, fulfilling the same duties at Wimborne House, Piccadilly. I was then head gardener at Berwick House, Shrewsbury, where I was successful as an exhibitor, winning many prizes and three silver medals. On the death of my employer, I became gardener and bailiff at The Dell, Birmingham, where I remodelled the gardens. At the end of five years I accepted a similar post at Avon Castle, Ringwood, where I entirely made the gardens. Two years ago I came to Shendish as head gardener. I have a genuine interest in horticulture, and my work is my greatest pleasure. When I was in the Midlands, I often lectured on Carnations, Orchids, kitchen and flower gardening, and I acted as judge at many of the leading horticultural shows, particularly at Bournville. I am now honorary secretary to the Hemel Hempstead Horticultural Society. There is an old saying that a sitting hen never gets fat, and I advise young gardeners never to remain in one place too long. Every garden has different subjects, and every gardener different modes of culture. The man has yet to be born who knows everything respecting horticulture; indeed, the older one grows, the less one seems to know, so extensive are the details." ALFRED WILCOX.

COLEUS CORDELIA is a very vigorous variety, with large, wrinkled leaves, of which the groundwork is red, with a shading of orange, but as the leaves become aged they assume more of a yellow hue.

Letters from a Lady Gardener.

No. 260.—BOG TUBS, AND FREESIAS

DEAR KATE,—At this time of year, bog tubs and water-gardening have decidedly the pull over the rest of the garden, especially during a spell of hot weather. The Water Lilies growing in tubs (of which I wrote to you on April 20th) are in full bloom, each tub containing lovely flowers in pink, white, crimson or yellow; and the Japanese Irises (Kæmpferi) are in bloom, making a grand show with their great flat blossoms in white and gold, or in various shades of purple.

Then other tubs contain masses of scarlet Lobelia (fulgens), or of the brilliant pink herbaceous Spiræas, palmata and venusta, which grow to the height of a yard or more, each spike being crowned with fluffy bloom in metallic-pink, quite a different tint from that of the shrubby Spiræas (bumalda, Antony Waterer, etc.), which are not nearly so bright or effective. All the Spiræas revel in a bog-tub, especially those of the herbaceous varieties. They generally look sick and miserable in the dry border, but with their feet in water they are quite at home, and happy.

A PICTURESQUE APPROACH TO A BOG GARDEN.

Canna Indica.

The same may be said of the Indian Shot (Canna indica), for, unless it is given extremely rich soil, and a moist corner, it fails to do well in the border, and the only alternative to planting it in a tub is to shift the plant in May into a larger pot (about nine inches), with very rich soil (half of which may be well-decayed manure), and sink the pot in the border; but then it must be thoroughly supplied with water every day in warm weather, and never allowed to get very dry.

The beauty of a bog-tub of Cannas, edged with silvery foliage plants, is remarkable. In the centre of the Cannas you can plant a bronze Castor-oil (Ricinus Gibsoni), if it be a good large tub, and keep the whole thoroughly moist by filling up the tub once a week in dry weather. During this season the rain has done all that was necessary to keep them right up to the middle of July; but, since that, the heat and consequent evaporation make it desirable to add more water occasionally to all the bog-tubs, which should, as a rule, be half-full of water.

In the spring we had a grand show of golden Marsh Marigolds, both the double variety (Caltha palustris flore pleno), and the large one (grandiflora), both of which are much more effective than the typical plant, though that is beautiful, too. In the centre of the Calthas there grows a Ghent Azalea, in pale shades of creamy-yellow and white, and these masses of double flowers toned down the brilliant Marigolds charmingly, making a beautiful group at the end of the lawn. The great scarlet Mimulus (coccinea), and a new yellow one (Mimulus luteus Tillingii), edge another tub, in which grows the lovely flowering Fern, Osmunda gracilis. Both these plants like a little shade, and the Siberian Irises, with Iris Monnieri, do well in the same tub.

When we go up to the boggy parts of Dartmoor (which are within a walk), we bring back all sorts of treasures for the bog-tubs, the tiny Bog Pimpernel, covered with a mass of starry pink flowers; the queer little Sundew, with its cruel leaves trying to catch unwary flies; the Bog Bean (Menyanthes trifoliata); the handsome yellow Villarsia (Limnanthemum peltatum); and the turquoise Water Forget-me-not (Myosotis palustris); whilst the long, golden fringe of the Creeping Jenny (Lysimachia nummularia), hangs low over the edge of the Japanese Iris tubs, and makes a delightful contrast with their purple flowers.

Some of our tubs are set in rockwork, and surrounded by rock plants; others are covered with wire netting, on which grow various climbers, such as Tropæolums, the Azure Pea (Lathyrus azureus), etc.; and some are sunk

John Caie

Gardeners' Chronicle 1875 new series 4

Some forty years ago, or thereabouts, the name and person of Mr. John Caie were familiar to the horticulturists of the metropolis. About that time, when residing at Bedford Lodge, Campden Hill, Kensington, he was one of the foremost, if not actually the first, to carry out to successful results the "bedding system" of flower gardening, which, by a revolution of the wheel of fashion, it has now, in some quarters, become the wont to decry. Whatever may be advanced in opposition to this system, and the heaviest charge against it appears to be that of creating monotony by producing its effects with comparatively few subjects, there can be no question that it has had an immense influence in brightening up and improving the flower gardens throughout the country, the toning-down and other modifications we are now introducing being, in fact, merely the outgrowths of lengthened experience in working out the system. For much, at least, of this improved flower-gardening, the gardeners and employers of gardeners of the present day have to thank Mr. Caie, whose portrait we now introduce, and who has obligingly sent us the following sketch of his horticultural career.

"I was born, April 15, 1811, in Renton, a small village in Dumbartonshire, but I was soon removed from this place to Dowanhill, near Glasgow, my father having taken the management of the garden and farm there. The property belonged to James Buchanan, Esq., one of those merchants who, having made a large fortune, are anxious to have a well cultivated garden and farm. The garden was enclosed with brick walls and covered with fruit trees, such as Peaches, Plums, and Pears. Melons and Cucumbers were successfully grown. My father lived here forty-six years, and died very much respected by the family. It was here that I received my first lessons in gardening, I was educated in the parish school at Partick, and also in Glasgow. About this time I had the privilege of attending a course of private lectures on botany in the neighbourhood of Glasgow, and the progress I made was such that Mr. Daniel Ferguson, afterwards Curator of the Belfast Botanic Gardens, made mention of me to Mr. Stewart Murray, the highly esteemed and accomplished Curator of the Glasgow Botanic Gardens, who kindly made an opening for me at the Martinmas term, 1827. At this time the gardens had attained great celebrity for their extensive collections of plants, and for the indefatigable exertions made by Sir W. J. Hooker and Mr. Murray to uphold their character. Such being the case it was no mean advantage for young men to get into the gardens, for the rules were such as any man anxious to distinguish himself could not but approve of. I set to work in earnest, gathering specimens of plants at one time, learning their names with their culture at another, and attending the lectures delivered at intervals by Sir W. J. Hooker in the garden-hall; and I also had the privilege of accompanying him in his botanical excursions to the Highlands.

Mr. Murray was proud of his men, and when he found them worthy of his support he considered no trouble too great to advance their interest. In 1829 I went to Buchanan House gardens, the seat of the Duke of Montrose. Mr. Duncan Montgomrie, the gardener, placed me in the frame-ground, to look after succession Vines, Melons, Cucumbers, and other things belonging to this department, with occasional work in pruning bush fruit, and nailing on the wall?. Everything was done according to method and system. On entering my second year here I was put in charge of the forcing- houses, which were known at that period to carry good crops of fruit, and not less good in quality. Pines, Grapes, Peaches, and Apricots were grown, and I carried through the forcing to Mr. Montgomrie's satisfaction.

0n March 7, 1831, I started for London, and after a three week's sail I reached Chiswick House gardens, the seat of the Duke of Devonshire, where I was found employment by Mr. Lindsay, the Duke's gardener, who very kindly said to me that in the event of a more suitable situation turning up I should be at liberty to leave him; which I did soon after this for Woburn Abbey, Here the new kitchen garden and forcing-houses were finished and in good working order, as was afterwards shown in the fine fruit produced by Mr.

Forbes, both for family use and for exhibition purposes. The plant-houses in the pleasure ground were being filled with collections of plants, such as Cacti and Orchids. Ericas held a very prominent place here, and these were placed under my care, with a degree of liberty to exercise my own judgment in their cultivation which seldom falls to the lot of one in such a situation. That success attended our efforts will be obvious from a remark made by the late Mr. McNab, of the Royal Botanic Garden, Edinburgh, in reference to the growth of Heaths, that "our method was worth knowing."

In 1835 I left Woburn Abbey gardens for Bedford Lodge, a small place near Kensington, belonging to the Duke of Bedford, for the purpose of carrying out the bedding system of planting flower gardens, which was not much practised at that time, but which has become, as the late Sir Joseph Paxton remarked, strictly speaking the gardener's art. About this time the West London Gardeners' Association for Mutual Improvement was commenced, under the direction of the late Mr. Robert Fish, whose character and abilities attracted young men from all parts of the country. I connected myself with them, greatly to my own advantage; and the interests of horticulture in genera were not a little advanced by the Association.

March 10, 1856, I came to Inverary Castle garden; and, considering that the garden is not very favourably placed for high cultivation, owing to local peculiarities, inseparably bound up with such a mountainous country as this is, where the rainfall for 1874 measured 6 feet, still our bush fruit and wall trees, consisting of Pears, Plums, Cherries, and Apricots, with boards projecting 23 inches from the top of the wall, seldom fail to produce good crops. The soil taken from the low ground here is very suitable for all kinds of fruit trees, but especially so for Vines and Peaches. Our lean-to Peach-houses have a back wall, 17 feet high, and without any artificial heat; these houses, and our old vineries, carry good fruit. The flower garden and pleasure grounds have been very much extended, and many of the Conifers and hybrid Rhododendrons succeed well here. But anything which has been done in the way of ornamental gardening, when compared with the bold conception of the original design of this place, and the grandeur of the sylvan scenery which lies beyond, is but small indeed; still, the great variety of trees, shrubs, and flowers, in close connection with the Castle, have an interest in themselves as a home scene."

Mr. Caie intimates that at some future time he may discuss more fully some of the modes of culture adopted at Inverary, with reference to climate and other peculiarities, and we feel sure our readers would derive some useful hints should he find leisure to do so.

In connection with the gardens at Inverary Castle it may be mentioned that on the occasion of her recent visit to the Duke of Argyll, Her Majesty the Queen planted some trees as memorials of the auspicious event.

Gard. Chron., 1889

Obituary.

We regret to record the death, at his brother's house, Ivy Cottage, Clyde Street, Dunoon, on the night of September 22, of Mr. John Caie, for many years gardener at Inverary Castle. An autobiographical notice and portrait of this representative gardener was given in our number for October 9, 1875. Mr. Caie graduated, as it were, in the Glasgow Botanic Garden, then under the management of Mr. Stewart Murray, and had the advantage of studying botany under the late Sir William Hooker (then Dr. Hooker), whose zeal and influence did so much for the Glasgow garden in those days. Caie filled various situations, always with credit to himself and advantage to his employers, and in 1835 initiated, or, at any rate, was one of the first to carry out, the bedding-out system. He had been at Inverary in the service of the Duke of Argyle since 1856.

2. Ceará Rubber.—At the end of August of last year consignments of plants of the Ceará rubber, consisting in each instance of two Wardian cases containing eighty plants, and one dry box containing forty plants, were sent to Lieut.-Colonel Beddome, Conservator of Forests, Madras, and Dr. King, of the Royal Botanic Gardens, Calcutta. Dr. King now writes :—"Ceará rubber is going to be a success here."

At Ceylon in April one of the plants first sent out had already made an attempt to flower, and by the end of the year Dr. Thwaites was distributing copious supplies of seed to Calcutta, Burmah, Madras, and Singapore (where, however, it seems unable to stand the wet season).

I regard, therefore, the work of Kew completed as regards the Ceará rubber. Living plants of it have been distributed during the past year to Dominica, Fiji, Jamaica, Java, Sydney, Trinidad, Queensland, and Zanzibar.

New Garden Plants.

Miltonia Bluntii, *n. sp.**

A fresh novelty—a lovely and elegant thing. The flower is equal to that of Miltonia spectabilis, but the sepals and petals have another shape, and are smaller. They are whitish-yellow, and they have some great purple-cinnamon blotches chiefly in their centre.. The sepals are lanceolate acute, the petals oblong-lanceolate, less acute. The lip has exactly the form of that of M. spectabilis, but there are two different naked abrupt keels at the base ; its colour is white, and there is a purple area at the base. The column is thick and very short, with narrow, great darkish purple-violet wings. The whole aspect must be uncommonly pretty. If you take sepals and petals of a Clowesii, wash all the bars from base and top, and add the column and lip of a spectabilis, you will have rather a good idea of Miltonia Bluntii : only remember there are no bars at all, but blotches.

Mr. Richard Bullen informs me the plant is like Miltonia spectabilis in growth and habit.

I entertain no doubt of the plant being a mule between Miltonia spectabilis and M. Clowesii. It is a great satisfaction to dedicate the plant to its discoverer, Mr. Henry Blunt, who once more devotes his zeal to Orchids. Materials have been kindly sent by Mr. Richard Bullen, Woodlands Nursery, Hither Green, Lewisham, S.E. *H. G. Rchb. f.*

Cypripedium porphyrospilum, *n. hybr.*†

This is a fresh mule between Cypripedium Lowei and Hookeræ. It has the leaves of Cypripedium Lowei, but shorter and not so shining, also somewhat broader in the middle. The peduncle is two-flowered, with distant flowers, and very short bracts. The peduncle and ovary have velvet-like pubescence. The flower is nearly that of C. Lowei ; it has the twisted spatulate petals, but with very thick, callous, dark blotches, making one think of those of C. Hookeræ. The purple violet of the tip is confined to a small area. The staminode is quite that of C. Hookeræ, transverse, with two introrse forcipate, anterior horns, and a small tooth between in the sinus. The whole flower arrived very faded. It appeared to be brown with purple tips of petals, dark blotches on the upper part of them, and the staminode no doubt had been suffused with green. To be short, it is a reduced Cypripedium Lowei, with shorter leaves, thick calli on the sepals, and the staminode of Cypripedium Hookeræ. I have no doubt it is of Sedenian origin, since it was sent by Messrs. Veitch. *H. G. Rchb. f.*

Lælia pumila spectabilis.

A two-flowered peduncle is at hand, the flower nearly equalling those of Lælia majalis or L. Jongheana. Amongst the twenty-six flowers of my herbarium there is but one flower coming near those. The broad dark purple border of the lip is just as warm in colour as in Cattleya superba, while the interior is of a certain white with a hue of lightest purple and the very base orange with some small red spots. The seven median nerves are very obscurely keeled, the median ones running out in a triangular petaloid elevation at the base of the middle lacinia. This I have seen several times before, though not in such a prominent manner. The sepals, petals, and column are as in the common plant as to colour. I have no doubt this is the Cattleya spectabilis of the *Florist*, iii , p. 23, though I have seen no type.

I have to thank for the satisfaction of admiring, sketching, and describing this beauty Mr. William B. Boyd, Ormiston House, Kelso. *H. G. Rchb. f.*

Oncidium glossomystax, *Rchb. f.*

When I proposed this little gem as a species in 1852, I did not hope to see it one day alive in Europe. The other day it came in its full glory, a minute dwarf with little short leaves of an Iris, and an almost sessile, relatively large flower, light yellow, with a few brown blotches, and a white tabula infrastigmatica under a green stigma. The grand feature are two pairs of keels on the basilar disk of the lip. Each keel is covered with very many white hairs. We have two pairs of senile whiskers on the lip. When in full vigour the flower is developed on a thin capillar peduncle. My numerous herbarium specimens come from Loxa, v. Warscewicz ! Ocaña, Wagener ! Bogota, Karsten ! Caracas, Wagener ! The plant at hand was brought from New Granada by M. Kalbreyer to the establishment of Messrs. Veitch. *H. G. Rchb. f.*

* *Miltonia Bluntii* (Clowesii-spectabilis).—Flore florem Miltoniæ spectabilis æquante ; sepalis ligulatis acutis ; tepalis oblongo-ligulatis brevis acutis ; labello subpandurato antice valde dilatato obtuso, ante basin utrinque obtusangulo, carinis angulatis geminis calvis in basi ; columna brevissima crassa, alis magnis angustiusculis.—Sepala et tepala albido flavida medio maculis conspicuis atro-purpureis. Labellum album disco ante columna violaceo-purpureo. Columnæ alæ obscurissime atroviolaceæ. Oncidium Bluntii (Clowesii-spectabilis). Brasilia. Blunt. *H. G. Rchb. f.*

† *Cypripedium porphyrospilum*, n. hyb. (Lowei × Hookeræ.)—Foliis Cypripedii Lowei ; sed brevioribus majis opacis ; pedunculo puberulo bifloro ; bracteis spathaceis abbreviatis porrectis ovario pedicellato velutino multo brevioribus ; sepalo dorsali ovato obtuse acuto ; sepalo binato angustiori apice simpliciter acuto ; tepalis ligulato dilatatis obtuse acutis tortis maculis in parte superiori incrassatis ; labelli unguæ limbis involutis ; sacco antice retuso medio obsoletissime emarginato, lateribus breve angulatis ; staminodio semilunato antice utrinque incurvo forcipato ; angulo minutissimo in sinu.—Ex col. cl. Veitch. *H. G. Rchb. f.*

IN MEMORIAM.

JOHN CAIE.

In the death of Mr. Caie horticulture has lost one of its oldest and most distinguished practitioners. As an old friend, perhaps you will permit me to add a few sentences to your brief obituary at p. 442, for Mr. Caie was no ordinary man. He was nothing less than a genius, and one of the most original thinkers and cleverest gardeners it has ever been my happiness to know. His natural diffidence, and also his depth of thought and difficulty of pleasing himself, fettered his pen, and deprived horticultural literature of much of the information he was so well fitted to impart. But a night with Caie, twenty-five or thirty years ago, was an intellectual and horticultural treat of the highest order. When "Johnny," as we used to call him, got excited and warmed up to his theme, and talked himself into a "fog" on the "sublimities," then was the time for ordinary mortals to grasp the germs of truth in the rough, and mould them into the highest practical wisdom. His tendency was to think out everything so thoroughly in all its relations that he never seemed to have got to the bottom of it. Always learning, never coming to the full knowledge of the truth, was the normal attitude of his mind. Truth to him seemed in so deep a well that he could never draw up enough with his own cord and bucket. Hence I never found a man of such ability so grateful for the help of others in the discovery, elucidation, and establishment of truth. Take, for example, the bedding-out system, of which in its best form he was undoubtedly the originator. He was literally possessed with, lost in it, for years. He would talk for hours of the proper proportion of green to grey, of light and shade, the contrasts and harmonies of colour, the relative breadths of flower-beds and shrubberies to open spaces, of gravel to grass, of life and repose in landscape, of cold colours and warm, of the proportion of tall trees to dwarf bushes and flowers, &c., until the Dowager Duchess of Bedford's garden at Campden House, Kensington, became a lesson-book of decorative landscape art for all England.

But good as the garden was, the man was even more, and far better than his works. He saw infinitely more in his garden than others could see, and he was for ever striving to let all of us see the bedding-out system with his eyes. No one, indeed, was more grateful for help in the search for and elucidation of truth. He used to call my late brother, Robert Fish, his interpreter. "Show Robert half a truth," he said to me at my first interview with him, "he will make a whole one, a family, out of it directly." They were great friends for years, and my brother always said that Mr. Caie knew more about the proper disposition and arrangement of floral landscapes than any other man. They also worked together for the establishment and prosperity of the West London Gardeners' Association for Mutual Instruction, a Society which did great good in its day. Such societies are less needed now, as their mission is almost superseded by the popularity and ability of the horticultural Press ; but thirty years ago such societies were invaluable centres of intellectual life, and formed almost the only bond of union, friendship, and strength among practical gardeners. It was one of my highest privileges on my entry into Knight & Perry's nursery, to be introduced to the West London Association by Mr. John Caie, and on my leaving for my first situation Mr. Caie and the leading members accompanied me to the "World's End," to bid me good-bye for Robert's sake—and also for my own, as Mr. Caie put it. That act of kindness to a young and comparatively unknown man was just like Mr. Caie, whose goodness of heart and kindness to gardeners through a long and useful life were even more conspicuous than his intellectual force and ability.

His removal to Inverary was a loss to metropolitan and general horticulture. He wrote comparatively little from the far North, though to the end he continued a careful gleaner and recorder of facts, as your columns testify. I had hoped, as one of the greatest pleasures of my life, to see the beauties of Inverary under the guidance of Caie's inspiring genius, but instead I have only the privilege of thus chronicling a mere tithe of his sterling worth and rare ability. May this brief record inspire some young rising gardener to tread in the footsteps and follow the example of Mr. John Caie—one of the ablest men that ever advanced practical horticulture. Peace be to his memory. *D. T. Fish.*

THE FRUIT AND VEGETABLE TRADE OF LONDON.

A most interesting subject is now being discussed in your pages—interesting as affecting not only the millions inhabiting London and its suburbs, but also those in every county in the United Kingdom engaged in providing these "millions" with their "daily bread"—whatever shape that may take, from pure milk to the pure white Lily : for eye and brain demand food as much as do the digestive organs ; and happy they who can have all their wants supplied just as they ought to be.

So far as the discussion has gone, it seems to me that only the fringe of the subject has been touched ; and as probably not only the proper production of fruit, vegetables, and flowers, but also their profitable disposal, interests the readers of the *Gardeners' Chronicle*, I may be allowed to have a little to say in the matter. In most cases there are not only the now historical three, but four profits, to be derived from most of the produce sent to London markets ere the actual consumer is reached ; and it would appear that not the least important vendor and profit gatherer is the much-talked-of "spirited and enterprising coster." When this spirited individual is placed in the forefront it is time to say something about the ways of his life, so far as experience goes. My experience (of a very large number of the class) is that, like his "betters" (?), he is much given on occasion to what is termed "besting." He will purchase anything and everything ; he will assist in clearing the market ; paying rent he cannot always avoid, but taxes are quite out of the question in a free country—except, say, a hawker's license on occasion ; he will saddle shopkeepers and ratepayers with the expenses of educating, and occasionally of clothing, his children ; he will often give much trouble to the police, obstructing the traffic wherever he possibly can ; he will spend, occasionally in company with his better half, a great deal of his substance in riotous living ; and in "the family circle" and the nearest "public" he is, upon occasion, about as fine a specimen of a foul-mouthed man as can be found in any part of the world. If evidence is required, probably Scotland Yard, or any minor centre of police "vigilance committees," will be able to supply it. Remember, I do not condemn all the class, for they do a wonderful amount of good ; but surely this is not quite the sort of "tradesman" to encourage in the disposal of fruits, flowers, and vegetables. I am quite aware that there are very many virtuous and cleanly costers, as there are many virtuous and civil cabmen, and the affirmation of the Earl of Shaftesbury and "H.R.H." may be accepted

a very extensive collection of products from Rhodesia, and it is marvellous to see what has been attempted in this colony, which but a few years since was in a state of savagery. Now it is peacefully occupied with the raising of cotton, Sanseveria for its valuable fibre, rubber, cereals, tobacco, etc., samples of all of which were displayed.

The very large consignments of fresh fruits, which are now reaching our home markets from the Cape, show what is being done in this direction in the South African Colonies. Picked samples of these various fruits—Plums, Pears, Apples, Peaches, Nectarines, Grapes, etc., were freely displayed. The Rhode Island Fruit Farms Co., Ltd., had one of the best exhibits of fresh fruits, for which they received a Gold Medal, the same award being also granted to the Cape Orchard Fruit Company, and to Mr. H. Orton, Cape Colony, for similar groups.

We noticed that many of the softer-fleshed Apples from the Cape, including Warner's King, were badly affected with "black spot." Plums and Pears were the finest of the fresh fruits shown, but they might all have been staged to much better effect. Arranged on the walls of the hall and at other parts of the building were excellent photographic views and paintings of South African scenery, notably some splendid views of the Victoria Falls. Paintings of indigenous plants of Cape Colony were also displayed.

LINNEAN SOCIETY.

March 15.—A letter from Dr. Chr. Aurivillius, Secretary of the Kungl. Svenska Vetenskapsakademien, Stockholm, was read, in which presentation was made of copies by Jean Haagen of the portraits of Carl von Linné by Per Krafft the elder, and Alexander Roslin, in possession of the Academy, sent in acknowledgment of the loan of Linné's "Philosophia Botanica" interleaved and annotated by the author, which had been returned a few weeks ago through the Swedish Legation. A special vote of thanks for this most acceptable gift was moved from the Chair, and carried unanimously.

Prof. F. W. Oliver, F.R.S., F.L.S., then opened the announced discussion on "The Origin of Gymnosperms." He stated that in recent times the balance of opinion has been in favour of descent from the Ferns, the point of closest contact being found in the Cycads, this view gaining material support through the discovery of multiciliate spermatozoids in the last-named group and in Ginkgo, as well as from the recognition of Palæozoic forms (the Cycadofilices) which, whilst retaining the habit and many of the structural peculiarities of Ferns, show a distinct advance in the direction of the Cycads. Now that it is known that many of the forms there included were seed-bearing plants, a new class, the Pteridospermeæ, has been judged expedient for these Spermophytes which have so much in common with the Ferns.

It would appear that a preponderating number of so-called Palæozoic "Ferns" are in reality Pteridosperms which have been hitherto confounded with true Ferns in view of their frond-like habit and lack of distinguishing organs of reproduction. But if the Palæozoic is in reality the "age of Pteridosperms" rather than the "age of Vascular Cryptogams," the Hofmeisterian position becomes altered, and the question is one that should engage the attention of Botanists.

Palæobotanical work has shown that in the Lycopod phylum, seed-like structures were occasionally produced, and this discovery no doubt seems to strengthen what has always been a possibility, namely, that a portion of the Gymnosperms may have had its origin along this line.

Mr. E. A. Newell Arber, F.L.S., followed, on the "Earlier Geological Record of the True Ferns." He pointed out that the Palæozoic Pteridosperms exhibit marked characters in common with the true Ferns, and it is therefore more than probable that they sprang from a Fern-like stock. Thus the Fern-line of descent must be geologically older than the Pteridosperms.

There is, however, every reason to believe that true Ferns did exist in Carboniferous and Permian times. The Botryopterideæ were among the chief representatives. In the fossil state we have naturally no evidence as to the development of the sporangia, and further, the biseriate or multiseriate annulus of Palæozoic sporangia does not agree with that of modern Leptosporangiate spore-bearing organs. It would thus seem better to regard the Palæozoic Ferns as a separate class, from which both the Leptosporangiatæ and Eusporangiatæ were eventually derived. The name Primofilices is suggested to denote this race; since the preferable terms, Archæopterideæ and Palæopterideæ, are not available.

The question may well be asked, Is there any trustworthy evidence of the existence of the Eusporangiatæ in either the Palæozoic or truly Mesozoic floras? In neither is there any evidence at all of the Ophioglossaceæ, and the only instances of possible Mesozoic Marattiaceous fronds, with which he was acquainted, are three in number, and all of Rhætic age. In two species of Tæniopteris, sporangia, resembling those of the modern Marattia, have been found on certain fronds, while in Danæopsis, another related genus, the synangia more closely resemble those of Danæa.

In the Palæozoic rocks we find a plexus of fronds of the Sphenopterid and Pecopterid type, bearing exannulate sporangia, arranged independently in the sorus, or united to form synangia. The great difficulty, at the present moment, is to decide as to the true nature of these fronds. Did they belong to true homosporous Ferns, or were they the male fronds of Pteridosperms? On the present evidence he was inclined to think that a large number will eventually prove to fall under the latter category. We already know that one Pecopteris (P. Plukeneti) belonged to a Pteridosperm. Also the male frond of the Bennettiteæ, a group descended from the Pteridosperms, is known to have borne sporangia not unlike those of the Palæozoic Pecopterids and the modern Marattiaceæ.

The anatomy of the tree-fern, Psaronius, affords the most trustworthy evidence, at present, of the existence of the Eusporangiatæ in Palæozoic times; though there would appear to be little to indicate that this group ever attained to the position of a dominant or ruling type in either the Palæozoic or truly Mesozoic floras.

Mr. A. C. Seward, F.R.S., F.L.S., then spoke on "The Evolution of Gymnosperms: the Position and Ancestry of the Araucarieæ." The genera Araucaria and Agathis may be regarded as surviving members of an ancient group of Gymnosperms distinguished by several well-marked characters from other Coniferales. During the Mesozoic era the Araucarieæ were widely distributed; they are now confined to restricted areas in the Southern hemisphere. His object was to enquire into the statement as to the antiquity of the Araucarieæ, and to ascertain whether the records of the rocks lend support to the view that they represent the oldest section of the Coniferales. A further question suggested by the examination of palæontological data was the possession of characters by Agathis and Araucaria which may be designated primitive.

In view of the widely accepted conclusion that Cycads and Ferns were descended from common ancestors, it is important to consider whether the contention that Conifers, as well as Cycads, are derived from a Filicinean stock is supported by satisfactory evidence. While accepting Cycads as descendants of Filicinean ancestors, the author is led to the conclusion that Conifers, or at least the Araucarieæ, should be referred to a Lycopodiaceous origin.

The proceedings were then adjourned to a subsequent meeting, fixed for May 3, 1906, when Dr. D. H. Scott, F.R.S., Sec. L.S., will resume the discussion.

ROYALE SOCIETE DE FLORE.

March 18.—The meeting of this society was held on the above date in the Botanic Garden, Brussels. The awards made included four Diplomas of Honour, 35 Certificates of Merit of all classes, and two Botanical Certificates. Some of the best plants exhibited were Odontoglossum ardentissimum "Perle de Wolmoe," O. a. Lambeauanum from M. Lambeau, O. crispum var. "Th. Pauwels' Perfection" from M. Pauwels, and Cypripedium Talisman (C. ciliolare × C. Gallieri Hyeanum) from M. Hye de Crom. Listrostachys pellucida, a Congolese Orchid, was exhibited by the Botanic Garden authorities, with an exceptionally well-grown plant of Medinilla magnifica in full bloom. M. de Bievre showed a collection of 75 flowers of Carnation in 30 varieties, and M. Paras, fruit grower to King Leopold, exhibited a set of wonderful Lettuces.

NATIONAL CHRYSANTHEMUM.

March 26.—On this date the executive committee of the above society held a meeting at Carr's Restaurant, Strand. Mr. Thomas Bevan presided. The schedule for the three shows to be held in 1906 was presented in its amended form, and included an additional sum of £20 in value. The amounts offered are: for the October show, £64 8s. 6d.; November show, £248 15s. 6d.; and December show, £50 4s. 0d.

Mr. C. H. Curtis reported on the work of the publication sub-committee, who recommended the issue of a Year Book for 1907 as a means of interesting members, and with the view of obtaining new members. The proposition was carried. The report of the "Early-Flowering" Conference will shortly be distributed to members.

GLOUCESTERSHIRE ROSE.

March 27.—The annual general meeting of the Gloucestershire Rose Society was held on the above date at the Guildhall, Gloucester. It was reported that there was a deficit of £16 17s. 2d. on the last show—when the National Society's exhibition was held in conjunction with that of the local society—which would be met out of the reserve fund. The payments included £65 10s. 6d. to the National Society and £52 10s. for the band. Mrs. Elwes, of Colesborne, was elected president, and Col. the Hon. C. Dutton was appointed chairman in succession to Canon Maddy, resigned. The secretary, Mr. Sidney S. Starr, also resigned, and Mr. S. Gibbins was appointed his successor.

Obituary.

Mr. John Cairns.—We regret to record the death of this well-known Scottish gardener, which took place with startling suddenness, from heart failure, on March 15. Mr. Cairns was a native of the west of Scotland, having been born in the Colquhoun country, on the banks of Loch Lomond, about 67 years ago. He commenced his gardening career with the well-known Glasgow firm of Austin & McAslan;

THE LATE JOHN CAIRNS.

thence he entered the service of the late Earl of Home at his Lordship's Bothwell Castle establishment, where he was a favourite pupil of the late Mr. Andrew Turnbull. Mr. Cairns was later at Dalkeith Palace gardens, where he remained a number of years under the late Mr. Thomson. Subsequently, and while still a young man, Mr. Cairns was entrusted with the management of the gardens at the Hirsel, which position he occupied until last year with distinguished success, and with

marked approval of his employers, the late Earl and Countess of Home, and the present heads of the house, as well as of the various members of their respective families. Altogether Mr. Cairns was in the service of the house of the "Homes" for nearly forty years.

Mr. Cairns was a successful exhibitor, and the finest Leeks ever exhibited in Scotland were shown by Mr. Cairns in Edinburgh. His services were also in frequent request as a judge at the more important metropolitan shows. In particular his knowledge of fruit and of fruit culture was extensive and minute.

Less than twelve months ago Mr. Cairns relinquished his post at the Hirsel, when his employer indicated his appreciation of his services and character by bestowing upon him a generous pension.

Mr. Cairns has contributed to our annual report on the condition of the fruit crops for a quarter of a century at least.

The funeral took place on Monday, 19th inst., in the presence of a very numerous gathering of mourners.

MR. H. M. POLLETT.—The death is announced of this gentleman on the 20th inst., at his residence, Bickley, in his 78th year. Mr. Pollett was well known in horticultural circles, and till lately was a member of the Orchid Committee. He was well known as a printer of horticultural documents.

MR. THOMAS BARTON.—News has reached us of the death of Mr. Thomas Barton, head gardener and land steward at Dunsany Castle, Co. Meath, the seat of Lord Dunsany. Mr. Barton, who had reached the age of 70 years, was an Englishman who went to Ireland 45 years ago, and for the long period of 40 years occupied the responsible position of head gardener and land steward to the Dunsany family, by whom, and by all with whom he came in contact, he was held in the highest esteem and regard.

GEORGE CLINGING.—The death occurred at Catford, on March 20, of Mr. George Clinging, who at one time was a successful exhibitor of Grapes at Regent's Park, Richmond, and the Crystal Palace. Deceased, we are informed, was a Scotsman, and was employed in his early days in Broxmouth Park gardens. On coming to England he served at Marden Park, Sanderstead Court, Ammerdown Park, and Aston Rowant. *Correspondent.*

THE WEATHER.

THE WEATHER IN WEST HERTS.

Eight days of frequent snow. The past week has been a bitterly cold one. The temperature in the thermometer screen at no time rose higher than 43°, which is about 7° colder than is seasonable. On the two coldest nights the thermometer exposed on the lawn showed 16° of frost, which is only 1° higher than the lowest reading for the three previous winter months. The ground has become very cold, and is now 2° colder at two feet deep, and 4° colder at one foot deep, than is seasonable. Rain or snow fell on all but two of the 17 days ending the 26th, and on eight consecutive days during that period there occurred frequent falls of snow, sleet, and soft hail. On several occasions the ground was nearly covered with snow, but in each case it soon disappeared after it had fallen. The total quantity of rain and melted snow deposited in the rain-gauge during the eight days in question measured nearly an inch. The percolation through both the soil gauges, which had very nearly ceased on the 19th, re-started on the following day. During the week the sun shone on an average for four hours a day, which is slightly in excess of the mean duration for the time of year. Moderate winds and light airs have mostly prevailed, and the direction has been almost entirely some northerly point of the compass. The average amount of moisture in the air at 3 o'clock in the afternoon exceeded a seasonable quantity for that hour by as much as 14 per cent. *E.M., Berkhamsted, March 28, 1906.*

MARKETS.

COVENT GARDEN, March 28.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—ED.]

CALDERBANK Thomas of 34 Canon-street Bolton Lancashire retired coal-agent died 12 March 1906 Probate **Manchester** 21 April to Thomas Calderbank fitter and James Calderbank coal-agent Effects £323 3*s.* 10*d.*

CALDERONI Juan Teodoro of Lima Peru died 1 January 1893 Administration (with Will) (Limited) **London** 8 December to Ernest Thorndike gentleman the attorney of Isabel Calderoni de Majé Effects £50.

We have to mention, with much regret, the decease of our valued correspondent, Mr. David Cameron, which occurred on Sunday last. Mr. Cameron was an excellent British Botanist, had an extensive knowledge of exotic plants, was a good gardener, and a very worthy man. His notes and hints upon cultivation, which have occasionally appeared in our columns, showed the intimate knowledge he possessed of the habits of hardy plants, and the skill with which he knew how to turn that knowledge to account. For many years he filled the office of Curator to the Botanic Garden, Birmingham, with much credit to himself and advantage to the establishment; he was also a corresponding member of the Horticultural Society of London. He died at the age of 61. GC 1848

Medicinalpflanzen des Östreischen Pharmacopöe, Vienna, 1842.

Grundzüge der Botanik, Vienna, 1843, in conjunction with Unger.

He also continued, after Spenner's death, in conjunction with Putterlick, T. F. Nees von Esenbeck's 'Genera Plantarum Floræ Germanicæ;' and contributed largely to C. G. Nees von Esenbeck's edition of Mr. Brown's 'Vermischte Schriften;' to Pöppig's 'Nova Genera et Species Plantarum;' to the 'Annalen des Wiener Museums der Naturgeschichte;' to the 'Enumeratio Plantarum quas in Novâ Hollandiâ collegit Car. L. B. de Hügel;' and to the 'Flora Brasiliensis,' which he edited in common with Von Martius.

Of these numerous and important works the 'Genera Plantarum' is that on which his fame will chiefly rest, as a work of immense labour, great research and profound botanical science. It will long continue to be a book of standard reference to the systematic botanist, of whose labours it is a constant and indispensable companion.

In private life Professor Endlicher was a most excellent and amiable man. He died at Vienna on the 28th of March of an apoplectic attack, caused as some physicians presumed by an effusion of pus from the *pars petrosa* of the left side into the brain, as he had suffered for many years from a polypus in the ear. On the previous Monday he had received his friends with his usual calmness and serenity, complaining only of a slight headache; but at midday on Wednesday he lost his speech and became insensible, and about seven o'clock in the evening he ceased to exist, leaving a large circle of warmly attached friends to deplore his premature loss.

Two of our *Associates* are also to be added to the list of deaths.

Mr. David Cameron was elected an Associate of the Society on the 20th November 1827. He was then resident as head gardener at Bury Hill near Dorking, Surrey, the seat of the late Robert Barclay, Esq., F.L.S. &c., in whose service he remained until the early part of 1831, when he was appointed Curator of the recently founded Botanic Garden at Birmingham. During his stay at Bury Hill he communicated to the 'Gardener's Magazine' (to which Journal he was for many years an active contributor), two articles upon the Flowering Plants and Ferns introduced into this country by Mr. Barclay, or then growing at Bury Hill, with remarks on their culture, and woodcuts of many of them; also a paper on the mode of destroying the Red Spider in hothouses.

Among the numerous communications made by Mr. Cameron to the editor of the 'Gardener's Magazine' while he continued in charge of the Birmingham Garden, the principal are—

1. On protecting the Blossoms of Fruit-trees on Walls from Frost, vol. viii.

2. Account of the effects of the last winter (1837–38) on the Trees and Shrubs of the Botanic Garden, Birmingham, vol. xiv.

3. Account of the preparatory operations made in the Birmingham Botanic Garden previously to planting the Arboretum there; with the dimensions which some of the trees have attained in seven years, vol. xv.

Besides the above, he continued to forward from time to time for insertion in the same Magazine, notices of the new, rare, or otherwise interesting additions which were continually being made to the valuable collection under his care; and of the effects produced by hail-storms, unusually severe frosts, &c. &c. After the death of Mr. Loudon and consequent termination of the 'Gardener's Magazine,' Mr. Cameron became an occasional correspondent of the 'Phytologist,' to which he was one of the earliest contributors.

His communications to the 1st vol. are—

1. Note on (the culture of) British Orchideæ, p. 62.

2. Notes on the cultivation of *Lycopodium clavatum* and *L. Selago*, p. 63.

3. Note on *Dianthus plumarius* and *D. Caryophyllus*, p. 63.

4. Note on *Cibotium Barometz*, p. 427.

5. Note on *Anagallis arvensis* and *A. cærulea*.

6. Note on the Irish Furze (*Ulex strictus*).

7. Warwickshire locality for *Equisetum fluviatile*, p. 555.

The 3rd vol. of the Journal of the Horticultural Society (of which he was a Corresponding Member) also contains two papers by him:

1. On the cultivation of British Orchids, and

2. On the cultivation of Hardy Heaths.

Mr. Cameron appears to have been unusually successful in cultivating at Birmingham our terrestrial *Orchideæ*; owing, probably, to the excellent opportunities which he must have possessed of becoming acquainted with their habits, during the time of his residence among the chalk hills of Surrey. He never communicated any paper to the Linnean Society; but he frequently contributed to give additional interest to our Meetings by forwarding for exhibition fresh specimens of plants likely to attract attention, either from their rarity or beauty; many of which, proving new to our herbarium, have been dried and preserved. He continued to hold the office of Curator to the Birmingham Botanic Garden until the end of 1847 or beginning of 1848, when he removed to Shrawley in Worcestershire, where he

resided till the date of his death, which took place after an illness of a few hours' duration, on the 25th June last, at the age of 61.

Mr. William M'Nab, for many years Superintendent of the Royal Botanic Garden at Edinburgh, and a most skilful and successful horticulturist, was born in the year 1780, in the parish of Dailly in Ayrshire, where his father was a small farmer. When quite a lad he had a strong predilection for the occupation of a gardener, and was accordingly apprenticed at the age of sixteen to the gardener of Mr. Kennedy of Dunure, who after three years' service recommended him to Mr. Walter Dickson, a well-known nurseryman at Edinburgh. From thence he passed into the garden of the Earl of Haddington at Tyningham in East Lothian; and was subsequently admitted into the Royal Garden at Kew, where his diligence and intelligence recommended him to the special notice of Mr. Aiton, by whom he was appointed Foreman. Here he also attracted the attention of Sir Joseph Banks, who in 1810 recommended him to Dr. Rutherford, the Professor of Botany in Edinburgh, and he became Superintendent of the Edinburgh Botanic Garden, an office which he filled for nearly forty years. Some years after his appointment, the removal of the Botanic Garden to its present site was effected; and the laying out and planting of the new Garden, as well as the successful removal of large and valuable specimens from the old to the new establishment, afford striking testimonials of his industry and skill. He was the author of 'Hints on the Planting and General Treatment of Hardy Evergreens in the Climate of Scotland,' Edinb. 8vo, 1831; and of 'A Treatise on the Propagation, Cultivation and General Treatment of Cape Heaths, in a Climate where they require Protection during the Winter Months,' Edinb. 8vo, 1832. In the latter branch of cultivation he was indeed peculiarly successful, and his directions for the management of that beautiful tribe of plants are regarded as the most valuable practical suggestions that have yet been offered. As an assistant to the Professors of Botany, both in the garden and in the botanical excursions of the pupils, Mr. M'Nab acquired universal respect and esteem. He died on the 1st of December last, and was succeeded in the Curatorship of the garden by his son James, who inherits his father's skill as a gardener and devotion to botanical pursuits.

The Secretary also announced that twelve Fellows and three Associates had been elected since the last Anniversary.

At the election which subsequently took place, the Lord Bishop of Norwich was re-elected President; William Yarrell, Esq., was

is entirely absent, while in others it is small and temporary. In some members of the last class, such as the ordinary Zonal Pelargonium, it seems to act as a nurse to the dormant bud. I have often noticed that such plants break much more readily in early spring, when the withered stipules are allowed to remain on, than when they are removed, the obvious reason being that the stipules hold a certain amount of moisture in their axils where the buds are, and thus, by softening the skin, help them to start into growth.

June 9th.—It would not be easy to plant Rhododendrons where they would not look well. They are beautiful on a hillside or a steep bank, but perhaps they are most beautiful in a glade (as shown in the photograph reproduced last week), where they can be looked down upon. When they are massed thus, the colour effects are magnificent.

H. C. DAVIDSON.

Famous Gardeners at Home.

No. 238.—MR. JAMES CANTLE, AT THE GARDENS, MOUNTFIELD COURT, ROBERTSBRIDGE.

THERE are two special points of interest in connection with the gardens at Mountfield Court, which I visited the last week in April. One is that Mr. and the Hon. Mrs. C. A. Egerton, the owners, are just taking up their residence; and the other, that Mr. James Cantle, the young head gardener, was, for upwards of three years, foreman at Normanhurst, the seat of Lord Brassey (Mrs. Egerton's father), and had previously been on the gardening staff at Ammerdown Park, Lord Hylton's seat in Somersetshire. It will be seen that a great deal of Mr. Cantle's time, since he came to Mountfield Court last July, has been occupied in making alterations and transplanting. Nature has been very kind in this instance. The Court itself stands on a great eminence, almost the highest point in Sussex, and the views of the surrounding country from the lawns are superb. On my arrival, Mr. Cantle suggested that we should stroll up Church Walk, a portion of the gardens which is in process of improvement, and, though already pretty, may easily be made extremely beautiful. There are fine trees on either side, including some evergreen Oaks, and the Deutzias and Alstrœmerias planted here for the time being are thriving. Proceeding to the front of the house, a huge clump of Rhododendrons near the entrance almost dazzle the eye owing to the mass of colour. Others face the kitchen corner, where the beds were gay with spring flowers. Here, too, as Mr. Cantle pointed out, are Rose beds, standards and bush.

Roses and Rhododendrons.

"Which varieties do best?" I inquired.

"Jean Ducher, Marie van Houtte, Homere, Safrano, Viscountess Folkestone, Papa Gontier, Anna Ollivier, The Bride, and Souvenir de Therese Levet—Tea and Hybrid Tea varieties. The creepers on the Court itself are Jasminum, Wistaria, Ampelopsis Veitchii, and two varieties of Magnolias, as well as a Fig tree."

"I suppose that the Rhododendrons are named?"

"Many of them, among the best and newest being Norfolk Whitworth, Marchioness of Headford, and Duchess of Connaught."

"A feature on the principal lawn is, I suppose, the large herbaceous bed?"

"It is a great feature. The varieties comprise Papavers, Delphiniums, Iris of sorts, Aquilegias, Fritillarias, Hemerocallis, and Phloxes, with Sweet Williams in front, the whole at present being filled with spring bedding plants."

"Why do you put wire round?"

"Because of the rabbits. They are a great nuisance here, and we have to take all sorts of measures to protect things from them. The smaller herbaceous bed includes Solomon's Seal, Campanulas, Gaillardias, and Doronicums, edged with Myosotis."

"And the Rose bed of standards?"

"Dr. Andry, Maman Cochet, Captain Hayward, Duke of Edinburgh, La Rosiere, and Mrs. B. R. Cant. There are two beds of Azalea mollis, and one with Lilium candidum growing underneath, and Montbretias round the outside."

"How are the two egg-shaped beds nearer the Court made up?"

"With Wallflowers and Myosotis, now; and last summer they consisted of Geraniums, Begonias, and Heliotropes. Probably, they will be the same this year. Two beds for spring have been made up of Polyanthus and double white Arabis. Other beds include one devoted to Carnations (Crimson Clove), and two to Pansies, with mixed edging. The Pansies are

MR. JAMES CANTLE.

in six shades of colour—black, blue, yellow, white, purple-shaded, and brown."

"You have more Pansies on the north side?"

"Yes, but the same varieties in rows, and mixed with Carnations (Raby Castle). Further on, there is a bed with Pansies and Carnations of mixed varieties, including Duchess of Rothesay, Henry Faulkener, Miss Audrey Campbell, and Richmond. There are also two more Rose beds at the corner."

An Aged Chestnut.

Noticing a number of Irish Yews round one side of the lawns, and several masses of Rhododendrons, we proceeded to the Long Walk, which leads to Temple Wood, passing a rough lawn, bright with Heather and flowering shrubs, capable, also, of great developments. Quite a feature of the front drive are the Chestnuts, one being of such great age that some of the branches would themselves make fine trees. A little distance away is the orchard, where Apples and Potatoes divide the interest.

"In addition to this," continued Mr. Cantle, "we have half an acre of ground for growing Potatoes for selection. I suppose there are twenty varieties. Then there is a quarter of an acre utilised for Broccoli and winter greens. The varieties of Potatoes grown in the orchard, with rows on each side, are Lincolnshire Kidney, Satisfaction, Up-to-Date, Toogood's Tremendous, and Harbinger. About midsummer, we put in Peas on each side."

"There is a fine old tree of Northern Greening, and the best of the other varieties are Peach Apple, Blenheim Orange, King of Pippins, Cox's Orange, Annie Elizabeth, and Duchbill (a rather large cooking Apple)."

Recent Changes.

"Your kitchen garden stands remarkably well."

"It is quite one of our features, and a good many changes have been made since I came. The pergola at the entrance consists of Carmine Pillar, Crimson Rambler, and Wichuriana Roses, Clematis flammula and Ampelopsis Veitchii. The beds right along the east wall are planted chiefly with herbaceous varieties, including Michaelmas Daisies in large number, Pæonies, Pentstemons, and Hepaticas, with a few annuals to fill up. The Wallflowers, Pansies, and Anemones pulsatilla are just over."

"I see that you have Sweet Peas in rows across, and wire put over them."

"The Pea-guards are necessary to keep the birds out. We only grow five of the very best varieties, viz., Gladys Unwin, Dorothy Eckford, Miss Willmott, Black Knight, and Lady Grisel Hamilton."

Plantation of Fruit Trees.

"You have a Fig tree of great age on a corner of the wall?"

"Yes, and it is rather in contrast to a number of fruit trees which I planted last autumn. Here, for instance, is one of Hemskirk Apricot, and a Cherry tree (Governor Wood), while, again by way of contrast, there is also a grand specimen of Marie Louise."

"You might mention some more of the trees which you recently planted in this part of the garden."

"Amongst them is an espalier Apple tree (Newtown Pippin), Humboldt Nectarine, and Apricot D'Alsace. There are a number of old varieties of Apricots not named, which bear indifferently, but the fruit, though small, is of good flavour. All along the north wall are Guigne de Winckler Cherries, a bright red berry, which hangs late. At the bottom entrance are plantations of Currants and Gooseberries, with a row of mixed Sweet Peas facing them."

Cordon Pears.

"Did you put in the cordon Pears?"

"They were all planted at the same time as the others, and the varieties are Clapp's Favourite, Doyenné du Comice, Pitmaston Duchess, Winter Nelis, Marie Benoist, Le Lectier, Nouvelle Fulvie, Comte de Lamy, Emile d'Heyst, Beurré Superfin, Glou Morceau, Durondeau, Passe Crassane, Charles Ernest, and Conseiller de la Cour. The system, as you perceive, is to plant the new trees close to the old ones, and, by degrees, we shall doubtless get rid of the latter. I may say that, wherever new trees are planted, I have dug out a good depth of soil, and put in drainage at the bottom. Before we go into the kitchen garden itself, I may call your attention to two Quinces, and a small plantation of Blackberries. The latter do well."

Varieties of Fruit.

"In the kitchen garden I see you have the Japanese Wineberry, which look as if they would also do well."

"There are four trees, which were planted in the autumn, but the Loganberry, which is trained on wires, has been grown for some time. The trees fruited well last year."

"Do you treat them the same as Raspberries."

"Practically the same. The Raspberries are grown on stakes, and then run up wires."

"What are the principal Peaches on the walls?"

"Alexandra, Dymond, and Sea Eagle. We also grow, on the inside walls, Moor Park and Powell's Late Apricots, and Spencer Nectarines. Plums are grown on the north wall, which will be planted underneath with winter greens and Violets for the frames. The latter are Marie Louise, Princess of Wales, and a few of the Czar. In the beds facing are Sir Joseph Paxton, Latest of All, and Royal Sovereign Strawberries. Another bed under this wall consists of Lilies of the Valley, which are just showing, and near here are the later Peas, including Sutton's May Queen, Early Giant, Invincible, Marrowfat, and Eureka."

Some of the Vegetables.

"Did you select these varieties?"

"Yes, all the vegetables and all the fruit planted since last autumn are of my selection. For instance, I sowed, in the Onion bed, James's Long-keeping and Exhibition; in the Carrot bed, Sutton's Favourite, a new red intermediate; and, in the Parsnip bed, Tender and True and The Student."

"Is there any more fruit which you would like to mention?"

"Among trees I have planted or shifted inside the garden are Peasgood's Nonsuch, Bismarck, and Red Astrachan Apples. I have also planted six young Apple trees, the varieties being Adams' Pearmain, Duke of Devonshire, Cockle's Pippin, Lord Burleigh, Court Pendu Plat, and Old Nonpareil. There are some old Bigarreau Cherries on the wall, which fruit at the end of July, and I have recently planted a Bigarreau Napoleon. Among the Pears shifted are Fondante de Thirriot and Duchess d'Angouleme. I might, of course, give you many more names of trees newly planted or transplanted, but I think that those mentioned will suffice to show the kind of work I have been largely engaged in doing."

The Houses and Frames.

Then we left the kitchen garden, which is diamond-shaped, and about an acre in extent, and looked round the houses and frames.

"We make the most of our space here," said Mr. Cantle, "growing what is most useful. Cucumbers are raised in boxes, the variety being Sutton's Improved Telegraph. The Tomato plants are called Little Hastings, and here are a few of our earliest Potatoes (Duke of York)."

"What about flowers?"

"They are chiefly Salvias splendens and Glory of Stuttgart, Begonia Gloire de Lorraine, Miss Willmott Verbenas, and Heliotropes. We are just making a start with Malmaison Carnations."

"How many are you commencing with?"

"Just over a hundred. The varieties are Trumpeter, Princess of Wales, Old Blush, H. J. Cutbush, Lady Hermione, Uriah Pike, and Cecilia. The Pelargoniums on the stage are mixed varieties."

"And the principal bedding plants?"

"Dianthus, Verbenas, Giant Park, Antirrhinums (white, yellow, and red), and Salpiglossis. A few Orchids are grown in this house, also a few Palms, and a batch of Gloxinias."

Winter-Flowering Carnations.

Having observed the pretty pink Cactus, I inquired the varieties of Grapes in the little Vinery.

"Muscats and Alicantes. We use the Vinery also for Fuchsias and Hydrangeas, which, later on, are placed outside the dining-room windows. Here, also, are Cannas for bedding, Stocks (Mauve Beauty and Intermediate), Larkspur, and a few winter-flowering Carnations, including Governor Wolcott, Lady Wright, Royalty, and Lady Henry Somerset."

"The cool house, I conclude, you use chiefly for bedding?"

"We are rather proud of the fine Aloysia citriodora in this house, but, as you infer, it is mainly devoted to bedding plants, such as Tagetes pumila, Gypsophila elegans, Gaillardias, Nasturtiums (Ruby King and The King), Geraniums (Souvenir de Charles Turner and Madame Crousse), Agapanthus, and Lobelias (Queen Victoria). Finally, there are the Chrysanthemums in the frames, of which the best varieties are King of Plumes, Madame Carnot, Mrs. Mears, Queen of the Exe, Lady Selborne, Vicar of Leatherhead, Mrs. Barkley, Mr. J. Thompson, Mr. T. Carrington, and Madame Paola Radaelli.

Alfred Wilcox.

Letters from a Lady Gardener.

No. 201.—IN THE VEGETABLE GARDEN.

Dear Kate,—Now that the flower garden is arranged for the summer, it will be well to turn our attention to the vegetable garden. Asparagus is a vegetable which we do not all grow as much or as successfully as we might, and yet there is nothing to equal it during the spring, until the early Peas come in.

Asparagus for Amateurs.

We find the Early Purple Argenteuil Asparagus the best of all, but Sutton's Giant and Connover's Colossal varieties are also fine, but not quite so early as the first-named kind. In too many gardens the Asparagus bed is a very old one, with sad gaps in it; and if yours is like that, it is not too late to sow seed at once, in drills, for planting out next April, by which you will save a year's time. You can, of course, buy plants of two years' growth then, and so save two years' time; but if you want plenty of this delicious vegetable, it is much more economical to sow seed, although it is a good plan to do both.

I believe the old delusion that Asparagus needs extraordinary amounts of manure, with faggots below it, and all sorts of things, prevents many gardeners from undertaking the work of making an Asparagus bed, but the truth of the matter is that it may be grown quite as easily as Cabbages in any ordinary soil, although in a heavy clay it is desirable to drain it with a layer of broken crocks, two feet down, and to lighten the soil with sea sand, burnt materials, and stable manure, for Asparagus is a seashore plant, which grows well on some of our coasts, and it prefers a light soil to a heavy one. In the gravelly soil of our garden it flourishes amazingly, and I will tell you exactly how we manage it.

The beds are not made up any higher than usual, and are double trenched and well manured before planting, which is best done early in April, just as growth begins. The young plants are watered and shaded, for they must not be allowed to droop—and, for this reason, seedlings taken as we want them from our own garden are easier to manage than bought ones, which must be put in directly they arrive—and are planted in three rows on long beds forty inches wide, at intervals of one foot, and the same distance between the rows. Broad beds are not desirable, because no foot should tread on the surface in cutting Asparagus, or the sprouting growths just below will be spoiled.

We do not cut the heads before the third year, and then only sparingly, but the fourth season it is very fine and abundant. We never heap up manure on the beds in autumn, as the old practice used to be, for this proceeding, which is often carried out with a mistaken idea that it keeps the plants warm, in reality makes them very cold, for the sun's rays cannot penetrate the thick mass, the soil below which is soaked with foul stuff, which the dormant roots cannot assimilate, and, consequently, they are apt to rot, hence the aforesaid gaps.

No, let the purifying and fructifying effects of the frost and snow penetrate the soil; the plants are hardy, and the sunshine will also do them good in winter. It is in the spring and summer that they should be highly fed, when they are growing fast, and making crowns for the following season. Early in March the beds are lightly forked over—never must a spade go near them—and then sprinkled with salt at the rate of two ounces to each square yard, or, if the soil be poor and hungry, any other suitable chemical manure may be given at that time.

A Salt Dressing.

Salt checks the weeds, and helps to keep the soil moist, so that it is a good plan to give the beds a light dressing of it just before the heads are expected to appear, but you should never exceed the quantity mentioned (*i.e.*, two ounces to the square yard) at one time, though the

The North Side of Mountfield Court.

THE GARDENS AT CHARTERS, ASCOT.

Interview with Mr. F. W. Capp.

THE prolonged thunderstorm which broke out over the Sunninghill district soon after my arrival did not prevent me from looking round the gardens at Charters, and fully appreciating their numerous beauties. The owner of Charters, Mr. Edward Iveson, and his daughters, take the keenest interest in the estate, and as Mr. Capp, who has the oversight of the estate as well as of the gardens, was quick to tell me, they are extremely solicitous for the comfort of all who are employed on it. For example, Mr. Iveson has erected and equipped a model bothy for the young gardeners, with a separate room for the foreman; and when Mr. Capp took up his present appointment, five years and a half ago, his employer rebuilt his house, and made important additions. The two great features in the gardens at Charters are the pleasure grounds and the fruit; and as soon as the weather allowed, we proceeded to the former, approaching by way of the kitchen garden.

Herbaceous Plants for Massing.

"What is the width of your fine herbaceous border, with grass in front?" I asked.

"About fourteen feet. Some of the most useful plants, arranged in groups for massing, are Delphiniums, Webbs' hybrids; Chelone barbata; Coreopsis grandiflora and lanceolata; Crambe cordifolia, Dictamnus caucasicus and fraxinella; Digitalis grandiflora; Doronicums austriacum, Clusii, and Harpur Crewe; Echinops bannaticus; Erigeron amethystinum; Euphorbia pilosa major; Gentiana acaulis; Gypsophila paniculata and elegans; Lupins in variety; Œnothera fruticosa major; Papaver orientale; Pentstemons mixed; Irises in variety; Pyrethrums, double and single; Potentillas Gloire de Nancy and purpurea; Trollius giganteus; Phloxes in variety; Asters Brumalis roseus and amellus; Statice tatarica; and Thalictrum adiantifolium. Large masses of all the leading tall varieties of Helianthus are used at the back of this and other borders for colour."

The Best Flowering Shrubs.

"Then there are the shrubs behind this border?"

"They are chiefly Euonymus radicans alba marginata, Olearia Haasti, Skimmia japonica, Cassinia chrysophylla, Cistus obtusifolius, Forsythia suspensa, Berberis Thunbergii, Retinospora plumosus aurea, Viburnum plicatum, Taxus elegantissima, Biota orientalis elegantissima, Cupressus Lawsoniana Wisselii and Stewartii, Thujopsis borealis aurea, Garrya elliptica, Prunus Pissardi, Acer negundo argenteum, Euonymus europæus variegatum, Pyrus spectabilis, Buddleia variabilis and globosa."

"You have further herbaceous borders under a fruit wall beyond?"

"Those are what we call 'The Young Ladies' Borders.' They are filled at each end with herbaceous plants, and the two beds in the middle are occupied with hardy Fuchsias in groups, the varieties being gracilis, virgata, pumila, gracilis variegata, and Riccartoni. You will see that fruit trees are largely used to adorn the pleasure grounds, but the wall behind 'The Young Ladies' Borders,' which are edged with Eulalias, is limited to Plums, Kirk's, Paul's Seedling, and Jefferson."

"How do you manage to get such a splendid display of Marigolds?" I asked, as we passed on to the lawns, and a dazzling mass of colour confronted us.

"They only require simple treatment. It is the arrangement which renders them effective. As you see, there are five rows; at the back African lemon, then gold striped, and in succession a row of African Orange Prince, a row of Webbs' French Marigolds, and a row of Silver Star, the edging in front being entirely composed of double Lobelias. Perhaps, before we go up the lawns, you would like to see the Rose garden."

Mr. Fredk. W. Capp.

How Roses are Grown.

"What is your principal arrangement in it?"

"The Hybrid Perpetuals are grown in beds by themselves in good, rich loam and manure. In September we give a heavy top-dressing of nine inches of cow manure, which is renewed in February. At pruning time, the last week in March, when the Roses have been pruned back to two or three eyes, we fork in the manure for the season, making everything neat and tidy. The Hybrid Teas, which are grown in mixed beds, are treated in the same way, only I find that they do better in a rather lighter soil. Where Roses are grown on a large scale, I recommend the massing of colours, with trees planted in groups of six to twelve of one variety."

"Now, as to the combinations on the lawn of charming fruit trees, with a groundwork of annuals?"

"The standard fruit trees are top-dressed with manure, and in the spring we sow the annuals at the base. Some of the Apple trees bore no fruit until the ground was broken up, but, as you can judge for yourself, they are thriving now."

Bedding Combinations.

In the centre of the pleasure grounds, which all slope more or less, are many admirable combinations of bedding, such as Cupressus, with Hybrid Tea Roses; a large bed of Montbretias, backed with Bamboos and Hollies; a long border with Portugal Laurels at intervals, a groundwork of dwarf bedding Nasturtiums, and an edging of Ageratum; a circular bed of Pentstemons, mixed with Hydrangeas paniculata; a fine bed of flowering shrubs, faced up with Roses, Sweet Williams, Campanulas, and Calceolarias; a large bed of mixed Azaleas, which are kept trimmed every season. Turning my attention to trees, I noticed some striking specimens of Sweet Chestnuts, Limes, Oaks, Acacias, Cedars, and Beeches, on the lawns, while specimens of variegated Hollies abound. I asked for the names of the best of these.

"Golden Queen, Moonlight, Waterer, Handsworth, Shepherdii, laurifolia, marginata, rotundifolia, myrtifolia, crenata, and latifolia. The Asters, to which an entire corner of the lawns is devoted, are planted to colour. Other bedding combinations are Violas mixed, dotted with Nicotiana affinis and Sanderæ; Kalmia latifolia, filled in with groups of Nicotiana; Francoa ramosa, and Gladiolus Brenchleyensis, bordered by Tagetes Silver Star."

"You are remarkably rich in Rhododendrons?"

"Yes; we have a choice collection, some in large beds by themselves, and many others in the borders, including numerous unnamed hybrids. In the two sub-tropical beds facing the large beds of Rhododendrons are a specimen of Pittosporum Tobira, with Abutilon Thomsoni, and scarlet and white Geraniums, edged with Lobelias. But the principal sub-tropical beds are in the East Garden, below the terrace."

"How are they made up?"

"Two with Fuchsias, standards and bushes, Ivy-leaved Geraniums, Salvia splendens, and a groundwork of Lobelia Barnard's Blue and Geranium Bijou, which is allowed to flower for effect, the edging being Lobelia Blue Beard. Of the circular beds, two are composed of Streptosolens as standards, intermixed with Lobelia cardinalis and Zinnias, the groundwork of dwarf Tropæolums, with an edging of Lobelia Blue Beard and Geranium Little Dandy. There is also a bed with Fuchsias Mrs. Marshall as standards, Abutilon Thomsoni, and a groundwork of dark Zinnias, edged by Geraniums Madame Crousse; and the bed at the corner consists of golden Cupressus, filled in with Berberis Darwini, and edged by white Ericas."

"The tubs show up well on the terrace."

"They are all filled with Hydrangea Hortensis and Agapanthus umbellatus. On the mansion the chief creepers are French Honeysuckle, Ivy, Clematis montana, and Cotoneaster."

The Terrace Scheme.

"And the bedding on the side where the carriage entrance is?"

Digitized by Google Original from CORNELL UNIVERSITY

"That is the north side, and the features are the three herbaceous borders backing the extensive croquet lawn, with more large beds of Rhododendrons."

"All your lawns seem to resemble a lovely carpet."

SOUTH FRONT, CHARTERS, ASCOT.

"I attribute their appearance chiefly to the fact that in October they are always top-dressed with wood-ashes, lime, soot, and bonemeal.

"On the east side of the terrace," continued Mr. Capp, "are four beds of Geraniums, edged with Pyrethrum Golden Feather; a centre bed of standard Fuchsias, silver Abutilons, and Plumbago capensis, with a groundwork of Geraniums Charles Turner, edged with Lobelias Blue Beard; and two beds of Geranium Madame Crousse, also edged with Lobelias Blue Beard."

"Then, there is the great display of bedding facing south, with the sloping lawn and tennis-courts beyond?"

"Four of the beds consist of tuberous-rooted Begonias, rose and pink, edged with Lobelias Blue Beard. Four more, larger, are composed of Geranium Henry Jacoby, edged with Pyrethrum Golden Feather. The two circular beds are standard Fuchsias, and a groundwork of Geraniums Madame Crousse, with Heliotrope President Garfield, edged by Geraniums Little Dandy, and a front line of double Lobelias. A centre bed contains Abutilon Thomsoni, and Geraniums Henry Jacoby, edged with Pyrethrums Golden Feather. There are two beds with Geraniums Charles Turner, intermixed with Lobelias Blue Beard; and two of larger sizes composed of silver Abutilons and Plumbago capensis, with a groundwork of Geranium Madame Crousse, edged by Lobelias Blue Beard. The vases, dotted about on the south front, are filled with Geraniums double Raspail and Queen of the Whites, intermixed with Marguerites, with a groundwork of double Lobelias and Geraniums Madame Crousse."

"Do you plant all these beds in spring?"

"Yes, with May-flowering Tulips, Wallflowers, Polyanthus, and Myosotis, all massed to colour. This is the principle which we carry out in all the bedding."

As it continued fine, we next inspected, in the excellently arranged kitchen garden, the hardy fruit, with which the name of Mr. Capp is associated as a most successful cultivator.

"First of all," I said, as we looked at the finely-grown fruit, "as to the pyramids and standards now laden with Apples?"

"The varieties grown are Lane's Prince Albert, Cox's Pomona, Lord Derby, Sandringham, Ecklinville Seedling, Annie Elizabeth, Bismarck, Stirling Castle, Peasgood's Nonsuch, Bramley's Seedling, Blenheim Orange, Pott's Seedling, Keswick Codlin, Byford Wonder, New Hawthornden, Lord Suffield, Alfriston, Cellini Pippin, Warner's King, King of Pippins, Sturmer's Pippin, Early Transparent, Ribston Pippin, and Cox's Orange Pippin, which is very scarce this season. These, with the last exception, are bearing the best year."

Culture of Hardy Fruit.

"I should like to know how you succeed in securing such chains of well-developed fruit on the single cordon system."

"All trees showing the least signs of running to wood are lifted in the early autumn. I consider it is essential to the successful culture of hardy fruit that young trees should be frequently lifted, that the older ones should be root-pruned, and that all roots should be raised to the surface, and periodically top-dressed. Four times in the year I use good raw cow manure for top-dressing, and at stated times I apply other manures which I mix myself. When I apply these, I give the trees a thorough soaking, so that everything is washed through to the roots."

"Your Pear crops appear to be equally successful."

"The varieties bearing good crops, mostly on the walls, are Pitmaston Duchess, Marie Louise, Doyenne du Comice, Beurre Bosc, Glou Morceau, Beurre Superfin, Winter Nelis, Beurre de Joliche, Duchess d'Angouleme, Marechal de la Cour, Josephine de Malines, Beurre Rance, Clapp's Favourite, Brown Beurre, Beurre Diel, Louise Bonne of Jersey, and Williams's Bon Chretien. The last, however, is not bearing so well on the pyramids, owing to the number of frosts and quantity of rain at setting time. The system of cultivation I have mentioned in respect to Apples, applies to every class of hardy fruit."

Fruit Storage.

"Do you care to say anything on the subject of storing?"

"It is one of vital importance. I have two very good fruit rooms, but I always place a thin layer of the best wood-wool procurable on the fruit racks. This admits air to the fruit and prevents it from being damaged in contact with the racks. I might say, with reference to pruning, that I prefer to leave Pears until the last week in July, and Apples till the second week in August. Then, there is no danger, or very little, of the buds coming into growth again, which, of course, is highly detrimental to the future cropping of any kind of fruit."

"When do you commence picking Strawberries?"

A GROUP OF DECORATIVE CHRYSANTHEMUMS, WITH WHICH MR. CAPP SECURED FIRST PRIZE AT ASCOT.

"The first week in June, beginning with Vicomtesse de Thury. The other varieties are Royal Sovereign—of which we force about five hundred, ripening the 1st of April—Noble, Leader, Sir Joseph Paxton, Fillbasket, Latest of All, Trafalgar, Givon's Late Prolific, St. Antoine de Padoue, and St. Joseph. As to cultivation, I

Digitized by Google Original from CORNELL UNIVERSITY

prepare the ground for new beds, which I plant in September, at two feet apart between the rows, and from one foot to eighteen inches, according to the variety, from plant to plant. I use none but cow manure on our light soil. This is dug in in trenches, eighteen inches deep, about nine inches of manure being used all through the ground. We never fail by this system to have an abundant crop. The beds are cleared and renewed every three years."

"What was your yield of fruit last year?"

"Four and a half hundredweights. This year it was much the same, but we lost about three-quarters of a hundredweight owing to the wet weather. There are two thousand two hundred Strawberry plants in full crop."

THE STAFF, AND BOTHY AT CHARTERS, ASCOT.

Cordon Currants.

"I observe that your Raspberries and Currants are bearing heavy crops, and that you have a number of Currants and Gooseberries on pillars of a wall, both on cordons and fan-trained."

"I am a strong believer in growing both Currants and Gooseberries in this manner. The flavour is better, and we can get fruit a good deal later—right up to the middle of September, in fact."

"As to flowers in the kitchen garden, Sweet Peas are very prominent, and you have some very fine plants."

"They are a special feature here. We sow the named varieties the last week in January, five seeds to a pot, in a mixture of good loam, leaf-mould, and a little sand. These are watered and placed in an intermediate frame. After the seeds have germinated and become hardened, we put the pots close to the glass, either in the frame or on the shelf of a cold house where frost is excluded. I usually plant out the first week in April, in ground previously prepared. I take out the soil to a depth of eighteen inches or more, and place nine inches of cow manure in the bottom, covering it with two to three inches of soil, leaving room for top-dressing. With regard to varieties, we are very careful not to allow colours to clash, keeping two feet clear between each space. This season some of the flowers have gone up to the height of eight or nine feet, and the quantity of blooms has been very large and lasting."

A Hint in Chrysanthemum Growing.

"I need not ask if Chrysanthemums are a feature, as they appear to line the whole length of the garden, with every indication of producing fine blooms."

"They extend over a line of one hundred yards. Eight hundred are grown in pots for exhibition in groups at the local shows, both in large-bloomed varieties, and Singles and Decoratives. The last-named are very much to the front here. I have won the challenge cup at the Ascot show for two years in succession, as well as many other first prizes, including Windsor. We keep up a supply of cut flowers for the house from October to February, and have also a number of the early-flowering varieties, which extends the season from July.'

"I do not see any sign of rust on any of your plants. To what do you attribute their healthy condition?"

"Largely to the use of my own manures, with the aid of a little Clay's Fertiliser at intervals. But to go into the question of Chrysanthemum culture would, of course, occupy too much of your space, unless dealt with separately. Violets are grown in large quantities by the Misses Iveson. The varieties outside are Czar, Princess of Wales, and Admiral Avellan. In frames we grow Marie Louise, De Parma, and Lady Hume Campbell. These are lifted and planted in a compost of two parts good loam to one of leaf-mould, six inches from the glass."

Pelargoniums and Carnations.

Entering the range of houses, I noticed a quantity of Pelargoniums making a fine display.

"The best varieties," said Mr Capp, "are Joe, Princess Maude, Resolute, Lady Decies, Marguerite, Malcolm, Magnate, Marie Lemoine, Madame Thibaut, Romeo, Lady of the Lake, Mr. Coombs, Prince Henry, Empress of India, Amethyst, and Candidate."

"Your Malmaison Carnations also appear to be flourishing."

"A few of the varieties are Nell Gwynne, Mrs. Trelawney, Princess of Wales, Maggie Hodgson, and Prime Minister, grown in quantity for cutting. The American varieties are also grown in quantities, the varieties being Mrs. Kennett, Harry Fenn, Lady Bountiful, White and Pink Lawson, Enchantress, Elliott's Queen, Robert Craig, Flamingo, Nelson Fisher, Sir Henry Calcraft, Duchess of Portland, and America. I find that in the cultivation of Carnations it is wise to select the best varieties of the colours which are preferred by the family, and then to grow in large quantities. The best we grow are certainly Lady Bountiful (white), Enchantress, and Mrs. Burnett (pink)."

"Now, as to the Grapes and Peaches?"

"There are four Peach houses, the first containing Royal George; the second Alexander, Noblesse, and Barrington, with Nectarines Stanwick Elruge and Lord Napier. The third has Princess of Wales, and the fourth Nectarines Pineapple and Figs Brown Turkey."

As we looked at a tree of Royal George, covered with fruit from top to bottom, Mr. Capp said,

"We do not force these Peaches, but we take great care of them when we get them, placing on the floor of the house a thick cover-

THE LATE VINERY AT CHARTERS, ASCOT.

Digitized by Google Original from CORNELL UNIVERSITY

ing of wood-wool. On this the fruit falls, and is never injured. The Peaches on this tree run from four to six ounces each. One of the three Vineries is devoted entirely to pot Vines, propagated by us. The variety is Foster's Seedling. The back wall of this house is covered with Plumbago capensis. In the early Vinery the varieties are Black Hamburgh and Foster's Seedling. In the late Vinery there are Gros Colmar, Lady Downe, and Black Alicante."

Stove Plants and Ferns.

"Then there are the plant houses?"

"In the two stoves we have a large quantity of Begonias in variety, with Allamandas on the roof; also Dracænas, Crotons, and Pancratiums in quantity. The Fernery, which has a tiled floor, contains a selection of choice varieties, including Asparagus. In this house, also, are a few Orchids, Dendrobiums in baskets, Cœlogyne cristata, and Oncidiums."

"You devote a great space to vegetables?"

"Yes, as you see; in addition to large breadths of Peas, Asparagus and Beans in the kitchen garden with the fruit, we have another garden where quantities of Potatoes, Celery, Marrows, Beans, Lettuces and Greens are grown. Here, too, are standard fruit trees, Apples, and Plums, while Loganberries are grown on the fences."

Mr. Capp's Career.

"I should like a few details as to your own career, Mr. Capp, which I believe has been very varied."

"I started at Welbeck Abbey, and was next in Worksop Manor Gardens. I was then for two years at Elsham House, Grantham, and thence I proceeded to Plough Hatch, Ashdown Forest, Sussex. My first position as head gardener was at Newport House, Eardisley, where there was a nice range of glass and hardy fruit on a large scale. I was there between five and six years, and was then head gardener for a time at Wexham Park, Slough. After that I became head gardener at Paddockhurst, and, in conjunction with Mr. Milner, remade the gardens. I had charge of the entire staff of men, and got the whole place into order. All the hardy fruit was replanted and root pruned, and the splendid Orchid house was erected among other additions. At the end of four years I went to Caversham Hall, Suffolk, in order to remake the gardens for Mr. H. E. M. Davies. We built new garden walls, and planted a quantity of hardy fruit; the range of houses was also very extensive, and there was a fine collection of foliage plants. My next appointment was at Toddington Manor, where I carried out a series of planting operations, but fruit under glass was the chief feature. As you know already, I have been here between five and six years."

"You have told me about winning the challenge cup at Ascot, but I should like to know more about your showing."

"At Paddockhurst in May, 1896, I was awarded the Royal Horticultural Society's silver Banksian medal for a group of Orchids, and in August of the same year for a group of herbaceous plants; but there was no time for showing. Since I came to Charters, I have been showing a good deal, chiefly hardy fruits, Apples and Pears, and Chrysanthemums. For these my collection of prize cards includes many firsts; and I have taken seconds for Grapes, Tomatoes, and other vegetables. Even more than the prize cards, I value the many presents which kind friends gave Mrs. Capp and myself on the occasion of our silver wedding this year."

"They prove that only goodwill is felt towards you," I replied, as Mr. Capp pointed out some of the tokens of esteem which he received, the most treasured being a beautiful set of silver candlesticks, with an appreciative letter from Mr. Iveson and the Misses Iveson.

ALFRED WILCOX.

THE subject for next week will be Exhibition Dahlias, being an interview with the Amateur Champion Grower, Mr. S. H. Cooper, of the Hamlet, Chirpenham.

Gardening at Belvoir Castle.

"BELVOIR'S lordly terraces" are known by repute throughout the length and breadth of the land. Here are gathered together some of the choicest and most beautiful members of the floral world—collections which, under the fostering care of generations of ducal owners, assisted always by the highest horticultural skill obtainable, have made the famous gardens not only "the Cynosure of neighb'ring eyes," and the favourite pleasure resort of the teeming population of the Midlands, but a place to which admirers of horticultural art in its highest development gravitate. Favoured in position, with ample space to produce the most telling effects, and beautiful country on all sides forming a suitable setting, the various gardens well deserve all the praise that has been lavished upon them.

The Duke's Garden.

The spring gardening at Belvoir Castle has been described so frequently that it is unnecessary to make more than a passing allusion to it here. It became notable under the late Mr. W. Ingram, and the work thus started has since been ably carried on by the present head gardener, Mr. W. H. Divers. But spring gardening is only a small portion of the attractions, which include miles of walks amid varied scenery, well wooded, and pleasure grounds devoted to different subjects or styles. The illustration shows a corner of the Duke's garden, with a background of Conifers and other evergreens, besides deciduous trees. The central design has Palms occupying the middle bed, while smaller beds of flowers surround it, the whole forming an "island" in the long walk. On the outside of this walk are to be seen other beds, which, like those in the centre, are simple in conception, but unite to make a charming and restful scene. The taller plants on the right and left consist of variegated Maize; while the light-coloured edging to the four beds is made up of the silver-variegated Cock's-foot Grass (Dactylis glomerata elegantissima). It will be observed that the grass is kept beautifully neat and smooth.

Another feature of Belvoir is the Duchess' Garden, named after Elizabeth, wife of the fifth Duke of Rutland. This occupies about eight acres, and lies on the side of a hill, in a natural hollow, where, owing to the shelter provided by its situation, and also by a belt of forest trees surrounding it, many shrubs usually regarded as tender are grown.

The gardens of Belvoir illustrate a point often mentioned, but which cannot be too strongly emphasised—that to produce the highest results in gardening, it is not necessary to employ the rarest and most expensive plants, for here one of the chief charms is the simplicity with which all may be raised, and their comparative inexpensiveness.

Fruit Under Glass.

GRAPES.

GRAPE-GROWING has again been a hard, uphill fight with adverse climatic conditions. The summer months have been abnormally dull and sunless, making recourse to artificial heat necessary to an unusual extent. At the time of writing, the weather certainly shows signs of a welcome improvement; we may, therefore, hope that the autumn will make such amends as are now possible for the shortcomings of the summer.

One great danger the grower has to fear in a season like the present is immaturity of wood and buds. Well-ripened buds, fully stored with nutriment for the development of the embryo fruits, are of the first importance in the production of the ensuing year's crop; and, for the attainment of this maturity, the Grape Vine delights in bright sunshine, a clear sky, and a warm circulation of air. As this summer has not been too lavish with these benefits, we must do all in our power to supply the deficiency.

Artificial Heat Necessary.

Early Vineries that are cleared of their crops should be very freely ventilated at all points during fine days, and, in present circumstances, we would also recommend a slight warmth in the pipes. At night, artificial heating is a matter of considerable importance in counteracting the chilly air and mists so prevalent at this time of year. Towards evening the ventilators should be considerably lowered, but not quite closed, either at the top or front. Then, if the fire is roused so as to produce a comfortable heat in the pipes by nine o'clock, to be maintained till morning, a gentle current of warm air will be continually circulating amongst the rods—conditions from which they will receive great benefit. On dull, rainy days, it is specially advisable to keep the fire going, maintaining a temperature not less than sixty-five degrees, and, on the other hand, not much higher than seventy degrees. In aiming at the production of a warm, dry atmosphere, we must avoid the arid conditions arising from excess of artificial heat. It should always be possible to retain the hand upon the pipes without inconvenience or pain.

All sub-lateral growths should be cut clean away in gradual stages, until eventually the straight brown canes which form the main central growths from the spurs are clear of everything except their large and valuable leaves. Every care must be taken that these remain uninjured and healthy until the time for their natural fall.

Avoid too Much Moisture.

The border at this time of year should be allowed to get slightly dry on the surface, but water must on no account be withheld until the roots suffer from drought. When water is necessary, give a sufficient quantity to penetrate the whole bulk of soil on a bright morning under ample ventilation, but recollect that the roots are becoming less active, and, therefore, do not need so much moisture as they did earlier in the season. Too frequent applications at this period will render the border sour, and unhealthy as a rooting medium.

Houses containing hanging Grapes of the later varieties, such as Black Alicante, Gros Colmar, Lady Downe's Seedling, Muscat of Alexandria, etc., will need strict attention as regards heating and ventilation. A warm, dry air is here most essential at all times, and, as the season advances, these conditions will become increasingly difficult of maintenance. Ventilate with a reasonable freedom on sunny days, but close the fronts in good time, before the air gets cold and fog-laden. With reference to top ventilation, we make a point of leaving a slight aperture through the night if the air is relatively clear, but this is always in conjunction with a comfortable artificial heat of about sixty-five degrees. Muscats like a night temperature of seventy degrees.

It is undoubtedly the cold and humid atmosphere of early morning, from two or three a.m. until the sun rises, that often plays such havoc with Grapes in unheated or imperfectly heated houses. Little practical value attaches to the mere lighting of a fire, unless we take pains to ascertain that it is doing its work, and is capable of keeping the pipes warm until the stoker arrives in the morning. Dampness and a stagnant air will cause ripe Grapes to decay wholesale; accordingly, where growing plants are accommodated in the Vinery, take care that they are only watered when necessary, and always early in the forenoon. If water is inadvertently spilled upon the stone floor, especially in dull weather, it should be wiped up at once. Gradually trim off all sub-laterals, as advised for the early houses, and closely examine the bunches periodically, for the purpose of extracting decayed berries with a pair of Grape scissors.

The Garden, 1904

OBITUARY.

MR. WILLIAM CARMICHAEL.

WE regret to record the death of Mr. William Carmichael, for nearly ten years gardener at Sandringham, which took place at 14, Pitt Street, Edinburgh, on Wednesday, the 6th inst. Mr. Carmichael, who had reached the advanced age of eighty-eight, was a native of Comrie, Perthshire, and, after gradually working his way up in the ranks of gardeners, he was eventually appointed gardener to his present Majesty King Edward, then Prince of Wales, at Sandringham, for whom he laid out the grounds there, and in whose service he remained for nearly ten years until his retirement several years ago. Mr. Carmichael was perhaps the last of the men who were under the late Mr. William McNab, of the Edinburgh Botanic Gardens, and at one time occupied the position of foreman there. He afterwards went to Bath, and thence to Drummore, Stirling, where he had charge of both the garden and farm, from where he went to Sandringham. Mr. Carmichael was an able gardener, who cultivated particularly successfully many plants of various kinds. Fruit was one of his favourite departments, and in latter years he devoted much attention to the raising of new Strawberries, some of which have been put into commerce. He is also credited with having been the first to cross Azalea amœna and A. indica, from which cross he raised some good hybrids. Although for a long time in a feeble state of health, Mr. Carmichael retained to the last his interest in horticulture, and only a few years ago exhibited a new Godetia of his own raising at one of the Royal Caledonian Society's shows. His remains were interred in Warriston Cemetery, Edinburgh, on the 9th inst., the funeral being a private one.

plants are merely the old stools from which cuttings have been taken. Instead of being thrown away, as is often done, they are planted in the borders and in sheltered corners, and, beyond thinning them out slightly, very little attention is paid to them. Occasionally they are all

MR. GEORGE CARPENTER.

ruined by frost, but that seldoms happens. They nearly always give us some flowers at a time when flowers are most welcome.

H. C. DAVIDSON.

(To be continued.)

FAMOUS GARDENERS AT HOME.

No. 71.—MR. GEORGE CARPENTER, AT THE GARDENS, WEST HALL, BYFLEET.

LONDON has not yet extended to Byfleet, and, although there are some very modern houses near the railway station, there is nothing suggestive of the proximity of "Town" when you stand on the bridge over the Wey, in the tastefully-arranged gardens of West Hall, the pleasant residence of Mr. F. C. Stoop. These gardens again illustrate in a marked degree the excellent account to which a limited space can be turned by skilful management, reflect great credit on Mr. Carpenter and his staff, and afford encouragement to all amateurs who, like Mr. Stoop, delight in seeing the beauties of Nature made the most of. Mr. Carpenter, in showing me round, emphasised the fact that his employer, who owns the West Hall estate, is exceedingly fond of flowers, and is always willing to sanction any expenditure likely to render the garden more attractive, or more productive. He is also equally ready to concur in any proposals for improvements on the estate, the management of which, as well as that of the garden, largely devolves upon Mr. Carpenter. When we had finished our look round, including an inspection of the glasshouse and the conservatory, I was surprised to learn that less than nine acres are under cultivation for garden purposes. How much pleasure and satisfaction may be obtained from a small acreage may be gathered from my conversation with Mr. Carpenter.

"To begin with, the soil is unusually good," I remarked to my conductor.

"Nearly everything will grow here," said Mr. Carpenter. "The medium is a dark, sandy loam, with a subsoil of gravel, and, though the land lies low, it is easily drained."

"I suppose, however, that there are some things which do especially well?"

"Yes. As you see, there are Rhododendrons everywhere. We have nearly all the new varieties, as well as some of the old. This is their natural soil, and, if we dig and trench the ground well, we never have any trouble in respect to them."

"Which do you consider the best Rhododendrons?"

"The Pink Pearl, John Waterer, Kate Waterer, The Queen, Cynthia, Everestianum, Brayanum, Mrs. Shuttleworth, and Lady C. Mitford. Although the Rhododendrons are in the greatest profusion, there are many kinds of flowering shrubs, notably Deutzias, Spiræas of different varieties, Lilacs, Hydrangea paniculatas, Weigelas, Laburnums, Pyrus japonica, etc., with others useful for cutting."

"You have a fine avenue of Limes at the entrance."

"It is planted with Crocuses each side underneath the Limes. With regard to trees, we have some very fine specimens, including Chestnuts, several Cedars of Lebanon—two particularly big, Cedrus atlantica on the lawn, and Cedrus deodara at the entrance to the kitchen garden. There is a fine old Mulberry of ancient date, and a fine Spanish Chestnut."

"The river Wey, I observe, runs through the estate?"

"It forms the boundary on one side. In summer there is plenty of boating. The navigable part of the old river Wey runs around about half a mile to the east and south of us. Near the rustic bridge there are Water Lilies and the common Yellow Iris, which, in summer, looks very pretty. As you can judge, we pay a good deal of attention to the lawn. The whole of it was taken up last winter, dug, manured underneath, and every weed taken out of the turf."

"When do you begin to cut from your herbaceous border, which leads through the kitchen garden to the flower garden?"

"Very early in the spring, and we continue cutting from this border, which is a hundred and forty yards long, until late in the autumn. We grow nearly everything, beginning with early bulbs. There is a good collection of Delphiniums, Pentstemons, Michaelmas Daisies, perennial Sunflowers, Violas, Pæonies, Saxifrages, early-flowering Chrysanthemums, and, indeed, nearly any hardy flower you could mention."

"Do you go in much for Roses?"

"Largely. Our favourite climbing Roses, which are planted in the house, the archways, and the bower, are as follows:—Bouquet d'Or, Alister Stella Gray, L'Ideale, William Allen Richardson, Climbing Belle Siebrecht (syn. to Mrs. W. J. Grant), Belle Lyonnaise, Devoniensis, Kaiserin Augusta Victoria, Niphetos, Dr. Rouges, Duchess d'Auerstadt, Gloire de Dijon, Madame Berard, Maréchal Niel, Aglaia, Aimée Vibert, Crimson Rambler, Jersey Beauty, Leuchstern, Manda's Triumph, Psyche, Thalia, Felicité, Claire Jacquier, and Carmine Pillar."

"The bower is new, I think?"

"It was very recently planted with Roses and Clematis. We have a border of Roses in the kitchen garden, chiefly Hybrid Perpetuals, which are also grown in beds on the lawn."

"Which varieties do you recommend?"

"We grow mainly dwarf kinds, although we have also a few standards. The following, I find, do best with us:—Duke of Edinburgh, General Jacqueminot, Francois Michelon, Earl of Dufferin, E. Y. Teas, Charles Lefebvre, Caroline Testout (one of the best—a great favourite), Captain Hayward, Abel Carriere, Alfred K. Williams, Baroness Rothschild, Captain Christy, Madame Gabriel Luizet, Louis van Houtte, La France (another favourite), Her Majesty, Mrs. W. J. Grant, Mrs. R. C Sharman Crawford, Exquisite, Mrs. John Laing, Merveille de Lyon, Margaret Dickson, Marie Baumann, Xavier Olibo, and Ulrich Brunner."

"Do you also grow a number of Tea varieties?"

"Of Teas, those which do best are:—Catherine Mermet, Bridesmaid, Beryl, Comtesse de Nadaillac, Corallina, Devoniensis, Francisca Kruger, Madame Cusin, Innocente Pirola, Hon. Edith Gifford, Homére (there is a fine specimen on the house), Rubens, Miss Ethel Brownlow, Maman Cochet and White Maman Cochet (both great favourites), Madame Lambard, The Bride, and Souvenir d'un Ami."

"Further," continued Mr. Carpenter, "we grow some of the Austrian Roses, both the yellow and copper varieties. They have a bed to themselves, and look beautiful when they are in bloom. Last year we bedded underneath them some Iceland Poppies (yellow and copper), the same colour as the Roses, and the combination was much admired. We have a number of

WEST HALL (SOUTH FRONT) BYFLEET.

China Roses, which also have a bed to themselves. They are nearly always in flower through the summer. The old Monthly Rose is first favourite. Banksian Roses are grown on the house."

"I admire your Yew hedge, which divides the kitchen garden from the house and the pleasure garden."

"It used to measure six feet through the bottom, but now it is only a foot thick, answering the same purpose as before. Considerable pains have been taken with it. Six years ago it was cut hard back, and I think with success. As to the kitchen garden, we grow most of the Potatoes and Greens on the farm, with Oats and Mangolds in alternate years; and, in the garden proper, chiefly Peas, Celery, Broad and Dwarf Beans, Onions, Beets, Parsnips, and Seakale, so far as vegetables are concerned. We have to keep up a great supply all the year, including two to three tons of Potatoes."

"Do you use sticks or hurdles for the Peas?"

"Sticks; but then we cut them from our woods. Iron hurdles are very useful, and save a lot of time. For our earliest supply of Peas, we sow a few in pots, and grow them and fruit them in pots. Others we grow in pots, and plant out when hardened off; that brings them in a little earlier than those sown outside."

"What varieties do you grow in your Pear archway?"

"All the best early and late varieties, such as Bon Chretien, Beurré Diel, Doyenne du Comice, Louise Bonne of Jersey, Pitmaston Duchesse, Beurré Hardy, Jargonelle, Souvenir de Congres, and Clapp's Favourite, and others. Underneath the Pears are Tulips and St. Brigid Anemones."

"The Apple archway is on the same principle?"

"Yes. It is planted with Bismarck, Blenheim Orange, Lord Suffield, Peasgood's Nonsuch, King of the Pippins, Lane's Prince Albert, Wellington, Ribston Pippin, Cox's Orange Pippin, White Juneating, Frogmore Prolific, Keswick Codling, Brownlees' Russet, Beauty of Kent, Lord Burley, Duchess of Oldenburgh, King of Tompkins County, Scarlet Nonpareil, Cellini, Margil, and Worcester Pearmain."

"Do all these flourish?"

"Fairly well, but some better than others. Bismarck, Lord Suffield, Lane's Prince Albert, and Frogmore Prolific are particularly heavy croppers. We have other varieties of Apples in the orchards. One of the orchards consists entirely of young trees just coming into bearing, comprising all the standard varieties. Last year we had a very good crop, according to the season.

"Your wall fruit appears to be a feature?"

"It is, quite. Thus, on the south wall are Peaches of the following varieties:—Alexander, Early Alfred, Hale's Early, Barrington, Royal George, Dr. Hogg, and Walburton Admirable; Nectarines: Lord Napier, Early Rivers, Hardwicke Seedling, Humboldt, Violette Hative, and Elruge; Apricots: Moor Park, Powell's Late, and Dr. Alsac."

"And the west wall?"

"Chiefly Plums, including Jefferson's, Pond's Seedling, The Czar, Kirke's, Braby's Gage, Denniston's Superb Gage, Transparent Gage, Purple Gage, Green Gage, and Coe's Golden Drop. On the north wall are Victoria Plums and Morello Cherries. On the east wall, Pears of the same varieties as on the archway are grown. The walls being very old, Wallflowers flourish on the top of them. I put in two packets of seeds last year. Before we finish with the kitchen garden, I may say that we have a quantity of Asparagus and Globe Artichokes. We also sow Rhubarb seed every year."

"What kinds?"

"Royal Albert and Victoria. When the Rhubarb has been growing for three years, I take up a row for forcing, and put it in the Mushroom house to force; then, after we have had one crop, I throw the roots away."

"I suppose you did not have a good fruit crop last year?"

"No; it was almost a failure, owing to the May frost. The trees until that time were a lovely sight, and full of promise. The fruit on the arches was not so much affected; but, while the Pears were nearly all cut off, the Apples escaped."

"Now, about the houses."

"The Peach house is half planted with Peaches, and half with Nectarines. They are also planted with early and late varieties, so as to keep up the supply as long as possible. We start the house early in February, and gather in May and June, from the earliest varieties, such as Lord Napier and Early Rivers, of Nectarines, and Hale's Early, of Peaches. There are much earlier Peaches, but I do not consider that any which come before Hale's have much flavour. Prince of Wales is our last to be gathered under glass. Then we commence on the outside wall. Altogether, our season of Peaches and Nectarines runs from the end of May to the end of September."

"You have one very old Vine?"

"Yes, it is quite fifty years old. We get one hundred and twenty to one hundred and thirty bunches from it every year. It is a Black Hamburgh, commonly known as Frankenthal. The Muscat house contains only Alexandras and Cannon Hall. The latter is a beautiful Grape, of fine flavour, but it wants a house to itself, and requires a lot of doing. In the early Vinery are Madresfield Court, Black Hamburgh, Foster's Seedling, and Buckland Sweetwater. We grow Asparagus plumosus on the back wall of this house. In the late Vinery are Black Alicantes, Gros Colmars, Lady Downe's Seedling, and Madresfield Court."

"How many houses are there altogether?"

"About ten, besides the pits. In the stove house are Crotons, Dracænas, Anthuricums, Palms, etc., for table and house decoration. In the Orchid house are Cattleyas, Oncidiums, and Cœlogynes, etc. In the greenhouse we have Arum Lilies and winter-flowering Carnations, among other things; the Lapageria rosea and alba on the roof, also Luculia gratissima—a lovely pink flower and sweetly scented. Another house contains some Orchids—Odontoglossums—Cyclamens, and winter-flowering Geraniums. In the summer it is full of Tomatoes. My favourite is All-the-Year-Round for winter. In the middle of the range are Cucumbers and Melons; and in yet another house are several hanging Orchids—Dendrobium Wardianum, etc., Melons are grown all through the summer in this range."

"When were the houses put up?"

"The whole of the glass, except the conservatory and frames, was erected in 1891 by Messrs. T. Burton and Son, of Bexley Heath, and has given every satisfaction. You may like to know that in the pits we have Pines, Cyclamens, Violets, Lettuces, Endive for bleaching, and Strawberries."

"You have not mentioned Chrysanthemums, though you have some fine flowers in the conservatory."

"They are two seedlings—Crimson Market, and a good late bronze. The other contents of the conservatory, which is lighted by electricity, include a good many varieties of Chrysanthemums, such as King of the Plains, Framfield Pink, Mrs. Filkins, Niveus, and other late varieties; Palms, such as Kentias Belmoreana, Fosteriana, etc.; Latania borbonica, Cocos plumosus, Phœnix dactylifera, Seaforthia elegans, good specimens of Dicksonia australis, Euphorbia jacquinæflora, Poinsettia, Cobæa scandens on the roof, with Abutilon, Roses of varieties, Plumbago capensis and alba, Arum Lilies, Begonia Gloire de Lorraine (in baskets and in pots), Begonia Gloire de Sceaux, etc. All plants that are in flower are taken to the conservatory and rearranged every Friday. Also plants for the house, including Orchids, have to take their turn, when in flower, and when plants for vases, etc., are wanted. We force a lot of plants for the house and conservatory, such as Lilac, Viburnum, Roses, Rhododendron, Prunus, Hydrangeas, Deutzias, Azalea, and Spiræa, etc."

"Was the bothy more recently built than the houses?"

"It was built a year ago, and four young men live in it. There is one good mess room, and two bed rooms which can be divided with curtains."

"When did you come here, Mr. Carpenter?"

"Seven years ago. I was apprenticed in 1875 at Dangstein, near Petersfield, Hants, under the late Mr. Vair, head gardener to Lady Dorothy Nevill, for two years. Then I went to Lord Leconfield's, at Petworth, under the late Mr. George Bruce, and afterwards, for a short time, to Veitch's, of Chelsea. Later, I went as second gardener to Ewell Castle; and, before I took my first place as head gardener, to Burhill, Walton-on-Thames, where I had charge of the kitchen garden."

"Has your experience as head gardener been varied?"

"I was first for eight years at Rydens, Walton-on-Thames; secondly, at Broad Oak, Byfleet, for seven years; and then I came to West Hall."

"You have, I believe, done a lot of showing?"

"I used to show a good deal. In fact, from 1884 to the spring of 1895 I exhibited regularly, summer and winter, taking over two hundred first prizes."

"What did you show?"

"Principally Chrysanthemums. I have shown at the Walton, Chertsey, Shepperton, Esher, Kingston, Weybridge, and Wimbledon shows repeatedly, also at the Crystal Palace on several occasions, and at the show of the National Chrysanthemum Society, at the Royal Aquarium, several times. I may mention that we grow about a thousand Chrysanthemums in different ways. Some are grown for large flowers, others for bush plants, which are so very useful for conservatory and house work."

"Do you not show now?"

"Only at Byfleet, and at the monthly meetings of the Woking Cottage Gardeners' Association. At the latter show, the gardening staff here are encouraged to exhibit what they like every month. This is done in order to induce them to take an interest in their work. There is always something to learn from the papers which are read. I think it much more useful, from a horticultural point of view, for the learning of young men, and older ones, too, to go and state each other's experience, and spend the evening together, than to attend a big show, say, once a year."

Alfred Wilcox.

LETTERS FROM A LADY GARDENER.

XXVII.—GESNERACEOUS PLANTS.

Dear Kate,—One of the first things we do, in the greenhouse, after the New Year begins, is to start some Gloxinias, Tydæas, Achimenes, etc. These are all sorts of first-cousins to the Gesneras, which you know have most beautiful, velvet-like leaves, veined with crimson, and spikes of scarlet, yellow, or creamy-white flowers, so that they all belong to the great Gesnera family, of which some of the members (Gloxinias, for instance) are amongst the most strikingly beautiful flowers we have. Besides these four well-known groups, there are many others, such as the Streptocarpus, Saintpaulia ionantha (a lovely little flower, just like a blue enamel tie-pin), and the richly fragrant Dolichodeira tubiflora, which

I hope you don't let the sweep make off with the soot from your chimneys; it is far too valuable, and legally belongs to the person who paid for the coal, of which it is a product. The man may ask for an extra sixpence in lieu of the soot, but it is worth much more than that in the garden.

Your friend,

I.L.R.

A NEGLECTED RACE OF GREENHOUSE PLANTS.

(Continued from Page 297.)

CUPHEAS are very pretty, low-growing plants of an under-shrubby nature, with small, tube-shaped blossoms; they bear a considerable resemblance to the Libonias, which will be treated of presently, and are chiefly natives of Mexico. They are of very easy culture, free in growth, and very floriferous, and, being of a dwarf and bushy character, may be employed for bedding out during the summer, as well as for growing in pots They are increased by means of either cuttings or seeds, the former rooting freely in sandy soil, with a gentle warmth, in the spring, and the latter producing nice flowering plants the same season, if sown early, and in a moderate warmth.

Several species are known, but as some need a higher temperature than that of a greenhouse, and yet are no more ornamental than the others, they are scarcely worth troubling with. Two of the best kinds for greenhouse culture or bedding are C. eminens, with red and yellow blossoms, and C. platycentra, scarlet and white; C. cinnabarina (crimson) is also a desirable kind.

The Cytisus (or Genista, as it is very frequently called) is one of the most charming and easily-grown, as well as fragrant, of all the numerous subjects included in this class, and should find a place in every greenhouse, while it is also a capital subject for a window. The plants grow freely in either loam or peat, and succeed under ordinary cool greenhouse treatment, but a good, loamy compost, of a not too heavy character, with a slight addition of leaf-mould and sand, usually affords the best results, the growth being more floriferous than when grown in peat, while smaller pots, in proportion to the size of the plants, are necessary.

Fine and fragrant as small examples of this plant, in 5-in. or 6-in. pots, are, however, they cannot compare with larger specimens of several years' growth, if healthy and well-flowered, some five or six feet high, and trained in either the pyramid or bush form. Such specimens are extremely ornamental, especially in a large conservatory; and when the flowers are over, and all danger of frost is past, they may be removed to the open air for the summer. They flower naturally during the spring, earlier or later, according to circumstances, but if the wood is well-ripened the plants may be had in bloom very early in the year, by means of a little forcing, especially in country places, where the atmosphere is pure and clear.

Cuttings of the young shoots, taken, if possible, with a "heel" apiece, will usually root without much trouble in sandy soil in the spring, if kept moderately warm, close, and shaded. Those who grow the plants in large numbers, however, usually employ more ripened cuttings, taking them from plants that have stood outside during the summer; these are inserted closely and firmly in 5-in. or 6-in. pots, and kept close in a cool frame or pit till callused, when they are plunged in a gentle hot-bed for a few weeks, and potted off singly when rooted. Any repotting should be done in the spring, after flowering, draining the pots moderately, and pressing the soil quite firmly in the pots. Water should be given rather freely, as a rule, especially during the season of growth and blooming, but keep rather drier in winter; some weak liquid manure is very beneficial when the plants are coming into flower.

The oldest and best-known species is C. racemosus, but there is a decidedly finer form, or variety, of this, known as C. r. superbus. Another fine kind, flowering rather later, is C. Attleanus, and C. filipes is a fine white-flowered species, with a slender, drooping habit of growth; this makes a nice standard plant when grafted on a suitable stock. R.

(To be continued.)

The Gardeners' Bothy at West Hall, Byfleet.

BEGIN preparing ground intended for lawns. It is necessary that the seed-beds should be firm, and free from weeds and stones.

PREPARATIONS FOR A BEAUTIFUL SUMMER GARDEN.

(Continued from Page 294.)

WELL-GROWN annuals are at one and the same time beautiful and useful in the summer garden. Those who have only grown annuals in thickly-sown patches, and left the seedlings more or less unthinned, to grow up weakly, drawn-up plants, half-choking one another, have no idea of the real capacity for beauty and decorative effect of annuals grown under favourable conditions.

As half-hardy and tender annuals need to be sown under glass, and succeed all the better for a lengthy period of growth before flowering, we will consider them before the hardy types, which may be sown where they are to flower.

The treatment advised for the hardy and half-hardy perennials that flower the first summer (see previous articles) is the same as that which these half-hardy and tender annuals require. I would add one word of caution, however, concerning early sowing where there is insufficient accommodation for the growing seedlings. The seeds may be reared in a gentle heat, but afterwards they require protection for some weeks, and if this cannot be secured, it is far better to put off sowing such subjects until March, at any rate, is past. Then, with the accommodation of a couple of frames, many plants may be reared. If, however, there is a greenhouse or conservatory where the seedlings may find room, this early sowing is greatly to be recommended.

Under this useful category of plants—half-hardy annuals—come those effective and long-flowering "bedding" annuals: Ageratums, Lobelia, Phlox Drummondi, Petunias, Stocks, and Asters, and others which are equally well-known. But my thought to-day was not so much to speak of these familiar subjects, as to draw attention to some of the less well-known varieties that are of easy culture, and far too little known, even among those who have the beauty of their gardens much at heart. I do not think the majority of people sufficiently realise that it is by growing some of the less well-known plants that they may achieve a really interesting garden. We often lose sight of the "interest" in the garden, and fail to recognise it as the important factor it is, only second to the "beauty" of the garden. Does one garden owner out of twenty know by name, much less by sight, that charming half-hardy annual—Cosmos? It is one of the finest and best types of autumn-blooming annuals that can be grown. C. bipinnatus hybridus gives an effective range of colour, from pure white to crimson and purple. The individual flowers are large, and therefore of great decorative value, and the plant attains a height of four feet.

Every garden, whatever its size may be, requires a proportion of those graceful and delicate types of plants that shall be used to enhance the character and boldness of denser and sturdier classes of plants. Such a subject may be found in the slender-stemmed, fairy-looking Alonsoa Warscewiczii, and when I add that this plant yields masses of glowing scarlet blossoms, its value in the summer border will be better realised. To add the names of one or two more plants of this indispensable character—*i.e.*, lightness and daintiness of effect, I would mention the invaluable Calliopsis. All the varieties of this plant to be found in seed catalogues of reliable growers are good; some are bi-colour, some self-coloured. The plants bloom for months, and are good for cutting. A year or two ago I saw a large border of Geraniums interplanted with this Calliopsis. The addition of this taller and more graceful plant had the effect of banishing the monotonous flatness that is the evil of many of the familiar bedding schemes. It is true the combination left much to be desired as to colour—the two did not blend happily—still, the idea was good and worth remembering, and showed what, with a happier ground colour, this annual is capable of. Again,

FAMOUS GARDENS :: IN WAR TIME. ::

HOW THEY ARE BEING MAINTAINED WITH REDUCED STAFFS.

IX.—Interview with Mr. G. Carpenter, West Hall, Byfleet, Surrey.

THE surroundings of West Hall, Byfleet, possess great natural charm, and this has been carefully conserved and developed, thanks to the enthusiasm of the owner, Mr. F. C. Stoop, and the skill of the head gardener, Mr. George Carpenter, who has been in charge for the last twenty-one years. The river Wey forms the boundary of one part of the estate, and streams give opportunity for the naturalising of many fine plants of an aquatic and semi-aquatic character. There are woods of great beauty; and fringing the pleasure grounds are choice specimen trees. Even with the flower borders in the kitchen garden an effort is made to preserve the keynote of naturalness. These kitchen gardens are famous for their fruit, which is grown in all forms; while Mr. Carpenter has, in the past, been very successful with flowers, and has raised several new varieties of Chrysanthemums and Perpetual-flowering Carnations. As an exhibitor he has carried off high honours. The home farm is also under his care, and on the occasion of my visit, towards the end of July, I was shown a fine herd of Jersey cows, together with a number of pigs, poultry, etc.

"To keep these gardens at their normal state of excellence must require a large staff," I suggested.

"In ordinary times the staff consisted of nineteen men and a boy," responded Mr. Carpenter.

GARDENING AS A HOLIDAY TASK.

"And now?" I asked.

"The number fluctuates a lot now," was the answer. "We have three discharged soldiers, who were here before the war; several old hands over military age; and two young ladies, Miss Cora Stoop, the fourth daughter of my employer, and her friend, Miss Money, the youngest daughter of our late rector. I will show you presently some of the work these ladies do. Then I have been able to get down help from London—firemen and others who come here during their holidays. They live in the bothy, and receive the usual wages and overtime, and declare they are greatly benefitted by the change from a town life. Of course, they are not skilled gardeners, but we have plenty of digging, weeding, and other work, which they do efficiently."

(Later on, during our walk round, I spoke to one of the firemen, who assured me he thoroughly enjoyed the work, and felt all the better for it—in fact, it was a real holiday for him.)

"So that nothing has been seriously neglected, I suppose?"

"We have done the best we could; but some things have had to go, for we are giving most attention to the kitchen garden. For instance, we used to have five men and a boy in the houses, and now we have only two men—both wounded soldiers—and two boys, who, however, do their work well. My employer, too, is very kind, and makes every allowance. In addition to the gardens, we have taken in a large area of ground on the estate, and here we are growing Potatoes and other vegetables."

A HINT ON SEED POTATOES.

Making our way through the kitchen garden, I watched the lifting of a fine, clean bed of Potatoes. The variety was Sharpe's Express, and I counted as many as sixteen and eighteen good, eating-size tubers to a plant.

"We have seven acres planted with Potatoes in a field in the village," said Mr. Carpenter, as we passed outside; "and many more in the field we are now entering. They are all main-crops here."

"What are your leading varieties?"

"Factor and Up-to-Date do best with us. King Edward does not seem to suit our soil, and the tubers are not so good for table. We have also a bed of Arran Chief, which looks as though it will be very satisfactory. All these rows have been sprayed."

"Some rows of Factor do not seem so vigorous as others," I remarked.

"That," replied my guide, "shows the difference between fresh seed and that saved from last year. The fresh seed has certainly a much better appearance. I am also making an experiment with 'Rito,' and have dressed some rows with it, while others, for comparison, have had none," and Mr. Carpenter indicated the different rows.

"The rows that have had 'Rito' look more promising," I observed.

"They certainly show up better," was the answer. "It is perhaps too early to decide definitely, but so far it promises to give good results. I like it for plants, but this is the first time I have tried it for Potatoes."

SUNFLOWERS FOR POULTRY.

"You appear to be growing Sunflowers on a large scale," I said, pointing to a number of rows.

"As there was likely to be a scarcity of poultry food I had this quarter of an acre sowed with Sunflowers. It took a pound of seed, and the plants are a foot apart, with two feet between the rows. They have had no further attention paid them, but are doing well."

"And what is this Dwarf Bean which you are growing in quantity?"

"That is the Dutch Bean which the Royal Horticultural Society sent out. I had a gallon of seed, and sowed the whole of this plot, which is a hundred and fifty yards long by seven yards wide. The variety is evidently a good cropper. We shall gather the pods when they ripen in the autumn, and dry the Beans for winter use."

After stopping to inspect another piece of ground of one and a half acres, planted with all kinds of winter greens, we turned back towards the kitchen garden proper. Here the first thing I noticed was an enclosed space planted with fruit trees, with winter greens beneath them.

"This enclosure," explained Mr. Carpenter, "is forty rods in extent, and was formerly part of the chicken run. But Miss Cora Stoop, Miss Kathleen Stoop, and Miss Money dug it up, and have put in the plants. They had no help whatever."

MR. GEORGE CARPENTER AND HIS ASSISTANTS.

The ladies are Miss Cora Stoop (left), and Miss Money (right). Mr. Carpenter is in the middle, with a discharged soldier on each side of him; in the back row is a holiday helper.

"The trees are bearing well," I remarked.

"They always do well here," came the answer. "Bramley's Seedling is our favourite, but there are good specimens of Allington Pippin, Lady Henniker, and others, and you see they are all heavily laden with fruit."

Standing on ashes close by, I noticed some rows of Chrysanthemums in pots, and inquired how many were now grown.

"There are five hundred seedling Japanese and Singles of my own raising. We used to have a thousand large Japanese varieties, but we have reduced them by half. The men attend to the watering of them, but I do all the disbudding myself."

ARCHES OF FRUIT TREES.

Coming to the Pear arch in the kitchen garden—an especially attractive feature—I asked Mr. Carpenter how the trees bore. His reply was:

"They do better here than elsewhere, perhaps because they are sheltered from strong winds. We have all the leading varieties."

Digitized by Google Original from CORNELL UNIVERSITY

"And your Strawberries?" I asked, noticing an extensive bed of them.

"They have had wonderfully good crops, and this is the first year we have not had to net them. There were very few birds about, and I think many of them must have been killed last winter."

"What is the length of these rows of Peas?" I asked, as we passed along.

"These are each ninety-five feet long. Hercules is one variety—a splendid cropper; and another is Quite Content, which is a good Pea, but wants time. For late Peas we start early, and sow two rows; then, when they show above ground, we sow two more rows; and repeat this again. We thus get a good succession. There is a bed of early Peas farther round, however, which has not been cleared, as we are short of labour."

"When did you sow these rows of Cabbages?"

"That was done on July 15th. I like always to make a sowing about that time. Between them you can see rows of Endive just coming through. They will be taken up and put in frames later. We use a great many salad plants, and have frames specially for them, so that we can cut every day in the year."

"What are the varieties of Cabbage you have sown for spring?"

"There are three—Earliest and Best, Model, and Ellam's Early. The Cabbages on the other side, where we have started cutting, are Enfield Market, a very fine variety."

"Your Apple arch looks almost, if not quite, as good as the Pear arch," I remarked, as we came to it.

"It is very successful," was the answer. "We find Cox's Orange Pippin does well, but Peasgood's Nonsuch is not so good as a cordon."

Walking on, we passed in turn thriving rows of Cauliflowers and Parsnips; Cardoons and Celery in trenches; and a bed of Seakale. Touching this, Mr. Carpenter said:

"We always dig up three rows, and force them; and leave one row, which is earthed up and blanched on the ground."

"You have also long rows of Runner Beans which are going to give you good crops."

"The variety is Scarlet Emperor," was the reply; "and there is also a row of Butter Beans. You will notice that we grow almost every vegetable, including Chicory, Kohl Rabi, Salsafy, and Scorzonera. Our Celeriac is also good."

"And the Gages on the wall are something to be proud of," I added.

"They are of several varieties, and all are heavy croppers," said Mr. Carpenter.

It was when we passed the border of Roses in the kitchen garden that the first signs of the lack of labour were manifest, mildew having taken hold of many of the plants.

"In the ordinary way this would not be," said Mr. Carpenter; "but we have not been able to spare time for spraying. There are all the leading varieties here, but one of the best, both as bush and standard, is Ophelia."

A FAVOURITE WALK.

Leading from the kitchen garden is a walk one hundred and thirty-five yards long, with a wide herbaceous border, backed by old Pears, over which Roses and other plants climb.

"This is a favourite walk of Mr. Stoop's," said my guide, "and he particularly likes to see the plants climbing over the Pears. He will not have it altered, although the Pears are worn out and useless. He is an admirer of everything that looks natural. At the same time, he makes every allowance for the shortage of labour, and does not complain of the untidy state the border is in through lack of attention. By the way, nine out of ten of the Roses were killed to the ground last winter, and we have not had time to replace them."

And now we found ourselves outside the winter garden, a handsome extension to the house made four years ago, and built of carved stone and solid English oak.

"There is little to be seen inside to-day," said Mr. Carpenter, "for I have been cyaniding the place to get rid of insect pests. This is the best method of cleaning a house, and, if done with proper precautions, it is quite safe. But it should not be done in a house with a temperature above sixty degrees. It does no harm to plants, except perhaps Begonia Rex and some of the Maidenhairs, and we always remove these first."

"Do you keep the winter garden constantly filled?" I asked.

"There is a constant change of plants wanted for it, and it is kept bright summer and winter. Most of the plants in the houses are brought here in turn."

The main front of the mansion, which we now approached, looks south, and is faced by a lawn two acres in extent, backed by numerous clumps of Rhododendrons, with tall trees behind.

HOW THE LAWN IS MAINTAINED.

"You manage to keep this lawn in fair condition," I observed, as we crossed it.

"For over nine months there has been no male labour on it," replied Mr. Carpenter. "All the work has been done by the two young ladies, who use a small mower drawn by a pony. The idea is to save the lawn from going altogether to ruin. Under normal conditions you would not find a weed, for we kept two men for the lawns. One of them had been on it for fifteen years."

"And do the ladies also attend to the flower beds?" I asked.

"Yes," was the answer; "not only here, but in the Dutch garden, which we will visit next. There is a nice combination in these beds beneath the windows—Viola Maggie Mott and Geranium Golden Harry Hieover, which blends nicely with the Clematis on the house."

THE DUTCH GARDEN.

Arrived at the Dutch garden, we saw the two ladies busily weeding and trimming up the beds, which consist of different varieties of Geraniums, such as Flower of Spring, West Brighton Gem, Surprise, Maxime Kovalesky, Madame Crousse, and Souvenir de Charles Turner. These are combined with Heliotropes and with Violas of different colours. In the centre is a Water Lily pond, with many choice varieties, and dotted about are a number of trained trees.

"Do the ladies attend to the topiary work?" I inquired.

"No; I trim all these myself. Some were badly injured by the severe weather last winter, and I fear it will take years for them to recover, if they ever do. We shall probably have to replace them."

"And the fine Yew hedges—do you attend to these?"

"Yes, I always take them in hand. This was originally six feet thick, sloping to the base, but I reduced it as you see. It is a curious thing that if you cut a Yew back close to the main stem it makes good growth, but if it is only half cut it often dies right back."

WOODLAND AND STREAM.

Next we made our way across the lawn towards the boathouse, which abuts directly on the part of the River Wey known as Navigation—a straight section running nearly parallel with the old river, which, however, has so many twists and turns hereabouts that it is not navigable. Here is a wealth of Ferns—all British—and though overgrown and wanting thinning, still very effective. A walk through the trees—where here and there an opening gives a splendid view across the lawns, taking in perhaps a corner of the house, or a fine Plane, smooth and straight of trunk for a height of thirty-five to forty feet, or a splendidly feathered Cedar—and we pass through the children's playground to the banks of a little brook, where Senecios japonicus and Clivorum, Impatiens biflora (with seedpods that seem imbued with life, for they jump when held by the fingers), Saxifraga pellata (with leaves of noble proportions), and many another fine plant is naturalised. Then, crossing the brook by the rustic bridge, we see more British Ferns, together with lovely Irises of the Kæmpferi group, calling loudly for attention, but unlikely to get it while conditions are as at present.

SOME FINE TREES.

Retracing our steps, Mr. Carpenter showed me a wonderful old Plane, with a girth of twenty-two feet at a height of four feet from the ground.

"This," he said, "was a favourite with the late Richard Dean, who used to say it was one of the finest specimens he had ever seen. Many other tree experts have also greatly admired it. It has had to be placed in the 'tree doctor's' hands, but now it is patched up there is no reason why it should not last for many more years."

There was another fine tree, a Chestnut, which we passed on our way back towards the houses. But it is not for its girth, but for the straightness of its trunk, that it calls for notice. From the ground up to a height of about forty feet no sign of a knot is to be seen, but above it branches gracefully, and it is altogether a magnificent specimen. At one side of the lawn, too, is a grand avenue of Cedrus deodara, but this, unfortunately, was badly injured by the frost last winter, and some of the trees are shorn of many branches.

"You seem to have a considerable extent of glass," I remarked, as we neared the houses; "how much is there altogether?"

"There are two hundred and fifty yards of glasshouses, and the same of frames," was the answer.

A NEW PERPETUAL CARNATION.

The first we entered is devoted to Perpetual Carnations, and here I saw a seedling of Mr. Carpenter's raising, which was exhibited last year at the Royal Horticultural Hall, and won much praise. It has been named Dr. Ward, and is a rosy cerise in colour, with stout calyx that never splits, a delicate fragrance, and very upright growth. In answer to my question, Mr. Carpenter said:

"No; it is not yet on the market. I am raising a good stock of it before parting with it; but it will no doubt find its way into commerce before very long."

The Orchid house was next visited, a batch of Cœlogyne cristata, Chatsworth variety, being a notable feature. From this we passed into a stove house, forty-five feet long, where Stephanotis trained the full length made a glorious show.

"This house furnishes another instance of the value of cyaniding," said Mr. Carpenter. "Stephanotis is always a prey to mealy bug, and last autumn the plant was smothered with the pest; but it has all been cleared out, and the plant is now perfectly clean. The Crotons, Anthuriums, Begonia Rex, Ferns—in fact, all the plants—are used in turn to decorate the winter garden."

Other houses that we passed through in quick succession have, among other subjects, good batches of winter-flowering Begonias, Calanthe Veitchii, Celosias, Coleus, Gloxinias, Maidenhair Ferns, the Sensitive Plant, and Fuchsias; and Mr. Carpenter said:

"All these have been potted up and looked after by the two men and two boys I told you of. They have done their work well. True, one of the men was with me before the war, and came back when he was discharged from the Army after being badly wounded."

THE PEACH HOUSES.

The Peach house we now entered is one of the largest in the gardens, and is a splendid structure, with six large trees on each side. The varieties grown are Princess of Wales, Dymond, Kestrel, Barrington, Duke of York, and Peregrine Peaches, and Humboldt, Stanwick Elruge, Pine Apple, and Lord Napier Nectarines. These give a long fruiting season.

"There are from a hundred to a hundred and fifty fruits on each," said Mr. Carpenter. "Kestrel is one of the newer varieties. It is of rather weak growth, but the fruit is of the highest quality. In another house we have

Digitized by Google Original from CORNELL UNIVERSITY

Lord Napier and Pine Apple Nectarines, which were replanted last year, the border being made up. They are giving very big crops."

I was able to confirm Mr. Carpenter's words when we entered the house to which he referred; and was equally impressed by the appearance of the trees in the next two houses. In one the Peaches were Peregrine—which the men had just finished thinning and tying in—Barrington, and Bellegarde; in the other, Libra and Dagmar.

THE VINERIES.

There are four houses devoted to Vines, the first we visited being a lean-to, filled with a Black Hamburgh, carrying as many as a hundred and ninety-five good bunches, colouring nicely.

"This," said my guide, "is an old Vine in an old house, but it still does well."

In the next house, Muscat of Alexandria was showing enormous crops, while the Guava is trained on the walls. Of Prince of Wales, which is growing in the next house, Mr. Carpenter said:

"This is a very good Grape, but not everyone succeeds with it. It is all right if you grow on the young canes every year, but otherwise it is 'miffy.'"

In the late house are Alicante, Madresfield Court, Gros Colmar, Gros Maroc, and Appley Towers, and these look fully as promising as the others.

Emerging once more into the open, a number of frames, conveniently situated near the potting sheds, were inspected. There are, it may be mentioned, two potting sheds, one artificially warmed for winter, the other for use in summer. Several lights had Pineapples in various stages of development; in others were good batches of Eucharis. Others had Cyclamen, just starting into growth; while a further lot had some three hundred plants of Perpetual Carnations, ready to be moved into the greenhouse.

THE BEST TOMATOES.

The Tomato house into which we next passed had on one side Ailsa Craig, and on the other Moneymaker.

"Both of these are excellent varieties," said Mr. Carpenter; "but it would be difficult to say which is the better; indeed, there is little to choose between them. They both, as you see, have enormous trusses of shapely fruits, and both are short-jointed and vigorous in growth, but it is difficult to see much difference between them."

"Are these the only varieties you grow?" I asked, as we came away.

"No; in this house we are now entering, in addition to more of Moneymaker, there are Kondine Red and Bide's Recruit—both new varieties."

"And what is your opinion of them?"

"Kondine Red is one of the best on the market. Look at these trusses, and see how large the fruits are, and what a number there are on a truss. They are, too, of splendid flavour, while the plant is of vigorous habit and growth. Bide's Recruit does not make so much growth, but the trusses are good, and I should say it is the best variety to grow where space is limited."

A miscellaneous collection of plants in the same house—Cannas of choice sorts, Kalosanthes, Kochias, and others—also came in for inspection, and the tour of the houses was completed.

There is not space enough to descant on the many beauties of the woods outside the gardens, through which Mr. Carpenter led me on my way back to the station, and which recalled to mind the Choric Song in "The Lotus Eaters."

One interesting fact that I learned was that Mr. Stoop's two sons and his son-in-law are officers on active service, while he himself is a member of the same company of National Volunteers as Mr. Carpenter.

W. J. CHITTENDEN.

Next week: Mrs. Humphrey Ward's garden at Aldbury, Tring, Herts.

THE COOL GREENHOUSE AND FRAME.

By William F. Rowles, Author of "The Food Garden"; "The Vegetable Plot Productive"; "The Greenhouse Ever Gay"; "The Garden Under Glass"; "Greenhouses: How to Make and Manage Them"; "How to Make and Manage a Garden"; "Garden Difficulties"; and "Garden Operations."

PROPAGATING BEDDING PLANTS.

OUR cool and practical greenhouse, as I have previously pointed out on several occasions, will be used as well for the benefit of the flower garden and the vegetable garden as for the provision of greenhouse plants proper.

We now arrive at the period when we must consider the propagation of summer-flowering tender plants, with a view to providing sufficient stock for propagating next spring. Many of the choice subjects are best propagated wholly at the present time, while with others of an easy-rooting and quick-growing character it will be sufficient if we propagate a small stock to carry us through the winter, and then propagate more

A PRETTY CORNER IN THE CONSERVATORY.

largely from them, up to the limit of our requirements in the early spring. Subjects which fall within this category are Heliotropes, Ageratums, Lobelias, Iresines, etc. I much prefer to root some cuttings now than to rely on potting or boxing up old plants from the flower garden.

Whether pots or boxes be used for propagating these bedding plants will depend on the number required. I prefer boxes myself, and I think that in the majority of cases it will be found that these are more convenient, and are open to less errors in management. Of course, we have several weeks in front of us in which to propagate these plants, so we need not unduly denude the flower beds of growth, for naturally we want them to look gay until the cold, frosty weather arrives. If we start propagating now we can be sure of getting a sufficient stock together, and the rooting takes place at a time when we can expect good weather.

The cuttings are prepared in the usual way, by cutting them straight across below a joint, and removing the leaves from that part of the cutting which, when inserted, will be beneath the surface. Each cutting should be inserted to about one-third of its depth, the hole being made with a dibber blunted at the end. Care should be taken that the cutting rests solidly on the bottom of the hole made, and that the soil is pressed back firmly against the stem. After insertion, the cuttings should be well watered, and the boxes or pots be placed in the greenhouse or frame.

A good, sandy soil, mixed with leaf-mould and free from manure of any kind, is the best material for rooting. It will only be necessary to drain the boxes with a layer of leaves. Usually the space of three inches apart will suit these cuttings.

POTTING STANDARD PLANTS.

Most of the cuttings intended for the formation of standard plants, which were inserted at the end of July, will by now have rooted, and may be potted singly into 3-in. pots. If smaller pots are used I find the soil dries out quickly, and as they can be easily overlooked it often happens that they suffer from neglect.

We have, of course, put in far more cuttings than we shall need; and I advise that we also pot up far more young plants. This gives us the power of selection. Get all the young cuttings out, and then select those which have robust tops and the best roots. The remaining inferior ones may be destroyed, unless we have a friend who would be glad of them. Water the plants well, and stand them in a light place. Of course, where we intend to form standard plants no point-pinching will take place, for the leading growth must grow forward, and all side growths be removed.

The Heliotrope is an easy example. It often happens that this will develop a flower head at the point. This must be removed, and the uppermost growth be allowed to take the lead. The side growths are pinched out as soon as they can be taken between the thumb and finger. This removal of the side growths is assiduously followed until the desired height of clear stem has been obtained. Whatever subject is trained as a standard, the same course is pursued.

POTTING CARNATIONS.

The Malmaison and Border Carnations which were layered early in July should now be ready for potting up. There is no hurry if this be not done until September, but if they have rooted well it will be quite safe to move them singly into 3-in. pots. Lift one or two typical plants carefully with a small hand-fork. If they have a nice mass of roots to which the sandy soil clings well, then we may safely sever them from the parent plant and pot them up. In doing this we must be very careful not to get the varieties mixed. If the label has been put in at the ball of the plant which was layered, it will be an easy matter to trace each layer to its source before removing it.

At this stage a fairly open, sandy soil will suit the Carnations. All the material in the compost should be passed through a half-inch sieve. For preference it should consist of good yellow loam, flaky leaf-mould, Mushroom manure, sharp (but not too coarse) sand, and a sprinkling of a good fertiliser. Crushed brick, passed through a quarter-inch sieve, will form a valuable addition to the soil. We should crock the pots carefully, making sure that they are quite dry, and protect the drainage with a few leaves. Each plant should be so potted that no part of its stem which has been cut during the process of layering is above the soil. Water the plants well, and place them pot-thick in a cold frame, where they may remain until a further potting takes place.

OTHER PLANTS TO BE POTTED.

There are some other plants which might receive a further shift during this month. We may, for instance, move Primula obconica to

Digitized by Google Original from CORNELL UNIVERSITY

The Gardens of the Postmaster-General, at Fox Warren, Cobham.

INTERVIEW WITH

MR. J. CARPENTER.

ONE of the loveliest seats in Surrey bears the quaint name of Fox Warren. In former days, more than half a century ago, foxes were reared on the estate, which was purchased by the father of the present Postmaster-General, the Right Hon. Sydney Buxton. Not only was the handsome mansion erected by the late Mr. Charles Buxton, but he also transformed the whole of the grounds. The glory of the position is fully realised by a survey of the surroundings from the terrace, which faces south. Not a house is to be seen, but there is a splendid expanse of country, embracing hill and valley, woods and open spaces. On the occasion of my visit a few weeks ago, the autumn tints were at their best, and in discussing the features of the gardens with Mr. J. Carpenter, the head gardener, who conducted me round, I enquired about the creepers on the house.

"They are chiefly," he replied, "Clematis in variety, Roses (Marechal Niel, and Banksian varieties), Wistaria sinensis, Pyracantha Lælandii, Cratægus, and Virginia Creeper."

The Terrace Bedding.

"And the spring bedding on the terrace?"

"Two of the six beds are filled with Myosotis and white Tulips; two with yellow Wallflowers and white Arabis; and two with dark Wallflowers and Myosotis. In summer there are two with scarlet Begonias, Dracæna indivisa, and a groundwork of white Lobelias; two with white Geraniums and pale blue Violas; and two with scarlet Geraniums and a groundwork of yellow Violas. Below the terrace is a fine bed of Montbretias and Hyacinthus candicans, and, as you see, there are some nice plants of Pampas Grass still in flower."

Features of The Dell.

From the terrace we proceeded across the west front, with its spacious tennis lawn, to "the Knoll," which is just outside the gardens, forming a part of the estate of about five hundred acres. The great feature is the Scottish Pines. The balminess of the air may be judged by the fact that Agapanthus, planted out, was in flower in November, and needs only the protection of a little Bracken Fern. Within the gardens, and facing north, is a lovely spot called "the Dell," and here, observing the thriving appearance of the Rhododendrons, I asked,

"Is there peat in the soil?"

"A little, but we put more into it. As to the other plants which flourish here, there are some good clumps of Boccónia cordata. Earlier in the year, the Crimson Rambler Roses on the arches were very ornamental, and we get masses of flowers from the Tropæolum speciosum, which trails over the shrubs. In the borders, Foxgloves, Cannas, Spiræas in variety, Yuccas in variety, Tritomas, Tree Pæonies in variety, Azalea mollis, Eulalias in clumps, Bamboos, Gunnera manicata, and Tree Lupins are conspicuous. There are grass paths right through 'the Dell,' and there is an edging of Violas and Polyanthus, while Daffodils of many varieties are planted for spring flowering. In the border above are Darwin Tulips planted in clumps."

"Have you a continuous supply of water?"

"Water is laid on from the river, and pumped up to the tower, so that we always have plenty."

"You have more fine clumps of Pampas Grass near the entrance to the mansion?"

"Yes, and in the wide border near the house

MR. J. CARPENTER.

Asters, Montbretias, Delphiniums, Hemerocallis aurantiaca, Fuchsias, and Dahlias flourish; also the old Clove Carnations in clumps. Everywhere you will notice that we plant in clumps, and not in lines; also that we have exceptionally wide gravel paths."

Flower Combinations on the West Front.

"Then, there are the beds on the west front?"

"Three of these consisted of Roses—Gruss an Teplitz in the centre, and Princesse de Sagan outside—edged with pale blue Violas. Between the Roses we had Gladiolus Brenchleyensis. The four beds between the Rose beds contained, this year, Geraniums Surprise, with a groundwork of Blue King Violas; and in the four outside beds were Paul Crampel Geraniums and single blue Lobelias."

"How are these spring-bedded?"

"Two with Myosotis and white Tulips, two with yellow Wallflowers, and the outside four with white Arabis and Cottage Maid Tulips. In the side borders under the house are Roses in variety, including Climbing Caroline Testout. Here, Choisya ternata, now in flower, is quite hardy."

"Amongst the notable specimen trees, you include the Irish Yews on the west lawn?"

"Yes, but there is no more notable tree than the Stone Pine on the north front. I believe that, except in Kew, there is not a finer specimen in the country. The Scottish Pine, with spreading branches, is also remarkable."

"Have you any idea of its age?"

"It must be between three and four hundred years old. Other trees worth mentioning are the Chestnuts, Cupressus, Abies, and Cedrus deodara."

Roses and Gladiolus.

Between the kitchen garden and the pleasure grounds is a green walk where a vast quantity of bulbs are naturalised, but the kitchen garden itself is a striking combination of the useful and ornamental.

"One of the features here," said Mr. Carpenter, "is a wide border on which we mix Roses with Gladiolus, for cutting. The Roses are chiefly Mrs. John Laing, Caroline Testout, and General Jacqueminot; the Gladiolus, Warneri, Lemoine, and Nanceianus. The latter harmonise with the Roses, and do not take away the light."

Tulips and Iris.

"Any other specialities in flowers would be interesting."

"Tulips are largely planted. Here, for instance, are four rows, two of Gesneriana, one of Darwin White Queen, and one of fulgens, the whole edged with Aubrietias. Facing these Tulips are four rows of Spanish Iris of different colours, Chrysolora, King of the Blues, British Queen, and A. Von Humboldt. These, with the Tulips, are used for cutting. At the back of the Iris, for summer decoration, are crimson Antirrhinums, and in the front two rows of a special pink variety, the edging being of Mrs. Sinkins Pinks. Stocks follow the Tulips, Beauty of Nice (blush), and a scarlet variety."

"You have a border of Asters?"

"This border is all singles for cutting, with Aquilegias in front in spring. On the opposite border are Delphiniums in variety, planted in clumps."

"Which of the standard Roses in the centre walk do you specially recommend?"

"The principal I use are Mrs. John Laing, Lady Helen Stewart, and Mrs. Paul. On the arches are Dorothy Perkins, Crimson Rambler, Philadelphia Rambler, and Blush Rambler, while the varieties on poles at the back of the herbaceous border are Hiawatha, Dorothy Perkins, Carmine Pillar, Northern Star, and Clio. All these are used for cutting, and so are the early Tulips in the bed close by. The varieties are Red Bedder, Rose Gris de Lin, Elegans, and Summer Beauty."

"I should like the names of the principal clumps in the herbaceous border."

"Helianthus, Anemone japonica, early-flowering Chrysanthemums, Delphiniums, Oriental Poppies, Phlox in variety, Hollyhocks, and

Digitized by Google Original from CORNELL UNIVERSITY

Gypsophila paniculata, with Polyanthus and Violas in front. We fill in with annuals. Another border is entirely devoted to Michaelmas Daisies."

The Cultivation of Michaelmas Daisies.

"What is your system with them?"

"I take them up in December, divide them, and plant on fresh ground. This is done every year, with the result that we get much better flowers than otherwise could be possible. They are planted in rows, according to height, and include Top Sawyer (six feet), John Henshaw (five feet), M. Rayner (four feet), William Marshall and Cordifolia Diana (three feet), cordifolius elegans (two feet six inches), Delight (two feet), and amellus bessarabicus (one foot). The edging consists of Campanula persicifolia, Calceolarias amplexicaulis, and Desgrange Chrysanthemums."

"How do you grow your Sweet Peas?"

"In a trench in clumps of one variety, planted at the back of the flower borders, and a couple of yards apart. They are so much easier to cut when they are put close together. All the Sweet Peas are spring-sown. If I sowed any in autumn, the slugs would have them. In front is a row of Dahlias, and then early-flowering Chrysanthemums. The Dahlias are chiefly Cactus, and amongst the Chrysanthemums are Market White, Harvest Home, Soleil d'Octobre, and the Masse family. Opposite these, Iceland Poppies are grown for cutting. Now you know about most of the flowers outside, except that under the Apple plantations on the east side are thousands of Narcissus just beginning to show. The varieties include Barri conspicuus, Horsfieldii, Poeticus ornatus, Empress, and Sir Watkin. We cover them with rotten leaves, which act as manure."

Hardy Fruit.

"With regard to fruit, the absence of walls does not appear to make any difference to their growth."

"I do not think that there is any appreciable difference either to fruit or vegetables. The garden is wired in, to protect us from rabbits, but we are troubled by slugs in the spring when the seedlings are coming up. The best remedy for them is lime and soot. The principal Apples are King of Pippins, Cox's Orange, and Bismarck. Facing these are a number of Pears, which have just been put out. The Plums are all standards, and bear well. We root-prune now, and thin if they are growing too strong. Jefferson and Victoria give us the best crops, and Denniston's Superb is a good variety."

"Do you get good crops in your fruit cage?"

"Excellent, but we should not get any if we did not wire the side, and use netting over the top. We do not suffer from the Black Currant mite. Raspberries (Superlative) are grown, and several varieties of Strawberries. We keep the plants of the latter for three years, planting a new bed every year."

A Hint to Asparagus Growers.

"Vegetables appear to be a great feature with you."

"I am very fond of vegetable cultivation, and the soil is suitable. It is rather heavy, with clay in places. But we work in a lot of road grit, leaves, mortar-rubble, and lime, which improves it. In cultivating Asparagus, I use a great deal of salt, which checks the weeds and acts as manure. We begin to cut early in May, but do not go on after June 20th. It weakens the plants if the season is prolonged unduly. In vegetable cultivation, I aim at getting as many crops as possible in one year. Thus, in a border where I had early Potatoes, with early Cauliflowers planted in every other row, the Potato haulm being mown off from the Cauliflower plants where it had grown over, I afterwards put small Cabbages."

"What variety was the Potato used?"

"Veitch's Ash-leaved Kidney; another variety I like very much is Sir John Llewelyn, but we rely for our main crop upon Up-to-Date. These, however, are grown in a field outside, together with mixed crops of Artichokes, Beet, Turnips, Parsnips, and Chicory."

Treatment of the Land.

"You grow your spring Cabbages in the kitchen garden?"

"Yes, Ellam's Early. Before these Cabbages we had a crop of Onions—Veitch's Brown Globe and Ailsa Craig. With regard to the treatment of the land, I rake off the weeds, and give a good dressing of soot, before I plant the Cabbages. The point is that I do not dig the ground, because I like it as firm as possible for greenstuff."

"Have you many varieties of Brussels Sprouts?"

"Market Favourite and Paragon, of which we grow about a thousand plants. Then we have Veitch's New Sprouting Kale, Scotch Kale, and Cottage Kale, which is very hardy, and stands the frost when other varieties get cut off. The varieties of Broccoli are Model, Late Queen, and Brimstone. These followed Celery last year, and I only just levelled the ground before planting them. Now we come to the Pea quarter."

A Prolonged Pea Season.

"Tell me about your system."

"I put them in trenches, not so deep as Celery, and I find this much better for watering. As soon as I see one sowing above ground, I make another, and thus keep up a succession. Between the Peas I have Spinach and Radishes. We started picking on June 4th, and went on to the middle of October. The varieties on this ground include Gradus, Duke of Albany, Autocrat, and Ne Plus Ultra. We also, on another border outside the houses, grow early Peas—American Wonder and William I. These are sown in pots, and planted out after the frost has gone. Near the Pea quarters is a bed of Red Globe Turnip Greens, which were preceded by Early London Cauliflowers."

How to Grow Seakale.

"When did you plant your Seakale thongs?"

"In April. When I planted them, I cut them aslant at the bottom, and straight across at the top, putting them in a foot apart each way. They throw up several shoots, and as soon as these get long, we disbud, and leave only one crown. This is the way to get strong crowns. Runner Beans are grown in trenches; the varieties are Hackwood Park Prolific and Sutton's Best of All, which succeeded winter greens, the latter following Strawberries."

"You have a very fine show of Celery."

"There are seven double rows. We sow in spring, and prick the seedlings into the Violet frames about four inches apart, and get very fine sticks of Celery about the middle of September. The varieties are Major Clarke and Early Rose, and we grow Endive and Lettuce on the ridges. Winter greens will follow Celery."

Winter-flowering Geraniums.

Then, noticing the borders outside the houses, in which annuals, such as Mallows, Cornflowers, Coreopsis, and Larkspur, are grown, we entered the flowering house.

"Here," said Mr. Carpenter, "are a few Primula obconica grown out in cold frames during the summer, and some pots of Mignonette sown in August and thinned out. The Nerines have just finished flowering, but the winter-flowering Geraniums are a feature. We decorate tables with them."

"When do you put the cuttings in?"

"During April. They are grown in cold frames in the summer, and put in their flowering pots in July. I work them in here with the Chrysanthemums."

FOX WARREN, THE SURREY RESIDENCE OF THE POSTMASTER-GENERAL.

The Best Japanese Chrysanthemums.

"How many Chrysanthemums do you grow?"

"A hundred and fifty each of Japanese and bush. The best of the Japanese are, I think, Mrs. W. Knox, Mrs. A. T. Miller, Mrs. Greenfield, Mrs. J. Dunn (which, it may interest you to know, was raised by my brother, Mr. G. Carpenter, at West Hall, Byfleet), Madame Oberthur, F. S. Vallis, Mrs. T. Dalton, Madame Paola Radaelli (not easy to grow), W. A. Etherington, Lady Talbot, Walter Jinks, and Mrs. Norman Davis. Behind the Chrysanthemums are some Arum Lilies, which flower right through the winter."

"Your Peach house seems full of a nice collection of bush Chrysanthemums."

"There are enough here to keep us going until February. The four best varieties are Source d'Or, Lizzie Adcock, Edith Pagram, and Niveus. The Peaches in this house, which is an early one, are Hale's Early, Stirling Castle, Royal George, and Cardinal Nectarine. In the late Peach house are Violette Hative and

Digitized by Google Original from CORNELL UNIVERSITY

Princess of Wales, and here you see there are a lot more late bush Chrysanthemums."

"Have you many varieties in your early Vinery?"

"Black Hamburgh and Muscat of Alexandria; and in the late Vinery the same varieties, with Alicante in addition. The bunches of fruit of the last are particularly satisfactory."

The Value of Begonias.

"So are the Begonias in your stove. How do you manage to get such good flowers?"

"I take cuttings about April, pot them on, and put in 'thirty-twos' the beginning of July. These are the flowering pots. Then we feed them with manure-water and fertiliser. One of the Begonias is Mrs. Leopold de Rothschild, a variety of Gloire de Lorraine which I think is the best of the section. We use Begonias for groups indoors, for vases and for baskets. In the baskets all along the stove there are two or three plants, which we tie down in order to spread them out. Other features of the stove and the adjoining cool house, are Poinsettias (just showing their bracts), Asparagus in variety, Ferns in variety, Orchids (notably a batch of fifty Phaius, which throw up long spikes of flower in February and March), and Pancratium fragrans, which flower in August and September, and perfume the house."

"What about Melons and Cucumbers?"

"We grow Cucumbers in the Melon house, Improved Telegraph and Sutton's Matchless. In this house we get four crops in one year—two of Cucumbers and two of Melons. The varieties of the latter are Sutton's A1 and Hero of Lockinge."

"What else do you grow in the frames?"

"Cyclamen, for one thing. I grow the plants for a year only, sowing about August, and potting on. Malmaison Carnations are grown here, the only variety being Princess of Wales. The Fuchsias are Scarcity, Charming, Mrs. Marshall, and Display, and you might mention the Kalosanthes coccinea, which flower in July. These are grown in cold frames, and get a much better colour in this way than if grown indoors. I start them five in a 'sixty' pot, and they are afterwards moved on to the flowering pots. Clivias are also grown in large and small pots."

Mr. Carpenter's Experience.

"How long have you been head gardener at Fox Warren, Mr. Carpenter?"

"I came here nearly a year ago. My experience extends over about thirty years. My first start, as a garden boy, was at Deerleap, Rowlands Castle, Hants, and at the end of three years I went to Idsworth Park gardens in the same county. Then for two years I was in the kitchen garden, and for two years in the houses. My first appointment as foreman in the houses was at Brableigh, Esher, and there I had a good deal of experience in growing Chrysanthemums for exhibition, under Mr. R. Cawte. I next went as general foreman at Langley Park gardens, Kent and at the end of two years was appointed head gardener at Highfield, Eastbourne. There I stayed for five years, and gained a great many prizes at shows, including three of the medals of the National Chrysanthemum Society for trained specimens. In these I used to take a great pride, often growing them nearly five feet across, with as many as two hundred blooms on them. Returning to Surrey, I became head gardener at Fairmile Court, where I remained for twelve years, taking many prizes, including eleven firsts at one show, and a silver cup for a group of miscellaneous plants arranged for effect."

ALFRED WILCOX.

ROSE ARCHWAYS IN THE KITCHEN GARDEN AT FOX WARREN.

The subject of the next interview will be The Gardens of Lord Lytton, at Knebworth House, Hertfordshire.

A Neglected Race of Plants.

ACROPHYLLUM VENOSUM.

THIS evergreen cool greenhouse plant, from Australia, is a very pretty subject, with neat spikes of Spiræa-like flowers; but its culture is not so simple as that of many others in this class, as it has a bad habit of ceasing to grow suddenly, while in a young state, this being caused by the young feeding fibres dying off or shrivelling up. This failing has been attributed to the lack of a sufficient supply of water, for this Acrophyllum carries a large mass of foliage, and requires to be kept more evenly moist at the roots than most others of its class, and should have water rather before than after the soil becomes a little dry. It also cannot endure as much of the direct rays of the sun and light as most similar subjects, and must be rather heavily shaded during the summer, and not have quite so much light as other things, even in the winter and spring. Nothing but the finest fibrous peat, broken up into a rather coarse condition, with some sand, must be used for its culture, and this must be made quite firm in the pots, by means of the potting-stick.

Propagation.

This may be effected by means of either cuttings or seed. In the first case the cuttings will usually be found in the right condition towards the end of the summer, say, in August, and should consist of nice sideshoots, each with a slight heel of the older wood, three or four inches long. Put them in 4-in. or 5-in. pots, not too closely, using a mixture of fine peat and sand in equal parts, with free drainage, and keep them in a minimum temperature of about fifty degrees, for if kept too cold they are liable to decay. When rooted, in the spring, they should be potted off in small sizes and grown on in the usual way, moving them on again into 4-in or 5-in. pots, and if not pinched back too closely, they may bloom during the succeeding summer, or otherwise the next. It is important to keep the strongest shoots well stopped back, however, as they will form rather straggling, untidy plants, and will not bloom as regularly as they might do.

The seed must be sown in the autumn, as soon as ripe, placing it in 5-in. or 6-in. pots of sandy peat, keeping it also in a temperature of fifty degrees minimum through the winter. In the spring they may be pricked off at about two inches apart, and grown on until they become strong enough for single pots. Then pot them off singly, and grow on as usual. This Acrophyllum makes a fine specimen if it can be kept growing, and is very little liable to the attacks of any insects.

The Adenandras.

These are very attractive cool greenhouse plants, of a vigorous nature, and not nearly so difficult of management as the last. In fact, they are among the easiest to grow of all this class of plants They are propagated by means of cuttings, which should be taken directly the plants have done flowering, and, after trimming, be placed about an inch apart in pots of very sandy peat surfaced with pure silver sand. Keep them in a temperature of forty-five to fifty degrees during the autumn and winter, and pot them off singly in the spring, using 4-in. pots, and a light compost of sandy peat. When ready, or about Midsummer, pot them on into pots about three inches larger, using the same soil, and grow them on steadily through the winter, keeping them near the glass, and in a moderate temperature—not too cold. These plants may be grown in light, fibrous loam, leaf-soil, and sand, but they do better in peat, growing faster and blooming more freely.

The next spring they will probably bloom on almost every shoot, and the flowers will expand in April or May, when the plants may be removed from where they have been growing to quite a cool house, or conservatory. After blooming, cut back the shoots to about half-way between their points and where they were cut back before, but not more; keep them rather warm and close, and syringe them liberally overhead on fine afternoons. When well in growth again, they may be moved on into larger pots, if desired, but they will bloom well if kept in much smaller pots than would be suitable for many things.

About the end of July they may be turned out of doors for a month, to ripen the wood and induce plenty of bloom. There are two principal varieties—A. fragrans, which is very sweet-scented, and A. speciosa. AN OLD HAND.

REMOVE all decayed leaves or stalks from the flower beds to the rubbish heap, or, otherwise, fork them into the soil to form manure.

Digitized by Google Original from CORNELL UNIVERSITY

increased in energy up to August, and accomplished 65 per cent. of its increase in the latter half season.

4. The annual increment in evergreens is spread more equally over the months than that of deciduous trees. Several species of the latter grew more than 50 per cent. in a single month. Some of the results are shown in the table, which gives only those species in which the results are fully reliable. Experiments on many other species have been commenced with the view of ascertaining their characteristics, and whether a general law of distinction between deciduous and evergreen trees can be made out.

Monthly Percentage of Increase of Girth in different Species of Trees, in Edinburgh Botanic Garden or Craigiehall, based on Three Years' Measurements.

III. "On the Size and Number of Wood Vessels in relation to the amount of Wood Development." By Mr. Philip Sewell.

IV. "Report on the Progress of Vegetation at the Royal Botanic Gardens, Edinburgh." By W. R. Lindsay, Curator.

The weather during March was rough, with much snow, wind, and frequent frosts. Vegetation having been forced on by the unusual mildness of the preceding month, suffered a severe check, and made little progress till near the end of the month. Compared with last year, the season is still considerably in advance. The thermometer was at or below the freezing point on eighteen nights, collectively 100° of frost were registered for the month as against 134° for the corresponding month last year.

The lowest readings of the thermometer were, on the 12th, 24°; 13th, 18°; 14th, 24°; 15th, 23°; 21st, 24°.

The highest morning readings were, on the 2d, 42°; 3d, 44°; 7th, 35°; 27th, 39°; 31st, 39°.

The lowest day temperatures was 29°, which occurred on the 11th, and the highest 52° on the 30th.

Flowers of Rhododendron præcox, R. Nobleanum, and R. atrovirens were much injured by frost on the 9th, Roses, which had started into growth, had their young leaves slightly browned; no other injury was observed. Snow fell more or less from the 10th till the 22d, which helped to protect spring flowering plants. Thorns, Poplar, and Lilac are well advanced in leaf. Willows, Alder, Elms, Pyrus japonica, Ribes sanguineum and Forsythia viridissima are flowering profusely. Magnolias and Prunus triloba are well set with flower-buds. Spring-flowering bulbous plants are vigorous and flowering well, although cold drying winds and absence of anything like genial rains is beginning to tell on them.

On the rock garden a large number of plants are now in flower. Sixty-five species came into bloom during March, exclusive of those which opened in the previous month, many of which are still flowering. Among the most interesting which opened in March were the following, viz.:—Corydalis angustifolia, Primula denticulata, Erica carnea, Chionodoxa Luciliæ, Saxifraga sancta, S. oppositifolia var. aretioides, S. Burseriana var. Boydii, Puschkinia scilloides, Polygala Chamæbuxus and purpurea, Pachystema Canbyi, Draba Mawei, Anemone Pulsatilla, &c.

Of the forty spring flowering plants whose dates of flowering are annually recorded to the Society the following fifteen came into flower, viz.:—

Scilla bifolia... ...	Mar. 2	Erythronium Dens-canis	Mar. 19
Mandragora officinalis	,, 2	Hyoscyamus scopolia...	,, 23
Scilla bifolia alba ...	,, 4	Narcissus Pseudo-Narcissus	,, 23
Sisyrinchium grandiflorum	,, 4	Ribes sanguineum ...	,, 23
Orobus vernus	,, 6	Corydalis solida ...	,, 26
Sisyrinchium grandiflorum album	,, 8	Draba aizoides... ...	,, 28
Narcissus pumilus ...	,, 14	Adonis vernalis ...	,, 29
Aubrietia grandiflora...	,, 19		

V. "Report on the Temperatures and Vegetation at the Glasgow Botanic Garden." By Mr. B. Bullen, Curator: March, 1887.—During the month the night temperature has fallen below the freezing point twenty times, and several times very near it. The total frost registered this month is 117°. During the corresponding month last year the total was 139°. We have experienced a low temperature this month; but last year the temperature for the corresponding period was unusually so. The lowest reading was 16° during the night of the 12th. The lowest day reading was 32° on the 11th, when considerable snow fell. Rain and snowstorms have been light as compared with most other districts. Although an average number of fine days are recorded, outdoor gardening work has been retarded by the frequent frosts, &c. The same may be said as regards vegetation generally, for little progress has been made. Many plants, so much in advance of the season last month, have suffered slightly.

VI. Miscellaneous:—Mr. Lindsay exhibited plants in flower of Primula obtusifolia var. Gammieana and P. glabra, raised from seeds presented to the garden by Dr. King, of Calcutta, in January last. The former has large flowers, dark purple in colour, and is a great acquisition to this fine family; the latter has small heads of flower, somewhat like a miniature P. capitata. Also two plants of Primula Reidi, figured in the *Gardeners' Chronicle*, November 27, 1886, p. 693, raised from seeds presented by Miss Reid, in October, 1885; P. denticulata erosoides, P. Olgæ, P. viscosa, seedling varieties, having large, well-coloured flowers.

VARIORUM.

Science and Art.—Practice is often spoken of as if it were altogether distinct from science, and inconsistent with it. We hear science and practice spoken of as if in opposition, and sometimes as if they were mutually distrustful. I will not deny that strange contrasts of the practical and the scientific may be found among us, but these contrasts are constantly becoming more rare, and it is an excellent influence of scientific societies that they tend to cultivate the scientific mind and to maintain it in the practical life. For what practice may be depends, in all respects, much more on the person engaged on it than on its own subject matter. . . . It may be a mere useful art practised by one who has neither love for nor knowledge of any science, or to the man of scientific mind it may be a thoroughly scientific study as well as an applied science. . . . Practice is full of opportunities for science. Reflections on any day's work in practice may convince us that we have been using a good deal of knowledge or belief which we cannot explain by its relation with other knowledge. *Sir James Paget.*

Sub-tropical Plants in Small Gardens.—These, of course, are named as best sites, but the owner of a small village garden, who—as a matter of course—has no choice of sites, need not despair. If he only has shelter, he may, if so inclined, have a first-rate sub-tropical bed. Say, for instance, he has a large circular bed, and wishes it planted effectively after the sub-tropical fashion; here is the arrangement. In the middle plant a large clump of the hardy Bamboo (Bambusa metake), or else of New Zealand Flax (Phormium tenax); then three plants, equal in size, of seedling Acacia lophantha; and next six plants of Grevillea robusta; the outer row of all being twelve plants of variegated Abutilon: the edging to be the hardy variegated Plantain Lily (Funkia ovata variegata). All these plants can be bought at the price usually paid for common Pelagoniums, and are, therefore, within the reach of all. The bed can be filled out either with flowering or foliage plants; considering the position, we should advise the former, the kinds to be either Pelagoniums or Fuchsias, or both in mixture. Should foliage plants be preferred, variegated Thyme, Golden Feather Pyrethrum, or any of the mossy selection of Sedums would be appropriate. *Cassell's Popular Gardening.*

Obituary.

Richard Carr.—We regret to announce the death, under very painful circumstances, of Mr. Richard Carr, Head Gardener to the Duke of Portland, Welbeck Abbey. His death was due to an inadvertence in stepping from a railway carriage whilst in motion, at Retford Junction, on returning from a journey to London, on Wednesday, the 13th inst. He fell between the footboard and the platform, and was carried a distance of more than 40 yards, receiving internal injuries, to which he succumbed about three hours' afterwards. Mr. Carr made many changes and alterations in the gardens at Welbeck, which are several hundred acres in extent, the kitchen garden alone being about 36 acres. He put this department into thorough working order, the walls being planted with the choicest sorts of fruit trees for the consumption of one of the largest establishments in England, giving the greatest satisfaction to his employer. The planting and laying down of this large extent of ground, which some forty years ago was covered with bricks, stone, and mortar heaps, and the *débris* from the continued building work that had been carried on, was executed by him. Some short time since Mr. Carr was presented with a valuable gold watch by the Duke of Portland as a recognition of valuable services rendered. He was one of the most intelligent of gardeners, and enjoyed the confidence of his employer. He was interred on Saturday last at Cuckney, many of his gardening friends being present at the ceremony. The deceased, who was fifty-seven years of age, leaves a widow and eight children,

THE WEATHER.

MEAN TEMPERATURE OBSERVED AT CHISWICK DURING THE WEEK ENDING APRIL 30. (AVERAGE OF THIRTY-THREE YEARS.)

April 24	49°.5	April 28	50°.1
,, 25	49°.6	,, 29	50°.4
,, 26	49°.7	,, 30	50°.7
,, 27	49°.8	Mean for the week ...	50°.0

THE PAST WEEK.

The following summary record of the weather for the week ending April 18, is furnished from the Meteorological Office:—

"The *weather* has continued fine and dry in all parts of the kingdom. The nights were generally very cold, while the days were bright, and on some occasions rather warmer than they have been of late.

"The *temperature* has remained below the mean in all districts, the deficit ranging from 2° to 4° in Ireland and Scotland, to 5° over the northern parts of England, and to 6° or 7° in the other English districts. The highest of the maxima, which were recorded either on the 12th, 17th, or 18th, varied from 58° in 'Scotland, N.,' to 66° in the 'Midland Counties' and 'England, S.,' and to 67° in 'Scotland, E.' The lowest of the minima, which were registered on irregular dates, were unusually low for the time of year. In the 'Midland Counties' (at Cirencester) the thermometer fell to 20°, in 'England, S.W.' (at Llandovery) to 21°, in 'England, S.' to 22°, and in 'Ireland, S.' and 'England, E.' to 23°; in Scotland and the north of Ireland they were a few degrees higher, ranging from 24° to 29°, while in the 'Channel Islands' the lowest reading was 34°.

"The *rainfall* has been scarcely appreciable in any part of the kingdom. Over central and south

CARR Martha.

Personal Estate £17.

4 May. Administration of the Personal Estate of Martha Carr late of Side Beet Rishton in the County of **Lancaster** Widow who died 20 December 1885 at Side Beet was granted at **Lancaster** to James Tattersall of 44 Carlisle - street Lower Audley Blackburn in the said County Pointsman the Son and one of the Next of Kin.

CARR Mary.

Personal Estate £85.

4 February. The Will of Mary Carr late of 35 West-Percy-street North Shields in the County of **Northumberland** Spinster who died 30 December 1886 at 35 West-Percy-street was proved at **Newcastle - upon - Tyne** by Caroline Worswick of 35 West-Percy-street Widow and Frank Rennie of 24 Beverley-terrace Cullercoates in the said County Esquire M.D. the Executors.

CARR Mary.

Personal Estate £139 16s. 8d.

13 September. Administration of the Personal Estate of Mary Carr (Wife of Oliver Carr) late of Settle in the County of **York** who died 29 December 1868 at Settle was granted at **Wakefield** to the said Oliver Carr of Settle Labourer.

CARR Mary.

Personal Estate £911 9s. 9d.

18 October. The Will with a Codicil of Mary Carr late of Richmond in the County of **York** Widow who died 30 September 1887 at Richmond was proved at the **Principal Registry** by Thomas Wilde of Richmond Accountant and George Carr of 109 Ebury-street in the County of Middlesex Cabinet Maker the Son the Executors.

CARR Mary Ann.

Personal Estate £105.

14 March. Administration of the Personal Estate of Mary Ann Carr late of 57 Wentworth - street Spitalfields in the County of **Middlesex** Widow who died 14 January 1887 at 57 Wentworth-street was granted at the **Principal Registry** under the usual Limitations to Henry Beech of 3 Mylne - street Myddleton - square in the said County Mercantile Clerk the Guardian of Mary Ann Carr Spinster a Minor the Daughter and only Next of Kin.

CARR Richard.

Personal Estate £1,425 14s. 4d.

18 May. The Will of Richard Carr late of Welbeck in the County of **Nottingham** Gardener who died 13 April 1887 at West Retford in the said County was proved at **Nottingham** by John Carr of the Town and County of the Town of Berwick - upon - Tweed Innkeeper the Brother and Robert Tait of 43 Corporation-street in the City ot Manchester Seed Merchant the Executors.

CARR Robert.

Personal Estate £2,392 2s. in the United Kingdom.

1 March. The Will of Robert Carr late of Upper-Pitt - street Liverpool in the County of **Lancaster** Master Mariner who died 27 December 1886 at Upper-Pitt-street domiciled in England was proved at **Liverpool** by Maxwell Smith of Hartfell House Moffat in the County of Dumfries in North Britain Indigo Planter one of the Executors.

Mr Carr

THE GARDENS OF GOG MAGOG HILLS, CAMBRIDGE.

IT was in the teeth of a blizzard that I drove up the highest hill in Cambridgeshire, for the purpose of visiting the most historic gardens in the county. A combination of snow and north wind cannot be called favourable conditions, but the cold on the summit was less piercing than in the plains below, and I was able to get glimpses of the fair domains which in recent years have passed into the ownership of Mr. H. S. Gray. Both Mr. Gray and his wife take the keenest interest in their gardens, which, quite apart from past associations, have many attractions. They are in charge of Mr. W. H. Carr, who lost no time in showing me the more notable features, and the covering of snow in no wise prevented me from realising the beauty of the situation, the delightful surroundings, as well as the careful attention which is evidently given to arrangement and cultivation. The north side of the mansion, which dates from the seventeenth century, was first approached. Here there is a charming Rose border.

"That is to say," explained Mr. Carr, "the border chiefly consists of Roses. They are planted separately, and trained, as you can see, on wires, four feet from the ground, in order to form a hedge."

Flowers for a North Aspect.

"I suppose that here, too, are the principal flower beds?"

"Yes, there are sixteen beds of varying shapes and sizes, none of them raised, but all on a level with the house. For spring blooms, several of the larger beds are planted with red and yellow Wallflowers only; others with Myosotis and pink Tulips; and a number with Polyanthus, mixed with rose-coloured Hyacinths. Mrs. Gray likes all shades of rose and pink."

"Then, you get these shades into your summer bedding?"

"As much as possible. Thus, the corner beds contain Ivy-leaf Geranium Madame Crousse. These are dotted with Kochia trichophylla, which are green through the summer, and subsequently carmine. Four of the beds are occupied by Petunias, without edging, and four with Phlox Drummondi, dotted in each case with purple Sage."

"How do you treat Petunias?"

"They are sown in February in a gentle heat. When they are large enough to handle, we prick them off into boxes, subsequently potting into small 'sixties,' and hardening gradually in cold frames. They are planted out in the middle of June."

"How does the fact that these beds have a north aspect affect the flowering seasons?"

"The flowering seasons are late. But though the spring plants do not flower until April, they continue to throw up blooms until June is fairly well advanced. The summer flowering also begins late, but we have plenty of blooms until the first frost comes. Last year I did not clear the beds off until November."

"Have you any trouble in keeping the Ivy on the mansion strictly within limits?"

"It is clipped every year in March or April. Last year we started in March, and got it quite close back, securing the best effect. We shall repeat the same course next month. There is also Honeysuckle on the house."

"How do you fill the narrow border, divided by steps into the house?"

"With Wallflowers and Myosotis in spring, and in summer we shall have Calceolaria Golden Gem, with Periwinkles at the back. With the background of Ivy, they look very well."

THE ENTRANCE, GOG MAGOG HILLS.

A Floral Lounge.

"I conclude, from appearances, that there is no conservatory?"

"No; but in the mansion itself is a sort of winter garden. It is, in fact, called the Lounge, and, as you will observe, adjoins the dining-room. It is always thoroughly warmed, and decorated with plants in bloom; also with hanging baskets. Our last combinations of flowers consisted of Clivias, Cinerarias, Tulips, and Ferns.

"In the spring, outside," continued Mr. Carr, "we make a show of Rhododendrons in tubs on this side of the mansion. There are about two dozen, and they begin to flower in May. Judging by results, a north aspect suits them. They stand outside all the winter without harm, quite exposed."

"Do you put peat in the tubs?"

"Yes; the soil consists chiefly of peat. We have had some of the plants for three years, and they have grown into good specimens. We never cut the flowers."

"The tennis ground is on the lawn this side?"

"And also the croquet ground. A good view of the lawn is obtainable from the summer-house. Both on this lawn and elsewhere, the hardy varieties of Daffodils are naturalised, and make a big show in March and April. Very few of these are cut. This is the main lawn, with the famous cock-pit. The ornamental lake in the cock-pit does not contain Lilies, its solitary decoration being a few wild ducks. With respect to bedding, the feature of this, the main lawn, is the number of herbaceous beds."

The Herbaceous Beds.

"What are your combinations?"

"As to edging, Pinks are used, and for the front of the beds we have bold patches of Sweet William Pink Beauty. It is very showy, lasts a long time in bloom, and does not look naked at any period of the year. Doronicums, Spiræas, Canterbury Bells, Sedum spectabile, Michaelmas Daisies in clumps, Delphiniums, and Solidago, are largely used; while Chrysanthemums in variety supply an excellent patch of colour in November, when other flowers are scarce."

"How about specimen trees?"

"One of the most notable is the Cupressus Lawsoniana erecta virida, which can be seen from almost every part of the pleasure ground. It is forty-eight feet high, and the circumference of the stem four feet from the bottom is five and a half feet. The Tree of Heaven near the cock-pit is also worth mentioning, and other trees which thrive in the gardens and park are evergreen Oaks and Beeches."

The Ancient Yew Hedge.

"Can you tell me the extent of the gardens?"

"About six acres. The park, which is all fenced in, is very extensive, and the whole of it is on very high ground. The well from which we get our water is over three hundred feet deep. The soil is chalk."

"Speaking of trees, the soil must suit Yews."

"You are thinking of our great Yew hedge. Both English and Irish Yews flourish. The Yew hedge which divides the main lawn from the kitchen garden is a hundred and forty yards long, twenty-one feet high in the highest part, by ten wide. The age of these Yews is believed to be from a hundred and twenty to a hundred and fifty years."

"The hedge makes a splendid background to the lawn."

"Yes, it is very much admired. Now, you must see our latest addition outside the walls."

A Rockery in a Roman Encampment.

Crossing the bridge over the old Roman encampment, we speedily arrived at the rockery, which promises to be an extremely pleasing addition. I asked when it was made.

"Only in the autumn of last year," rejoined Mr. Carr. "Ideas were given to me by Mr. Gray, and I did my best to carry them out. In making this rockery, we were faced with a difficulty in securing a good natural effect. Owing to the chalk soil, we tried to scheme in order to avoid too much carting away. So we threw up the chalk from the paths to form mounds, afterwards adding a considerable depth of loam for planting purposes. To flower this season we put in, temporarily, such plants as Pinks, Alyssums, Arabis, dwarf varieties of Antirrhinums, and Wallflowers, taking care to give plenty of room to all the plants we intend to be permanent. The Roman ditch, nine to ten feet deep, we turned to account for a Fern bank."

Digitized by Google Original from CORNELL UNIVERSITY

"You have Daisies already in flower?"

"And a few of the Aubrietias. These are amongst the permanent plants. We hope to have a water garden at the foot of the pathway, with Japanese Iris. The fall of the water is five feet, and along the sides of the gully, which runs into the main pond, are numerous plants to flower in spring."

A Special Garden.

Proceeding to the south-east side of the mansion, which, on the walls, is adorned with Wistaria sinensis and Bignonia radicans, and also a quantity of Virginia Creeper, which is just cut away from the windows and allowed to hang down, my attention was drawn to a little enclosed garden, surrounded by climbing Roses.

"This," said Mr. Carr, "is Mrs. Gray's special little garden, containing in the centre a bed of mixed Roses, and round the sides herbaceous plants, similar to those in the beds on the north lawn. The rustic porch built out of the mansion is covered in summer with Roses and Virginia Creepers. A feature of this lawn later on is a show of China Roses, which fill two beds, and often flower right up to Christmas. Close to the sundial on the grass is a good clump of Delphinums, with a background of Crimson Rambler Roses on rustic poles and chains. Delphiniums and Roses harmonise well together."

Passing through a gateway in about the centre of the Yew hedge, we entered the kitchen garden, which is partly walled in, and partly separated from the pleasure grounds by a hedge. Before we inspected the range of glass, I asked Mr. Carr if he knew the age of the grand old Mulberry tree, which is a conspicuous object.

"It is probably about the same age as the Yew hedge. Although so old, it never fails to produce a good crop of fruit yearly, which for stewing purposes is most useful. Surrounding the tree itself are Rose beds, containing numerous varieties, the Roses being both dwarfs and standards. On the west side of the Mulberry tree are climbing and Pillar Roses on chains, amongst which are planted Daffodils in variety. The south-east side includes the herbaceous border, which is planted with varieties intended for cutting for use in the mansion."

Tree Carnations.

"I notice that in your greenhouse you have nice batches of Cyclamen and Freesias in flower, and that Fancy Pelargoniums are coming on."

"We grow a number of varieties of the last. Among other subjects of which we make rather a feature is the Justicia, a tall-growing plant with a pink flower. We have between thirty and forty, and they are in flower during the summer. Tree Carnations are in flower from January to September. We layer old plants on outside borders in summer, pot off when rooted, grow in winter in the greenhouse, plant out in April, and get a good supply of flowers during summer. A plant worth growing extensively is Dielytra spectabilis. It is quite easy to work up a good stock quickly, and when the plants have been potted up and gently forced, they make splendid specimens for house decoration. The varieties of Tree Carnations are Mrs. T. W. Lawson, Enchantress, The Belle, and Floriana."

"Do you go in largely for Chrysanthemums?"

A Favourite Sweet Pea.

"We have a fair collection, but they are Singles chiefly. Sweet Peas are just showing in 5-in. pots. We subsequently plant out in rows and separate clumps. The varieties are Countess Spencer, George Stark, Clara Curtis, Princess May, Princess Victoria, Thomas Stevenson, Rose du Barri, and several others. Gorgeous is very much admired here, and we grow a considerable number. Although a small flower, Gorgeous is an excellent decorative colour, and last year it made far the best show. I think this was accounted for by the soil in which it was grown, namely, the mud from the bottom of a soft water well, which had lain out all the winter, and was mixed in as the trenching proceeded with the usual manure."

"In your stove everything seems to be overshadowed by Bananas. How long have you fruited them?"

"This is the second year. A Banana plant does not fruit twice; the old stem is thrown away, and young plants put in. The plant you see is seven feet high, and six inches through. It carries one hundred and fifty fruits, which are exceedingly good, far better than any we can buy. The border in which it is planted out is two feet wide by four feet long, with hot-water pipes underneath. There are other Bananas coming on, and one which will fruit in March. We put the smaller trees into the Lounge for a short time. Perhaps the most striking point about the Bananas is that they are growing with many other things, and are not in a house by themselves, as it is sometimes said is necessary. For example, there are a number of Palms, and on the stages, now in flower, are Eucharis amazonica and Deutzia gracilis. Here we also grow Azalea indica, Lilies of the Valley, and Tulips. In the Fernery we have two or three dozen Adiantum Farleyense, and a few Asparagus Sprengeri. Nephrolepis Whitmanni is grown in quantity in baskets, for use in the house. We have one plant three feet through. The collection of Orchids embraces three or four varieties of Cattleyas, Cœlogyne cristata, Cypripedium insigne, Odontoglossum Crispum, O. Pescatorei, and O. Adriani, which is just coming into flower."

"I see you have Arum Lilies in your Peach house."

"They are just throwing up good spathes, with Clivias making a good show of colour, amongst them. We do not coddle Clivias in any way. In winter they are kept in our coolest house; and in summer they stand outside on ashes, and are frequently watered."

THE LAWN AT GOG MAGOG HILLS.

Forcing in Pits.

"What do you use your rows of heated pits for?"

"For a number of purposes. We force about two hundred Royal Sovereign Strawberries. Peas do better in large pots than planted in pits. We pick them early in May, and continue for a month until they are ready outside. Seakale, Asparagus, and Carrots are forced in the pits, and on a hotbed outside Tom Thumb Lettuces."

"What fruit does best on your walls?"

"On the east walls Plums flourish, especially Victoria, which never fails to give a good crop. Other varieties are Coe's Golden Drop, Prince Englebert, Grand Duke, and Denniston's Superb. On the south walls are Apricots, Peaches, and Pears in variety."

Peas in December.

"I should like to have any details about particular vegetables?"

"As to Peas, after Chelsea Gem has been grown in pots for early work, it is succeeded by William the First. We sow these early in November on a warm border, sowing the same variety again early in February. Then we grow Veitch's Criterion, a first-rate cropper. Although the pods are not large, the Peas are quite equal in size to many other varieties with big pods. It also has a very good second crop. For our main crop we depend upon Duke of Albany; and for late work Autocrat and Chelsonian. The last two carry us on to the end of October. In fact, in 1910, Chelsonian was producing good pods late in November, and early in December."

"I think you make a feature of Celery?"

"Yes, it is largely grown here, because it is cooked as a vegetable. We can always do with one thousand five hundred heads. We only grow two varieties, Superb White and Standard Bearer. The former is ready in August if sown early in February, and we send a quantity to Scotland during the shooting season. Onions also are largely grown. We sow a few in January for extra large bulbs. The main crop are sown as early as possible in February. The ground for them is trenched three spits deep in the autumn, and plenty of stable manure added. The three varieties are Ronsham Park, Nuneham Park, and Bedfordshire Champion."

Mr. Carr's Career.

As we strolled along the Lavender walk, and observed the fine Holly hedge, which divides Mr. Carr's house from the garden, I asked how long he had been at Gog Magog Hills.

"Five years. This was my first appointment as head gardener. I started at Playford Mount, Suffolk, where I remained six years. I went next to Carlton Hall, Saxmundham, and thence in succession to Eynsham Hall, Oxfordshire; Greenham Lodge, Newbury; Warfield Hall, Berkshire; and Loughton Lodge, Lewes. So that I have had experience in representative gardens in various parts of the country."

ALFRED WILCOX.

THE subject for next week is: "What Worcestershire is Doing for Horticulture." Interview with Mr. Udale, F.R.H.S., Instructor for the County.

The Garden, 1881

MR. S. M. CARSON, for some thirty years gardener at Nonsuch Park, Cheam, died on May 22 last, at his residence at Gatehouse, of Fleet, aged 67. Mr. Carson, who was one of the foremost plant growers of his day, was for a lengthened period an exhibitor at the great London shows, successfully contending in the classes of Azaleas, and stove and greenhouse plants, with such men as Green, Falconer, Hunt, and Barnes, all in their day grand plant growers. But plant culture was not his only strong point; he was an equally good gardener generally—an excellent man in all departments, and as such appreciated by his employer, who allowed him on his retirement from Nonsuch Park, in 1872, a liberal annuity.

CAVE William of Hedley Cottage Mariners Homes Liscard Wallasey **Cheshire** retired master mariner died 25 December 1921 Probate **Chester** 9 May to Letitia Cave spinster. Effects £534 1s. 1d.

CAWDRY Betty of 7 Royd-street Little Horton **Bradford** widow died 13 March 1921 Probate **London** 18 January to Rufus Cawdry farmer Louisa Cawdry spinster and Frank Sutcliffe stuff merchant. Effects £497 11s. 6d.

CAWLEY Harriet Alice of 5 Wiltshire-street Higher Broughton Broughton **Salford** spinster died 13 August 1922 Administraton **Manchester** 9 September to Richard Cawley journeyman house painter. Effects £127 10s. 7d.

CAWLEY Mary of Carrowbehy Casterea county **Roscommon** (wife of John Cawley) died 14 August 1920 Administration (with Will) **Tuam** 25 November to the said John Cawley farmer. Effects £268 2s. 3d. in England. Sealed **London** 28 October.

CAWOOD Reuben of 72 Seymour-street Crossmyloof Shawlands **Glasgow** died 5 April 1922 Confirmation of Arthur Montgomerie Cawood Sidney Dalton Cawood and Lawrence Syme Cawood. Sealed **London** 18 May.

CAWRSE Joseph of West Lewarne St. Neot **Cornwall** retired butcher died 13 October 1921 Administration **Bodmin** 4 July to Mary Marks widow. Effects £65.

CAWS Bessie of The Oaks Shide Cross Newport **Isle of Wight** spinster died 30 August 1921 Probate **London** 2 August to George Allen Caws works manager. Effects £1288 14s. 3d.

CAWS John George of The Elms Sea View **Isle of Wight** died 16 August 1922 Probate **London** 11 October to Emmeline Amelia Caws and Hetty Cecil Caws spinsters and George William Colenutt solicitor. Effects £12259 11s.

CAWSE Richard Mann of South View Cottage Brixton **Devonshire** retired gardener died 1 August 1922 at The Exminster Asylum Devonshire Probate **Exeter** 6 October to Mary Ann Cawse spinster Edith Emily Bess (wife of David Arthur Bess) and Fanny Eliza Stone (wife of James Stone). Effects £1698 16s. 11d.

CAWSEY Elizabeth Ann of 4 Searle-terrace Northam **Devonshire** widow died 9 March 1921 Probate **London** 11 March to Elizabeth Christian Cawsey spinster. Effects £756.

CAWSTON George Phillip of 4 Cumberland House Highbury-crescent Highbury **Middlesex** died 8 March 1922 Probate **London** 30 March to Catherine Amalie Cawston widow. Effects £2005 8s. 10d.

CAWSTON Sarah of Caversham Bridge and of 206 Caversham-road both in **Reading** died 19 June 1922 at 206 Caversham-road Probate **London** 1 August to Edward William Cawston William Edward Cawston and Arthur Reuben Cawston boat builders. Effects £5429 18s. 9d.

CAWTHORN Robert of Hawthorn Cottage Medomsley county **Durham** died 1 April 1921 Probate **Durham** 18 March to Elizabeth Hannah Cawthorn widow. Effects £379 2s. 6d.

CAWTHORNE Gertrude of The Claremont Hotel **Harrogate** died 23 September 1921 at The Nursing Home Stokesley Yorkshire Administration **London** 20 July to Mary Jane Blackburn (wife of George Albert Blackburn). Effects £1874 14s. 10d.

CAWTHORNE Nicholas of Leeming Brickyard Leeming near Bedale **Yorkshire** died 16 April 1922 Probate **London** 9 August to Thomas Cawthorne tile merchant and William Tate retired coal agent. Effects £2044 4s. 4d.

CAWTHORNE Sarah Rebecca of 178 Wallace-road **Sheffield** widow died 10 April 1922 Probate **London** 26 July to Mary Eleanor Cartledge widow. Effects £482 8s. 2d.

CAWTHORNE William of King Edward-road Nuneaton **Warwickshire** retired printer and stationer died 20 April 1922 Probate **Birmingham** 13 July to William George Cawthorne printer and stationer Frederick John Cawthorne schoolmaster and Arthur Hall Cawthorne printer and stationer. Effects £6900 18s. 8d.

CAWTHORNE Willie of 25 Cranbrook-avenue **Leeds** died 30 September 1922 at Beeston-road Leeds Probate **Wakefield** 26 October to Annie Cawthorne widow. Effects £1585 1s. 9d.

CAWTON Ellen of 1 Bradenham-place Penarth **Glamorganshire** widow died 18 August 1922 Probate **London** 30 September to Lydia Thompson (wife of Osborne Thompson) and Frances Cawton spinster. Effects £2507 8s. 3d.

CAY Albert of Woodside Kenilworth **Warwickshire** esquire died 16 November 1921 Probate **Birmingham** 13 January to Hubert Kenrick Beale solicitor and sir Harry Gilbert Barling baronet F.R.C.S. Effects £36217 12s. 1d.

CAY Margaret of 39a Emperor's-gate Kensington **Middlesex** spinster died 2 February 1921 Probate **London** 11 January to Isabella Cay spinster. Effects £5040 15s. Former Grant P.R. May 1921.

CAY Robert Barclay of 2 Godwyn-road **Dover** died 2 June 1922 Administration **London** 26 June to Mabel Frances Cay spinster. Effects £24.

CAYFORD Mary Ann of the Trout and Chequers Inn Yiewsley **Middlesex** (wife of Arthur Cayford) died 11 June 1922 Administration **London** 9 December to the said Arthur Cayford licensed victualler. Effects £535 8s. 10d.

As smaller the garden, the more necessary it is cleverly to conceal its limits from any one point of view. This is certainly true, and it is in the manner in which the concealment is effected that the hand of the artist is seen.

The rare Peristeria elata, sometimes called the Dove Orchid or the Holy Ghost-flower, is a most singular plant. The extraordinary resemblance which the flower bears to a dove would seem to serve no useful purpose, especially as the difference in size would surely prevent any insect from mistaking the flower for the bird. In that case the resemblance must be purely accidental.

H. C. DAVIDSON.

Famous Gardeners at Home.

No. 241.—Mr. O. CATLING, AT THE GARDENS, BAYFORDBURY, HERTFORD.

ONE of the most interesting features of the gardens at Bayfordbury, which I recently visited, by permission of Mr. H. Clinton Baker, the owner, who takes the keenest interest in them, is the remarkable collection of rare trees and Conifers, many of them being the largest in England. Going round the beautiful lawn, in front of the mansion, with the gardener, Mr. Catling, I asked for the dimensions of some of these noble specimens.

A Collection of Rare Trees.

"The most notable of the Oaks," he rejoined, "include Quercus palustris (six feet seven inches round), Quercus velutina (six feet eleven inches), Quercus rubra (eight feet ten inches), Quercus Phellos (five feet ten inches), Quercus imbricaria (four feet seven inches), and Quercus Toxeri (three feet five inches in girth)."

"What about Pyrus?"

"There is a specimen of P. pinnatifida, five feet two inches in girth, and forty feet high. As to Pines, I may mention Pinus cembra seven feet two inches in girth, sixty-four feet high, P. pungens (three feet one inch in girth, thirty-five feet high), P. ponderosa (nine feet four inches in girth, a hundred feet high), P. Coulteri (eight feet eleven inches in girth, seventy-two feet high), and P. contorta (four feet nine inches in girth, forty-nine feet high). The principal Abies are A. cephalonica (six feet eleven inches in girth, seventy feet high) and A. Nordmanniana (six feet nine inches in girth, and ninety-one feet high)."

"Then there are also the splendid Cedars on the lawn."

BAYFORDBURY, HERTFORD.

"They were planted in 1765, four on one side and six on the other, and are generally admired. The collection of Pines used to be even finer than it is, but the frost of 1860 killed a number. Many of the Oaks were planted by members of the family.

"There is, also," continued Mr. Catling, "a nice piece of ornamental water of about one acre and a half in extent, dotted over with four islands, and planted with various trees, that adds much to the beauty of that part of the gardens, as viewed from the carriage drive, which goes past it to the village. It is fed with surface water, which is drained to it from higher ground, and it is situated on a higher level than the Rose garden and greenhouses, so that it forms a welcome source of supply for use in the garden and stables, and for refilling the fountain in the centre of the Rose garden when necessary."

The Bedding.

Proceeding to the terrace walk, which is laid out with beds, edged with cement coping, I inquired how they were made up.

"There are six beds of golden Calceolarias, eight of Heliotropes (in two varieties—light and dark), and two beds in the centre of outlets to the lawn, containing Nicotiana affinis and scarlet Gladiolus, with Nicotiana Sanderæ on each side. Of the two narrow beds, one is planted with Mrs. Pollock Geraniums, and the other with dark Heliotropes; the centre oblong bed contains Golden Gem Calceolarias, another one Heliotropes, and a third Madame Crousse Geraniums. The little round beds last year contained Grevilleas in the centre, edged with Lobelias, and Alternanthera round the coping, but this year I am trying Coleus Verschaffeldtii, edged with Lobelias."

"Have you tried tuberous Begonias on the terrace?"

"Yes, and we found they would not do, because it is too hot. The row of beds, with a narrow border on the left side close to the wall, goes the length of the terrace, and is about a hundred and forty yards long. The border itself contains a mixture of Geraniums, Verbenas, or anything we happen to have. As to the beds, there is one containing Heliotropes, the next has Irisii Lindeni intermixed with Geranium Manglesii, another is generally filled

MR. O. CATLING.

with fibrous-rooted Begonias, a fourth with scarlet Geraniums, a fifth consists of variegated Gazanias, a sixth of pink Ivy-leaf Geraniums, a seventh of Heliotropes of a light colour, an eighth of Miss Kingsbridge Geraniums (white variety), and the ninth of Golden Gem Calceolarias. The beds at the other end of the terrace correspond."

Vases and the Terrace.

"How do you fill your vases?"

"The large ones on the coping with Aralia Sieboldii, filled in with Geraniums and Fuchsias, Ivy-leaved Geraniums hanging over the edges of the vases. The smaller ones are arranged in pairs, two having Cleopatra Geraniums, two Happy Thoughts, and two Henry Jacoby. There is one odd bed outside on the terrace which I have omitted to mention; it is filled with sub-tropical plants, such as Nicotianas, Solanums, and Ricinus. As you see, the terrace is raised from the lawn, and there are beds on both sides of the steps. On the mansion, Choisya ternata thrives, also Magnolia grandiflora and Tecoma, while the different creepers on the verandah include Honeysuckle and Wistarias, with Roses intermixed. On the pillars of the portico two Vines are trained. Yuccas, planted in the grass, are doing fairly well."

"You have a nice piece of Plumbago capensis alba on the roof of the conservatory."

"Yes, and also P. capensis. The conservatory is very old, and the floor is of flag-stones; it is sixty by twenty feet. We have had a splendid lot of flowers from the Camellias, in spite of the fact that they have only a border fifteen inches wide and fifteen to eighteen inches deep to feed on. Occasionally we give them a little artificial manure."

"I notice you have some white Rhododendrons."

"They are useful both for house and church

decoration. The Liliums are a hardy variety, all grown under the Vines, and brought from the Vinery here, the conservatory being necessarily used as a plant house. We have one Orange and one Lemon tree on the back wall, and two Orange trees in slate boxes, which are moved out on to the terrace during the summer months."

The Rock and Bog Gardens.

From the conservatory we proceeded to the north end of the mansion, where there is a garden of Yews, these consisting of the ordinary green and a few golden kinds. There is also one fine specimen of Wellingtonia. The rock garden includes on one side a little bog garden, planted with choice varieties, and the rockwork is built chiefly with stones and old brick burrs.

"What are the principal varieties?" I inquired.

"The Alpines which grow here are, chiefly, Androsace carnea, A. lanuginosa, A. sarmentosa, and A. villosa, Anemone sulphurea, Dictamnus Fraxinella, and D. alba, Draba ciliaris, Eritrichiums, Lewisia rediviva, Potentilla ambigua, Primulas, Auricula marginata, P. calycina, and P. villosa, Saxifraga apiculata, S. Burseriana, S. Boydii, S. Grisebachii, S. oppositifolia, S. sancta, and S. Valdensis. Sedums in variety and Alpine Phloxes are also grown, while, in the bog garden, Cypripedium calceolus (or the English Lady's Slipper) and C. spectabile are just coming into flower. Other contents include Thymes of different colour, Aubrietias of the most recent introduction, which are a great improvement on old-fashioned varieties, and Gunnera manicata and G. scabra."

The Vineries.

As a thunderstorm was at this time in progress, we sought shelter in the houses.

"There are three Vineries," said Mr. Catling, "ninety feet long. The varieties in the early house are Black Hamburgh and Madresfield Court; in the medium Vinery, Muscat of Alexandria and Mrs. Pince; and, in the late house, Alicante and Lady Downe's Seedling. All the roots are outside, excepting those of the Muscats. We begin cutting in the early house about the middle of July, in the second at the end of August, and in the late house towards Christmas. This year we had Grapes until the first week in April."

"Then there are the stove and the intermediate house?"

"They are forty-two feet in length. The stove contains, chiefly, Dracænas, Crotons, Caladiums, and a few plants of Farleyense Ferns and Gloxinias. We grow about fifty of the latter (mixed varieties), also a couple of dozen Clerodendrons for the autumn. In the intermediate house we have a number of Fuchsias, which are useful for indoor decoration, and a few cool Orchids (Odontoglossums, Cypripediums, and Lycastes Skinnerii), which come in either for cut flowers or to adorn the plant house."

"What about Nectarines and Peaches?"

"They are all grown in the orchard house, which is cool. The first Peach is Alexander, and Golden Eagle the last. Other varieties are Duke of York, Hale's Early, Dymond, and Barrington. We keep up a succession of fruit from the beginning of July until the middle of October. The Nectarines are Early Rivers, Lord Napier, Rivers' Orange, Pineapple, and Humboldt. Our system is to fill up the old trees with younger ones planted in pots, but these are not yet rooted out. With respect to cultivation, it is most essential that the border should be regularly watered, because the foliage draws up so much moisture, and the usual attention in disbudding is required."

"I notice that you have also Cherries here."

"Two varieties—Rivers' Early, which we begin picking in the middle of June, and Governor Wood in July. Although there is no apparatus for heating, we manage to keep the frost out pretty well, and if it comes to the worst we light a paraffin stove."

A Sheltered Corner in the Gardens at Bayfordbury.

A Charming Rose Garden.

"When did you plant your Rose garden?"

"We replanted the centre of it between seven and eight years ago, and we have filled up the beds each year with a few newer varieties. You will observe that all round the garden are asphalte paths, which are a great assistance in the way of keeping off weeds. Roses are grown in all the main beds, six of which are almost square, four (round the fountain) circular, and four corner beds with Roses grown as chains. There is also an outside border on each side, and another one lying between two banks, the varieties grown here being all Teas. The others are mixed varieties planted in groups, three of one variety together, so as to get effect in colour."

"You grow Strawberries in your Rose garden?"

"Yes, a large number, and we consider that they do not in any way detract from the appearance. The varieties are Royal Sovereign and President, which we grow on from year to year. The other feature is Sweet Peas, a few varieties grown singly, so as to get a handful of decided colour."

Fruit in the Kitchen Garden.

"I suppose you have the usual fruit in the walled kitchen garden?"

"The pyramid trees up the centre walks and all round are Apples, Pears, and Plums. A few of the best Apples on pyramids are Worcester Pearmain, Adams' Pearmain, Peasgood's Nonsuch, Brodrick's Nonpareil, Lady Suffield, and Cox's Orange Pippin. On standards we have Tower of Glamis, Nelson's Codlin, and King of Pippins. The number of varieties is not large, but we get plenty of Apples, and our crop last year held out until the end of April."

"What are the varieties of Pears on pyramids?"

"Chiefly Doyenné du Comice, Beurré Diel, and Pitmaston Duchess. We have a few on cordons, but they do not thrive so well as those on pyramids. Plums are grown on bush and pyramids, mostly Victoria and Monarch. Cherries—the Morella—do well on the walls, but will not grow on standards. No Peaches or Nectarines are grown outside, because we get as many as we want in the orchard house. Currants and Gooseberries are grown as bushes, and we get good crops of Raspberries—Superlatives and Semper Fidelis. The Raspberries are trained on wires, but I think that they did better when we had the old Red Antwerp grown up the stakes. We have also two rows of Loganberries, which were planted four years ago, and yield good crops of fruit."

Vegetables and the Frames.

"Your Peas look remarkably well?"

"They are rather a special feature; the early varieties are Exonian and William I., and they are succeeded by Gradus, Dr. McLean, Criterion, Lord Mayor, Alderman, and Autocrat. Of Potatoes, a few of the best varieties are Myatt's Ashleaf, Sir J. Llewellyn, Factor, and

Up-to-Date, which latter takes a good deal of blanching. Of Celery, which is grown in double rows, we have about seven hundred plants. For the rest, a considerable quantity of useful varieties of different vegetables are grown. There are three lights of Cucumbers (Lockie's Perfection), and Melons are also grown in frames. The varieties include Dickson's Exquisite, which is green-fleshed and of good flavour.

"Have you anything special in the other frames?"

"There are four lights of Begonias for baskets, and for the front of the conservatory, with a number of Cyclamen and Primulas, Cineraria stellata, Nicotiana Sanderæ, a light or two of Geraniums for autumn flowering, a few Asters and annuals for planting out, and three lights of Violets, while Radishes, succeeded by Carrots, are grown in three cold frames. There are about two hundred Chrysanthemums standing out, which are grown to cut from, but are not new varieties. Generally speaking, I may say that the plan is to grow what is most decorative out of doors, and most useful for decoration and consumption indoors. As to myself, I think it is only necessary to say that I have been here as head gardener for eighteen years."

ALFRED WILCOX.

Letters from a Lady Gardener.

No. 207.—SUMMER PRUNING, AND REGELIO-CYCLUS IRISES.

DEAR KATE,—When you have quite done clearing your rock borders from weeds, and also your lawn (and that will not be done in a day, I expect), your sharp old knife may still find work in the summer-pruning of many plants. For some of them you may, indeed, need the secateurs, but, as a rule, it is only the young growths which are removed or shortened at this time of year, and a strong, sharp knife will do the work.

The Currant Bushes.

Red and White Currant bushes should be pruned on somewhat the same plan as a Vine—*i.e.*, the young shoots can be shortened (except those you wish to extend the branch) to three or four leaves, which will have the effect of filling out the bunches of fruit, and plumping up the buds left, for it is at the axils of the leaves that these Currants are produced, on the last season's wood. But Black Currants are quite different, and must not have their young growths shortened in summer, for they bear their crop on the current season's wood (no joke intended, mind), and this should not be cut back until December, when you should only thin out the weaker branches from the centre, and, of course, remove any dead wood on all the bushes, whether of Red, White, or Black Currants at that time, and shorten the spurs of the Red and White Currants to two inches, only sparing the terminal shoot, which can be left untouched, to lengthen the branch.

Apple Trees.

Apple trees are, I think, often injured by too close pruning while young, and should be allowed their own way to a considerable extent until they have attained ordinary size. All that they will need is to top their branches in December, and cut away, then, any that cross each other, or fill up the centre of the tree too thickly, for each branch should have room to grow, and the sunshine and air must penetrate all parts of the tree to ripen the wood properly.

An old tree, however, as well as espaliers and cordons (both Apples and Pears), must part with some of its young growths in the summer for the purpose of regulating its shape, and inducing the buds left on the tree to form fruit. The lateral branches, therefore—*i.e.*, those which form at the sides of the older wood—must be shortened in summer to within six leaves of their base, leaving the leading shoots to extend, if there should be space for them to do so, and merely removing their tips.

The necessary winter pruning, which may be done in January or February, consists in further reducing the length of the shoots to within four buds of the base of the shoot. But here, again, a careless pruner, thinking only of the neat appearance of the tree, is apt to do much damage, for, unless we can tell fruiting buds from leaf buds, and take care not to remove the first-named, even though they should be on the fifth or sixth axil left on the spray in summer, we shall lose a great deal of the crop. For this reason the winter pruning is best done rather late in the winter, when the fat, globular buds which will bear fruit are more easily discernible from the thin, spiky leaf buds, and each shoot should be examined for these before pruning it.

IRIS PSYCHE.
(Regelio-cyclus hybrid.)

The Flowering Shrubs.

Many flowering shrubs, too, can be pruned in summer, just after they have blossomed, more safely than in winter. Pyrus japonica (more properly called Cydonia japonica), the Japanese Quince, can be treated like an Apple tree, and will even grow into a hedge, if pruned in that way. Lilacs (Syringa) must not be cut back if you wish plenty of blossom, for this is produced on the young shoots of the previous year; the deadly shears must never be used to clip these things into a hedge, or you will lose the next year's flowers, but, of course, it is sometimes necessary to cut out dead or half-dead branches, or to remove those for which there is no room.

Those who own a few good shrubs should study the natural shape of each before pruning them, and never give way to the temptation (under which old John is apt to suffer) to reduce them all to a sort of plum-pudding shape with his favourite shears.

The long shoots of Clematis montana, if left alone, will be covered next May with snowy, starlike blossoms, but they may now need to be thinned out and regulated, if on the house. This plant makes a wonderful amount of growth, and covers an arbour, a pergola, a wall, or an old tree, with exquisite wreaths of bloom in May. Many other Clematises blossom only on last year's wood, so that the fatal plan of clipping them close is responsible for many disappointments in the matter of their flowers.

It is never safe to prune back a Clematis hard unless you are very sure that it will blossom on the growths of the season, so that I advise you to study any Clematis you may have in your garden for a year before touching it with the knife at all.

A Good Hybrid Iris.

I promised, in the early spring, to tell you more about the fine hybrid Iris, Psyche, which was then making good growth on the Iris border under a dry, south wall. It is a far more satisfactory plant than either of its parents, for the Oncocyclus Iris, Susiana, is difficult to manage (like all those of the Oncocyclus group),

A HEDGE OF CLEMATIS MONTANA.

A Strange Plant.

November 21st.—A very interesting description of that strange plant, the Dodder, which is such a pest among Clover, is given by Professor Henslow. The seed, which resembles a tiny coiled spring, germinates by pressing its club-shaped end in the soil, and then throwing up a thread-like stem, which twists about like a tendril in search of support. When it comes in contact with a suitable host plant, it forms a sort of sucker, which serves the double purpose of enabling it to adhere and also to abstract the sap from the host. The lower part then dies, and the Dodder becomes entirely parasitic, spreading rapidly. If, however, the thread-like stem does not find a suitable plant to cling to, it falls to the ground, and, if moisture is present, the apex continues to grow, drawing its food from the base, which dies yielding up its substance, just as a bulb growing without roots does. The young Dodder thus moves along, literally hunting for its prey, its existence depending on its success. If it fails, it dies in time; but if it succeeds before it is exhausted by its efforts, it grows with remarkable rapidity, throwing out long arms, which bind its victims in tight bundles, and eventually strangle them. It grows not only on Clover, but also on Gorse and many other plants. The Dodder belongs to the same family as the Convolvulus.

The Utility of Ivy.

November 22nd.—I should like to see Ivy utilised very much more than it is at present. We expect to see it on old masonry, draping gateways, arches, and so forth, and to it many of them owe much of their effect, but there are many ugly modern buildings and walls with a north aspect which could be made beautiful by its means. It is sometimes said that Ivy makes a wall damp. I can only give my own experience. I planted it against a wall which had previously been incurably damp, and after a time all trace of moisture disappeared. I do not suggest that it would do this in a case in which, owing to the want of, or a defect in, a damp-course, the moisture ascended from the ground. In the wall I am referring to, the mortar was old and absorbent, and rain easily obtained a lodgment in it. Here, no doubt, the broad evergreen leaves acted as a protection. There must be many other damp walls which they would dry in the same way. But it is mainly for the sake of appearances that I recommend Ivy. There are many varieties of Ivy, green, silver and golden, some with large leaves, others with small, all of them admirably adapted for covering ugly, sunless walls. They are fairly cheap, and when once established they can all look after themselves. The only attention they need is a little clipping occasionally, to prevent their breaking away from their support. But trimness should be avoided—they look far better when allowed to grow naturally.

H. C. DAVIDSON.

The Gardens of the Earl of Pembroke at Wilton House, Salisbury.

INTERVIEW WITH MR. T. CHALLIS, V.M.H.

THERE are, of course, many features of interest in the gardens of Wilton House—Lord Pembroke's historic seat, in Wiltshire—but the most conspicuous is the remarkable collection of fruit. To this, therefore, I devoted special attention on the occasion of my visit in the summer, when I was welcomed by the Countess of Pembroke (who congratulated me upon coming in beautiful weather), and by Mr. Challis, the well-known and popular head gardener. Starting, however, with the flower garden, as a matter of convenience, considerable time was necessarily spent in exploring the large area which it covers.

WILTON HOUSE AND THE ITALIAN GARDENS.

The Flower Garden.

One of its greatest charms is that it is quite old-fashioned. Lord and Lady Pembroke do not admire the modern system, and, moreover, the present style accords with the original design. Cedars of Lebanon (some dating from 1640) are in profusion, evergreen Oaks, Thuja gigantea, rare specimens of Abies, and many varieties of Conifers, adorn the lawns, and memorial trees, planted by illustrious personages, including members of the family, are numerous.

"One of the Abies," said Mr. Challis, "is the finest tree of its kind in the kingdom."

"And the variety?" I enquired.

"Parviflora. In 'George Herbert's Walk,' which we are just approaching, there is a fine specimen of the dwarf variety, Clanbrasiliana, over a century old. You will notice that Roses are allowed to grow naturally, and that there are many groups of the Lord Penzance Briers; also of Monthly Roses. In fact, the practice of grouping is largely adopted."

The preservation of its old-world appearance does not hinder the introduction of additions in the flower garden. As I admired the prospect from the Palladian bridge (by Inigo Jones) which spans the river, Mr. Challis said:

"We are making Lily ponds, and planting the best of the new Nymphæas, such as Marliacea sanguinea, M. albida, M. chromatella, gloriosa, and Ellisiana."

The formal bedding is limited to the Italian garden on the terrace, and I enquired how the four central beds were made up.

"At present with sub-tropical plants, intermixed with flowering varieties. The other beds are chiefly composed of Violas, Heliotropes, and double Begonias, in different colours, the varieties including Argus, Lafayette, Snowflake, and Pink Perfection. Roses are used round the sides, and the numerous urns are filled with sweet-scented flowers, chosen for fragrance and colour. Here you see one of the finest kinds of Chamærops Fortuneii, in flower, with its golden bloom and beautiful raceme."

"I notice that you have an Orangery."

"It is now mainly used as a Palm-house. The rock garden was made seven years ago, and the Lily pond here contains some of the varieties which we are using in the new pond. Among notable plants in the rock garden are Meconopsis integrifolia (a seedling of our own), Eremurus himalaicus, and Polygonums in variety. The island near is covered with various shrubs."

We next made our way to the handsome herbaceous border, which runs along the side of the fishing stream. At the time of my visit, the plants were intermixed with fruit trees.

"One of the most effective of the plants," remarked Mr. Challis, "is the Dropmore variety of Anchusa, with its deep blue flowers. Delphiniums are also largely grown. We get as much variety in colour as we can in this border."

"Which do you consider the best variety of Delphinium?"

"Formosum is our favourite, and Bella Donna and The Queen are very good varieties. Campanula persicifolia alba grandiflora supplies some fine white flowers. Other plants grown largely are Liliums speciosum and candidum, Pentstemons, Asters, Phlox in variety, Tree Pæonies, and Iceland Poppies."

A Remarkable Orchard.

I could have lingered for a long time among the beautiful glades in the flower garden, and I could have asked many questions about the treatment of plants, but there were nine acres of kitchen garden to be seen, and several ranges of houses, as well as the orchard, planted eight years ago. Proceeding to the latter, I was much impressed with the striking combination it presented. Fruit, of course, occupies most of the space, but in front of the laundry, which stands nearly in the centre of the orchard, were a superb bed of Liliums (in bloom) and beds of Iris, with a hedge composed of Brier Roses. Many other Roses were also in bloom, noticeably Bardou Job, Paul's Carmine Pillar, Félicité Perpétue, Bennett's Seedling, Crimson Rambler, Aglaia, and splendens. With respect to fruit trees, those in goblet form at once attracted my attention, and I asked Mr. Challis to tell me the advantages.

"The primary object of training fruit trees in goblet form is to get the maximum of light and air. There are twelve branches to each tree; each tree is about seven feet high, and

the branches are eighteen inches from the ground. Most of the Apples grown in this manner are for late use."

"Which are the most suitable varieties?"

"Wellington, Prince Albert, Bismarck, Newton Wonder, Gascoyne's Seedling, Bramley's Seedling, Belle Pontoise, Blenheim Orange, Ontario (a new Canadian), Chelmsford Wonder, Alfriston, and Hambling's Seedling. The partitions are covered with Pears as cordons, of which the varieties are chiefly Doyenné du Comice, Marguerite Marillat, Josephine de Malines (which we get from November to the end of February), and Winter Nelis. A cage for Plums has just been planted. For six years we hardly gathered any Plums from the unprotected trees, and I am trying this system in the hope of being able to preserve the crops. I intend to do the same with Cherries as cordons, and I am trying a few Damsons on the same principle. In the kitchen garden itself there is a large cage, covering a third of an acre, filled with Currants, Gooseberries, and Cherries, trained on upright standards, and Raspberries planted right round, so as to form a hedge for protection. But I think we had better now go to the kitchen garden, and there you will see a great deal more of the methods upon which fruit is grown here."

Starting in the kitchen garden with the ranges of glass, we entered the early forcing houses, which, though erected forty-five years ago, when Mr. Challis became responsible for the gardens at Wilton, are still very useful. Here are grown Cucumbers, of which Improved Telegraph is the favourite. The Melon house was carrying a second crop, and, in reply to a question, Mr. Challis said:

"The favourite Melons are the Badsworth, Early Scarlet, Supreme, Scarlet Perfection, and Late Perfection."

Seedling Richardias.

"I notice that you have a fine collection of Richardias on the stages."

"They are seedlings, the principal being R. Elliottiana, which we bed outside; it seeds very freely, and blooms late in the autumn. I have raised several thousands of seedlings. E. Rossi is rather deeper in colour than Elliottiana. The variety with the green leaf is R. Pentlandii."

"The next little house," continued Mr. Challis, "is devoted to cool Orchids, Odontoglossums Crispum, grande, and Pescatorei. We go in for just enough Orchids for decorative purposes. This house was originally intended for a Pine pit, and the next one also. The latter has now a batch of Tuberoses and Poinsettias."

"Have you many varieties of Tuberoses?"

"No, they are all The Pearl and Excelsior. I do not care about the African varieties. They are not so useful."

Pines and Grapes.

"But you still grow Pines?"

"Yes, we have just restarted growing them in one house, and shall have three. The only varieties grown are Queen's, Cayenne, and Charlotte Rothschild. They are much better in flavour than the foreign Pines. Now we come to an early Vinery, containing Black Hamburghs, which we began to pick in May. In the next house, also devoted to Black Hamburghs, we grow Duke of Buccleuch at the back. When this variety is grown in a dry atmosphere, it usually thrives. I have tried it from time to time, and like it very much."

"Do you grow the new Grape, Melton Constable?"

"Yes, and I think it is a very useful variety, nearly allied to Gros Colmar, but with a better flavour. I also grow another comparatively new Grape, Diamond Jubilee, which is rather showy in appearance, but not of very good flavour."

"Are your Vine borders all inside?"

"Yes, I did away with the outside borders thirty years ago, covering the space with glass, and using scantlings for rafters. I suppose the entire cost of the buildings which I put up on the space did not exceed £40. Neither fresh rafters nor paint were used, and the cost of keeping them up does not exceed half a crown a year. They are a hundred feet long and fifteen feet wide. On the stages, Tomatoes and Strawberries are grown, and afterwards the Chrysanthemums come in, the Tomatoes being then turned longitudinally, in order not to shade the Chrysanthemums. Returning to Grapes, I am rather fond of growing the varieties separately—in fact, there are some which should always be cultivated alone. Hamburgh and Madresfield Court should never be grown in the same house."

Points in Grape Culture.

"That is to say, they require different conditions?"

"Precisely. The conditions which suit Hamburgh cause Madresfield Court to crack. I have seen them growing together, and the Madresfield Court were splitting because the variety would not stand the same amount of moisture which is necessary to the growth of Hamburgh. I crop Madresfield Court heavily every year, and I never have any split Grapes. Another point you may like to mention is that I always find moderate-sized bunches of Grapes the most useful."

"Do you root-prune much?"

"I root-pruned the whole of these last year, and, as you see, they have quite recovered the check. The border is very shallow, not more than eighteen inches deep. By the way, we have just been experimenting with Canon Hall Muscat, and I think I can set it as well as Muscat of Alexandria. In front of these Vineries we grow early Chrysanthemums, putting a mat across to protect them. By this means, the wall being warm, we begin to cut flowers in September, and continue until January."

"When do you begin to pick Peaches?"

"In April. Before we discuss the Peaches, I may point out that we plant the transverse way, starting with the earliest variety at one end, and continue to the other with a succession of varieties, Fig trees being planted on the back wall."

"What are the principles of the building?"

"The dry glazing method was adopted. We built the houses ourselves. The squares of glass, which are all of one size, and can be glazed on the inside if necessary (though, as you can see, we do not glaze), are supported by two copper clips. There are three trees planted on each trellis. We started with one, then tried two, found that both did as well as a single tree, and so went on to three. The primary advantage of this system over the longitudinal is that we get six times as much space for the trees, and, therefore, a far greater quantity and variety of fruit."

"What are the varieties grown in the first house?"

"Cardinal, Lord Napier and Early Rivers' Nectarines, and Royal George, Hale's Early, Waterloo, Amsden June, Grosse Mignonne, and Alexandra Noblesse Peaches. You will notice that they fruit right down to the bottom."

"How do you manage it?"

"It is simply a question of pruning and pinching."

"You grow Vines in the same range, I see."

"Yes, this is the late Vinery, in which we grow Lady Downe's Seedling. The other varieties are Gros Colmar, Alicante, and Mrs. Pince. Mrs. Pince is also grown in the next house; it is a good Grape for late use. Diamond Jubilee and Gros Colmar are grown on the back, and, seeing that, like Mrs. Pince, they were root-pruned last year, we are getting some very good crops, the bunches weighing about three pounds."

"What varieties of Peaches are in the last house?"

"Dymond, Barrington, Condor, Royal George, Violette Hative, Princess of Wales, and Duchess of Cornwall. The Nectarines are Pineapple, Humboldt, and Victoria. The four varieties of Figs are St. John's, White Marseilles, Negro Largo, and Brown Turkey, known in earlier days as Lee's Perpetual."

Houses, Ancient and Modern.

"Your Rose-houses are very much less modern than some of your fruit-houses."

"Yes, they were built a hundred and twenty years ago, and the wood of each of the fruit houses is still sound. We have Roses for cutting all through the winter, the varieties being chiefly Niphetos, Souvenir d'un Ami, L'Idéal, and Maréchal Niel. A number of Figs (in pots) are grown in these houses, the varieties, in addition to those already named, being Pingo de Mel, Grosse Verte, Col de Signora Bianca, and Bourjassotte Grisse. By way of contrast to these venerable houses, you will notice the Orchid houses, built four years ago on the same principle as the fruit houses we have just been inspecting. This is the first time that Orchids have been grown under such conditions."

"And you find they do well?"

"We are quite satisfied with the results thus far, and you can judge for yourself by some of those in flower that the system suits them. The varieties include Cattleyas, Cymbidiums, Cœlogynes, Oncidiums, Lælias, Lælia anceps in baskets, and Vanda cœrulea, just imported. Amongst those in flower are Cattleya Mendelii, Mossiæ, Warneri, Lælio-Cattleya Empress Frederick, Lælias grandis, g. tenebrosa, Lælia purpurata, and Oncidium sarcodes. The whole range of houses is connected by a corridor, and we are now entering a forcing house, the pipes of which are covered with a screen, Ferns being planted along the pathway. Begonias (President Carnot) are planted to go across the roof; in winter we put the Gloire de Lorraine in little pans among the Carnot, and a very brilliant effect is produced. The Gladioli now in flower here are Colvillei, Colvillei alba, and Blushing Bride."

"Then you have a house reserved, apparently, for Dendrobiums?"

"For Dendrobiums and other Indian Orchids. You will observe that in these new Orchid houses we get ventilation from underneath the pipes in the middle, as well as at the sides. It is a distinct advantage that the plants do not get any coddling. This system was condemned when I started, on the ground that the air would be too rarified. My experience is that the plants get all the moisture they require, and that care is needed mainly in respect to shading. The Dendrobiums now in flower are Bensoniæ and primulinum. D. Dalhousieanum is just going out of flower, but was in bloom a fortnight since."

Carnations and Violets.

"Do you go in largely for Carnations?"

"We have them in the house all through the winter, and continue out of doors. The best Tree varieties are Winter Cheer, Enchantress, Harlowarden, and Lieutenant Peary. The Malmaison include Maggie Hodgson, Calypso, Duchess of Westminster, Princess of Wales, and Mercia. We go in for the sweet-scented varieties. Outside, in the frames, Violets are grown largely, and we are able to gather flowers from September to June. Marie Louise is still the favourite, but we also grow Admiral Avellan, King of Violets, Princess of Wales, and other varieties. A batch of Roses, occupying a third of an acre, chiefly of the Tea section, are grown for cutting, and you may like to mention that the Canadian Rice, with grass-like flowers, seeds itself, and comes up each year."

"Challis Fruit Arcades."

Proceeding outside, Mr. Challis said:—

"I am a great believer in the protection of fruit, and, bearing in mind the nature of our climate, I do not think that the importance of this is anything like sufficiently realised."

"You protect all your wall fruit, I see."

"Yes, the system is carried through the garden, and applies to Pears, Apricots, Peaches, Plums, Nectarines, and Cherries. There is a coping of glass, and, as you perceive, I make use of the supports to grow another set of fruit in the border. The trees on the walls do better, but the other trees yield quantities of later fruit, and give a longer succession. Over the supports, galvanised zinc netting is used. When the fruit is ripe, we can lock it up. Two or three ½-in. nets are suspended over the wire netting, to protect the trees from frosts; these are taken off early in June. The protected fruit walls are named the 'Challis Fruit Arcades.'"

"The crop of Cherries seems especially good. What are the varieties?"

"May Duke, Black Tartarian, The Noble, Late Duke, Belle d'Orleans, and Bigarreau de Schreken. Apricots are the most difficult to grow under these conditions. I have tried the protected border system for seven years, and am quite satisfied that it was worth adopting, and is worth preserving. I am afraid that there is only time to add that we have a complete system of watering. A boy can water each quarter in the kitchen garden in a couple of hours, if necessary."

Alfred Wilcox.

Letters from a Lady Gardener.

No. 277.—RHUBARBS AND PANCRATIUMS.

Dear Kate,—Do you grow Burbank's Winter Rhubarb? We find it most useful at this time of year, as a change from Apples and Pears, for it starts its fresh growth in October, and continues to throw up stalks until the spring, when, of course, it is easy to get ordinary Rhubarb. Dr. Luther Burbank has been most successful in his work of hybridising various plants, but I think no one of his late introductions excels this new Rhubarb in practical value. It was, I believe, obtained by hybridising the seed of the Australian wild Rhubarb (a poor, thin-stalked thing) with pollen from a fine, cultivated Rhubarb, and the result is a plant which, although its stalks are not so thick as those of our finest varieties, is large enough for ordinary purposes, stews well, and is of good colour and flavour, besides which it retains its Antipodean dates of starting into growth. It is not, however, quite hardy, needing some slight protection in winter to ensure its safety from frost; this can be given by covering it with a frame, around which leaves can be heaped, and a mat should be thrown over the glass at night, although plenty of air is necessary during the daytime. Another plan, suitable for a single plant, is to place a wooden box or a small barrel (with the ends out) over it, surrounding this with leaves (for these give a slight but steady warmth as they ferment), and taking off the wooden covering every day (unless the frost is severe) for a few hours. A close, dark atmosphere is apt to bring mildew in its train, and must be avoided; yet we don't want the frost, and you will need care and judgment in sheltering this plant, adding a mat over the round wooden top, if necessary.

Rhubarb of all kinds are very hungry plants, needing plenty of feeding, which is easily explained when we consider their quick growth, large foliage, and the fact that we are constantly depriving them of their substance. The soil in which Rhubarb is planted can scarcely be too rich, and a mulch of manure should be laid around their roots just as they start their growths, *i.e.*, in September for Burbank's Winter Rhubarb, and in the early spring for other varieties.

A Good Forcing Variety.

An excellent Rhubarb for forcing is Laxton's Bedford Scarlet. It is naturally so early in growth that it is easy to obtain new stalks in January, with a little warmth. Fresh stable manure can be used to give this, at the end of November, first covering the root with a box or barrel, as it does not do to shut in new manure with the young growths. The stalks of this Rhubarb are very large, and excellent for cooking, and so are those of the Sutton Rhubarb; and Champagne Rhubarb, which quickly follows the earliest, has, perhaps, the finest flavour of any, but the stalks are not quite so large. The Victoria Rhubarb, a later spring variety, is the largest of all, but the stalks are neither so red nor so finely flavoured as the rest; it is, however, useful for preserving, and for use when the other kinds are over.

Rhubarb must not be forced every season, or it soon deteriorates; it is a good plan to have two separate plantations of it, and to give each a rest every alternate year. Another mistake is to continue to pull the stalks too long, and also to pull them before the leaf is fully expanded. Like everything else in garden work, it needs plenty of consideration to determine which leaves and how many of them should be pulled. If the plant be deprived of most of its young growth at one time, it will be seriously weakened, but a few fully-expanded stalks may safely be taken, allowing it to retain the central growths, and some of the rest. Clumps of strong roots of Rhubarb can, of course, be taken up now, and forced in a dark warm place, for early work, and you can buy them for this purpose. But they are not of much use after this process for two or three years. They should be planted out in the spring, and, if not forced again, will recover their strength in time. You can also plant Rhubarb in the open ground now, but you must not pull its leaves next spring, as it needs a year's rest after moving, in which to grow strong. Burbank's Rhubarb, however, cannot be moved now, as it is in full growth, but you should get young plants in April, which will then give you a crop the following autumn. But be sure to plant them in very rich soil, and keep them watered until they have taken to it thoroughly.

Pancratium fragrans.

Fairy Lilies.

I think the Pancratiums are amongst the finest of the Amaryllids, and they well deserve their title of Fairy Lilies. They are not often seen, unfortunately, and yet they are very easily managed—in fact, they like to be left alone, as most of the other Amaryllids do. They only need good loam and charcoal in small lumps, as soil, and, when in large pots, should not be repotted every year; and although they should never be so dry as to make the foliage droop, the evergreen varieties do not require much water after flowering, and are almost dormant in winter. Like all the Amaryllis family, they should be shaken out and repotted (if necessary) just as they show signs of starting fresh growth, after which they will need more water (always giving it in a tepid state), and should have a top-dressing of rich soil, unless they have been repotted, when this will not be required.

The king of them all is Hymenocallis Macrostephana, which blossoms in November, and has been most beautiful in the conservatory lately. It is reckoned amongst the hothouse varieties, but is not very delicate, only needing a minimum temperature of fifty degrees in winter. A commoner Pancratium is P. fragrans, and this variety is still more hardy, doing well in an ordinary greenhouse, free from frost. Its flowers, like those of H. Macrostephana, are in the purest white, fringed, and very elegant, but not nearly so large nor so deeply cupped as those of H. Macrostephana. Each bloom of this variety measures eight inches across, and as there are about a dozen of them on one stalk, their effect is grand. The Sea Daffodil, Pancratium (syn. Ismene) calathinum, is another good kind, but it only produces two flowers on the stem. Pancratium maritimum (which grows in such abundance on the shores of the Mediterranean and in Corsica) is nearly hardy and very beautiful, doing best against a south wall, where it can get well roasted with sunshine in the summer. But it should have good drainage, light soil, and the protection of a pane of glass, or a small frame light, raised over its bulbs in winter, to keep it fairly dry and free from severe frost, and the bulbs should be covered with ashes to the depth of three inches, taking these away in April, and substituting a little rich soil for them, over the roots.

A Curious Variety.

Pancratium viridiflorum is a curious variety with white flowers, centred with green. This bulb sheds its leaves after flowering, in the way of the Daffodils, whilst the more delicate varieties retain their foliage, which takes a long time to ripen away, and only disappears just as the fresh growths appear. All these Pancratiums are worth more attention than they receive, and most of them can be grown without great heat.

About this time of year a number of greenhouse plants begin their winter rest, needing but little water until spring comes again. In this category are the Phyllocacti, which need to be kept cool, as well as nearly dry, until the end of February. They are excellent window plants, and often flower better in a cottage window than in a greenhouse, where they are apt to get too much warmth and water in winter. They are natives of Africa, growing on the sides of the rapid mountain streams of that continent, which dry up completely during the hottest weather, and so give rest to the succulent plants which grow near them, until the rains come again, bringing down with them

THE GARDENS AT DERBY LODGE, SUNBURY, MIDDLESEX.

AS everyone acquainted with the course of the Thames knows, Sunbury is on the banks of the river. But Derby Lodge, the residence of Mr. E. R. W. Bennett, is a charming country house, occupied by its owner all the year, and not merely during the boating season. The gardens, which, by the courtesy of the owner, I visited late in September, are not on a large scale. It will be seen, however, that they possess several features of interest, and that in the hands of Mr. Chant, who has charge of both the gardens and the farm (which forms a part of the property), they are turned to the best possible account. A striking feature which arrested my attention as soon as I entered the pleasure grounds was in the form, as it appeared in the distance, of a mass of scarlet and green in a raised bed, the effect being brilliantly successful. But, as Mr. Chant promptly informed me, the bed was not raised.

Salvias in Masses.

"It is quite level," he said, as we approached nearer, and then I saw that the contents consisted chiefly of Salvias, of quite unusual height, with magnificent trusses of flowers.

"The height of some of the plants," said Mr. Chant, "is three feet six inches, and many of the trusses are eight inches in length."

"How do you manage to get such a fine show?"

"The situation is, of course, a great help. It is south, and Salvias rejoice in the sun. The bed certainly looks as if it had been raised, and its size helps to confirm the illusion. It is eighteen feet across, and contains about three dozen plants."

"What is the variety?"

"Sutton's Fireball. I consider it to be an improvement on Glory of Zurich, both because of the blooms, and the foliage, which for cleanness could hardly be excelled. I have grown it for several seasons. My system is to throw the old plants away, and strike cuttings in the autumn. The Salvias have been in flower since July 1st, and the dot plants in the bed are Grevillea robusta and Abutilon Thompsonii, with an edging of Centaurea candidissima."

"But for the Salvias, the bed of Paul Crampel would be the most conspicuous feature on the lawns."

"Yes, I think that Paul Crampel is the best scarlet Geranium for bedding purposes. In addition to an edging of Centaureas, there is a double row of Echeverias."

"And Kochias as dot plants, which add materially to the effect of the beds."

"The effect in the original colour is the more pleasing in combination with Paul Crampel, but the change to crimson in the late summer is not unwelcome."

"Are they difficult to grow?"

"Not at all. I raise them from seed in March, grow in moderate heat, and plant out the first week in June. After that they only require to be staked, and clipped, though this year the clipping meant cutting them back to keep them in bounds. The dimensions of this bed are forty-two feet by twenty-four. Next to scarlet, pink is our most favoured colour, and the bed adjacent is filled with pink Begonias, edged with Centaureas, and dotted with Grevillea and Cordyline australis."

The Predominance of Pink.

"Then, there is a bed mainly composed of Nicotianas?"

DERBY LODGE, SUNBURY.

"Sutton's Hybrids, which are raised early in the spring, potted, and hardened off. The edging is Geranium West Brighton Gem, which does very well. Pink is again to the fore in the bed of Fuchsias Mrs. Marshall, edged with Violas Yellow Prince. There is a predominance of pink, too, in the bed chiefly occupied by Verbena Miss Willmott, edged with Begonia Fairy Queen. Scarlet again prevails in a bed of fibrous-rooted Begonias, and in a bed of Stocks."

"I should like to have an idea of your spring bedding."

"The bed of Paul Crampel will be filled in spring with Polyanthus, and Tulip Keizerskroon; that of pink Begonias with Viola Bridal Morn, and Tulip Yellow Prince—mauve and yellow. The Violas begin to flower at the end of March."

"How do you occupy the great Salvia bed?"

"With Tulip Cottage Maid; the Nicotiana bed with Wallflower Cloth of Gold; the Stock bed with Tulip Cottage Maid; and the Verbena bed and the scarlet Begonia bed with Wallflower Blood-red."

"The Roses also contribute largely to the decoration of the lawns?"

"There are about four dozen standards, and the rest are bushes, the most valuable of the latter being Frau Karl Druschki, Richmond, and the Lyon. Druschki is also useful as a standard, the others being Ulrich Brunner, Ben Cant, and Hugh Dickson. Of course, the Rose bed is not planted for spring, but in the bed of shrubs at one end of the lawns, containing Azalea mollis, Rhododendrons, Skimmias, Olearia Haastii, and Veronica Traversii, we have earlier in the season Spanish Iris."

Shrubs and Specimen Trees.

"Then, you have a bed composed exclusively of Rhododendrons facing the summerhouse."

"They are all named varieties, and do extremely well, but we have to put peat and loam in the soil, which is naturally light and sandy."

"Which do you consider the best specimen trees?"

"One of the finest is the Plane near the entrance, and amongst others is the Cupressus gigantea close to us, very erect and about fifty feet high. Cupressus Lawsoniana, Araucarias, and Pines find the soil congenial. As you can judge by the belt of trees on one side of the bowling green, we get as much shade as we require. The wall opposite is entirely covered with Ivy."

"Giving the bowling green a very pretty appearance. You have rather a nice combination in the border under the dining-room window," I remarked, as we paused to look at the house.

"It is made up of Geraniums, Mrs. Martin and Black Douglas, grown for foliage only, with, for edging, Echeverias and Lobelias. In spring we use blue and white Hyacinths. The house itself is considered very ornamental, and we only use climbing Roses as creepers, making rather a feature on the terrace outside of standard Fuchsias in Oak tubs, with a number of Agapanthus umbellatus."

Next, with a glance round the well-kept tennis and croquet lawns, we made our way to the north front. Here, there is a charming grass walk from the house, with standard Roses on either side, and a delightful corner of Ferns, underneath the Roses being a border of pink Antirrhinums. Close to the walk was a large bed of Zinnias of every variety of colour, pink again predominating.

"And in spring, too," said Mr. Chant, "pink predominates in this bed, the Tulips used being Cottage Maid. Now we come to a part of the garden which is in course of transformation. The long walk with herbaceous plants on either side will next year be a Rosery, with bushes, half-standards, and dwarfs, on either side, and standard weeping Roses at the back. The standards grown on either side, which are already in evidence, comprise Hiawatha, Lady Gay, Killarney, Gruss an Teplitz, and Climbing Devoniensis. We shall continue to grow fruit on the kitchen garden wall. The borders are about forty yards long, and we hope that the result of our plans will be quite a representative Rosery, with the end clearly marked out by a magnificent specimen of Cedar of Lebanon. Roses do quite as well in the north as in any other aspect."

"This, I conclude, disposes of your flower bedding?"

"Scarcely," rejoined Mr. Chant, as we strolled across the south lawns to a delightful orchard, adorned by a herbaceous border of considerable dimensions, the principal varieties being Sun-

Digitized by Google Original from CORNELL UNIVERSITY

flowers and Michaelmas Daisies at the back, with a line of Pæonies, Spiræas, and Cannas, and in front salmon-pink and White Queen Antirrhinums, with an edging of Pinks, Mrs. Sinkins."

"Your fruit here is chiefly Apples?"

"Yes, and all standards. They were planted a long time ago, but include a number of trees of Cox's Orange Pippin. We do not grow anything under the Apples, because, in my experience, the ground will only do justice to one crop. Next to this is the new orchard, which was only planted four years ago, and here, again, the varieties are only standards."

"You find that they crop satisfactorily?"

"We have had very good crops hitherto, and the flavour of Apples grown as standards is certainly quite equal to any grown as cordons or pyramids. The varieties here are principally Cox's Orange, Lane's Prince Albert, Bismarck, Gascoigne's Scarlet, Emperor Alexander, Peasgood's Nonsuch, Charles Ross, Cellini, Cox's Pomona, Mannington Pearmain, and Warner's King."

"What are your varieties of Pears in a double row of pyramids, with Red and White Currants at the end?"

"Doyenne du Comice, Durondeau, Clapp's Favourite, Pitmaston Duchess, and Beurre Diel. Just behind the Pears is a wall of Runner Beans."

"And you are picking them still?"

"I have been picking since the middle of June, and they will last until cut down by the frost. I have picked plenty of them a foot long, and have not had any of them stringy. The secret of good Runner Beans is deep cultivation; in fact, that is the secret of most successful vegetable cultivation."

"You go in largely for vegetables?"

"Well, we have three gardens in which they are grown in quantity. In the piece of ground beyond this orchard, Broccoli, Kale, Spinach, Winter Turnips, and Brussels Sprouts occupy a good deal of space."

Asparagus and Late Cutting.

"How old is your Asparagus bed?"

"Quite twenty years, and we still get very good crops from it. A very important point in Asparagus cultivation is not to cut late. I seldom cut after the beginning of June. I have known in many cases beds utterly ruined by late cutting. Between the rows of Celery—Solid White and Major Clark (red)—we grow Lettuce, and elsewhere Leeks, but the latter do not like dry and hot weather. A portion of this plot is utilised for Black Currants, Boskoop Giant, from which we get very good crops, exempt, so far, from the dreadful pest. But now we enter the original walled kitchen garden, which also contains the glasshouses."

"I suppose your flowering house will be filled during the ensuing months with Chrysanthemums?"

"Practically. We grow about two hundred. At present the house contains two or three dozen Impatiens Holstii, whose scarlet flowers are very acceptable; Zonal Pelargoniums, of which the Rev. Dr. Morris, Beauty of Kent, King of Denmark, and Turtle's Surprise (a good double scarlet), are the best; and Primulas of various sections, sinensis being, in my opinion, the best, as it is the most compact."

"How old is your Vinery?"

"Quite forty years. The varieties are Muscat of Alexandria, Black Hamburgh, and Black Alicante."

"But the feature of your Vinery at the present moment is the collection of Gloxinias, which I believe you have shown with much success."

"I have exhibited them three times at Richmond, winning respectively second once, first twice, and gold medal. About eighty plants are grown, and all shades of colour are represented."

The Treatment of Gloxinias.

"It is not only the flowers, but the wonderful leaves which render them particularly striking."

"The leaves are fifteen inches in length and thirteen in width. I usually grow about eighty plants."

"Do you care to tell me how you treat them?"

"I usually start them on February 10th, in about sixty degrees of heat. I put them in boxes in cocoanut fibre, and keep them well syringed until they have made good growth. They are then transferred to their flowering pots, the compost used being one part each of good wood ashes, dried cow droppings, and peat; also three pounds of bonemeal, and four bushels of good loam. The syringe is kept going every bright day until the buds begin to show, and then the floors and the stage are kept damp by the use of the water-can."

SPRING BEDDING AT DERBY LODGE, SUNBURY.

"Is there anything notable in the stove house?"

"Its age is rather notable, for it dates back fifty-six years, and still answers its purpose admirably. The Allamanda Hendersonii on the wall was struck as a cutting five years ago, and gives plenty of bloom. The stage is chiefly filled with Crotons and Dracænas, of one division, the other being devoted to Begonia Gloire de Lorraine, Streptocarpus, and more Crotons. We shall finish with the Carnation house."

"In which also you grow Tomatoes?"

"The only variety of Tomato is Best of All, which I have grown for about five years. I have fruit weighing half a pound each, and it is good not only in size and appearance, but also in flavour. We have a long Carnation season. One of the favourite Trees is May Day, a very light pink, and the others are Britannia, Winsor, White Perfection, White Enchantress, Mrs. Burnett, Mrs. W. Riley, and Fortuna. Of Malmaisons, we have only a few, the varieties being Thora, Churchwarden, H. J. Jones, King Oscar, Sault, and Lady Grimston. But I vastly prefer Trees. You can cut more from one plant of a Tree than from five or six Malmaisons."

"I should like to know something about your Sweet Peas."

"The varieties are selected entirely because of their value for cutting. They are Dorothy Eckford, Gladys Unwin, King Edward VII., Clara Curtis, Countess Spencer, Etta Dyke, Helen Lewis, Chrissie Unwin, America Spencer, Evelyn Hemus, George Herbert, Mrs. Charles Foster, Sunproof Crimson, Paradise Ivory, Mrs. Henry Bell, and Constance Oliver."

"You have some fine fruit on your walls?"

"Not only is it fine, but we gather Peaches, Princess of Wales, as late as October. This year we have had a splendid crop. The varieties are Early Rivers, Royal George, Condor, and Nectarine Stanwick Elruge. The Peaches are protected at the top of the high wall by coping, which keeps the rain off, and saves the fruit from a good deal of damage."

"I see that you have a standard Pear tree laden with fruit of extraordinary size, including a cluster of six enormous fruits."

"The variety is Uvedale St. Germain, which always crops well. Kept late, it is a very fine stewing Pear. As to other hardy fruit, Plums and Morello Cherries do well on a north wall, and a plantation of Gooseberries yields an enormous crop. The fruit is all stored in a room which was formerly an ice-house, and which is always cool in summer and warm in winter. The Potatoes are housed below in the same building, the varieties being Factor, Up-to-Date, and May Queen."

"How long have you been in charge of the gardens, Mr. Chant?"

"Fourteen years. For the first nine my employer was Mr. John Fletcher, who owned the property for fifty years. For the last five it has belonged to Mr. and Mrs. Bennett, who take the keenest interest in their gardens, and have made many improvements. Before I came here, I was foreman for eight years at Claremont, and previously I was at Melksham Court, Hampshire. So it cannot be said that I have been a rolling stone."

ALFRED WILCOX.

NEXT week the gardens at The Grange, Askham Richard, Yorkshire, will be described.

TOMATOES IN FRAMES.

GROWING Tomatoes in frames is a common practice where a house is not available. Most of those who so cultivate them plant near the front of the frame, and train the stems, on wires or otherwise, from front to back beneath the glass. Without dwelling on details of comparison, another method may be put forward as having advantages.

Where the frame is backed by a wall of some five feet, or over, the young plants are put in close to the wall, that is, six inches to one foot from the wall, and allowed to grow upright, with such support as may be necessary, till they touch the glass. The lights are then drawn down a few inches, and the tops of the Tomato plants brought above the frame, and secured to the wall as they grow.

The frame should be of sufficient depth to

SOUTH SIDE OF ORCHARDS, EAST GRINSTEAD.

THE SUNK GARDEN AT ORCHARDS.

The Gardens at Orchards, East Grinstead.

TWO miles from East Grinstead, in the heart of the loveliest English scenery, there has been built and laid out during the last four years, a delightful country house, with a setting of a series of gardens already most fascinating, and affording promises of richer developments. The residence of Mr. and Mrs. Leonard F. Harrison, Orchards, is situated on high ground four hundred and fifty feet above sea level, on the borders of Sussex and Surrey, commanding on one side a fine view of Crowborough, while all round the attractions of the prospect are enhanced by the charms of Ashdown Forest. The whole of the district is well wooded, and the numbers of magnificent Oaks constitute a feature of the landscape. The pleasure grounds are nearly a quarter of a mile long, and the gardens cover about ten acres, of which every corner has been turned to good account. My visit was paid at the end of January, in inauspicious weather, and Mr. Chapman, who has been in charge of the gardens from the outset, expressed his regret that I had not chosen a later period. But there was not the slightest difficulty in realising the wonder of the work which has been accomplished, with the result that Orchards to-day, in most modern dress, will bear comparison with demesnes which date back for many decades. It is at once apparent that skill and sound judgment have been exercised in making the most of the conditions, and great credit is due to the designer, Mr. E. T. Lingwood, of Saxmundham. The mansion, which is of fine proportions, is adorned by a representative collection of creepers. The formal water, enclosed by a Yew hedge, contains a number of good varieties of Nymphæas, and the banks are ornamented by Rushes. The Lilies in the water are chiefly Frœbelli gloriosa, James Brydon, Marliacea chromatella and M. carnea, W. Falconer, alba, and odorata sulphurea grandiflora.

THE ROSE GARDEN.

"One of your great features," I remarked to Mr. Chapman, "is the rosery on the other side of the drive?"

"Yes; there is nothing of greater interest. But it was only made three years ago, and therefore must still be reckoned as in process of development. The length is one hundred and twenty feet and the width sixty feet. The pergola, which runs up each side, consists chiefly of Roses, but they are interspersed with Wistarias and Clematis. As to the beds, there are nine containing one variety only, the respective contents being, Madame Abel Chatenay, Madame Ravary, Le Progres, Mrs. W. J. Grant, Liberty, Richmond, Lady Ashtown, Elizabeth Barnes, and Lady Battersea. The mixed beds include Marie Baumann, Ulrich Brunner, Hugh Dickson, and Frau Karl Druschki; and Caroline Testout supplies a length of pink on each side of the Rose garden. The number of plants is quite a hundred and fifty. The paving is laid down in broken pieces quite informally, and, in fact, there is nothing conventional about the rosery. The temple at the end is already an interesting piece of architecture, and when the walls are clothed with creepers, will be of a highly decorative character."

"Are there any favourite colours?"

THE PERGOLA AT ORCHARDS, EAST GRINSTEAD.

A CORNER IN THE ROCK GARDEN AT ORCHARDS.

Digitized by Google Original from CORNELL UNIVERSITY

"You may judge by the prominence of Caroline Testout and Madame Abel Chatenay that pink is one of the favourite colours. Yellow and crimson are also much appreciated, and the beds at the top consist exclusively of white Roses. The natural soil was sandy clay, which was very difficult to treat, but when we added some good loam and manure, it made rapid progress. The best show of Roses is, of course, at the end of June and the beginning of July, but the varieties on the pergola give a succession of blooms right into the autumn."

THE AUTUMN GARDEN.

"Close to the Rose garden is a later addition, the autumn garden, which is approached by a flight of steps, has a dry wall three feet high filled in with Alpines, and a Lavender hedge running along the top one hundred and twenty feet long. The Lavender does well on the sandy soil. Heleniums are grown in clumps; Michaelmas Daisies are largely used in the beds. One long, narrow bed is filled in the spring with Canterbury Bells and a few early-flowering annuals, and in the autumn with Chrysanthemums. But the most striking show in the autumn garden is made by Dahlias. Nearly all varieties of the Cactus section are represented, and far into November last year we obtained a bright display of crimson, yellow, white, and pink.

"The autumn garden is divided from the sunk garden by the long summer-house. A nice collection of pigeons form a picturesque feature at this stage. Underneath the summer-house are China Roses and Lavender in combination. On the same level is a bed with Spanish and English Iris in the centre, and at the back are Delphiniums and Liliums. In the sunk garden with a fountain in the centre are large clumps of Rosemary, different varieties of German Iris, Pæonies, and Statice latifolia. Here, in the spring, are numerous early-flowering and Darwin Tulips, followed by Pentstemons, Salpiglossis, Ten-week Stocks, and other half-hardy annuals, all grown in large clumps about level with the wall. The tall-growing varieties are not used.

"In the adjoining shrubbery, which is approached by a little terrace, the feature is a half-circle border, maintained by a dry wall about two feet high planted with Alpines. In the half-circle border is a collection of flowering shrubs, embracing most of the best species."

MR. CHAPMAN.

THE DUTCH GARDEN.

Passing by another little summer-house we proceeded down steps to the principal lawn. On the right hand side is the Dutch garden, which was added two years ago.

"This," said Mr. Chapman, "is quite formal, the garden being raised off the lawn and paved inside with stone put up on edge all round. The spring bedding consists of Narcissus poeticus, Tulips in variety, Myosotis, and Violas. The long border is filled in at the back with Gypsophila paniculata, planted in between with Tulips Cottage Maid in the spring, pink Gladiolus America taking their place later on. Two of the beds are filled out with blue and white Nemesias, and pale pink Phlox, and two others with Arctotis grandis, interspersed with Lobelia ramosa, edged with blue Pimpernel. The Arctotis is a West African plant resembling a Daisy, with a blue disc, a mauve back, and a white shade of foliage. For decorative purposes many hardy annuals are employed, one of the most beautiful being Phacelia campanularia. It is a lovely shade of blue. We grow a certain number in pots for its colour, but we grow it on generally as a hardy annual. On the extreme left side of the terrace, the garden is entirely given up to annuals."

THE ROCKERY.

"Now we come to the rockery, which was only made last year. It is on the site of an old clay pit, except the flat part on the top, which is part of an old orchard. Before we could start, we had to clear the top spit from the clay pit right away, and to make the pond at the bottom."

"You have succeeded wonderfully well, for the rockery conveys the impression of considerably greater age than twelve months. What position does it occupy?"

"It faces south-east on one side and north the other. The collection of Alpines is a large one, and includes most of the choice varieties, which are nearly all doing well, though it is rather too soon to judge. The rockery covers about a quarter of an acre. Its position is very fine, and the general appearance I think effective, and there is a pretty waterfall which flows into the pond at the bottom. On the side of the stream are quantities of Primulas, all of which are flourishing. I raised them from seed, and have never had any difficulty in growing them. The outskirts of the shrubbery consist in the main of flowering shrubs."

THE WILD GARDEN.

From the rockery we approach the wild garden, with its flowering shrubs and ornamental water, the banks of which are clothed in spring with Daffodils, Primroses, and Bluebells. One of the features is a bog bed, with Senecios, Lythrums, Epilobiums, Gunneras with some very fine leaves, and the common Yellow Iris. On the banks of the pond, in which are Lilies and a number of goldfish, are Japanese Iris, Osmunda Ferns, and a general collection of water plants. Bamboos and Spiræas are doing exceedingly well in the copse."

HERBACEOUS BORDERS.

"What is the extent of the kitchen garden?" I enquired, as we entered an enclosure with houses running the whole length of the end, with a high wall behind.

"About an acre inside. Considering that in 1910 it was a rough field, we have not, I think, done amiss with the various departments of the kitchen garden. To take the artistic features first, the herbaceous borders, with a grass walk nine feet wide, run the whole length of the garden. They are eight feet wide, and are backed by a wooden fence clothed with Roses and Clematis. The borders are planted so as to provide a succession of blooms from March until the frost cuts them down."

"Do you go in largely for Sweet Peas?"

"Yes, they are grown in quantity, so as to furnish a plentiful supply of blooms from early summer right into the autumn. We sow the first batch in October, the second in February, and the third outside in April.

"All round the paths and borders in front of the glasshouses, flowers are grown for cutting, Border Carnations and Antirrhinums being two of the features. The frames are used chiefly for Violets, which do remarkably well, and are afterwards used for bedding-out stuff. The Chrysanthemums are chiefly Singles. In showing these we have been most successful. In 1912 we won three Awards of Merit with Miss M. Borrer, Leonard Harrison, and Michael Harrison, which were raised here; and at East Grinstead last year we took three firsts and two third prizes out of six entries for Chrysanthemums, which were not really grown for exhibition purposes.

"Most vegetables do extremely well, especially Peas, Celery and Onions, which took second prize at East Grinstead last season. The various tribes of Brassicas thrive on the stiff, sandy clay soil, and the Asparagus beds look very promising for the coming season.

"Two favourite Melons here are Ringleader and a seedling, a cross between Ringleader and Hero of Lockinge, raised here. Messrs. Sutton and Sons have kindly included the latter in their trials for 1914."

MR. CHAPMAN'S CAREER.

"In conclusion, I should like to have a few particulars of your own career."

"I was practically brought up in the garden, with my father, who is a gardener, whom I left when sixteen years of age. Since then I have lived in several counties. This is my first situation as head gardener. Previously I was foreman for six years at The Hollies, Weybridge. I am very fond of gardening, and take a great interest in anything connected with it."

Alfred Wilcox.

Digitized by Google Original from CORNELL UNIVERSITY

thousand seedlings raised from the seed, all were destroyed except one, and this hybrid, a very handsome one, is now on the market under the name of Lady Dixon. Now that a beginning has been made, we shall probably hear of others. The Pink can also be crossed with the Sweet William, though, so far, no very remarkable hybrids have been produced in this way. So little is known about the conditions that, in most cases, it is practically impossible to say beforehand whether one plant can or cannot be fertilised with pollen from another of the same family. The only way to test the question is by experiment, and even that may not be conclusive, for it is impossible to prove a general negative. The shrubby Begonia, it was supposed until recently, could not be crossed with the tuberous, and then Messrs. Veitch succeeded in doing it, fertilising one of the latter with pollen from B. Socotrana, a very handsome race being the result—witness, Mrs. Heal.

Mr. J. Charlton.

July 20th.—I have alluded to the fact that the blue tit serves a useful purpose in the garden by keeping down woolly aphis. The fact is worth emphasising, for many persons regard this pretty little bird as a very destructive one, and do all in their power to drive it away. That it sometimes pecks off the buds must be admitted, but if an opportunity of examining them occurs, it will almost invariably be found that they contain insects. All the tits are insect feeders, and it is very rarely that they show any disposition to vary their diet. There is, however, one thing that they cannot resist—the seeds of the Sunflower. So if there is any fear that they may attack the fruit—and it is alleged that they sometimes make small holes at the base of Apples and Pears—it may easily be protected by growing some Sunflowers near. In any case, the good these birds do in a garden far outweighs the harm. As the result of close observation, it has been found that both the blue tit and the great tit feed their young on nothing but grubs, caterpillars and other insects, and the number a pair can destroy in the course of a season must be enormous. Late in autumn and in winter, when insects are scarce, they may turn their attention to seeds and fruit, but "so beneficial in every sense are the tits," says the Board of Agriculture, "that everything possible should be done to encourage their increase. In winter, during severe weather, they should be supplied with some food, *e.g.*, fat, acorns, or Beech Nuts." And, in spring, nesting-boxes should be arranged for them.

July 21st.—A fortnight ago I showed Rhododendrons grown in a mass; in the present illustration they are arranged as shrubbery plants, for which purpose they are far more beautiful than the common Laurels. Now that peat has been shown to be not essential to their cultivation, it is to be hoped that they will be planted much more freely than they have hitherto been.

H. C. Davidson.

Famous Gardeners at Home.

No. 199.—Mr. J. Charlton, at the Gardens, Davenham, Malvern.

Under the shadow of the Worcestershire Beacon and the Great North Hill, the two most notable of the range of Malvern Hills, is the beautiful residence of Mr. Dyson Perrins, and, by his permission, I paid a visit to Davenham early in June, in order to see the gardens. They are extensive, as well as noteworthy, and, on my arrival, Mr. Charlton, the head gardener, at once proceeded to bring to my notice some of their most interesting features.

One of these, which was only made two years ago, is a charming bank of flowers facing the asphalte tennis court, while round the court are Roses—Alister Stella Gray and Crimson Rambler. On the pretty pergola facing the pavilion are Queen Alexandra Roses, and an old stump has been turned to excellent account, being covered with Clematis montana and Crimson Rambler. Opposite are shady trees, including some excellent specimens of Copper Beech. In fact, the taste and ingenuity displayed in these arrangements quite prepared me to find much to admire at Davenham. A subway connects the three acres of kitchen garden with the seven acres of pleasure grounds, and, passing under it, after pausing to observe the careful manner in which the work was done, we came on the other side to a fine old rockery. It was made out of huge stones, and in addition to a general collection of Alpine plants, there are Japanese Maples and Bamboos.

"Bamboos," said Mr. Charlton, in reply to my inquiry, "do exceedingly well, though they require a little more water than in some places."

Here we entered the Fernery, which is remarkably handsome and well stocked. My attention was attracted at once by some fine examples of the Killarney Fern.

"Although we have some of the best specimens of Ferns," continued Mr. Charlton, "the most tender varieties will not grow here, because this is a cool Fernery, and we only just keep out the frost. There are many Tree Ferns—Dicksonia antarctica. One which has now a stem of five feet was quite small when I came, ten years ago, and I have taken out some with stems ten feet high. The varieties, which are very numerous, include Aspleniums, Davallias, Gleichenias, Lastreas, Lomarias, Nephrolepis, Pteris, Platyceriums, and Woodwardias."

Near the Fernery is a grand Weeping Beech, and in this locality I first saw one of the representatives of Japanese dogs, which came from a Japanese Temple, and are remarkably realistic. The lawns are undulating, and outside the Fernery a peep of the house and conservatory only can be had. But we stayed at this point to look at some of the numerous beds, the first being Calceolarias (Golden Gem), edged with Dactylis glomerata. Next was a very effective bed of about thirty plants of one variety of Roses—Victor Verdier—on their own roots, which, at Davenham, is found to be the better plan.

Seeing so many Roses, I asked if this part of the garden was not entitled to be called the Rosery, and Mr. Charlton said it was known as such. In the centre is a summer-house covered by Gloire de Dijon, Dundee Rambler, and Crimson Rambler; but the beds consist mainly of a single variety of Roses, standards being grown between them. Fortunately, it was not too late in the year to see a magnificent show of Tulips with lovely green foliage, and I inquired the names of the varieties in the two beds.

"The crimson Tulips are Gesneriana major, or

The Fernery at Davenham.

The assertion that this Fernery is "remarkably handsome and well stocked" is abundantly justified. In the foreground is seen a fine specimen of the Tree Fern, Dicksonia antarctica, and among other varieties are Aspleniums, Lomarias, Pteris and Nephrolepis.

spathulata; the almost blue shade is The Sultan, a late Tulip; the rose, flaked crimson and white, Summer Beauty; the white, Kate Greenaway; the rich lemon, with orange centre, Parisian Yellow; the combination of blue and mauve, a double, Blue Stag; and the golden-yellow, Double Crown."

"From whom did you get the bulbs?"

"Messrs. Smith, of Worcester. They have been in flower three weeks. Next season I shall have more, because I am so pleased with these."

"We have not yet exhausted the list?"

"No. There is La Merveille, a May-flowering Tulip, with terra-cotta flowers, also Parisian White and Sutton King. We treat them all in just the ordinary way."

"Then you have some beds of Geraniums?"

"Chiefly West Brighton Gem, edged with Alyssum maritima, and there is one bed of Henry Jacoby. The central arch has round it Begonia floribunda (rose), edged with Geranium Bijou."

Proceeding, we arrived at another rockery, and I asked when it was made.

"Only last summer, and planted in the autumn. It is on the site of an old Rose garden, and, as you see, has trees all round, with a summer-house looking on to it. The walks are made of Malvern Hill stone, crushed, and the rockery was built of the same material. The varieties planted, some of them in flower, are Primula japonica, Silene acaulis, Iberis, Veronicas in variety, Megasea crassifolia, Lychnis splendens, Alyssum saxatile, Heuchera sanguinea, many varieties of Saxifraga and Sedum, and the double white Arabis. In the pools are Water Lilies, edged with Japanese Iris."

From the new rockery we crossed over to the house, on the front of which is Ceanothus, flowering beautifully, and Ivy, while the front drive is adorned with some of the most effective of scarlet Geraniums, with fine foliage.

"The Geraniums," said Mr. Charlton, "are Malvern Beauty, and were raised by a local nurseryman—Mr. Towndrew, of Malvern Link. It is really a splendid variety, of dwarf habit, and is nearly always in flower. I find that it is one of the best for flowering in pots in winter. It never requires stopping, but breaks naturally. I have never had a Geranium which was more satisfactory."

"Another feature of the drive is the Rhododendrons?"

"Yes, we have a number of the best of the named varieties, as well as the ponticum. Rhododendrons will not do on the natural soil; it is too heavy. We have, therefore, to prepare soil, and to use peat freely."

"On the south-east front of the house I notice you have Magnolia grandiflora."

"And borders of Geranium Madame Crousse below; also near the house is a bed of Malvern Beauty, while opposite is a bed of Begonia Worthiana. Another bed contains herbaceous Poppies, Pæonies, and Wallflowers. You observe that we have pigeons in a cot, and underneath is a Japanese Pæony, white and crimson."

"The collection of Poppies on the lawn is very brilliant, and underneath the conservatory I see you have Auriculas."

"Yes, they are border varieties of one colour."

In the noble conservatory, Mr. Charlton pointed out some very thriving plants of Schizanthus, but these were quite eclipsed in splendour by a glorious mass of Calceolaria Golden Gem.

"How do you manage to grow them to such perfection?" I inquired.

"The plants are lifted from the borders in the autumn, kept in a Peach house all the winter, and they begin to flower in April, lasting more than two months, especially if they are shaded a little. I consider that we get a better return from Golden Gem Calceolarias than from anything we grow for purposes of decoration, considering their easy culture. With respect to the greenhouse Calceolarias, they are Veitch's strain of every colour, and about a hundred pots in all. There are eighty pots of the herbaceous Calceolarias."

"What was the rockwork made from?"

"Derbyshire stone. One of the stoves adjoining the conservatory, with a waterfall and mirror at the end, contains, on one side, Ferns, Pandanus, Dracænas, Crotons, and Begonias (President Carnot), while on the other is a large collection of Caladiums."

"You have more Ferns in the other stove?"

"Chiefly Maidenhair. Here there are some Gloxinias and Arums; also Begonia President Carnot on the roof. At the end is a fine show of Anthuriums, which last from two to three months."

"How many Cyclamens do you grow?"

"About two hundred seedlings. I keep the smallest of last year's bulbs, and grow them on the next year without potting. They do much better in this way than if they were repotted. We grow a quantity of Celosias, giving them just ordinary treatment. When they are further advanced they will go to the conservatory."

"Do you go in largely for Orchids?"

"No, but last year I had two pieces of Coelogyne cristata with upwards of a hundred and fifty spikes on them. There are now between twenty and thirty Miltonia vexillarium in flower; they last about six weeks. We have also some Odontoglossum citrosmum, Cypripediums, and a few Dendrobiums."

"Which do you consider the best of the Tree Carnations?"

"Mrs. Leopold de Rothschild is one of the best, and Duchess of Devonshire, C. A. Dana, and G. Pierri Ruegues (scarlet) are particularly good. We have had some very fine flowers. Fuchsias are grown on the roof. The Shah is one of the best, and The Doctor, General Greenfell, and Mrs. Todman are among other good varieties."

"You have some nice varieties of Pelargoniums."

"If I were asked to name half a dozen of the best, I should say Mrs. Coombes, Sir Victor, Murmeris, Duchess of Fife, Pilgrim, and Ethel."

"How many houses are there in all?"

"Twenty-seven, but several are in the kitchen garden close to my house. In the cool greenhouse we have four varieties of Spanish Iris—gold, pale yellow, white, and blue; also late-flowering Liliums and The Bride Gladiolus."

In the kitchen garden, which has a separate entrance, and is no less ornamental than useful, we started with the five Peach and Nectarine houses.

"The Nectarines," said Mr. Charlton, "are Early Rivers, Victoria, and Lord Napier; and the Peaches, Hale's Early, Princess of Wales, Dymond, Walburton Admirable, and Stirling Castle. We force about a thousand Royal Sovereign Strawberries on the shelves. I think Royal Sovereign is the Strawberry of all others. The Melons are Blenheim Orange, and a seedling of our own for the main crop. The Cucumber is Lockie's Perfection."

"And Grapes?"

"The principal of the earlier kinds are Muscat of Alexandria, Black Hamburgh, and Madresfield Court. The last does very well here. There are four Vines of Madresfield Court, with fruit just colouring. We never have any split berries, and the growth is perfect. In the late Vinery we grow Mrs. Pince and Lady Downe's Seedling."

"Do you grow French Beans in the pits?"

"Yes, and also Tomatoes—Sutton's Earliest of All, the best for early work. In the Fig house we have two varieties, Brown Turkey and Prolific; and there is one house containing a tree of Early Rivers' Nectarine about eleven years old, with nice fruit on it."

"Then you have a house devoted to bedding plants in winter?"

"Entirely. Here we have a number of Marguerites. I prefer the smaller variety. It does not get the maggot in the leaf. Tea Roses in pots are grown here, and more Tomatoes—Duke of York and Frogmore Selected."

"You have a house for Malmaison Carnations?"

"I think that it is essential for them to have a house to themselves. The best is the Princess of Wales, but the Old Blush and Florizel are nearly as good. Florizel is a killing colour with others, but arranged by itself it is grand. The Malmaisons make a great display in the conservatory, and I keep them there about three weeks. The number in pots is between three and four hundred."

"Now, as to some of the vegetables?"

"Of Potatoes, Sutton's Ringleader does best in pits, and for early work. Duke of York is the best outside. I think that the best varieties of Peas are Chelsea Gem, Dr. Maclean, Veitch's Main Crop, Ne Plus Ultra, and Duke of Albany."

THE GARDENER'S HOUSE, AT DAVENHAM.

Herbaceous borders and pergola-covered walks are becoming and picturesque adjuncts to the kitchen garden, imparting beauty to what has hitherto been looked upon as a necessary but decidedly uninteresting portion of "the grounds."

"Which varieties of Apples do best with you?"

"Cox's Orange Pippin, King of the Pippins, Boston Russett (a very late Apple), Duke of Devonshire, Cockle's Pippin, and Ribston Pippin. The crop of Apples, Pears, and Plums is very light, owing to the cold winds which have done so much damage. The kitchen garden is entirely exposed to the east wind. The best Pears include Williams's Bon Chrétien, Louise Bonne of Jersey, Doyenné du Comice, Thompson (a very good Pear), Beurré Rance, and Glou Morceau."

"Can you tell me the length of the pergola, which is such an attractive feature of the kitchen garden?"

"About a hundred yards. It was put up six years ago, but some of the Roses growing on it have only been planted quite recently. The Roses are Gloire de Dijon, Crimson Rambler, The Garland, Bouquet d'Or, Cheshunt Hybrid, Longworth Rambler, and Gloire des Rosamanes. Apples and Pears are grown between; and Border Carnations in front. Behind the pergola is a bed of Hybrid Perpetuals on their own roots, and on the other side a bed of Teas and Hybrid Teas in variety, Lilies being in the centre."

"You grow Currants and Gooseberries as cordons on wires?"

"Also Cherries and Raspberries, all protected by bird-proof netting. They are much easier to manage, because they take up less room, and can be gathered with less trouble. We grow Strawberries between them—Laxton's Noble; Royal Sovereign will not do in this garden."

"Is the netting always kept up?"

"Yes, but the gates are opened when the fruit has been picked."

I should have been glad to add some details about Mr. Charlton's own career, but, though quite willing to tell me all about the gardens, he was very unwilling to talk about himself, and it only remains for me to add that in the decade he has been in charge at Davenham he appears to have been singularly successful in his methods of cultivation.

Alfred Wilcox.

Letters from a Lady Gardener.

No. 155.—BLUE FLOWERS, AND DRY BORDERS.

Dear Kate,—Have you plenty of blue flowers in your garden? Red, yellow and pink are fully represented in every possible shade amongst our summer flowers, but a certain amount of blue, and plenty of white flowers, too, are needed to show off the warm tints to the best advantage. Many gardens are almost lacking in blue shades, except, of course, in Lobelia, which makes a pretty edging, especially for a warm and sunny border. But I like to have taller blue flowers, and the splendid spikes of the blue Delphinium are grand in the summer garden. If you have not yet planted clumps of them (in October or in March), you might sow some seed at once, in a broad, well-drained box of light soil in the greenhouse (or in any rather shady corner of the garden), and keep it moist until the autumn, when the plants go to rest for the winter. The little plants can be put into the borders in the early spring, just as they show signs of starting, and they should have deeply-trenched and rich soil, as they root

Flowers in a Dry Border.

For such a border as this, Geranium pratense—a British wild flower—is a suitable subject. It forms great tufts of handsome foliage, which is almost covered with blue flowers in June.

Another beautiful blue flower which is very useful (for it will grow on a dry border) is Geranium pratense, a British wild flower, which forms great tufts of handsome foliage, almost covered in June with its amethyst-blue flowers, each about two inches across, and in nice sprays for cutting. The leaves of this Geranium turn brilliant colours in the autumn, too, and we should give them a mulch of manure every year, in spring. You should plant them in clumps (*i.e.*, from five to seven plants, each eight inches from the next) at the back of the border, for they grow, in a year or two, to the height of about eight feet, and they will need careful staking before they are as tall as that, for they are much damaged by wind. As soon as the flowers are over, we cut them down, when fresh growths appear very quickly, and we get smaller spikes for cutting with the Chrysanthemums in October and November. You can sow the seed early in June in the open ground, but a box is better, so late as this, for the safety of the young plants during their first winter.

vessels should be cut off (unless you want the seed) directly after the flowers are over. For the rock border, the rich blue of the Gromwell (Lithospermum purpureo-cœruleum) is very good. This is a dwarf, creeping thing, which is also amongst our indigenous plants; and the blue Italian Pimpernel (Anagallis) makes a good edging plant for a herbaceous border. The glorious colour of the Gentianella (Acaulis) is over; this lovely Alpine plant is not too easy to grow, as it will not stand being constantly interfered with, and likes a well-drained soil. But unless it gets a mulch of old hotbed stuff every spring, the roots gradually dwindle away; with this little attention, however, it forms a grand mass of its splendid blue trumpet-flowers in the early spring. Then there is Salvia patens, just now in great beauty in the borders, with blossoms to which "Reckitt's Blue" is dim! No purer blue is possible, perhaps, but all the lighter shades of this colour are lovely, too; and the new variety of Love-in-a-Mist, called after Miss Jekyll, is one of these. There is an old-fashioned little flower which blooms in February (one of the Borage order, all of which are in some shade of blue), the dwarf Alkanet, Anchusa tinctoria, a most beautiful little herbaceous perennial. It is seldom seen now, but is worth preserving, for its sky-blue flowers are like large Forget-me-nots, only with a white raised eye, and the whole plant is only four inches high.

Forget-me-nots (Myosotis), of course, you have in plenty, and the evergreen Alkanet (Anchusa sempervirens) is lovely, too, for its intense azure-blue; the hedges here are adorned with this flower, but it is not really a British plant, I believe, but an "escape" which has come to stay. Another richly-tinted blue flower is Commelina cœlestis, the blue Spiderwort; there are several shades of blue amongst the Tradescantias (Commelinæ), but all are good. The tuberous roots of this plant are not, however, hardy enough to survive a severe winter, even in Devonshire, and they should be taken up in October, with the Dahlias and the blue Salvias, and wintered in boxes of sand or soil in the cellar, starting them again in March.

The Cornflower (Centaurea cyanus) which is named after the Emperor William is delightful in the garden, especially when growing amongst Shirley Poppies and white Marguerites, for these three flowers enhance each other's beauty, whether in a bouquet or in the border. Cornflowers sow themselves in abundance here from year to year, and we only have to thin them out; but this is on a rather dry, sunny border, and the soil is gravelly, so that many seeds survive in it which would rot in a clay soil in winter. But, as you have a dry border on your terrace, you may like to know what plants I find do best without much water in summer, *i.e.*, in a raised and well-drained position, a great advantage during the winter, but not always so in summer. Early-flowering Gladioli (of which I wrote to you on June 10th) do extremely well there, as you will see by those on the left of the photograph; these are Bride Gladioli, and they increase and multiply yearly, giving no trouble.

Pinks, such as Mrs. Sinkins (white), and Old Chelsea (white, laced with crimson), etc., make enormous tufts, and need to be taken up and divided every fourth year, in October; Irises of many kinds (Spanish, English, German, and Italian) all do well—you may distinguish a group of them in the upper right-hand corner of the photograph; blue Delphiniums (which root very deeply, and seem independent of dry weather), stand well at the back, and Aquilegias, too, in variety.

The winter Gladiolus (or Kaffir Lily), Schizostylis coccinea, makes this border gay in October and November, and increases itself mightily, needing to be taken up and replanted in March every third year, as the bulbs become too thick, and need more room. The same may be said of the Montbretias, which sometimes become a nuisance, as they throw their long, underground stems all over the place, and we have to pull them up wholesale in the spring (but some of

themselves the best. Among Hybrid Teas were: "Camoens, bright rose, one mass of lovely buds; Clara Watson, salmon-pink, very free; Gruss an Teplitz, one sheet of bright scarlet, both in bush form and as a climber; Lady Henry Grosvenor, soft pink, a very fine variety; Caroline Testout, not only covered with flowers, but most of them fit for the exhibition table; Mrs. W. J. Grant, with its lovely pink flowers, equal to any in all respects; all the Waltham Climbers, viz., Nos. 1, 2 and 3, very fine as bush or pillar varieties, No. 1 being the deepest

Mr. George Cheal.

crimson. Among Teas, Comtesse de Nadaillac (orange-copper and salmon), Enchantress (white), Ma Capucine (orange-yellow), Maman Cochet (flesh-colour) and its white form, Muriel Graham (pale cream), and Mrs. Edward Mawley were all first-class." This is certainly a list to keep for future reference. Some of these Roses are already in most collections; the others should be added at the first opportunity.

April 28th.—I have just looked to see whether Parsons mentions the Euonymus. Speaking about lawn-planting for autumn effect, he says: "First and foremost are the Euonymuses, with brilliant scarlet four or five-hooded seed vessels that hang on far into November and even December. A good specimen of E. latifolius, for instance, presents one of the most splendid sights of the year, with its dark green foliage literally studded with scarlet or crimson fruit. The European Euonymus and its varieties display the finest masses of colour, although the American kinds have very attractive fruit."

April 29th.—The Amaryllis is often a conspicuous object in a cottage window, but it is when several bulbs are grown in the same pot that it is seen at its best. Unfortunately, it does not like disturbance, and it seldom flowers well until the roots are pot-bound. A shift into a larger pot should, therefore, be postponed as long as possible, feeding being resorted to instead.

H. C. Davidson.

Always take great care to harden your bedding-out plants off well, those of a comparatively tender nature more particularly. If planted out directly from a warm house, or frame, the foliage will go all manner of colours (especially if the weather is at all cold), and the plants stop growing for perhaps a month.

Famous Gardeners at Home.

No. 187.—Mr. GEORGE CHEAL, AT THE GARDENS, UNDERMOUNT, BONCHURCH.

THE gardens of Undermount, Bonchurch, the picturesque residence of Mr. Henry Michell, have the reputation of being second to none, even in the Isle of Wight. This is a great reputation, and it is doubtless due, in the first place, to the fact that Mr. Michell himself is not only keenly interested in horticulture, but understands the cultivation of plants, as well as loves to see them at their best. In the second place, Mr. Michell is happy in having, in the person of Mr. George Cheal, a singularly capable and intelligent head gardener, who takes a legitimate pride in making every department as excellent as possible.

"The cultivation of indoor and outside plants," he said, when, by Mr. Michell's courtesy, I paid a visit, on a glorious spring day in the middle of March, to Undermount, "has a special attraction for me, though, of course, we pay close attention to every feature of the gardens."

As I remarked upon the singularly beautiful and striking entrance under the cliff, Mr. Cheal explained that it suggested the name of the place, and, after pausing a moment to admire the prospect from the Mount, we proceeded to what is quite one of the features of the gardens, namely, the conservatory bank. Here were Ericas in abundance, and Mr. Cheal informed me that there are always Heaths in bloom at Undermount.

"Some of them have flowered for four or five seasons," he said, "others are just established, and others have been in their present position a number of years."

"What is the name of the variety between four and five feet in height?"

"Erica mediterranea. The other varieties on the conservatory bank are E. perspicua nana, E. coccinea minor, E. carnea, E. Cavendishii, E. magnifica, E. Caffra, and E. Bothwelliana. At this point you see clumps of Megasea crassifolia, which have been in flower since the end of January. The blooms last until April."

"What is the treatment?"

Photo by] Undermount, Bonchurch, Isle of Wight. [*J. M. Allen, Ventnor.*

"It is only roughly planted in the bank, and wants no looking after subsequently—it does not even require to be watered."

"When did the Primroses come into flower?"

"Before Christmas, and Crocuses soon after. Snowdrops were rather earlier. Acacia armata is just coming into bloom on the bank, and they grow quite freely."

"I also observe that the Genista is in flower."

"It has been in flower for some time. The variety is G. racemosa. The Coronilla glauca has been in flower all the winter, and the Choisya ternata is already in bloom. It flowers luxuriantly. The New Zealand Flax—Phormium tenax—grows well in this locality."

"You have a splendid specimen?"

"Yes, and it is an effective contrast to the flowering Almond close by. Just here we started, three weeks ago, a new venture. Mr. Michell sent from the South of France twenty-four trees of Nandina domestica, six of which are planted on the bank, and eighteen in other parts of the gardens. The foliage is very pretty—like autumn tints all the year round."

Proceeding to the west walk, and leaving the conservatory until we had finished our inspection outside, Mr. Cheal pointed out the Jerusalem Sage—Phlomis fruticosa—which he has propagated, and Abutilon vitifolium, which flowers beautifully out of doors in May and June. The herbaceous border in the walk includes Calceolarias, which, with Pentstemons and Cape Pelargoniums, were out all the winter, Geraniums Henry Jacoby having been out for five or six seasons. Other subjects are Anemone japonica, Lilium candidum, Hydrangea Hortensia, Delphiniums, Anemone fulgens, Thalictrum, Aquilegias, Incarvillea Delavayii, Heuchera, and Montbretias.

"In the summer," resumed Mr. Cheal, "we fill up the intermediate spaces with annuals and other summer-flowering subjects. At one end of this border is a group of Her Majesty Pink, with Tulips of various varieties between. The Hydrangeas and Fuchsias are established in the border, and remain out in winter."

"What do you cover the posts and wires along the border with?"

"The ordinary Hop, which looks very nice, especially from the other side of the lawn. Beyond the border is an entire bed of Crimson Powellii, and in the sunk bed, close to the memorial stone, erected in memory of four pet dogs, are a certain number of Incarvilleas, the intervening space being filled out with Pentste

mons. At the bottom of the lawn are mixed Hyacinths, with beds of Polyanthus on either side, and at the south end a bed of Wallflowers, Sutton's Cloth of Gold. There are about two hundred plants, with magnificent foliage, just beginning to bloom."

Next we made our way down a flight of stone steps to a very sheltered border, such as can rarely be seen, even in the Isle of Wight, which is suitably called "The South of France," with Primroses and Veronicas growing from the steps. At the end is an arch covered with white and blue Clematis.

"'The South of France' is certainly our most sheltered spot," said Mr. Cheal, "and here Acacia floribunda grows so luxuriantly that we have been obliged to take the tops off, so as not to obstruct the view from the house. Here, too, in flower, and very fragrant, are a number of Coronilla glauca; and other subjects are Agathæa cœlestis, Opuntias, Gazania splendens, Aloes of sorts, Buddleia globosa, Escallonia macrantha, Genista racemosa, and Mesembryanthemums in variety. In our favoured climate we are able to venture upon growing these somewhat tender subjects out of doors."

When we arrived at a bank with a westerly aspect, I found such a remarkable collection of Mesembryanthemums that I asked Mr. Cheal to give me a list of the names.

"Aurantiacum, coccinea, rubro tinctum, caulescens, blandum, productum, Polyantha, mucronatum, edulis, sanguinea, spectabilis, uncinatum, stellaris, linquæformis, agnium, Cooperii, candens rosea, Bolusii and rhomboideum. Mesembryanthemums flourish at Undermount exceedingly, and, mixed with Gazanias, Wallflowers, double and single Arabis, and Ivy-leaved Geraniums, they look remarkably well later."

"What do you consider the most showy varieties of Mesembryanthemum?"

"Polyantha (pink), and spectabilis (red). They are quite hardy, and some varieties are always in bloom. No special treatment is required for Mesembryanthemums. They merely want shelter, and in the summer a quantity of water."

From this bank we strolled to "the Meadow," which is gradually being converted into an extension of the gardens. New beds are constantly made, one of the newest consisting of Rhododendrons, and when I had noticed the specimens of Albizzia lophantha, which were in flower more or less all the winter, I inquired whether Mr. Cheal found it easy to grow Rhododendrons.

"They entail a lot of labour," replied Mr. Cheal, "as the peat has to be brought from the other side of the island. They are all named varieties, and include the very best, such as Nobleanum, maximum triumphans, Southamptonia, delicatissimum, Duc de Brabant, Lady C. Neville, Soleil d'Austerlitz, congestum roseum, Bodartianum, Comte de Gomer, George Hardy, Michael Waterer, Mrs. J. A. Sellar, Helen Rogers, Lady Frances Crossley, album grandiflorum, Alarm, Nelsonii, Victoria, concessum, Jewess, fastuosum, stella, Mrs. Fitzgerald, Queen, Prince Albert, Prince Arthur, Perfection, Minnie, James Mason, Mrs. Milton, Garibaldii, and Kalmioides."

"I see that you have a little rockery between the Rhododendron beds."

"It is simply a heap of stones laid in the turf, filled in with earth below the stones. Mr. Michell took an active part in making it. The plants include the Mesembryanthemums, Dianthus, Rock Cistus, Grape Hyacinths, Thyme, and Gentians. At the back of the rockery, in the shade, is a clump of Cypripedium spectabile. We are just trying it in this position; in another part of the gardens it does well."

"And in 'the Meadow' itself?"

"Opposite the summer-house, from which the outlook over the sea is very fine, there is a clump of single and double Gorse. The meadow contains two new Rose beds, one made last year, and one in 1903."

"But you have Roses in other parts of the gardens?"

"Yes, and we have had stray Roses in bloom all the winter. I pruned the Roses last week, and cut off some flowers at the same time. Mr. Michell takes a particular interest in the Roses."

"It would be a convenient moment for you to give me the names of some of the varieties."

"The Hybrid Perpetuals are Frau Karl Druschki, Duchess de Morny, General Jacqueminot, Her Majesty, Marie Baumann, Senateur Vaisse, Madame Gabriel Luizet, Mrs. John Laing, A. K. Williams, Gustave Piganeau, and Boule de Neige."

"Do you go in largely for Hybrid Teas?"

"The varieties are Killarney, La France, Lady Moyra Beauclerc, Viscountess Folkestone, Grace Darling, Gustave Regis, Caroline Testout, Marquise de Salisbury, and Lady Battersea. The Teas are Catherine Mermet, Anna Olivier, Devoniensis, Etoile de Lyon, Madame Lambard, Madame Hoste, Niphetos, Jean Ducher, Homere, Hon. Edith Gifford, Perle des Jardins, Madame Falcot, Madame Berard, Bridesmaid, Madame de Watteville, Maman Cochet, White Maman Cochet, Marie van Houtte, Safrano, Souvenir de Catherine Guillot, Madame Cusin, and Gloire de Dijon."

"The Meadow," continued Mr. Cheal, "also contains half a dozen Apple trees, three of Cox's Orange Pippin and three of Wellington, which are placed in the centre of beds of Carnations of various kinds, including a white seedling, very sweet in perfume, and good in every way, which was raised at Undermount four years ago from seed supplied by Mr. Douglas, of Great Bookham."

"You have a bed of Tree Pæonies in a corner?"

"Yes, mixed with Irises, which have been in bloom for two months, and a groundwork of Arabis. The latter helps to keep weeds under. The Pæonies are protected by hurdles from wind. Another bed is filled with Spiræa rubra, which came from Scotland, and Anemone fulgens as a border. One corner is occupied by a little nursery, the contents of which include Veronicas, Aucubas, Euonymus, Laurustinus, Lavender, Buddleia, and cuttings of Gooseberries. We propagate a number of our own plants. Close by we have just planted Fabiana imbricata, and we are about to put out a clump of Bamboos."

"There are herbaceous Pæonies also?"

"The bed contains about a dozen varieties. Another bed consists of Azaleas—mollis and Ghent varieties. We have to make the soil to suit them. A large bed in the centre of 'the Meadow' is Lythrum roseum, which came from Scotland, and was only planted last year. Then, there is a bed of the old-fashioned Maiden's Blush Rose, a bed of Tritomas and Campanulas, and, at the end of 'the Meadow,' a number of Escallonia macrantha."

In the kitchen garden, close to the sea, with just a cliff intervening, is a herbaceous border running the full length, and containing some good-sized bushes of Lavender; also a new bed of Gazania splendens, and on the bank are Mesembryanthemums and Oleanders.

"We ought to have a few notes of the vegetables," I remarked.

"There are three large beds of Asparagus; Lettuce is grown all the year round, the Tom Thumb variety and All the Year Round. The Parsley is Sutton's Imperial Curled, the three varieties of Broccoli are Superb Early White, Sutton's Perfection, and Sutton's Late Queen—we have finished Sutton's Xmas White and Autumn Protecting—the Brussels Sprouts, Sutton's Exhibition, with Cabbages of several varieties."

"I believe that your Spring Cabbages are exceptionally early?"

"They were ready to cut at Christmas."

"How did you manage it?"

"The treatment was quite ordinary. Seed was sown on July 28th, and we planted out at the beginning of September. The varieties are Ellam's Early, Flower of Spring, and Sutton's April, all about equally early. We think that the appearance of the kitchen garden is greatly improved by the bank at the back being studded with Wallflowers and Narcissi of various sorts."

From the lower kitchen garden we proceeded to the principal orchard in 'the Dell,' protected by Pines on the north side, and by evergreen Oaks and Elms on the front towards the sea, all the Apples being grown on the pyramid system. In the higher part of the kitchen garden are Apple arches, and here the espalier system is in vogue. Gooseberries and Red Currants are grown on the standard and the bush principles, but the trees are only partially covered with netting during the winter months, the explanation being that the birds should have free access to destroy vermin, and that if they kill the vermin in the winter they deserve to get a little fruit in summer. The Raspberries are Superlatives, and the Strawberries Royal Sovereign and President. Here there is another long herbaceous border, of which a feature is the Helleborus orientalis in flower during Lent. In the frames are Violets, which are in flower through the winter; and the variety La France grown in pots is so successful that I saw flowers as large as a five-shilling piece. Persian Cyclamens grow in the open, and Sweet Peas, sown in the autumn, were six inches high, ready for sticking. Then, with a glance at the Plums (Victoria, Green-gage, Prince of Wales, and Magnum Bonum), and Apricots (Moor Park), growing on the walls, and the Pears (American Wonder and Sutton's Harbinger), which come in about the end of May, we arrived at the conservatory.

"What is the extent of this grand building?" I inquired.

"It has a capacity of some fifty thousand cubic feet. The Palms are Chamærops excelsa, Seaforthia elegans, Latania borbonica, Kentias and Coryphas; and the Tree Ferns, which are grown twelve to fourteen feet high, are Alsophila excelsa and Dicksonia antarctica. Planted out in the border are Strelitza Regina, Ferns in variety, Begonia Rex, and two very good specimens of Araucaria excelsa."

"You have a beautiful example of Datura suaveolens in one corner?"

"Yes, the white flowers are considered very charming, and the two baskets of Asparagus Sprengeri, with their long trails, are rather effective."

"I admire very much the white flower growing in the fountains."

"That is Aponogeton distachyon. The creepers suspended from the roof, or growing from it, include Abutilon variegatum, with trails twenty feet long, Tacsonias, Plumbago, Citrus, with, as you see, a number of fruit upon it, Tecomas, Fuchsias, Bougainvilleas, Wistaria sinensis, Pleroma macrantha, Cestrums elegans and aurantiacus, and Jasminum."

"You have a brave show of groups of flowering plants on either side of the dining-room window. What are the principal varieties?"

"Azaleas in variety, Cinerarias, Genistas, Arum Lilies, Deutzias, Spiræas, Eupatoriums, Narcissus, Tulips, Hyacinths and Coleus, backed by Camellias, and set off with a margin of Maidenhair Fern."

"And the plants and creepers on the pillars outside?"

"Roses, Pittosporum tobira (sixteen feet high), Jasminum, Chimonanthus fragrans, Lonicera aurea reticulata, Forsythia suspensa, Cotoneasters, Berberis, and Myrtles."

"Before we go into the Vinery and Peach houses I should like to know what is growing in the border running the entire length of them?"

"Freesias, Clivias, Aloysia citriodora, Myrtles, Crinums, Alstrœmeria, Eucomis punctata, Dimorphotheca Ecklonis, Liliums, Belladonna Lilies, Cineraria stellata, Francoa ramosa, Persian Cyclamens, and various spring-flowering bulbs. In the corner close by are Hedychium Gardnerianum, Solanum jasminioides, Cannas, and more Freesias and Crinums established; with Maidenhair and Pteris Ferns growing in the joints of the walls quite freely."

"Do you grow many varieties of Peaches and Nectarines?"

"Only Royal George and Gros Mignon Peaches, and in this house Early Rivers' Nectarine. The Nectarine tree was planted four years ago, and is trained from the front to the back of the house, almost in the shape of the roof."

"How long has the Lobelia Cavanillesiana been in flower?"

"Four months. It was raised from seed last spring, planted out in a border, and lifted in the autumn. It is a very graceful plant."

"You have Strawberries in the Vinery?"

"Yes, Royal Sovereign, just getting ripe. The only Grapes grown are Black Hamburgh and Foster's Seedling. The flower-spikes of a nice batch of Hymenocallis macrostephana are just pushing up."

Pursuing our course through the greenhouses, I noticed in one Palms in variety, Pancratiums, Acalypha Sanderæ, Billbergias, Antirrhinums, etc., with Stephanotis and Allamanda trained to wires on the roof; and, in another house, double white Primulas, Primula stellata, Cineraria stellata, and large-flowered Lachenalias tricolor and Nelsonii, Malmaison Carnations, Ericas and Azaleas, with Lapageria alba on the roof. To give some idea of the success with which Primulas are grown at Undermount, I may mention that I saw one plant (double white grandiflora) in a 7-in. pot carrying two hundred and twenty-six blooms."

In the stove I asked Mr. Cheal which he considered the features.

"We grow four dozen Gardenias," he replied, "and the rest of the plants are made up of Crotons, Dracænas, Ixoras, Eranthemums, Pandanus Veitchii, Hisbiscus, Centropogon lucianus, Gloxinias, etc. The Orchid house, as you observe, is small, but the Fernery is large. Here we have a batch of Callas (The Godfrey) doing well. As to the other houses, in the Intermediate are Amaryllis seedlings and named varieties, including Sydonie, Nesta, Lubertia, Prolonig, and Jadera, in all about forty; Begonias Gloire de Lorraine, Gloire de Sceaux, and President Carnot, and about a dozen Celsia arcturus. In another greenhouse are batches of Primula—The Duchess, stellata, and others—with some very good Daffodils, and a fine plant of Euphorbia splendens."

"Then there is the Nectarine house."

"We have two varieties of Nectarines there, Victoria and Rivers' Orange. About a hundred Freesias are grown here—refracta alba and Leichtlini major—also Fuchsias and Crassulas, etc."

"You have some well-established Cucumbers in the propagating houses?"

"Yes, and here also we have growing batches of Caladiums—argyrites, Muries erubescens, and other named varieties, with about six dozen of the new Nicotiana Sanderæ."

Several of these houses are situated above the kitchen garden, and past the bank going to the Mount, along which are clumps of Wallflowers of different shades of colour growing in among the Winter Heliotropes; but I must not omit to mention the wire arches in front of the range of fruit houses near the conservatory, which are clothed in summer with Roses and Clematis. To each upright there is a little bed, filled at the time of my visit with various spring flowers.

When, as far as possible, we had gone the round, I asked Mr. Cheal how long he had held his present position.

"For five years," he rejoined. "My previous appointments have included that of head gardener at Polesden Lacey, Dorking, and I was head for a short time at Grove House, Westgate. I was also a foreman for three years at Loseley Park, Guildford."

"What is the extent of these gardens?"

"About eleven acres, including the meadow. The number employed in them is seven. I consider that I am very fortunate in my position as gardener to Mr. Michell, because he takes so much interest in all the details, gives me a plentiful supply of material to deal with, and, in fact, does a good deal of gardening himself.

"And I think," concluded Mr. Cheal, "that the horticultural press is helping gardeners very considerably in these days. I have no doubt that some of the successes upon which you have been good enough to congratulate me this afternoon are due to what I have read in the columns of GARDEN LIFE, to which I have been a subscriber from the time it started."

ALFRED WILCOX.

Letters from a Lady Gardener.

No. 143.—SPRING BLOSSOMS.

DEAR KATE,—A garden is always delightful, but especially so, I think, when well furnished with spring flowers, which are so doubly welcome after the want of colour in the winter borders. There are three flowers of something the same type, which are so charming mixed together (especially on a raised or rock border) that they should always be arranged in this way; I call them the three A's, Arabis, Aubrietia, and Alyssum.

At one side of the entrance drive here there is a wall about four feet high, and behind it a broad, raised border, containing various beautiful Pæonies, with shrubs behind them. In front of the deep crimson foliage of the Pæonies there are now Wallflowers in many tints, including pale creamy-yellow (Fairy Queen), pink and apricot mixed (Eastern Queen), and the crimson-purple of Purple Queen, besides the deepest red-brown and golden-yellow. All are sturdy, dwarf plants sown last May, planted out in a nursery bed in July, and placed in this border last October; and they are all covered with blossom. In front of them, again, are hanging masses of snow-white Arabis albida, the double variety of which is such a great improvement on the older single form, for each flower is like a cluster of tiny Roses, instead of being simply cruciform. Aubrietia græca, in the richest violet, makes broad masses of colour amongst the white, and above it grows Alyssum saxatile, the gold-dust flower, which adds the needed brilliance to the rest. Tulips in various tints, Anemones in variety, and other spring flowers add to the show at intervals, but it is the three A's, backed by the Wallflowers, which greet all comers with their abundant blossoms, and give a draped and wreathed effect to the grey granite wall.

Later on, when the Wallflowers are over, these will be pulled up, and their places filled with Ivy-leaved Pelargoniums, blue Lobelia, and other flowers which will stand a warm, dry border, and at the end of May the splendid specimen of the Golden-ball tree (Buddleia globosa), which backs the Pæonies, will be a perfect hive of bees, for every bee in the neighbourhood knows that the myriad balls of this bush are full of honey, so that it scents the air. This fine shrub is about seventeen feet high, and it extends to the same distance; I attribute its wonderful prosperity to the fact that it is thoroughly sheltered from the north and east by trees, and rising ground behind it, and it never suffers from the cold, and probably imagines it is growing in its native Japan, for the summer heat on that raised border is almost tropical, so that its new wood becomes perfectly ripened each year. Another plant of the same kind (I raised them both from cuttings, put into a frame in October some ten years ago) is not half the height of this grand specimen, for it gets the full force of the terribly cold winds which afflict us at this time yearly, and looks pinched, poor thing, as it is growing in a more exposed situation in the garden. The moral of this is be sure to plant your flowering shrubs in positions which will suit their needs, if you want them to do you credit, and flourish.

ARABIS ALBIDA.

How beautiful they are in spring! On the walls, the carmine of Pyrus (Cydonia) japonica and the delicate pink of its paler variety (alba) mingle delightfully, and the apricot rosettes of our old favourite, Kerria japonica, have been open since the beginning of March. This is a most obliging plant, which will grow at any aspect, and is sure to blossom and do well; for bouquets in early spring it is most effective, especially when mixed with the carmine-splashed shining foliage of Mahonia (Berberis) aquifolia, which is now covered with its own pale yellow clusters of Barberry blossom. Berberis Darwinii, growing on a warm terrace, looks now as if on fire, for every tiny spray is hidden by a mass of orange-coloured blossoms, shading to scarlet. This shrub only needs to be well ripened by sunshine in summer to produce this gorgeous effect in spring; it is one of the best of the beautiful Barberry group, and should be in every garden, with B. stenophylla (which is covered with scarlet berries in autumn), and Mahonia aquifolia. The purple berries of B. Darwinii are devoured by the birds in summer; directly the Barberries are ripe, the bush becomes the resort of all the blackbirds, titmice, and chaffinches in the garden, so that a flight

into friends. This surprising conversion deserves the serious consideration of every farmer and gardener. It occurred in a field of Barley, which was over-run with weeds. Artificial manure was drilled in with the seeds, and the acid in it protected them from the wireworms, which were consequently driven to feed upon the weeds, and ended by almost completely demolishing them. "Since that time," says Mr. Moss, "I have had no fear of wireworms in a Corn crop. I have simply used a fertiliser-drill, and deposited the artificial manure down

MR. ALFRED CHEFFINS.

the coulters with the Corn, and the wireworms have helped to clear the field of weeds. I have not proved that artificial manure is inimical to wireworms, but this is not important if the presence of the creature can be made to assist in the economy of the farm, and the pest be converted into a friend. I believe superphosphate is sufficient for the purpose, but I have found a complete manure the best to adopt, and the most economical, as the increased yield obtained invariably more than compensates for the increased outlay." If this method succeeds with Corn, there seems no reason why it should not succeed with other plants which are liable to be attacked by wireworms. The fact that these pests are less prevalent in land where an artificial fertiliser has been strewn in the ordinary way has long been known, but it does not seem to have occurred to anyone before to try the effect of concentrating it in the drills.

Vegetables and Trees.

February 23rd.—In many gardens fruit trees are planted in the part allotted to vegetables, and every spring the question crops up, What is to be done with the ground under the trees? Quite the best plan is to leave it unplanted. Apart from any injury to the trees, nothing will grow there in a satisfactory manner. I have seen Potatoes, for example, tried again and again—merely because a gardener did not like to leave a bare patch in the middle of a plot—but the invariable result has been failure. As the result of a series of experiments on the Continent, Mr. E. Oven finds that this is due to the reduction in the temperature and deficiency of light and moisture. He states that the temperature under a large Cherry is, on the average, three degrees C. lower than it is in the open, while the dryness of the soil, owing to the absorption of moisture by the tree roots, is even more serious. He considers, however, that the most important factor is the deficiency of light. He estimated a crop grown in the shade to be only one-fifth what it would be if grown in the open.

A Rose Garden.

February 24th.—The photograph of an old-fashioned Rose garden is a fitting companion to that of a Rose walk which appeared last week. If the old sundial in the centre could speak, it could tell of many changes since it was first erected. The old Cabbage Roses and many others, which our forbears loved, have gone, and their place has been taken by Teas and Hybrid Teas. We have gained in shape and colour, but have we not lost somewhat in scent?

H. C. DAVIDSON.

Famous Gardeners at Home.

NO. 229.—MR. ALFRED CHEFFINS, AT THE GARDENS, NEWBOLD REVEL, RUGBY.

THE seat of Mr. Arthur Howard Heath, in Warwickshire, which bears the name of Newbold Revel, is of considerable antiquity, and the gardens, which, by the courtesy of the owner, I had the opportunity of going over during the first week in January, present several features of interest. The head gardener, Mr. Cheffins, may fairly be regarded as in the front rank of the younger generation. Before his appointment (three years ago) to his present important position, where he has under him a staff of about a score, he was foreman at Newbold Revel, his previous experience being gained at Spalding (where he started in the gardens of the Head-master of the Grammar School), Wellsby Hall, near Grimsby, Wentworth Castle, Yorkshire (where he was two years in the kitchen and flower gardens, and two years in the glass department), and Shipley Hall, Derbyshire. So much for the man; now for his work. Proceeding from his pleasant house, at the end of the kitchen garden, we commenced our rounds in one of the Peach cases.

Peaches and Strawberries.

"Here," said Mr. Cheffins, "we grow Peaches (Hale's Early, Crimson Galande, Dymond, and Princess of Wales), Nectarines (Lord Napier and Elruge), and Pears (Marguerite Marillat and Pitmaston Duchess), besides Gooseberries and Cherries. With regard to Peaches, we find that the buds do not drop nearly as much if we syringe thoroughly in the autumn and winter, as well as in the summer, when they are growing, this applying especially to trees that are forced."

"When do you close your early Peach house for forcing?"

"On New Year's Day; and we commence to gather Peaches, from a tree of Hale's Early, in the middle of May. Other varieties in this house are Amsden June and Royal George, and Early Rivers, Lord Napier and Elruge Nectarines. We force all our Strawberries on shelves in fruit and forcing houses. They are brought into gentle warmth in November, and we commence to gather ripe fruit about the middle of March—a thousand plants are grown in this way."

Vine Cultivation.

"Do you commence to force your Vines at the same date as early Peaches?" I inquired, as we entered the early Vinery.

"Yes, the first week in January. In this house we have Black Hamburgh, Foster's Seedling, and Gros Colmar. The first is the best all-round Grape. In the next house we grow Madresfield Court only. This fine Grape can thus be treated effectively with regard to the berries splitting by keeping the air moving and suppressing the stopping of young growth during the colouring period. I consider it very important to grow Madresfield Court in a house alone."

"Do you adopt the same plan with respect to the White Muscats?"

"No, only that they are in a house to themselves. We give them a higher temperature, and close the house when charged with moisture. In the late Vinery the varieties grown are Mrs. Pince, Black Alicante, Lady Downe's Seedling, and Gros Colmar. The last is a great favourite here. The Vineries here were all planted about twenty years ago, and bear fine crops of fruit."

"And also the Figs."

"Figs succeed admirably with us. One large tree of Brown Turkey produced nearly five hun-

NEWBOLD REVEL, RUGBY.

dred fruits in last year's first crop, and as many more in the second. Another variety is Pingo de Mel. This house is closed for forcing the first week in January."

English and American Carnations.

Then we entered the house devoted to Tree Carnations, which are one of the most notable features at Newbold Revel.

"When do they begin to flower?" I asked, as I admired some of the blooms.

"About the middle of October, and we clear them out about the end of February. During that period they are a mass of many thousands of blooms."

"What is the number of plants grown?"

"About eight hundred. Madame L. Rothschild is the best all round; it is free-flowering and continuous. Other very good varieties are Reginald Godfrey, Miss M. Godfrey, Royalty, Mrs. T. W. Lawson, Enchantress, Mrs. G. Roosevelt, Nelson Fisher, Alpine Glow, The Belle, Governor Roosevelt, Harlowarden, and Harry Fenn."

"As you grow both English and American varieties, I should like to know which you prefer."

"American are not so free-flowering as the English, but the stems are long and stout. The flowers last about the same time. I may say that we do not disbud so vigorously as some people. Many of the plants have forty blooms upon them under our present system, whereas the disbudded plants would only give us from eight to a dozen, and we find that the blooms are nearly if not quite as large by practising the former method. Of course, they have to be well fed up with stimulants. Drainings from the farmyard are best, and soot water, but we also use a fair quantity of artificial manure."

"What temperature do you keep up in the winter?"

"From forty-eight to fifty-five degrees—a little lower in frosty weather. If it gets too low, the flowers do not open kindly. It is of great importance to have a house devoted to Tree Carnations during the flowering period. They cannot be grown to perfection under any other conditions."

"When do you put them out of doors?"

"About the end of June, and we keep them out until October. The rain seems to suit them, but in dry weather we have to syringe them many times during the day. We are not, however, at all troubled with rust."

"Why not?"

"We have done nothing in particular to prevent it, but I think that growing them as far as possible in the open checks the rust better than anything else."

The Value of Farmyard Manure.

Then, Mr. Cheffins having pointed out a pink seedling of great beauty, we went into the stove house. Here are Orchids, notably Cœlogyne cristata, which were split up three seasons ago, eight bulbs being put into a pot; each of these now averages twenty-four spikes.

"Do you feed them?"

"Yes, with weak liquid manure from the farmyard in the summer season, and, as you can judge for yourself, it suits them. Here, also, we grow Gardenias in two varieties—Florida and the Intermediate. They are the same in colour, but the flower of the Intermediate is larger. They commence flowering in February, and continue for a long season."

"What is your treatment of them?"

"They require plenty of heat and moisture, and must be kept free from all insect pests, which soon attack them if they are not closely watched. In propagating we just take a large branch with plenty of growths on it, putting it in Cocoanut fibre in a propagating frame, where it readily takes root, and is a plant to commence with."

"You have a considerable number of Poinsettias in the Palm house. Can you tell me how much the bracts measure in diameter?"

"Over a foot. We do not take cuttings of Poinsettias until June. They are grown near the glass, and in a good heat, until the bracts are formed in November. Then, when the bracts are fully developed, they are transferred to a rather cooler atmosphere. The other contents of this house are chiefly Bamboos; Arundinaria falcata, which are highly ornamental and useful for the corners of rooms; Palms, mainly Kentias and Phœnix; and Ferns.

The Best Malmaison.

"You, also, I see, go in very largely for Malmaison Carnations."

"Yes, we grow in this house about a thousand plants in pots, ranging from five to twelve inches in diameter. The varieties include Princess of Wales, Prime Minister, Florizel, Calypso, Thora, Sault, Grace, Mrs. Trelawney, Jubilee, and Duchess of Westminster, which latter, in my opinion, is the best Malmaison sent out. Veller Gal also promises to be good. We are not troubled with the rust, and I think that if Carnations are cultivated well there is no danger of it, one essential being the exclusion from the house of any other plant, and giving plenty of fresh air at all times. During the flowering time we have a few of the Border varieties, such as H. J. Cutbush and Agnes Sorrel, in order to lighten up the Malmaisons."

"You have a little house with more Orchids."

"There are about two hundred and fifty plants here, but the best time to see them in flower is in May and June. They are all Odontoglossums, chiefly O. crispum. Some good spikes of O. Pescatorei are showing at the present time. We keep the house between fifty and fifty-five degrees, and the plants are potted in nothing more than sphagnum moss and peat, in which they appear to be quite happy. The house has a northern aspect."

"How many plants are there in the Pelargonium house?"

"About two hundred Zonals for winter flowering. The Fancy section are also grown for cutting and decorative purposes. In the next house we grow only Tomatoes for winter. The variety is Sutton's Perfection."

"When do you sow the seed?"

"On July 1st, and we stop the plants after the fourth truss is formed. We begin to gather about the middle of November, and go on until the middle of February."

Begonias and Calanthes.

"You have a fine show of Begonia Gloire de Sceaux. How do you treat these?"

"We give them plenty of heat and moisture in the growing season, syringing them many times in the day overhead with soft water, an important point being to keep them in the shade. Their growth is remarkable; plants in 6-in. pots grow to the extent of three and a half feet wide and four and a half feet high. It therefore takes very few to fill a small house, and the blending of colours (the dark, metallic foliage and the pink flower) is very fine."

"Another house appears to be entirely devoted to Calanthes."

"It contains about a hundred and fifty plants of C. Veitchii, which begin to flower early in December. Calanthes also require plenty of heat and moisture during the summer, and we feed them towards the autumn with weak manure water. By the way, all the rainwater is caught from the roofs of the houses, and each is therefore supplied with both soft and hard water."

"How many varieties of Callas do you grow in the house? It seems full of them."

"Only one, Calla Æthiopica. We grow about two hundred potted in loam. We plant them out in the open every year, about the end of June, and take them up at the end of August. They begin to bloom freely at Christmas, some of them sending up two spathes to a leaf. They follow the Chrysanthemums, and continue flowering until after Easter. In the house devoted to Begonias Gloire de Lorraine and Turnford Hall there are several plants over three feet in width."

The Propagating House.

"And here I notice you have Daffodils in flower."

"Yes, they have been in flower a fortnight. The variety is Obvallaris, which is splendid for forcing. It can easily be got to flower by Christmas. In the nursery or propagating house we have at present a quantity of Coleus thyrsoides, but are discarding them; the flowers are good by daylight, but show off badly under artificial light. Begonias of the Rex family are propagated here, and Tree Carnations, etc. We propagate Chrysanthemums in the cool house, and in close frames. I do not recommend the early striking of cuttings. The end of December is the best time, and later still for the decorative varieties. About five hundred Chrysanthemums are grown, mainly for cutting purposes."

"Which do you consider the best amongst the large blooms?"

"Valerie Greenham, Mrs. J. Dunn, Mrs. Greenfield, Viviand Morel, Godfrey's Pride, W. Duckham, Guy Hamilton, Ben Wells, Miss A. Byron, General Hutton, Mrs. G. Milcham, Miss O. Miller, Mrs. F. S. Vallis, Madame Gustave Henry, and Mr. L. Rémy. The best bush varieties are Lady Selborne, Scarlet Gem, Source d'Or, Phœbus, Miss M. Anderson, Miss A. Holden, W. H. Lincoln, and Miss Nellie Pockett, the last being an excellent companion to W. H. Lincoln."

"Do you go in largely for Violets?"

"Only two varieties are grown, Marie Louise and Princess of Wales. We have a continuous supply during the autumn and winter months. In the Mushroom house we force quantities of Seakale crowns, and a considerable quantity of Rhubarb. Lettuce is grown in cold frames; for winter use the varieties are Hicks' Hardy, and Veitch's Golden Queen is excellent for early spring.

Asparagus and Melons.

"What about Asparagus?"

"We force a good deal in frames on hotbed, commencing to cut before Christmas, and continuing until we can gather outside. The variety is Connover's Colossal; we have sown the seed of the French variety, and had it planted out, but as it takes three years to get it fit for forcing we have not yet tested it. In the season we have five houses of Melons; the varieties grown are Blenheim Orange, Reid's Scarlet Flesh, and a seedling of our own, not yet named; the latter is similar to Countess. We sometimes have an entire house of one kind only."

"Do you care to say how you grow Melons?"

"They are grown on a hotbed in loam made firm, planted about eighteen inches apart, with two or three fruits to the plant. They require abundance of heat and moisture till they show signs of ripening, when the atmosphere should be drier and more air admitted."

Next we strolled into the kitchen gardens, of which there are two, one of about two acres, the other one and a half acres in extent.

The Herbaceous Borders.

"In what we call the home garden," said Mr. Cheffins, "we grow the summer vegetables, Asparagus, Strawberries, etc.; the latter include Royal Sovereign, Monarch, The Viscountess, Latest of All, and Waterloo. The central walk in this garden is bounded on either side by a herbaceous border, planted with the idea of having a succession of flowers during the whole of the season. Amongst other subjects grown are Doronicums, Pinks, Pæonies, Delphiniums, hybrid Aquilegias (these should be in every garden), Pyrethrums, Anemone japonica, Rudbeckias, Michaelmas Daisies, and autumn Phlox, the last including Etna, Coquelicot, Brilliante, St. Gregory, and Lamartine."

"Have you any particular method as regards the arrangement of Sweet Peas?"

"We plant them in clumps on either side of one of the cross walks, the colours being kept together. The varieties are Miss Willmott,

Lovely, Scarlet Gem, Emily Eckford, Gladys Unwin, Lady G. Hamilton, and Sadie Burpee."

"You might give me a few details about the fruit on the walls."

"The west wall here is devoted entirely to Pears grown on the single cordon system, which I consider is the best method, because the trees can thus be easily dealt with in regard to root

A GOOD TYPE OF MICHAELMAS DAISY.

pruning, etc. I agree with 'pinching,' and the summer pruning of most of the hardy fruits, though shallow planting and root pruning are quite as important as summer pruning, if not more so. The principal varieties of Pears are Jargonelle, Louise Bonne of Jersey, Marie Louise, Doyenné du Comice, Pitmaston Duchess, Beurré Rance, Passe Colmar, Glou Morceau, and Winter Nelis."

Hardy Fruit.

"What do you grow on the south walls?"

"Plums and Apricots. Varieties of the former are Greengage and Jeffersons, and Moor Park and Hemskirk Apricots. On a north wall Gooseberries are grown. This situation appears to suit them well, the varieties being Dan's Mistake, Crown Bob, Whinham's Industry, Broom Girl, Berry's Late Kent and Langley Gage. Morello Cherries are also on the north wall."

"Apples are the principal feature in the second garden," I said.

"The principal hardy fruit; but we also grow here Winter Greens, Celery, Seakale (Lilywhite and Beddard's Improved, the latter an excellent kind, being hardy in constitution), and other vegetables. The best Apples are Worcester Pearmain, Gascoyne's Scarlet, Ribston Pippin, Cox's Orange Pippin, and Allington Pippin, of dessert kinds; and among the best kitchen varieties are Lord Grosvenor, Lord Derby, Ecklinville Seedling, Warner's King, Prince Albert, and Bramley's Seedling. As to winter greens, I find Sutton's Dwarf Gem Brussels Sprout excellent in every way. Dixon's Cabbage First and Best is also good, preceding Ellam's Early. Of Celery we only grow two sorts, Veitch's Early Red and Major Clarke."

A new Rose garden has recently been made, and I inquired the principle.

"It is planted with one colour only to a bed, the colours being chiefly pink, white, crimson, and yellow. The varieties include Ulrich Brunner, Mrs. John Laing, Frau Karl Druschki, Viscountess Folkestone, and Mildred Grant."

The Pleasure Grounds.

As we walked towards the pleasure grounds I asked about the spring bedding.

"We do not," rejoined Mr. Cheffins, "go in for either winter or spring bedding, which is much to the advantage of the summer plants. Our bedding is chiefly of the formal style. Zonal Pelargoniums are not planted to any great extent, but the Ivy-leaf varieties are used more generally. Fuchsias are freely used, the plants being two or three years old, and also Verbenas, Heliotropes, Begonias, Dactylis, and Veronicas. I also find Kœniga maritima excellent for groundwork, while Abutilon Swartzii looks very fine among scarlet Begonias, not being so rampant as the older varieties. Such plants as Castor-oil (Ricinus Gibsonii), Cannas, Indian Corn, Eucalyptus globulus, Helianthus major, and Hydrangeas are also used."

"You have some fine specimens of Conifers," I remarked, when we had visited the wilderness, with its fine vistas and imposing water.

"The chief specimens are Wellingtonia gigantea, Cedars, Abies pinsapo, Junipers, and Thuja gigantea, etc. The flowering shrubs are also a feature, and very much in evidence during the season. They include Lilac, Laburnum, Cherries, and pink Hawthorns."

There was much more to be seen if time had permitted, but I was obliged to bring my questions to a close with the inquiry whether Mr. Cheffins had done any showing.

"Nothing to speak of at present," he replied.

Quantities of Daffodils were growing in the grass in different parts of the grounds, also Snowdrops, the former including such varieties as Horsfieldii, Sir Watkin, Emperor, and Empress.

As I took my leave, Mr. Cheffins observed, "You will have noticed that we do not go in for a great number of varieties, and I may add that I strongly believe in the policy of having only a few of the best in colour and in kind during the respective seasons."

ALFRED WILCOX.

Letters from a Lady Gardener.

No. 186.—THE HERBACEOUS BORDER IN SPRING.

DEAR KATE,—As soon as March begins, the herbaceous border must be considered, for this is an excellent time to look through it and re-arrange the plants which need this. We always make a raid on the Michaelmas Daisies to begin with, for they spend the winter in pushing out their thick mat of roots on all sides, ready to smother their neighbours, after eating up all the soil around them. The Helianthuses do just the same, and if one doesn't keep these plants in strict order, they will monopolise the whole border in a few years in a really shameless way. But both are so pretty, and useful for cutting, that we have to avoid destroying them entirely, though every year at this time we give away barrow-loads of their roots to friends with new gardens, for there is nothing like these two to make a show quickly in a bare space.

A Well-behaved Michaelmas Daisy.

But there is one really well-behaved Michaelmas Daisy, which we leave alone for several years before it needs to be taken up and divided, and the name of this highly-respectable member of the Aster family is A. ericoides. It is the prettiest little Daisy bush, so neat and nice, myriads of little flowers, about the size of real Daisies, covering it in September, which are specially desirable for bouquets at that time. It only grows to the height of three feet, and makes a compact plant, which is really quite free from the robbing propensities of its family connections, and leads a quiet life amongst the other flowers. So if you have not got this Aster, now is the best time to get it. When you have removed the plants which have become too rampant, you will be sure to find gaps which will need to be filled up, and the question will occur to you, How best can this be done?

Too many herbaceous borders are a muddle of plants and of colours, and really a great deal of consideration is needed before one adds more plants. Sometimes I see borders which are full of nearly all white, or all yellow, flowers, with tall plants hiding the low-growing kinds, and magenta killing the other pink tints in a terrible way. Now, it is a very good thing to have plenty of white flowers, because they divide the other colours so well; blue, too, is most useful in this way, and sometimes yellow; but when one puts in any shade of red, it is well to look round and make sure that it will not be an eyesore to anyone with an eye for colouring, because it grows too close to some jarring tint. It is better, in arranging herbaceous plants, to have a good large clump of each kind, instead of dotting them all over the place; and this is not so terribly confusing, either. For instance, a tall group of five or six white Foxgloves will look well near the back of the border, or the same number of blue Delphiniums; any red or pink flowers of moderate growth (such as Pæonies or Roses) will be suitable for the next group, and for the edge you will find few better things than Pinks, either white or laced with crimson, for they are lovely in May, and their neat tufts of blue-green foliage always looks tidy. Forget-

IMPERIAL PÆONY, QUEEN ALEXANDRA.

me-nots (Myosotis), such as Perfection or Victoria, in neat tufts, also make a good edging in spring, but have to be pulled up at the end of May, when they become too untidy. They can be planted between clumps of Pinks (Mrs. Sinkins is still the best of these, I think), and you can fill up the gaps later on by planting out half-hardy annuals in them, such as dwarf Zinnias, China Asters, or Stocks.

paratively rare. Some of them are too large for small gardens, but there are others which are quite dwarf. M. obovata, for example, is seldom more than four or five feet in height, and M. glauca, ten or twelve. The latter is an evergreen, with very fragrant white flowers towards the end of spring, and often during the greater part of the summer. The former is deciduous, and has large, scented, Tulip-shaped flowers, white inside, and purple outside, in April. M. glauca is far more often seen in America than it is in this country. Parsons speaks of it as "the common, sweet-scented, white swamp Magnolia often sold by boys in our railway cars." He adds that it is "generally quite hardy, although I have known winters severe enough to nip its young growth, especially if that young growth was not sufficiently matured during the previous fall." In this climate it may certainly be called hardy —at any rate, in the southern counties, while it may be safely grown farther North in a warm corner.

Too Much of a Good Thing.

March 26th.—A friend who has taken a new house with a small garden, informed me that he was making a big bed of China Roses, and meant to confine himself entirely to them. I was surprised until I found that he was acting on the advice of the head man of a well-known landscape gardener, whose grounds, beautifully laid out by himself, are nearly sixty acres in extent. It shows the danger of passing on a prescription from one patient to another, without any regard to the conditions. The China Roses, especially some of the newer varieties, are charming, and the abundance of their flowers and the length of their season render them of exceptional value. But we want in our gardens something more; we want also variety. If there were a single plant which bloomed magnificently throughout the year, and we had nothing else, the time would certainly come when its beauty began to pall and we longed for a change. In extensive grounds it is possible to fill large beds with China Roses and other plants, and at the same time to get as much variety as anybody could wish; but in a small garden it is not possible, and to attempt it simply means taking a tiny section of the former and leaving out all else—obviously, a serious mistake. It would be equally a mistake to take a reduced scale as the plan, for this would involve "dotting"—a disastrous blunder. In the small garden, as in the large, plants should be massed, but the masses must be smaller, and, in order to get sufficient variety, fewer. In other words, we must select the best and the most suitable. A predominant feature is excellent; it gives a tone to the whole if the others harmonise with it; and China Roses will serve the purpose as well as any plant. But if they are the sole feature, or nearly so, their owner will surely tire of them.

H. C DAVIDSON.

MR. FRED. J. CHITTENDEN.

Science in the Garden.

INTERVIEW WITH MR F. J. CHITTENDEN, F.L.S., AT THE LABORATORY, WISLEY.

IT will be two years in June since Mr. F. J. Chittenden, F.L.S., was appointed by the Council of the Royal Horticultural Society, Director of the Laboratory at Wisley, and two years in July since the Laboratory itself was opened by Lord Avebury. At my suggestion, Mr. Chittenden was good enough to see me a few days ago for the purpose of a talk about the progress of the work under his auspices. The twofold purpose of the Laboratory, as he explained on my arrival at the garden, is the pursuit of scientific investigation in matters concerning horticulture and the instruction of students in its principles.

"Perhaps you would like to say something about the instruction given to the students first?"

"Just as you prefer. There are two courses of instruction—elementary the first year, and advanced the second. Each course includes laboratory instruction in elementary science as applied to horticulture, together with field work and garden instruction in the practical operations of horticulture."

"Has there been an increase of students since the Laboratory was started?"

"When I came here there were under twenty. Now there are thirty, the utmost number we can take. This shows that the school is filling a place. The age of the students varies from sixteen to twenty-two, and the aim of the instruction is to enable them—whether they take up fruit-growing on their own account, become private gardeners, or engage in any other branch of work—to apply the knowledge which has been imparted."

"How much time do they spend in the Laboratory?"

"Nine hours every week, and the rest in the gardens. One of the interesting features is a discussion which takes place on alternate Wednesdays. It is originated by a student reading a paper on some point of gardening. Recent subjects have included the propagation of herbaceous plants, the Cabbage tribe, and British trees. The advantage to the reader of the paper is that he learns to write definitely, and it is useful to those who hear it, because it stimulates inquiry, and sometimes is suggestive and informing. As you know, the practical work in the garden is under the general direction of Mr. Wright, the superintendent, and the time the students spend here is divided so that one year is devoted to fruit and vegetable cultiva-

THE LABORATORY AT WISLEY IN THE GARDENS OF THE R.H.S.

Digitized by Google Original from CORNELL UNIVERSITY

tion (under Mr. A. C. Smith's instruction), and the other to work in the wild garden and propagating department (under Mr. Thomas Frazer). Altogether, the time of the students is pretty well occupied while they are here."

Certificates and Prizes.

"You grant certificates when they leave?"

"Yes, at the end of the two years' course a certificate is given to every student who passes a written and practical examination in the principles and operations of horticulture. An essay has to be presented on an approved subject, a collection of properly dried plants must be shown, and a collection of insects injurious or helpful to plant life must be submitted. Prizes are also awarded. We have just instituted another prize—in memory of the late George Nicholson—for observation of the natural Flora of Wisley Gardens and the neighbourhood.

"It may be of interest," continued Mr. Chittenden, "to mention that the students are expected to keep a diary of all the work they do in the gardens. This diary is revised every week by the instructors, so that anything left out can be easily filled in. The diary will be of use to the possessor later on, because it gives the idea of what we can do at different seasons of the year. The students, too, help in making the meteorological observations. Our station is very finely equipped, and is under the control and periodical inspection of the Government Meteorological Department. The School of Horticulture is also under Government inspection, which commenced when I was appointed Director. We have had a very excellent report from the inspector."

Investigation of Plant Disease.

"Now, as to the ways in which science can help horticulture?"

"Science in the garden! There are so many ways. Many people are of opinion that investigation in the diseases of plants is one of the most important. We have now experiments proceeding on the disease from which Apples and Pears suffer."

"You mean scab?"

"Yes, and, unfortunately, we suffer from it here. We have had a large number of replies sent in to our schedule of queries, and a considerable amount of useful information has already been obtained. When the whole of the replies are in our hands, they will be collated, and a report upon the occurrence of the disease will be drawn up for publication in the 'Journal' of the society. Last year we published in the 'Journal' the result of an investigation into Apple-leaf spot, which we carried out here."

The Questions about Scab.

"What sort of questions do you ask in your schedule about scab?"

"Whether it has made its appearance in the grower's fruit during the past season; what proportion of the respective crops of Apples or Pears is estimated to have been damaged by the disease; the total quantity of fruit damaged by it; whether the damaged fruit is allowed to rot on the ground, or is given to pigs; whether the fruit slightly attacked tends to rot in the fruit-room more quickly than other fruit; whether in the experience of the grower the disease is more prevalent now than in years past; the kind of soil and subsoil on which the trees are planted; whether any system of manurial treatment is practised; whether the trees are growing in grass or in cultivated land, and, if in both, whether a difference is found in the amount of disease under different conditions; whether the disease is more prevalent in some parts of the plantation than others, and, if so, what is the character of those parts."

"Your questions are very searching?"

"We have tried to make them as exhaustive as possible. But there are many others. We also ask whether the trees grown are mainly dwarfs or standards, and if any difference is found in the amount of the disease on the two forms, where both are grown; the age of the bulk of the trees, and whether the disease is worse on the older or the younger trees; whether the trees are systematically pruned in the winter, or the summer, and whether all dead wood, both branches and twigs, is cut out every year; what is done with the prunings; whether it has been noticed that the leaves of the trees are attacked; whether any trace of the disease has been found upon the shoots in the shape of small scabby spots, or otherwise; at what time and upon what part of the plant is the disease usually first noticed; whether there are in the near neighbourhood any old and neglected orchards, and whether there are Crab Apples or wild Pears in any considerable number in the hedges; whether any conditions are suspected, seasonal or otherwise, which would favour the appearance and spread of the disease; whether it is found that some varieties are more severely attacked than others, and, if so, their names; also the names of the varieties, both Apples and Pears, which are caused to crack badly; whether any varieties growing amongst others which are diseased remain free from the attack, and, if so, their names; whether any remedial or preventive measures have been tried, and, if so, with what success. In addition to these specific questions, we have asked for any general remarks which individual growers may like to make."

Etherised Lilac.

Plant C was subject to etherisation, while Plant D was not. In every other respect they were grown under similar conditions.

The Fertilisation of Apples and Pears.

"While we are speaking of fruit, is there any point you care to refer to?"

"We have prepared, for pruning experiments, four rows of Apples and Pears, all of the same age and history, the Apples on Paradise and Crab stocks, the Pears on Quince and Pear stocks. There are altogether about two thousand trees. Then there is the question of immunity from disease which is enjoyed by certain plants. Take Potatoes and Wheat. With respect to the latter, Professor Biffen, of Cambridge University, has shown that immunity is an hereditary characteristic; and if this is true of Wheat, it may also be true in many other cases. Another most important question is the conditions under which plants become diseased. Thus it has been ascertained that certain conditions (such as over-manuring with nitrogenous manure) expose the plant to the attack of parasitic fungi; and that certain weather conditions act in a similar fashion. We need further investigation respecting this particular matter. Another point is the fertilisation of Apple and Pear flowers. Some varieties will form fruit when the pollen of the same variety falls on the stigma of the flower. But these are exceptions."

"Can you name any of the most notable?"

"One of the exceptions amongst Apples is Stirling Castle, and one amongst Pears is Durondeau. In the majority of cases it is necessary that pollen should come from another variety. The practical application of this comes in when the trees are planted. You might plant twenty acres of Stirling Castle alone with every hope of success, but it would be no use planting twenty acres of Cox's Orange Pippin without interspersing other varieties amongst them. The same is true of Plums. But I cannot say with certainty whether it applies to any other fruit."

The Etherisation of Lilac and Spiræa.

"Speaking of experiments, I think you had one last year on nitro-bacterine in the soil?"

"Yes, and we found that in our soil nitro-bacterine is absolutely of no use. But I believe that bacteriology may in a few years do much for agriculture and horticulture; probably along other lines than the inoculation of leguminous plants. Now we might turn to another question—the etherisation of plants for forcing. Professor Johannsen, of Copenhagen, found that certain plants, after being exposed to the fumes of ether, started into growth considerably before their normal time; and the effect of ether upon various plants is now being tested here. If you would like, I can show you what we have done so far."

We proceeded into the greenhouse which forms a portion of the Laboratory, and Mr. Chittenden showed me some plants of Lilac which had been etherised, and some which had not.

"The former," he said, "have been flowering bountifully since Christmas, and the latter, as you see, are not yet (in the middle of February) in bloom. All the plants were brought indoors at the same time, and the variety is the same —Marie Legraye."

"There is no mistake about the difference. Have you any other illustrations?"

Digitized by Google Original from CORNELL UNIVERSITY

"Yes; here are two plants of Spiræa, one blooming freely, and the other not in bloom. Both plants were put in this house at the beginning of November, the one in bloom being etherised, and the other not. So it is all through with Lilacs and Spiræas. Then we have been trying the result of etherising Strawberries. They were brought in six days ago, the variety being President. The plants which were etherised have strong new leaves starting into growth, but those which were not have not made any growth. Here is another variety —Royal Sovereign—with etherised plants showing flower-spikes, and the others several days behind."

Bulbs Not Affected.

"What about bulbs?"

"We have tried ether with several varieties of bulbs, and first with two batches of Emperor Narcissus, with the result that the progress made was very similar. Then we tried other varieties of Narcissus, Hyacinths, Spanish Iris, and early-flowering Tulips, but we did not get blooms from the etherised subjects any sooner than from the others. Certainly, the Lilacs and Spiræas show that ether has a very considerable amount of influence. So it has with Seakale, but not with Chicory, which is something like Seakale in growth. A small dose is fatal to Chicory. Potato tubers do not appear to respond to it. Of course, the dose and the time of the experiment are matters of vital importance."

"Is it easy to experiment with ether?"

"Both easy and free from risk, so long as the one precaution of avoiding flame is always observed. Here is our chamber, which is two feet six inches deep, three feet nine inches wide, and four feet high. It is made quite airtight, and charged with four hundred cubic centimetres of ether. The plants are left in the chamber for two days at a temperature of about sixty degrees. I think it may be added that only plants which are well prepared for forcing are likely to respond to treatment by ether."

"Any other means by which you are trying to make science valuable in the garden would be appreciated."

"We are at work in connection with soil sterilisation by steam, having special reference to Tomatoes and Cucumbers. When these are grown in houses, the usual plan is to cart all the old soil out and to replace it with fresh, because pests, such as eelworm, increase in the soil, and ruin the succeeding crops. The object of sterilisation is to kill the pests, and do away with the necessity of changing the soil, but we also desire to ascertain the effect of the heat upon the soil, and upon the plants subsequently grown in it. I can already say that under certain circumstances a fortnight may be saved in growing plants fit to plant out. But it is too soon to say what the circumstances are. Some experiments are also in progress as to the inheritance of character in certain flowers, particularly of the Primula genus, many species of which, such as P. japonica and its near relative, P. pulverentula, grow remarkably well here. Similar experiments are also in course with several of the annual Poppies. But you can imagine that all experiments take a great deal of time, and cost money, sometimes much and sometimes little. In making an experiment, it is essential to guard against having more than one point of difference between the experiment and the control. Experiments in a garden are extremely difficult, because of differences in cropping and manuring."

The Trouble of Experiments.

"Can you give me an illustration of the trouble involved in making an experiment?"

"Yes. When we made the experiment with nitro-bacterine, we picked over a thousand pounds of Peas. They were picked from ninety-six rows, and the Peas were shelled. The Pea-pods, at each picking from every row, were counted and weighed, before and after shelling, separately."

"Do you think that science is likely to do much in lessening labour in the garden?"

"No, except, perhaps, in perfecting tools; but science is likely, I believe, to render the fruits of the labour greater. Take, for example, the effects of thorough cultivation on the crop. We made experiments on two halves of a plot of land on which Peas were grown. One half was cultivated, and the other half was fallowed land. The weight of the pods in pounds of Ne Plus Ultra on the cultivated land was 152½, and on the fallowed land, 106; of Duke of Albany, 165½, compared to 75½; of Telegraph, 190½, compared to 128; of maincrop, 120, compared to 59. The totals were 628½ in one case, and 368½ in the other, the difference in yield in favour of deep digging for Peas being 70 per cent., and the benefit derived very marked in the case of every variety.

"Science," concluded Mr. Chittenden, "is also likely to prevent time being wasted on work which is almost sure to be unprofitable. For example, if we know the exact conditions under which certain varieties of fruit prosper, and the conditions under which they fail, a great deal of unprofitable work would obviously be avoided. If you want to add anything negative, it may certainly be asserted that science will not do away with mechanical work."

ALFRED WILCOX.

Letters from a Lady Gardener.

No. 348.—HARDY FLOWERS IN WINTER AND SPRING.

DEAR KATE,—I think we ought to consider our gardens from the point of view of the four seasons. Winter is, of course, the most difficult of these to provide for, and consequently there are many gardens which are given up to desolation from November till the end of March. But this should not be, for there are really a number of hardy plants which will blossom in winter. The early Irises (I. stylosa especially), of which I wrote last week, and Christmas Roses (Hellebores) in variety, will cover the whole time. Then the varieties of Crocus with smaller flowers (C. Susianus) blossom much earlier than the rest, and are extremely pretty, being striped mauve and white, or golden-yellow and bronze, as well as all in purple, and in white. We find that they multiply so fast in this light gravel soil that we have to take up the clumps and divide them every third year.

All the Crocus tribe are most obliging in the way they stand being moved. You can plant them in the autumn (which is, of course, the right time), or remove them in bloom in the spring, or take them up after the leaves have ripened away. You may fill the edge of a window-box with them, just as they show colour, or move them at will any time during the summer and autumn, and they don't seem to mind it at all. The only time when you should not interfere with them is in the late spring, after they have blossomed, when they are busy making their flower-buds for next season whilst their foliage is ripening. This is a critical period with all bulbs, and unfortunately the ordinary gardener is apt to think that when the blossom is over, the plant may be pulled up with impunity, and sometimes he even cuts down the foliage (for the sake of tidiness), which effectually destroys the hope of flowers for the next season, as plants are unable to do their work without their lungs—for leaves act as lungs in the case of vegetation, taking in the necessary gases which plants need, and giving out oxygen, etc. The period of rest comes when the embryo bud is formed in the centre of the bulb, the foliage having then

DAFFODILS IN A WILD GARDEN.

were some central society, to which he and all other subscribers could send in their reports, so that they might be systematically recorded and collated, all the expense, time and trouble might be saved. Each, with the information at its command, it could give an authoritative answer to the question whether certain seeds were worth buying or not, and to many other equally important questions besides. Authors have such a society, and as a member of many years standing I know something of its value. Why should not amateur gardeners form a similar combination? Far from being antagonistic to any reputable horticultural firms, it would, I feel sure, be welcomed by them, as it would relieve them from the worry of many unreasonable complaints which now reach them. If only a fair proportion of amateur gardeners were to join, it could be run on a very small subscription.

The African Lily.

November 1st.—A single plant of Richardia africana, bearing nine flowers, is shown in the illustration. Of course, a fine plant like this is not a young one. On the tuberous root there are many crowns, and the different flowers spring mostly from different crowns. Some years ago I ordered a hundred plants from a Continental firm, and when they arrived every crown, except the central one in each case, had been sliced off for propagating purposes. It is against such firms that the society I have suggested would protect us.

H. C. DAVIDSON.

Famous Gardeners at Home.

No. 234.—MR. A. D. CHRISTIE, AT THE GARDENS, ROCKINGHAM, EDGBASTON, BIRMINGHAM.

IT is not surprising that the gardens at Rockingham are exceptionally interesting. The owner, Mr. E. A. Wilson, is an enthusiast in all that pertains to Nature, including beauty, and the head gardener, Mr. A. D. Christie, is well known as an expert in both the scientific and the practical sides of horticulture. Rockingham itself, though only two miles from the centre of Birmingham, is quite in the country. The only residence in close proximity to the splendid new university, it stands on high ground, with most pleasant surroundings, and is quite untouched by the smoke from the factories of the Midland metropolis. On the occasion of my visit, early in September, in bright, sunny weather, both house and gardens presented a delightful appearance. The latter consist of only four acres, including a small meadow, and Mr. Wilson did not come into possession until May, 1906. Yet, as it will be seen, they contain an unusual number of features, every foot of space being turned to useful or beautiful account. Moreover, while many important additions have been made in twelve months, the results are already apparent. Looking round the lawns, the first thing that attracted my attention was a striking bed, composed entirely of succulents, with a fine specimen of Phœnix spectabile in the centre, and I enquired whether the cultivation of species of Cactus was a feature.

The Collection of Succulents.

"Yes," replied Mr. Christie, "Mr. Wilson takes the keenest interest in the species, and we have a house devoted to them. There are about twenty-five of the species in this bed. They are chiefly Yuccas, Aloes, Agave americana variegata, Crassulas (or Kalosanthes) in variety, Echeverias in variety, Mesembryanthemum in variety (tricolour, as well as the annual one), and Opuntias—the Prickly Pear. Would you like to see the house of succulents while we are talking on this subject?"

THE RECENTLY-CONSTRUCTED ROCKERY.

"It would be very convenient."

We accordingly made our way to the houses, passing a modern border, in pretty contrast to the bed of succulents opposite, and containing, in flower, Geraniums, Petunias, Lobelias, Ageratum, and Dianthus.

"Which are the most notable of these plants?" I asked, as we entered the house.

"The collection includes many varieties of Phyllocactus, Mesembryanthemums, Gasterias, Mamillarias, Prickly Pears in fruit, Rhopsalis, Staphylea (which have a flower like the star of India), Penecias (which come from South Africa, and are not in commerce), Haworthias, Cereus, Rochea perfoliata (with bright scarlet flowers), Echinopsis, Gasterias, Cotyledons, and Echinocactus obvallatus in flower."

MR. A. D. CHRISTIE.

"You have Orchids and Ferns in the next house?"

"A small number of Orchids, chiefly Cattleyas, Dendrobiums, Cypripediums, Odontoglossum, Cymbidiums, and Cœlogyne cristata. The collection of Ferns and Selaginellas is a representative one, and embraces many varieties. On the walls are Smilax and the creeping Fern, Lygodium scandens. We intend to grow Nymphæas at the end of this house, in a tank, with rockery around it, which will be planted with Ferns, etc."

The Hardy Winter Garden.

"This," continued Mr. Christie, as we made our way into a building resembling a conservatory, "is what we call a hardy winter garden. The object is to show what plants will thrive under the conditions of cultivation."

"But surely some of the specimens were planted before 1906?"

"There was not a thing in the house when we came from Bell Court, Warwickshire, in June, last year. In July we planted the house. We brought with us the Eucalyptus globulus, which develops its soft foliage in two years, and its proper leaf in four years; the Plumbago capensis, the Abutilons, Eulalias, the Phœnix spectabile, the Tacsonias (in pots), the Ficus elastica, and the Acacias. Tacsonia Van Volxemii, with its scarlet flowers, covering the roof, and the Plumbago, make a striking contrast."

"The growth has certainly been all that you could desire.

"Of course, we give them fresh soil and feed well. In the other portion of the winter garden, which is a little warmer, is Hoya carnosa (the Wax-flower), which keeps on blooming, and on the back wall is Bougainvillea glabra. In pots on the stage are Ferns and foliage plants, the latter including Fittonia argyroneura, Strobilanthus Dyerianus, Streptocarpus, and Nephrolepis exaltata, which is very useful for baskets or pots. You might add a collection of Amaryllis, and, combining the useful with the

decorative, we grow Ham Green and Prolific Tomatoes, and Telegraph Cucumbers."

Returning to the lawns, Mr. Christie pointed out, near the house, a bed of Rhododendrons, well set for next year.

"Did you use peat?" I asked.

"Yes, a good deal, and also for the hybrid seedlings, which we planted last year. In a warm corner, under the house, you see Schizanthus, now in flower, and close by are three varieties of Magnolia—grandiflora, Exoniensis, and conspicua."

"How long has your London Pride been in flower in the border?"

"Three months. It lasts so long because the sun does not reach it. In the early spring this border is gay with flowers of bulbs, Primulas and Wallflowers, planted in the autumn, and, later, with German Iris."

"You have also a plantation of border Carnations, which, with the Stocks, form a pretty combination?"

"The Carnations are principally white and scarlet Clove, Reynolds Hole, and Raby Castle. The Stocks are the Ten-week variety."

Rockingham, Edgbaston.

"Before we leave the lawn, I should like to know if the fruit trees on it do well."

"The Codlins yield exceedingly good crops, and are, therefore, useful as well as ornamental. Originally, the pleasure garden must have been an orchard, and a certain number of old fruit trees have been allowed to remain. But most of our fruit trees are in the kitchen garden."

Root-pruning.

"I believe you are specially fond of fruit cultivation," I remarked, as we entered the kitchen garden.

"I have great faith in root-pruning of fruit trees, and my experience is that they all require both summer and winter pruning to yield the best results. The general idea is that the more you prune, the more wood you get, whereas, with proper pruning, there is less wood. Pruning ought to be done at both seasons of the year, with a view to flower, and, if it is done properly, Nature will furnish the fruit. When there is a failure, it is the gardener who is at fault, not Nature."

"Any hints on this subject would be useful."

"With regard to summer pruning, the mistake is often made of beginning at the top of the tree and finishing at the bottom. The right course is to begin at the bottom and finish off at the top, within a period of ten days or so, because, by this means, you check the growth in the shoots you wish to keep and when you come to cut the top part, the sap, being arrested, goes back into the shoots that have previously been stopped. By this means more light and air reach the bottom of the tree, and the leaves can elaborate the extra sap that will go to make the flower buds."

A Practical Illustration.

"To give you a practical illustration," continued Mr. Christie, "here is a fruit bed, containing Keswick Codlin Apple trees, etc., and also Plums and Pears. Twelve months ago this bed was a thicket of wood. Now, as the result of root-pruning in some cases, and judicious winter and summer pruning, which has given light and air, you can see through the trees, and every branch has fruit on it. The fact is, wherever we have pruned, we have obtained fruit. Last year there was not a Pear in the garden, and now, as you see, we have several trees with large crops."

"What are the principal varieties of Pears?"

"Marie Louise, Beurré de Capiaumont, Beurré Brown, Williams's Bon Chrétien, Jargonelle (which does well as a standard), and Louise Bonne of Jersey. We are also trying Duchesse d'Angouleme, Pitmaston Duchess and some of the larger sorts. I may say that I work upon the principle that if a tree does not produce a crop in three years, it is not worth preserving. But, as a rule, the second year after operating upon there is a crop."

"All your fruit is, I notice, grown on standards."

The Best Apples.

"Yes, we have no walls to the garden, but on a few old buildings, and the back wall of the greenhouse, I have planted Cherries, Plums, Apricots, Pears and Peaches, as an experiment, because I do not believe in not using vacant space for that which is most pleasing and useful. As to the variety of Apples, the fruit of Lord Suffield is particularly good, both in size and shape. We have some nice fruit of Cellini, Cox's Orange Pippin, and Ecklinville Seedling, which is as free as any, and Stirling Castle and Court Pendu Plat are also excellent."

"You have a line of young fruit trees, with fruit buds on them. When were they planted?"

"Last spring, and they are three years old. I attribute the fact that they have fruit buds on them now, entirely to winter and summer pruning. There is one other point in connection with fruit trees that is worth emphasising. Each variety has a habit of growth peculiar to itself, and this, it should be remembered, varies according to the cultivation, soil, situation and temperature."

"Although you seem to have a good supply of Apples and Pears, your Plum crop is different."

"Yes, it is rather curious that, although Plums are very plentiful in the country, our crop is rather poor. The varieties that do best here, I think, are The Monarch, Pond's Seedling, Victoria, The Czar, Transparent Gage, and Early Prolific. We have had a very fine crop of Gooseberries, especially of Sulphur Yellow. The other varieties are Whinham's Industry, Warrington, Lancashire Lad, and Ironmonger. The Currants (black and red) and Raspberries (Superlative and the Old Prolific) have done well."

"What about Strawberries?"

"For young plants, eighteen month old, St. Joseph is a decided success. This is the second crop. In addition to St. Joseph being a perpetual bearer, of very good flavour, it is, when well grown, quite as large as The President. We also grow more largely, Royal Sovereign, other varieties being Laxton's Prolific and British Queen."

"You have a fine show of the American Blackberry."

"Everyone with a garden close to town ought to grow these. They have only to be fed well with manure, and they will yield quantities of fruit, continuing to bear until severe frosts set in."

The Principal Vegetables.

"Flowers are as much a feature of your kitchen garden as fruit, but, before we discuss them, you might say something about your vegetables."

"There are Brussels Sprouts coming on, and between these we have had Cauliflowers, the supply being larger than we can use. Celery is rather a feature, and White Plume is a splendid early variety. The others grown are Wright's Giant White and Leicester Red."

"Do you grow many varieties of Potato?"

"We are trying a few as an experiment—The Colonist, Reading Russet, and Stourbridge Glory. Last season we depended upon Ashleaf, Royal Kidney (a Potato which has come to stop, and will do either for field or garden), or Snowdrop, a round white Potato, of splendid flavour. We have had very good crops of Peas, beginning with Chelsea Gem, and continuing with William Hurst, Gladstone, Autocrat, The Queen, and Gradus. Our only variety of Runner Beans is Hero; of French Beans, Canadian Wonder; and Broad Beans, The Windsor. We have not yet started Asparagus and Onions, so far, have not done well, but Carrots (Intermediate and Short Horn) and Turnips (Early Milan and The Model) have been successful. Egyptian is a fine variety of Beetroot for early work, and Brood-red is the best for later."

A Remarkable Rockery.

"I conclude that you found your rockery here when you came?"

"On the contrary, the foundations of the rockery were not made until the middle of January of this year. It is built on a site which was previously covered with Gooseberries and other fruit trees, and is composed of stones brought from Gloucestershire, which Mr. Wilson had inspected and arranged for previously. In fact, I may say that the rockery is entirely my own work."

"It is amazing to see how the Alpines have grown, and the number of plants in flower at

this period of the year. You might give me the names of some of these."

"Many, such as Sweet Alyssums, have been in flower ever since May. Then, there are Sedums and Campanulas in variety, numerous Saxifrages (including the red Rheii and sarmentosa), Aubrietias (Fire King, Moerheimi and Campbellii), Veronica rupestris (now in bloom for the second time), Polygonum affinis, Gazania splendens (this makes a splendid addition to a rock garden in summer), Primulas denticulata, rosea, farinosa, and Kewensis (now blooming a second time), double-flowering Arabis, Sempervivums in variety, Oxalis rosea, and Gypsophila prostrata (the latter a continuous bloomer). Some of the varieties on the top of the rockery are used for the sake of the foliage. They include Juniper prostratum (which is one of the best plants for the purpose), Ericas in variety, Olearia Haastii, Cytisus purpureus, a number of Brooms, Veronicas in variety, Rock Roses in variety, Genistas sagittifolia, incarnata and capitata, Xanthoreza Upiifolia (very beautiful bronze foliage, and very uncommon), and Heucheras in variety, particularly sanguinea, which is grown for its foliage, as well as for its beautiful scarlet flowers."

MAKING THE ROCKERY AT ROCKINGHAM, IN MARCH, 1907.

"Can you tell me how many species of plants are represented in the rockery?"

"Upwards of fifty. There are several hundreds of Sedums, of which we have over twenty varieties. You will notice that the wall of old bricks on one side of the rockery is covered with plants, and these, I believe, embrace quite forty different varieties."

A New Rosery.

"You have quite a nice Rosery close to your rockery."

"The Roses have only been planted twelve months; some are new, and others we brought from Bell Court. The varieties include La France, A. K. Williams, Boule d'Or, Boule de Neige, Killarney, Frau Karl Druschki, Dupuy Jamain, Earl Dufferin, The Queen, and Baroness Rothschild. On the half-dozen arches in the central walk, the climbers include Dorothy Perkins, W. A. Richardson, Crimson Rambler, and Pink Rambler. They are looking well now, but we have had to feed them up."

In another part of the garden, facing the tennis lawn, is a remarkable collection of herbaceous plants.

"I should explain," said Mr. Christie, "that all these plants were brought from Bell Court and put in lines in the border, which is ten feet wide, without the idea of keeping them there. But Mr. Wilson thought that the arrangement could not easily be improved upon."

"Here, again, you might give me the names of some of the varieties now in flower."

"There are at least twelve varieties of Michaelmas Daisies, Mrs. Ash being one of the best. The lines now in flower are mainly Trollius in variety, Lobelia cardinalis, Helianthus rigida, Phlox in variety, Rudbeckia Macowani and purpurea, Pyrethrums, Galegas in variety, Montbretias, some of the double Campanulas, Monarda didyma, Chrysanthemum maximum (several varieties), Hellebores (now in flower for the second time), Anemone japonica, Pæonies in variety, Irises (the foliage of which shows up well at this season, between those in bloom), Doronicum, Echinops and Tritomas (four varieties). Mr. Wilson is carrying out a system showing how the Rockingham collection is made up. On a card is given the popular name, and full details of the genus, species, variety, habit, blooms, colour, how acquired, and the date of planting. A space is also left for remarks and references, and we find these cards very useful."

A Representative Shrubbery.

"What is the length of the shrubbery facing the tennis court?"

"Forty yards long, and seven feet wide. There are about three hundred different shrubs and trees represented in this border, and it will, no doubt, suffice, if I give you just a few of the names. Among the most prominent are Abies, of which there are six dwarf specimens. There are four varieties of Golden Yews. The Cupressus is represented by Allumii and Lawsoniana and its varieties, and Thuja by Lobbii in variety. Then there are the Picea concolor, Pinus contorta, Abies pungens glauca, Cephalotaxus Fortunei, the variegated Dogwood, Olearia macrodonta, Araucaria imbricata, Zanthoriza apiifolia, Symphoricarpus variegata, Wellingtonia gigantea, Ilex in variety, the Sciadopitys verticillata (or Umbrella Pine), Cedrus atlantica glauca, and two varieties of Bamboos. Considering that all these have been planted for over a year, the growth of six feet of one of the Bamboos is, I think, encouraging. We propose to have a number of varieties, and in time to come the shrubbery will be a very important feature of the gardens."

"You ought to say something about annuals, which are admirably represented by Sweet Peas and Hollyhocks."

"Of Sweet Peas we grow about three dozen named varieties, of which, perhaps, the best are Edward VII., Blanche Burpee, Golden Glow, Phyllis Unwin, Black Michael, and Romolo Piazzani. We have had an enormous mass of flowers, and have been sending batches to the hospital every week."

"What is your system of cultivation?"

"I sow them in pots, and plant out in April or at the beginning of May, in single clumps. In order to obtain flowers till the frost begins, the seed-pods should be cut off the moment they are seen. The Hollyhocks are all seedlings, mostly doubles—yellow, red and white; they were all grown out of penny packets, and last year they were ten feet high. Of course, the seed must have been good, but I attach importance to the fact that I syringe them with weak paraffin to keep the disease away."

THE SAME ROCKERY IN SEPTEMBER, 1907.

"You were with Mr. Wilson for some time before you came to Rockingham?"

"At Rockingham and Bell Court I have been with him for four years. I was previously head gardener to Lord Hertford at Ragley Hall for fourteen years, and head gardener to the late Lord Warwick, at Warwick Castle, for ten years. I have also represented Messrs. Veitch in Russia, giving me the opportunity of studying horticulture in various places on the Continent; and have had a varied experience in Dalkeith, Heaton, and the London parks. Prior to leaving Ragley Hall and Warwick Castle, I received from each of my employers a marble timepiece, and both at Warwick and Alcester I was presented with an illuminated address from the townspeople, and other tokens of esteem, in acknowledgement of the interest I had taken in horticultural matters, especially in cottagers' gardens, allotments, and the flower shows. I have been a member of the Royal Scottish Arboricultural Society for upwards of thirty years, and I hold a certificate from the first Forestry Exhibition held in Great Britain, in 1884, for a section of Cedar wood, with Boring Giant Sirex at work." ALFRED WILCOX.

Letters from a Lady Gardener.

No. 274.—FURNISHING PLANTS.

DEAR KATE,—Flowers are getting scarce in the garden, and we must now replenish our stock of furnishing plants, to take their place, as far as possible, in the house. It is not wise to put this off until severe weather arrives, because the sudden change from a warm greenhouse to a room is very trying to all plants, and it is better to give them a few weeks to get inured to the change before the frosts are sharp, and the bitter air blows through the rooms every morning whilst the sweeping is done. Palms, of course, are the most effective of all our room-plants, and they will grow well in the semi-shade of the house for many years, if well managed. Unfortunately, they do not always get the care they need to keep them in health, and then the tips of the leaves turn brown, and their beauty is a thing of the past.

A BED OF SUCCULENTS AT ROCKINGHAM, EDGBASTON.

How to Treat Palms.

Palms do not require large pots for their size, and a Kentia, thirty inches high, will do very well in a 6-in. pot for several years; but they must have plenty of water in the summer, and even in the winter the strong coil of roots which they make must never become quite dry, or disaster will follow. It is a good plan to soak their roots, pot and all, in tepid water, once a week in winter, and twice a week in summer, for half an hour at a time, to ensure their moisture, watering them between whiles in hot weather, for they need a plentiful supply then, with a little soot-water, too, once or twice a week when they are growing. This liquid manure is the best to use for room plants, as it is quite pure and without unpleasant smell; you can easily make it by soaking a potful of chimney soot in water. A coarse linen bag will hold the soot; it should be tied in at the mouth of the bag, but still have room to move, so that the water may pass through it, and you should only use the surrounding water (in the pan), in a clear, thin state, for it must not clog up the surface soil at all. Another danger to a Palm (besides want of water in summer, or over-watering in winter) is this, that in moving the plant to dust the room, it is sometimes pushed against a wall, when a tender leaf will be bruised, and fail to expand properly. Special care is needed by all room plants in this particular, for no good foliage should be crushed against furniture, or it is sure to suffer.

The best Palms for a room are the Kentias (Belmoreana being specially handsome), Seaforthia elegans (a large and graceful plant), Chamærops humilis (which is very hardy), and Latania borbonica (another fine fan Palm). It is not desirable to get hothouse Palms for furnishing, as they seldom survive the chilling draughts, and are very disappointing in consequence.

Propagation of Dracænas.

Dracænas are managed in the same way as Palms, and the green Dracænas are very hardy, but I much prefer the crimson foliage of Dracæna Lord Wolseley, which is, I think, the only red Dracæna which stands well in a room. These plants get too tall and leggy after a few years, but it is easy to keep up a supply of young plants in this way: We lay the old leggy one down in a Cucumber frame, in April, covering its roots with soil, and making a notch between every two inches of the bare stem with a knife, half way through the stem. The stem is firmly pegged down into good soil, and the young plants, which soon appear, throw down roots into it all along the stem, when they can be potted up singly, and grown on in the greenhouse.

India-rubber plants (Ficus elasticus) need much care in watering. They are not very hardy, either, and must be kept on the warm and dry side in winter, or their great leaves will turn yellow and drop off. They can be stem-rooted in May in the same way as Dracænas, but you should use powdered charcoal freely on the notches, as you cut them, for they will otherwise lose a quantity of milky sap.

Aspidistra lurida variegata is often called the Parlour Palm, but it does not belong to the family of Palms. It is the easiest of all room plants to manage, for it seldom needs to be repotted, and will stand a certain amount of neglect philosophically. It can be divided and repotted in May, if necessary, but do not give it rich soil, or it will lose its white stripes, which are really the result of vegetable anæmia. Ordinary garden soil will suit it, without manure of any sort, though it really seems rather cruel to keep it anæmic, poor thing!

A Unique Subject.

One of the best of the smaller furnishing plants is Anthericum variegatum, with handsome striped foliage which is not the result of starvation. It is hardy, and will even stand the fumes of gas, besides which it propagates itself in a most obliging way, for its white, star-like flowers (produced at the end of a long, pendulous stem) turn into seed, which ripens without dropping, and grows into young plantlets without any soil. These are quite ready to throw down roots into any soil which they can reach, and you can cut off the whole spray and peg the little plants into a box of soil, which they will seize upon with avidity, and soon make enough roots to enable you to pot them up singly. This is best done in the early spring. We use a number of these pretty little plants to edge flower borders, as we have so many of them. Others are potted on, and make excellent room plants in winter.

Centaurea plumosa is far more beautiful than the rest of the foliage Centaureas; its leaves are like silver, and trebly pinnated, giving them the appearance of an ostrich feather. I am glad to find that it is possible to obtain seed of this fine room plant, which is much too rarely seen. It is quite hardy, and you can scarcely have too many of them, for they are useful to edge borders, and for winter window-boxes, as well as for the conservatory and the house. They are at their best as foliage plants before they blossom (which they do in the second year of their lives); they then produce numbers of young shoots all up the central stem, which will take root quickly if dibbled into a box of light soil in spring, and kept very moist and rather cool. Few of the silver-leaved plants can compare with them in beauty of outline. They are hungry plants, needing good soil, and an abundance of water, with very little fire heat, if any.

lent to nearly £354 per acre, surely a record in this country for Strawberries! It would be interesting to know how Mr. Heatley managed to get on the average 1s. 2½d. per pound for outdoor fruit. That, too, I should think, would be a record price. In a year of extraordinary abundance it would be almost incredible if it

MR. FRANK CLARK.

were not vouched for by Sir Horace Plunket himself.

January 5th.—At this season flowers which would earlier in the year be passed without notice in the garden arouse our keenest delight. I wish Roses could be placed among them. I have had them on a Gloire de Dijon as late as Christmas, but that was exceptional. Miss Violet Biddle speaks of seeing, in a friend's garden, in December, some lovely sprays of Gloire des Rosamanes, a Bourbon, with semi-double crimson flowers, arranged in clusters. It is always advisable, when buying Roses, to include among them some varieties which bloom fairly late in the year. Most of the Teas do, but none of the Hybrid Perpetuals, though Alfred Colomb, Ulrich Brunner, and, perhaps, one or two more, sometimes produce a few flowers at the end of September. Marquis of Salisbury is one of the best of the Hybrid Teas for late flowering. In this connection, of course, the old Pink Monthly should not be forgotten, though a better Rose of the same class is Laurette Messimy. Miss Biddle recommends the special propagation of plants intended for late flowering. "Reserve one bed," she says, "in which all the buds must be picked off from the beginning of July to the beginning of September. A vigorous crop from then on till the frosts come will result. Of course, it is understood that only those varieties which naturally bloom in autumn will flourish under the circumstances." I am not sure, however, that many of us would care to practise such severe self-denial.

January 6th.—In several Cucumber houses belonging to amateurs, I have noticed two mistakes. There is not enough heat, and the plants are trained so close to the glass that the leaves are often damaged by coming in contact with it. The photograph shows an excellent house for market purposes. It will be observed that there are six rows of 4-in. pipes, and the wires are kept well away from the glass. If all the pipes are not wanted, they need not be used. Some of them may be cut off by means of taps at the end.

H. C. DAVIDSON.

Famous Gardeners at Home.

No. 171.—MR. FRANK J. CLARK, AT THE GARDENS, WISTOW HALL, LEICESTER.

IN contrast to the veteran gardeners who have been the subjects of the last two interviews, Mr. Frank Clark is one of the younger men who have come to the front in horticultural circles.

Not only does he occupy a position of very considerable importance, as head gardener at one of the historic country houses in the Midlands, but he is well known in his own and other counties as a successful exhibitor of Chrysanthemums, fruit, and vegetables, while, as a cultivator of Sweet Peas, his reputation is far more than local. On the occasion of my visit to Wistow, towards the end of November, I had the gratification of seeing everything under most picturesque conditions. The trees and shrubs were decorated by snow, and the whole of the gardens presented a singularly fascinating appearance, scarcely to be rivalled even in the full glory of the summer. Wistow Hall, the ancient seat of the Halfords, where Charles I. slept the night before the Battle of Naseby, is now the country residence of Mr. Mark Firth. Situated a short distance from Great Glenn station, it is approached by a pleasant drive, and is surrounded by pretty country, with plenty of timber. On my arrival, early in the morning, Mr. Clark proposed that we should commence our tour of inspection in some of the houses, and the first plants which atracted my attention were a batch of Poinsettias, with singularly fine bracts.

"They are two-year-old plants," said Mr. Clark. "I cut them back hard, and grow them quite cool during the greater part of the summer. A hot summer is favourable to them. In this house, as you see, there are from fifty to a hundred plants of Begonia Gloire de Lorraine. I also grow the white variety, Turnford Hall, but it is not so useful as the pink. Most of these are young plants."

"How do you raise your Clerodendron fallax?"

"From seed. If they are grown on in an intermediate temperature through the summer; the best plants can be got from seed. Formerly, I raised Clerodendron by means of propagation, and I am, therefore, telling you my own experience."

"The Crotons, I judge, are young plants?"

"All quite young. They were only struck in the spring, and consist entirely of the narrow-leaved varieties, which are grown solely for table use during the winter months."

"Do you go in largely for Freesias?"

"We grow a couple of thousand. They begin to flower early in December, and we get a succession of bloom all through the winter and early spring. Tulips are also grown largely in pots—from three to four thousand. We depend largely during the first three months of the year upon Tulips and Daffodils for flowers for room and table decoration."

"Have you been growing quantities of Tulips for many years?"

"For some years before I came here. We go in for self-colours chiefly, and stick to the best varieties. One of the best yellow is Mon Trésor. Cottage Maid is a very good pink; Proserpine (carmine), Pottebakker (white), and Crimson King (crimson)."

"Which do you consider a particularly good Daffodil for early forcing?"

"One of the very best, at any rate, of the old favourites, is Golden Spur. There is no doubt that if a good display at a small cost is desired, it is wise to keep to old varieties. Among the best of the other varieties, I include Princeps, which is especially useful for boxes, being cheap to buy, and easy to grow. Horsfieldi, Bicolor, Empress, Emperor, Sir Watkin, and Maximus are very nice for pots. Three of the newer kinds which I can strongly recommend are Glory of Leiden, an improvement upon Emperor; Mrs. Langtry, and Barrii conspicus."

"You might mention the names of your varieties of Polyanthus Narcissus?"

"Grand Monarque, Mont Cenis, and Her Majesty. We find these very useful. Of Lilacs, which are grown in pots, we limit ourselves to two varieties, Madame Lemoine (double white), and Charles the Tenth (single, purple). These, after flowering, are cut hard back, and are plunged in their pots outside, and are allowed a full

CALADIUMS AND GLOXINIAS AT WISTOW HALL.

season's rest before being forced again, another batch being depended upon for the following winter. Lilies of the Valley are grown largely for the autumn and winter months. Other specialities are Lilium Harrisii, Azaleas mollis and indica, Spiræas, and Deutzias."

From these houses, which are close to Mr. Clark's comfortable cottage, we proceeded into what is known as "the old garden." This is tastefully laid out, and has several charming features. "Among the beds here," continued Mr. Clark, "are one of La France Roses, and another of summer-flowering Chrysanthemums, lately cut down. To give variety, I cut off the top of an Apple tree and planted climbing Roses, Paul's Carmine Pillar and the Dundee Rambler. Another excellent Rose growing on the walls is Reine Olga de Wurtemberg."

"How large is the kitchen garden?" I inquired as we entered.

"Nearly two acres. The shape is somewhat unusual—oval. The Peach trees you see on the wall have been planted since I came here. They are Royal George, Rivers' Early York, and Waterloo; and the Nectarines are Pitmaston Orange and Lord Napier."

"Which varieties do you grow in pots?"

"One of the finest Peaches for pot use is Amsden June. We have also Early Rivers and Early York. The finest Nectarine is Cardinal, while Lord Napier, Violette Hative and Pitmaston Orange are also good. We grow about three dozen in pots. Last season I got an average of a dozen to fifteen fruits off each tree."

"You have a quantity of Celery?"

"Yes, we have a big demand for it through the hunting season. I prefer Standard Bearer for flavour, and for standing late into the season, and Sutton's White Gem for earliest use."

"What do you consider the best Onion?"

"Ailsa Craig is the best, but Cranston's Excelsior is very good. If well ripened, large Onions will keep as long as small bulbs. We have kept large Onions (Ailsa Craig) ten months out of the ground. With regard to cultivation, we trench as deeply as possible."

"Then you believe in deep trenching?"

"As an old pupil of Mr. Beckett, I am convinced that it is one of the roads to success in the kitchen garden. Our soil is heavy, with a dry subsoil."

"Speaking of Mr. Beckett, do you include Edward Beckett among your Peas?"

"I not only include it, but consider it one of the best. Sutton's Early Giant and Gradus are grand for early and mid-season use; Autocrat is one of the very best late varieties. Peas do particularly well with us. Among other vegetables, I prefer Cauliflower Magnum Bonum, Prizetaker Leek, and New Red Intermediate Carrot. Amongst Potatoes, May Queen, Windsor Castle, Sion House, and King Edward the Seventh. Of Parsnips, Tender and True, and of Runner Beans, Sutton's Best of All."

"Do you grow any notable varieties of bush fruit?"

"Of Currants, I find that Comet is the best of the Red. We grow several varieties of Red, White, and Black, and also of Gooseberries."

"And Strawberries?"

"For the main crop Royal Sovereign and Monarch, and for latest use Latest of All."

In the orchard-house, which is used in the season for pot Peaches, were a striking collection of Chrysanthemums, including some magnificent blooms, and all of the Japanese class.

"How many blooms have you cut?" I asked.

"About two or three hundred at present, either for exhibition or for home use. The favourite of the year has been F. S. Vallis. We showed sixty blooms in the Great Vase class at the Crystal Palace show this year. Among the best Japanese are, I think, Mrs. Barkley, Mr. F. W. Vallis, President Viger, Mrs. J. Dunn, Lady Hopetoun, Madame Paola Radaelli, Souvenir de Calvert Pére (a new one of Godfrey's), Madame Nagelmacher, General Hutton, Mafeking Hero, Miss Elsie Fulton, Miss Olive Miller, Kimberley, Bessie Godfrey, and Madame Waldeck Rousseau."

"When were the Muscats planted in your Vinery?"

"The year after I came—1889. Each rod bore thirteen bunches this year. The other Vine is Appley Towers, a fine late Grape, with a Muscat flavour."

Noticing a batch of the pretty, new single Chrysanthemum, Starlight, of Cyclamens just coming into bloom, and of Salvia splendens, we went outside again. Facing the Vineries is the fine, wide herbaceous border, about a hundred yards long.

"This border," observed Mr. Clark, was originally used for kitchen garden produce, and we turned it into a flower border to improve the aspect of this part of the gardens. It contains a fairly good collection of hardy herbaceous and bulbous plants, but at this end of it there is ample room between the permanent plants for groups of hardy annuals, which we sow in open ground each spring. We also plant some thousands of the half-hardy kinds that are raised under glass."

"I should be glad of the names of some of the best of the hardy for sowing outside."

"Very effective for massing purposes is Clarkia. The varieties we use are C. pulchella, C. pulchella alba, and C. Salmon Queen (Sutton's). I sow them in a broad patch, and thin them well. Care in thinning is the most important point."

"Does this apply to all hardy annuals?"

"Yes, and the great mistake so often made by amateurs is to sow in a tiny little patch. As to other varieties, Marguerite Chrysanthemums and Sutton's Morning Star are very useful. One of the prettiest flowers is Linaria reticulata aurea; and, in contrast, is Marocanna Hybrid, a blending of purple and mauve. For a wide border, if planted well, Lavatera is very fine. Then, we use Godetias and Coreopsis freely, and with these are planted, in combination, Pentstemons, Hollyhocks, Delphiniums, and Sweet Peas, the last in masses of colour. Stocks and Salpiglossis are also used. Hardy annuals are particularly useful if the ground is well prepared, the plants well treated, and looked after."

"What are your best Apples?" I asked, as we looked into the fruit house.

"Most of these were from young trees, and are fairly good, but the greater part of the Apple trees here are old and stunted. I think our six best varieties are King Pippin, Cox's Orange Pippin (for dessert), and Warner's King, Dumelow's Seedling, Hawthornden, and Annie Elizabeth (for kitchen purposes). The latter will keep until the end of May.

"There is one point which should be emphasised," said Mr. Clark, parenthetically; "we are three weeks behind the southern counties, and it is impossible for us to get the start that gardeners in the South are able to make in the spring, or to make it up. We are rather low here, and the soil is very cold in early spring."

"Your Rose garden must be lovely in the summer."

"It was only made in 1899. Crimson Rambler predominates on the poles; Tea varieties are on one side, and Hybrid Perpetuals on the other. The varieties are chiefly old standard kinds, such as Ulrich Brunner, Mrs. John Laing, Mrs. R. G. Sharman Crawford, Marchioness of Downshire, Duke of Bedford, Madame Eugene Verdier, Paul Neron, Baroness Rothschild, Margaret Dickson, Marie Baumann, and Elsie Drew, amongst the Hybrid Perpetuals. The Teas include: Killarney, Caroline Testout, Maman Cochet, White Maman Cochet, Bessie Brown, Mildred Grant, Hon. Edith Gifford, and Frau Karl Druschki."

THE CONSERVATORY AT WISTOW HALL.

"I see that you have a fine specimen of Wellingtonia close to the Rose garden?"

"Yes, but Conifers are not a strong point, though some of the Beeches and Elms are considered very fine. Two old Mulberry trees not far from the summer-house bear excellent crops of fruit."

"What are the Roses growing on the summer-house?"

"Rosa Rampante, The Garland (very pretty for pillars), and Crimson Rambler. But the summer-house is covered chiefly with Clematis montana, intermingled with C. Jackmanni."

"You have archways of Roses along the pathway by the side of the lawn?"

"Yes, we make a feature of Roses, generally. Crimson Rambler and Aglaia are very useful for the arches; the latter does not like hard pruning. W. A. Richardson is planted on the trelliswork. Along this border are spring-flowering shrubs, the majority yellow and white, including Syringa, Spiræa, and Choisya ternata. Roses, though you cannot see them, because of the snow, are planted at the foot of an old Fir, and climb up into the branches. The variety is Rampante."

"Bedding is an important feature," I remarked

as Mr. Clark pointed out the fountain in the centre.

"Spring bedding, especially. The old design was Dutch style, a great number of small beds. I have done away with some of them, and introduced a bolder mass of colour in one bed. There are now fourteen."

"What plants are in the beds at the present moment?"

"Just before the busy Chrysanthemum season commenced, I planted them as follows: In the first, Narcissus maximus, Jonquil campernelle, and a groundwork of red Daisies; in the second, the only difference is a groundwork of blue Grape Hyacinths (Hyacinthus botryoides); the third bed consists of Narcissus Sir Watkin, and a groundwork of double white Arabis; the fourth, of Narcissus Emperor, and the same groundwork; the fifth, Cottage Maid Tulips, and a groundwork of deep yellow Polyanthus; the sixth, of Tulips Proserpine, and a groundwork of pale yellow Polyanthus; the seventh, of Tulip Belle Alliance, and a groundwork of blue Primroses; the eighth, of Tulips Duchess de Parma, and a groundwork of Phlox divaricata; the ninth and tenth, of Tulip Kaiserskroon, very bold and telling, and a groundwork of Forget-me-nots (Sutton's Royal Blue); the eleventh with Wallflowers, Blood-red; the twelfth, with Wallflowers, Sutton's Purple Queen; and the thirteenth and fourteenth with seedling Polyanthus."

"It would be interesting if you add the varieties chiefly used in these beds in summer."

"One of the best combinations in summer is that of pyramidal Heliotropes, with a groundwork of Sutton's Fairy Queen Begonia. Another equally effective consists of Fuchsias (Lye's Rival), and the little Marigold Legion of Honour; a third is Fuchsias (Lye's Own), and Sutton's scarlet Begonia. A principal feature of the summer bedding last season was Calceolaria amplexicaulis, with a groundwork of Salvia Horminum purpurea, and Cineraria maritima. We have lately made use of Pentstemons for massing purposes."

"Which are the most suitable varieties?"

"P. Agnes Lang (scarlet), and P. John Cowe (pink) are fine for bedding, very free and stand well, and P. George Holmes (scarlet, with a white throat) is a very large, bold flower, and grand for borders. Seen from the windows of the Hall, the Pentstemons look exceedingly showy."

"The handsome and unique conservatory is filled, of course, according to the flowers in season?"

"Yes. Just now Salvia splendens and Poinsettias are the prevailing feature. The former are in flower from September to the end of November."

"What is the name of the very old tree growing right up to the top of the roof?"

"Casuarina equisetifolia. It is a New Zealand fruit tree, and it is said to have been brought here during the reign of George III. The conservatory was built about the time it was planted, I believe."

"The scarlet Geranium covering the end wall of the structure is also very old, is it not?"

"Yes, and it is always in flower more or less. I think it has been here about fifteen years. It was grown in the pot which it still occupies. It is the variety John Gibbons. The Streptosolen Jamesonii, growing on the pillars, is a pretty plant when in flower. As you see, the conservatory, like the mansion, is lighted by electricity."

Returning to Mr. Clark's cottage, and noting on our way a number of grand old Yews and one splendid old Cedar, also the view from the front of the lake, I mentioned the subject of showing.

"When did you begin to exhibit Sweet Peas?"

"At the Bicentenary show in 1900. For twenty-four varieties we were first out of thirteen competitors."

"That was a good start."

"It was encouraging. But in 1901 and 1902 we did better, and were first for thirty-six varieties at the exhibition of the National Sweet Pea Society. In 1902 we were also first at Leicester, Birmingham, and Shrewsbury. In 1903 I secured the Challenge Trophy, value £20, at Ulverston, and first prize in the open class. Owing to Mrs. Clark's illness, I did not show in 1904."

"How many varieties of Sweet Peas do you grow?"

"About sixty-five. Here are twelve of the best:—Dorothy Eckford (white), Prince of Wales (rose), Duke of Westminster (purple), Black Knight (maroon), Lady Grisel Hamilton (lavender), Navy Blue (blue), King Edward the Seventh (crimson), Lovely (pink), Hon. Mrs. Kenyon (pale primrose), Duchess of Sutherland (flesh), Lottie Eckford (picotee edge), and Emily Eckford (pretty blue)."

"How do you grow them?"

"In continuous rows of clumps, the clumps being three feet apart, and the rows six feet. I give them plenty of room, and some of them grow nine feet high. The ground requires to be deeply trenched. I sow six or seven seeds in a pot, and reduce to five to form a clump."

"Not twenty or thirty?"

"No, that is a mistake. Sweet Peas can be grown by all gardeners in gardens of all sizes. Nothing grown in the open can give a better return, if a little trouble is taken."

"You have shown Chrysanthemums largely?"

"Yes, and with tolerable success, at Leicester, Nottingham, Birmingham, Melton Mowbray, Bradford, and Sheffield. I exhibited at Sheffield this season."

"Vegetables?"

"Yes. We have been fairly successful with them at Shrewsbury, Birmingham, and local shows. This year we were third in Sutton's special class, amongst nine competitors, and in 1903 second to Mr. Beckett. I do not expect to beat him."

"You were under Mr. Beckett at one time, I think?"

"Yes, I was at Aldenham House for three years, as long ago as 1887. After that I spent some time in Messrs. Veitch's nursery at Chelsea. Subsequently, I was under Mr. Gray and Mr. Sutton, at Chevening Park, Lord Stanhope's place; again at Messrs. Veitch's, who sent me to a place in Yorkshire, and previous to coming here, in 1898, I was foreman for six years in Hertfordshire. My present employers, Mr. and Mrs. Mark Firth, take a real interest in their gardens as well as in their gardeners. But for that kindly interest, the gardens here would not be what they are."

ALFRED WILCOX.

Letters from a Lady Gardener.

No. 127.—BULBS AFTER BLOOMING, AND FERNS FROM SEED-SPORES.

DEAR KATE,—The "turn of the days" has arrived, and oh! how welcome the increasing light is, although it is yet so little! Has it ever occurred to you that the "spring" (*i.e.*, the yearly resurrection of the green things of the earth) begins with January, and not, as we usually think of it, months later on? A little close inspection of our garden plants will soon prove this; the last bulbs are all awake, and pushing up green points on all sides; the blossom-buds on the fruit trees are formed; it is easy to see where the Japanese Quince (Cydonia japonica) on the house wall will produce its bright flowers; and the buds on the Laurels are almost bursting into bloom.

LYGODIUM JAPONICUM.

Nature takes her rest during the three last months in the year, when the sunshine is lessening day by day; but directly the days lengthen, she awakes, and starts again on her way to the summer—it may be with many a pause, while the cold keeps her back, but with quicker and more joyous steps as the season advances. Even during the autumn, Nature is not idle, though apparently resting, for the fruit crop of the new year is already formed in the bud, and the flowers we hope to see in our gardens are now in embryo, only waiting the return of the sunshine to appear in beauty. This is a cheering thought, and it has behind it a lesson for all gardeners, some of whom are apt to fancy that when a plant has flowered it can be set on one side and neglected with impunity, whilst all the time it is preparing its flowers for the next season, and no jugglery can produce them when the time comes, unless this process has been properly provided for many months beforehand.

Liliums are a case in point; some of them (notably, the Nilgiri Lily) take some months to ripen away their foliage after flowering, and their leaves are absolutely necessary to them during this time, for they cannot do much if deprived of their lungs. So that they (as well as Hyacinths, Tulips, Freesias, and all other bulbs) should have quite as much care and attention during this ripening stage as when the plant is in full growth, if blossoms are desired for the following season. They need plenty of sunshine to ripen their bulbs, with only enough water to prevent their foliage from drooping; they will then part with it very gradually, the tips of the leaves turning yellow first, until all is gone, after which time the bulbs will need but little water for about one month, and may then be repotted. Forced bulbs do very little good the following season, as a rule, but Hyacinths, Tulips and Narcissi may be put out into the borders after the worst of the winter is over, turning their roots out of the pot, without disturbing them, into a hole deep enough to cover the bulbs two inches deep. The place chosen for them should be sunny, with good soil, and, if left alone after this for two years, you will get more flowers. The spikes of bloom on the Hyacinths are small the first year or two, and should be cut as soon as they are open; the third year they will again produce fine spikes, quite as good, I find, as the bulbs one buys. You should never let your bulbs produce seed,

FAMOUS BRITISH :: GARDENS. ::

BROOK HOUSE, ARDINGLY, SUSSEX.

Interview with Mr. Harvey R. G. Clarke.

ON a bright day in mid-autumn, while the trees still retained some of their rich tints of gold and crimson and bronze, though leaves were falling with every breath of the wind, it was my privilege to be conducted through the picturesque grounds attached to Brook House, Ardingly, my guide being Mr. Harvey R. G. Clarke, who, on behalf of his mother, Mrs. Stephenson Clarke, has managed these gardens for the past twenty-six years, and under whose superintendence much of the planting has been done. Brook House is situated about a mile and a half from Horsted Keynes station, in the north-east corner of Sussex, and is on the site of an old farmhouse dating back to the time of Henry VII., though so many alterations have been carried out under various owners that only a small portion of the original building remains. It stands on a gentle rise, and is approached from the south-west by a long, curving drive, with a sloping bank on the right hand side, planted with choice flowering and berried shrubs, deciduous and evergreen, and these again backed by tall conifers; on the left the ground falls away slightly, and is thickly wooded. Streams on two sides of the grounds meander through the woods, and afford opportunities for the successful cultivation of moisture-loving plants, and these, together with those that thrive in shade, have under Mr. Clarke's fostering care been planted with a liberal hand. Delightful walks abound, and advantage has been taken of the undulations of the ground, the well-wooded character of the lower slopes, and the streams, to retain an effect altogether natural, while introducing many features of the cultivated garden.

"At the outset," said Mr. Clarke, "I must ask you to make allowances for any shortcomings, for we are under-staffed. Before the war we had eleven men, and of these we lost eight; now we have five men, two boys, and a girl."

Leading the way through a narrow path up the bank, we turned and came out towards the back of the house. Here is a charming sunk garden, the paths paved with broken flagstones, and with many beds of Roses.

A DRAWBACK TO ROSE CULTURE.

"This," said Mr. Clarke, "was formerly a bowling green, but seventeen years ago it was altered into a Rose garden. Each bed is planted with a separate variety, and they are mostly Hybrid Teas, with a few Hybrid Perpetuals. They have done better this year than they had for the previous three years."

"How do you account for that?"

"There used to be Violas under them as a groundwork, and in consequence the hoe could not be used, nor could we give manure. This year we did away with most of the Violas, leaving them only as an edging."

On the right of this garden is a low retaining wall, and in front of this a narrow border, while at the end of the path is a sundial, and steps lead up to the higher borders above.

"The wall is not without colour at this late season," I said.

"Yes," was the answer; "both it and the border are planted for colour effect and to give a long flowering season. They are chiefly herbaceous subjects in the border, and include some fine Irises. This part of the garden was made by Messrs. Wallace, of Colchester, and they will shortly be undertaking some alterations and additions."

Turning up the steps near the sundial, we walked back along another broken path to look at the border, where Antirrhinums in good-sized clumps of one colour, and masses of Salvia patens, were still in flourishing condition, and were well framed by the shrubs at the back. The border on the other side of the path, edging the sunk garden, is planted with Wallflowers and Polyanthuses for spring. Then, pursuing our walk in the direction in which we started, we emerged into a charming glade, where tall Beech tops met overhead, and underneath the ground is carpeted with the Lady Fern, many of them self-sown. Stone steps lead down to a pool of running water, where Ferns also fringe the banks.

"The trees here are rather crowded," said Mr. Clarke, "and will be all the better for thinning. But now you may like to see our cricket pitch, where, before the war, we used to have some good matches each season. Indeed, this was one way my mother had of being 'At home,' for she used to invite her neighbours and friends, and tea was served in the pavilion."

"You have not been able to keep the grass cut?"

"We have given a little attention to the actual pitch; but the rest of the field has had to go. It has been mown once for hay, and will now be eaten off by sheep. One drawback to letting it go is that coarse grasses obtain the mastery, and crowd out the finer ones. Here we have some old Cherry trees, which do not bear much fruit, but we keep them for sentimental reasons."

I noticed that round these trees, and close up to their stems, in the circles cut in the grass, Antirrhinums were growing vigorously, and flowering profusely, as though the conditions suited them.

Leaving the cricket field, we emerged on to a narrow lane that led us through a small wood towards the front of the house, and so brought us into the main drive. Here I had opportunity for observing the many beautiful shrubs, some, like the Barberries and Cotoneasters, ablaze with their bright berries; others, such as the Laurustinus, gay with blossom. Rhododendrons, some of them twenty feet high, and as much through; handsome Cedars, and a particularly fine specimen of Araucaria imbricata, were other noticeable features; while further down the drive, and nearer the lodge gates, we entered a dense grove of Rhododendrons.

"Some of these plants," said Mr. Clarke, indicating them as we went on, "have not bloomed so well since they were moved here from a more open part of the grounds. I was advised to move them, but they are now too much shaded."

"Do you prepare the soil especially for them?"

"No; it is just the natural soil, which is two-thirds clay, and of no great depth, with stone below—it varies from ten inches to two or three feet. Of course, in planting trees, we have to take out this stony subsoil, to allow of a depth of three feet."

BROOK HOUSE, ARDINGLY.

"What are the varieties of Rhododendrons?"

"There are many of the best hybrids; also the old ponticum and other species."

JAPANESE IRISES.

And now, crossing the drive, we entered the woods, passing down a winding walk, lined with Wichuraiana Roses on poles, and emerging at the bottom of the slope. The scene here is one to arouse the poet and the artist. At the foot, on the banks of the stream, are clumps of Japanese Irises, and it is easy to picture the beauty of this spot when they are in full bloom. Here and there a choice Bamboo rises up, to add diversity to the view, while over all the tall trees tower, their branches now almost bare, but in the time when the Irises are at their best affording a glorious canopy of green, through which the sun filters gently.

"What are the best varieties of Japanese Irises?" I inquired.

"There are so many here, and they are all so lovely, that it is rather difficult to choose. Some of them were planted here on their first introduction from Japan, and before they got into commerce; others have been added since.

Tsuro-no-kegoromo is pure white with yellow blotches; Yezo-nishiki is crimson mottled with white; Iso-no-nami, sky-blue and grey, with yellow blotches. Then there is Morning Mists, with a mist-like shade of blue over white; and Mikado, which has a light shading of rose on a whitish ground. But these are only a few that I can recall offhand."

CHOICE BAMBOOS.

"And what is that splendid Bamboo on the bank?"

"That is Arundinaria spathiflora, a rather uncommon species. On the other side of the stream is another fine one, Bambusa Henonis. But the best Bamboo is the one we are now coming to, Bambusa fastuosa. This specimen is, I think, the finest in Sussex. In the first year of the war I was showing it to a visitor, who thought he had a taller one in his own garden; but after measuring both it was found that this one was thirty-three feet high, and taller than his."

"Bamboos seem to do exceptionally well here."

"The conditions are favourable to them. They are planted in moist soil, and near running water, and the trees give protection from the worst of the winds."

"Did you plan this part of the grounds yourself?"

"Yes; this is my own work, and it was planted under my own supervision. Of course, the trees were here—they are mostly Oak and Ash, and are, I expect, a survival from a corner of Ashdown Forest, which is not very far from here."

"Were the conifers here?"

"No; they have been planted in late years. They serve to show the importance of preparing the site by deep digging, for where the soil was taken out to a depth of three feet they are doing well, but in places where it is much shallower they are not so successful."

HARDY PRIMULAS.

Farther on, the stream crossed the path and broadened out, and the Japanese Irises gave place to Primulas in a bewildering assortment of species. One bed has denticulata alba, Cashmeriana, pulverulenta, and Poissoni, with their roots almost in the water. Most of the beds were surrounded by wire netting, and Mr. Clarke explained:

"We are obliged to protect the plants thus, as we are plagued with rabbits, which devour everything. You will notice that all the plants here are such as love moisture. Here is a clump of Spiræa aruncus, and there one of Spiræa palmata. Thalictrum dipterocarpum is a little further on, just below the waterfall."

"This must be a lovely place in spring."

"It is certainly at its best in the spring months. In March and April the ground is carpeted with Primroses, Anemones, and other spring flowers, and later on we have the Primulas and the rest. The wood is really at its best in May and June. On the other side of the bank is a large clump of Primula Mrs. R. V. Berkeley, which has done very well. Some of the Primulas seed themselves, and make little colonies, although they do not do so in every case."

PLANTS FOR MOISTURE.

"What other plants do you find are suited by these moist conditions?"

"Gunnera scabra is very fine, and its leaves, as you see, are quite four feet across. Senecio veitchianus has done exceptionally well, and reaches a good height, and Senecio clivorum is another that is very satisfactory. Both have yellow flowers, and strikingly handsome foliage. Rheum palmatum rubrum delights in moisture, and its leaves are decidedly ornamental."

"And what of the failures?"

"Well, Sarracenias have not thriven here. I had S. flava and S. purpurea, but though they flowered the first season they are slowly dwindling. I tried Gentiana asclepiadea, which lasted only two or three years, and gradually died away. But one thing that flourishes almost like a weed is the Royal Fern, Osmunda regalis; the smaller kinds have increased enormously."

The path followed the meanderings of the stream, which has been dammed in two places to make ponds; and on the side farthest from the water I noticed liberal plantings of many shade-loving subjects, all of which, I was informed, give no trouble after they are once fairly established. Dodecatheon Media—one of the American Cowslips; Trilliums of sorts, Day Lilies (Hemerocallis Golden Ball), and Muscari conicum were among the groups that were indicated to me. Ferns of many species were there in plenty, and numerous other interesting plants were seen as we worked our way round the wood, and came once more into the open.

And now fresh beauties were revealed, as we passed through a little dell thickly planted with Rhododendrons.

"These," said Mr. Clarke, in reply to my question, "are Himalayan hybrids. They flower early, but the sap does not rise too soon, so they do not suffer much, and we lost only a couple following a very severe frost in April."

We had started from the south-east side of the house, and had roughly described a half-circle, so that we now approached it from the north-west, and were on rising ground. Here, passing a large bed of Azalea mollis, with Heaths still in bloom, we came to a fairly large pond, with slight rock elevations on its margins, where Saxifragas of many kinds are growing. Around the pond are many noble trees, concerning which Mr. Clarke said:

"When making the two ponds from the stream, the roots of this large Oak were damaged, so that it is gradually going off, and the growth is becoming thinner. As a consequence, it affords less shade, and therefore the Ferns on the banks suffer, and are not so good as they used to be."

Among the trees worthy of special mention in this spot is a Crimean Lime, whose large leaves, now turned a rich golden-yellow, furnished a glowing touch of colour; and a magnificent specimen of the Japanese Larch, closely feathered to the ground, and said to be the finest in the county.

Beds of Irises, mostly of the pallida and germanica sections, next came into view, among the best varieties being Isola, Trojana, Helge, Amas, Shelford Yellow, Thorbeck, and flavescens. These are associated with Lupins, both herbaceous and tree varieties being well represented

THE CRUSADE AGAINST BIRDS.

As we once more passed into the woods—which almost encircle the house—I commented on the profusion of berries on the trees.

"There certainly is a good show this season," said my guide, "and this I think is due in part to the absence of birds. Children were paid to collect the eggs of sparrows, but I fear that in too many cases sparrows' were the only birds' eggs they did not get, and instead a number of our feathered friends were destroyed. The thrush has been disappearing from this neighbourhood for the last few years."

"What is the reason for that?"

"I hardly know; but I am told that many people eat them, as the peasants do in France. The thrush may be good eating, but I think we would rather hear the music of its song."

BEAUTIFUL FERNS.

It is in this part of the grounds that Ferns are to be seen in their most luxuriant state. Lomaria metallanica, a choice species from Mexico; Polypodiums in species innumerable; Adiantum pedatum, with fronds about a foot and a half long; the Tunbridge Wells Fern, under a bell-glass on the north side of a large tree; and many another gem—all are naturalised here. But the king of all is Osmunda regalis, whose spreading fronds were now assuming a fine golden colour. This was on the sides of the pond, and among the rocks standing out of the water.

"Many of these Royal Ferns are self-sown," said Mr. Clarke; "and some of them grow to eight feet high. They spring up in various places, even on the stones, and when the little earth that is there gets washed away, they die off. Rhododendron ponticum has also sown itself by the waterside, and is now a flourishing little colony; and another plant that has done the same is Hypericum."

Time would not permit of my taking more than a hurried glance at the autumn Crocuses in full bloom on the grass; the groups of Pernettya mucronata, planted on shallow soil at the waterside, carrying immense quantities of their pretty berries; the Pampas Grass with its stately tassels; the ancient and rugged Yews on the lawn—the pride of their owner; and the Japanese Quince, Cydonia japonica, with its yellow fruit, which in former years has been in request for making jelly, but now, owing to the scarcity of sugar, is unusable.

Quite close to the house stands an arbour, with Roses trained to cover it, and dwarf Poly-

Original from CORNELL UNIVERSITY

anthas of the Orleans and Jessie type in the border surrounding it. More Roses are seen in the broad border running along the outside of the kitchen garden, these being mostly Hybrid Perpetuals, grown for cutting.

The kitchen garden is laid out regularly in sections, with neat tile edgings, and all the paths are asphalted. Roses border each path, Teas predominating; and on one side is a broad bed of Daffodils, to supply cut flowers in spring. Asked what varieties he preferred, Mr. Clarke said:

"King Alfred is, I think, by far the best. It is a nice, deep yellow, and has size and substance. Weardale Perfection is another choice flower; Madame de Graaff is liked as a white trumpet variety; and Duchess of Westminster is good in the Leedsii section."

FAVOURITE CARNATIONS.

Save for the Vinery and Peach house, there is not much glass, but one large house revealed its owner's favourite flower—the Perpetual-flowering Carnation. In this house there were somewhere about seven hundred and fifty plants in pots, and many of them were in bloom, while all were full of promise.

"I think we have all the best varieties here," Mr. Clarke replied to my question. "Among them are Enchantress Supreme, Bishton Wonder, Mikado, R. F. Felton, Mary Allwood, Scarlet Carola, Benora, Circe, Philadelphia, Wivelsfield White, Champion, White Enchantress, Baroness de Brienen, Rosette, Nikko, and Eastern Maid. I get a big batch every season from Allwood's, of Haywards Heath, and there is another lot coming about Christmas. Then some of the oldest of these will be put outside, standing on a hard bottom, but with a glass screen over them to keep off the rain and snow, which is not good for them. They will then bloom in pots out of doors next season."

Had I more space I might mention many other interesting features, such as the extensive borders of shrubs facing the tennis and croquet courts; the rockery plants on mounds placed in advantageous spots; and the orchard, but sufficient has been written to indicate that the grounds of Brook House possess charms altogether out of the common.

W. J. CHITTENDEN.

Next Week: The Gardens of Col. A. S. Barham, at Hole Park, Rolvenden, Kent. Interview with Mr. C. J. Cradwick.

Letters from a Lady Gardener.

DEAR KATE,—At last, thank Heaven, peace is in sight, and we are no longer adjured to grow Cabbages in our window boxes and Potatoes on our lawns.

Of all the many lessons which the war has taught us, perhaps there are few that were more needed than that of the great value of the open air. Thousands of weakly city-dwellers have been transformed into sturdy and fine fellows; the girls on the land, on the motor, and in the gardens, have grown robust and extraordinarily efficient, and it has at last dawned upon us that "the doctor that comes in at the window," and awaits us in the garden, is not only the cheapest, but the best of all. I prophesy that before long our children will no longer be shut up in schoolrooms, but taught in the open-air school; and our nurseries will be in the garden, not in the house.

Reconstruction is in the air, and I think that we women might well take the word "Purity" as our watchword, and use our votes to grand effect for our country, our homes, and our children, by advocating pure air, pure politics, pure homes—and, in fact, purity everywhere.

PLANNING A NEW GARDEN.

Let us spend the next few weeks in planning a new garden, where all the members of the family may spend at least a part of their time in the open air, instead of being shut up from morning to night, between four walls, in poisonous atmosphere. I want to show you what might be done to create a little Paradise out of a small town garden. Occasionally one meets with such, but the dismal sight of foul backyards, with nothing but rubbish in them, is too common when one looks over a stretch of back gardens in a city. Some of these have, however, grown a few Potatoes this year, and the soil in those will be all right if lime is added to it, and it is well dug. Now is the time to purify the soil, and fill it with nitrates and other fine properties of which the air and the snow, as well as the rain, are full, by rough digging it, and laying it up in ridges, when our valuable under-gardeners, the birds, will rid it of thousands of grubs and wireworms, and it will be sweetened by Nature.

Heavy clay soil needs more digging than

AN ARCHED WALK IN A MIDLAND GARDEN.

light soil in the autumn, and you will do well to add all the burnt garden rubbish, leaves, and lime you can get. In the spring you can use the soot from your chimneys as a top-dressing, and the manure from your fowl-house, which should be mixed with six times its bulk in dry soil, and sprinkled with lime as you store it in a box under a shed until it is needed.

THE QUESTION OF PATHS.

With regard to planning your back garden, I think that too much room is often given to paths. You do not need one on each side, but one down the middle is apt to spoil the effect of the whole, so I should place it on one side, after it has crossed the top of the garden, from the garden door. It is best to have gravel, or a raised path made of sifted ashes, near the house and down to the children's playground, to keep their feet dry.

I think you will like a little plot of grass in front of your windows, with a few well-chosen flowering shrubs, and a pink May tree (the best of all shady places in hot weather) to shut out the shed, etc., below. Where there is room you might keep rabbits or fowls at the bottom of the garden; and the children must have gardens, with perhaps a low swing, and a lot of sea sand under the shed, where the tinies may dig and play with their little spades.

A REST HOUSE.

In the corner near the house you must have a shelter of some kind, with a dry, raised floor, and protection from the rain. Here you can bring your work or your book at all odd moments, and drink in the fresh air which you need. Have the shelter large enough to take in a six-foot lounge and at least two wicker chairs and a little table, all of which you can cover with either white or green paint. It is easy to bring out more folding chairs if needed—and you will probably need them, for everyone prefers tea in the garden in summer, and your husband will certainly like to rest and smoke there, after (I hope) doing his part to keep everything in the garden in good order.

Over the garden door, and on the house walls, you can grow Roses and other creepers. My last two letters (of October 19th and November 9th) will give you plenty of choice of climbers and shrubs, according to the aspect of the house. Be sure to have a Lady Waterlow Rose, for it is one of the loveliest and earliest to bloom.

PLANTS FOR ARCHES.

Over the path you can have arches (as many as convenient) to grow some of the best of the Wichuraiana Roses, which do not do well on walls, but enjoy the full air of an arch. You will find particulars of them in GARDEN LIFE of October 19th, and you might plant them now, adding a two-feet Clematis to each arch, to grow with the Rose, for these like shade for their stems. If you choose the large-flowered Clematises, do not put them in until April, for they are rather tender.

The herbaceous border between the gravel and the grass can be planted with the hardy things directly the soil is ready, and you can add others in March. Be sure to put in some tall plants, such as Hollyhocks, blue Delphiniums, and white Foxgloves, in groups at the back, leaving space for Carnations, Pinks, Sweet Williams, Snapdragons, and dwarf Roses in front.

On the narrow border opposite the door you might grow your Gooseberries and Currants; or put in a Pear tree or two, cordon Apples, or Cherries, if the wall is high enough for them.

THE KITCHEN GARDEN.

In the kitchen garden behind the lawn shrubs you can grow your herbs (Parsley, Mint, Sage, Thyme, etc.), and also some salads (Lettuce, etc.), for these are so much better when cut fresh, and not "shop-handled." If you have room, you might now prepare a bed for Onions, to be sown in February, for these are always useful; and the other vegetables which you might grow are only limited by the space available. I do not advise you to grow Potatoes, because they are sure to be cheap; and very likely other things, such as Carrots, Parsnips, Beans, and Peas, will keep up their price for some time.

"But, dear me," you will say, "all this will cost money!" Certainly it will, at the start, but you will get a rich interest on what you lay out in health and strength for all, as well as in the charming flowers you will grow, and the fresh fruit, salads, etc., which your family will greatly enjoy.

Doctors' bills will shrink, if not totally disappear, and you will even find that tempers become sweeter in the open air. You will, of course, keep your windows open, especially at night, when a few inches at the top will be best. Those who live in pure air cannot stand stuffiness, and the boys who will now come back from the war will have quite different ideas about the fresh air from those of four years ago, for they will have proved its immense value for health and strength. I wonder whether you will take my advice, and carry it out?—Your friend,

I. L. R.

leguminous plants, bulb-like nodules are formed on the roots by the agency of a certain kind of bacteria, and, in consequence of this formation, such plants possess the remarkable power of utilising the free nitrogen in the atmosphere. For some reason or other these nodules are unusually large this year—at any rate, in this garden. On the roots of some young Tree-Lupins, which I recently transplanted, they were almost as large

Mr. J. H. Clements.

as the excrescences on Cabbages affected by finger-and-toe disease. Still, in spite of a recent theory that all bulbs have been developed in some such way, these bacterial nodules hardly meet Mr. Tobin's case. So far as I am aware, there has never been an instance of their either prolonging life beyond its natural period, or growing independently. And, certainly, they don't cause any difference in the foliage.

August 7th.—There were some useful hints in a paper on "Rose-growing near Large Towns," read before the Horticultural Club, by Mr. H. E. Molyneux. He insisted on the careful preparation of the soil—if possible, six months before planting—its adequate drainage if it happens to be clay, and the necessity of ramming it hard, though the surface should be loose. Dipping the roots into tepid water immediately before planting was recommended. The juncture should not be more than an inch below the ground, but, "I believe," he says, "in earthing up dwarfs for winter protection." The roots of dwarfs should be planted rather deeper than those of standards. Frequent spraying is necessary to remove deposits of dust and soot, and at intervals the water should be mixed with an insecticide. Finally, "fifteen minutes with the hoe is better than half an hour's watering—that is, such watering as a suburban gardener gives—the damping of the surface with water often direct from the main, hard and cold." This point is often overlooked, yet it is of the greatest importance. If anyone will go out into his garden in the summer, loosen the soil with the fork and then plunge his hands deep into it, he will find it quite hot; if he will then place them in water direct from the main it will feel almost unbearably cold. It is unnecessary to dwell upon the injurious effect of subjecting the roots of any plants to such extreme changes of temperature.

August 8th.—Among trees which should be, if not excluded from the garden, at least grown by themselves, I should certainly include the Plum. It is so liable to the attack of aphis that, unless it is frequently sprayed, it becomes a hideous sight and the sticky deposit drips from the tree and utterly ruins everything below. For that reason nothing should be grown under it, except spring-flowering bulbs, Primroses, Polyanthuses and other plants which die down in summer. I have, unfortunately, a number of Lilies under a Plum and they look deplorable. It is an old tree, a poor sort, and quite worthless, and there are others no better in the garden. I mean to have them all up, and to plant instead Victorias, which, for some reason or other, usually remain cleaner than any other variety. Among other trees usually infested by aphides are the Sycamore and the Spruce. The latter has its own special aphis—the Sprucegall Aphis—which, by puncturing the buds, causes them to swell until they resemble little Pineapples. This, indeed, is one of the instances brought forward by those who maintain that tuberisation is primarily due to insects.

H. C. Davidson.

(To be continued.)

FAMOUS GARDENERS AT HOME.

No. 97.—Mr. J. H. Clements, at The Pleasaunce Gardens, Overstrand.

Nothing could have been greater than the contrast between the weather on the night of my arrival at Overstrand and that on the following morning. As the train from Liverpool Street, punctual to the minute, glided into Cromer station, the sun was shining brilliantly, and invested the charming country with every possible attraction. It is one of the features of the group of popular watering-places on this part of the Norfolk coast that, in addition to the bold cliffs and the magnificent air, the inland scenery is a constant source of delight; and it looks, of course, its best in fine weather. But the sun, which set in radiant splendour in the evening, could not be seen next morning. Nevertheless, though rain fell persistently and heavily, the visit which, by the courtesy of Lord Battersea, I paid to the gardens at The Pleasaunce, was very enjoyable, and I was quite able to realise the exceptionally beautiful appearance they present under favourable climatic conditions. But I was not prepared to hear from Mr. Clements, at the close of my inspection, that The Pleasaunce and its surroundings, on the edge of the cliffs, were not in existence fourteen years ago. Trees and shrubs—in fact, nearly all the features of the demesne—as well as the house itself, suggest a much greater age. However, Mr. Clements, at my request, proceeded to tell me the story of the wonderful marine gardens.

"In 1890," he said, "there were two ordinary, semi-detached villas on the site of the present house, with just a little grass in front, and stabling attached. Lord Battersea, in the autumn of that year purchased, along with the villas, half an acre of land. This was the start. In the following year he took up about ten acres, and converted the two villas into one. Then, gradually moving on, acquiring five acres or more each year, he added to the property, until now, with a small portion of land outside the gardens, it extends to upwards of sixty acres."

"When was the original house done away with?"

"In 1893 it was converted into the present mansion, which, as you see, is of the Old English style of architecture. At the same time, or early in 1894, the clock tower and the cloisters were built."

"And the garden cloisters, with seats, in the west front?"

"They were not commenced until 1901, and are not yet completed."

"Were you here at the outset?"

"Yes; but the first portion of the gardens was designed by the late Mr. C. H. Hawkes, the well-known landscape gardener, the idea of the whole being that of Lord Battersea himself. Mr. Hawkes was responsible for dealing with the first ten acres, and since then I have carried out Lord Battersea's instructions. The object aimed at throughout has been to make the gardens decorative and unique. The grass glades, and the stone paths, which tend to give an appearance of antiquity, are features. Lord Battersea has always taken the keenest interest in the details, and he also knows a great deal about the plants."

The Pleasaunce, Overstrand, Cromer.

"One of the most striking features seems to me to be the number of pergolas."

"Yes; there are four Oak-timbered pergolas, varying from twenty to eighty yards each in length, covered with creepers, particularly hardy Vines, Roses, and Wistarias, paths of old London paving underneath, the edges being broken by the common Thrift and the common garden Pink. There is also the brick pergola, one hundred and twenty yards in length, with grass glades on each side, covered with various creepers."

"It looks longer than one hundred and twenty yards?"

"That is owing to the perspective, which diminishes from twelve to eight feet. The brick pergola was only put up this year, and finished in time for planting in March. Then, there is the covered way of Laburnums, about thirty yards long. The Laburnums are placed four feet apart in the row, and stand over a gravel path six feet wide. They were trained over by a single wire in their young state, and now form quite sturdy trees, looking as if they had been planted a great many years ago."

"Quite so; and, as a matter of fact, when were they planted?"

"Only five years since. This walk is edged with rock flints from the sea-shore, and is planted between with strong-growing Alpines, such as Aubrietias, Arabis, Saxifraga, Iceland Poppies, and Cerastiums, which afford a charming variety of colour when the Laburnums are in bloom. On each side of the way, in June, we have a border of mixed Japanese Pæonies, which look very handsome."

"Why did you have a subway constructed in the garden?"

"Owing to the property being divided above by a road. The approaches to the subway are of fine Oak timber, and the roofs are thatched with Reeds from the Norfolk Broads, which grow in abundance in the district. The pavilions on the terrace and cricket ground are thatched in the same manner, and are fine examples of rustic buildings."

"You have two terraces, I notice?"

"Yes; from the north terrace there is a grand sea view. The garden cloisters adjoin the west terrace. They are constructed of concrete piers, placed about ten feet apart, with arches, the plain skeleton roof being of red tile. When these cloisters are broken up with the creepers which have been planted, they will present a very picturesque sight. The floor, like the floors of the terraces, is paved with London paving-stone; also the forecourt and square, in the centre of which a fountain basin, eighteen inches deep and sixteen feet square, has been made. The bottom of the fountain is paved with Mosaics, and the sides are tiled with beautiful Spanish tiles, the coping all round being of very old York stone."

"We passed through one of the Oak pergolas, I think, to the smaller Rose garden, with its beds of irregular size, and most striking arrangement of climbing Roses. How is the latter managed?"

"Oak timbers of different heights are connected in various twisted methods by chains, which for weeks are covered with masses of Crimson Ramblers and other hardy climbing Roses, including the old Dundee Rambler and Bouquet d'Or."

"What is the feature of the south garden, which we approached, through grassy glades, with herbaceous borders on either side, by a flight of steps?"

"It is more or less summer-bedding, the large bed in the centre being mixed herbaceous plants of the boldest type, including Helianthus, Asters of various types, Tritoma, the Day Lilies, and all that class. The large bed, sixteen feet in diameter, just outside the south garden, is filled with the Lady Battersea Rose, now at its perfection."

"How did you make your rockery?"

"It consists of a bank of Derbyshire tufa and spar, broken up with beds of the Norfolk car stone, in stratas. These are planted with the hardy forms of Alpines, and with plants, some of the most beautiful being Saxifraga, Sedums, Veronicas, Lophospermums, Arnebias, and Gentianas verna and acaulis. On each side of the rockery are masses of Tea Roses, planted in irregular borders, which are backed by other Roses, climbing upon Oak posts. These again are backed by some fine specimens of Yew trees. Here, as elsewhere in the gardens, formality has been carefully avoided."

"Yew trees are a remarkable feature of that part of the gardens which you described as the newest?"

"You mean the part approached from under the subway, by way of the longest of the straight paths, and through the kitchen garden. This addition only dates two years back. Here the system of transplanting trees has been very successfully carried out. The Yews, some of which are upwards of twelve feet in height and fifteen feet in diameter, were removed from the older portions. The idea is to make the whole of the gardens to appear of the same age. The first Yews were brought from Buckinghamshire about ten years ago. They grew so rapidly that it really became necessary, in any event, to move them."

"This part of the gardens," continued Mr. Clements, "is quite unlike other parts, and is more of the type of a Tudor garden, owing to its crosses and grass squares. The crosses are formed of gravel paths, lined each side with Lime trees, and round about are the choicest flowering trees and shrubs, which, in the spring, constitute a feature. The grass squares are bordered by herbaceous plants, backed up by huge masses of Delphiniums, of which we have had a fine show this year. We had about a thousand seedlings, and selected all the best. There are at least a hundred plants in one bed. A portion of the new addition is devoted to fruit and vegetables, and this is bordered by all the German varieties of Iris, while through the centre of the piece of kitchen garden a covered way of Pear trees has just been planted."

"The principal kitchen garden is notable for its pergola, is it not?"

"Yes; the first of the pergolas was put up in the kitchen garden, and the climbers (of which the principal is the Purple Vine) screen the vegetables from the eye. There is also a covered way of Apples, running as a cross section to the pergola, about forty yards long. This is constructed of iron arches, and the following Apples are grown in it:—Beauty of Bath, Ribston Pippin, Cox's Orange Pippin, Blenheim Orange, and Lane's Prince Albert."

"What do you force in the pits close by?"

"Melons and Cucumbers; and, in the winter months, a little bedding stuff. These two pits are all the glass we have, and also all we need. Practically, bedding stuff is not required, for the whole of the gardens are planted, more or less, with hardy plants. The pits join the fruit garden, which has recently been walled in."

"How long has it been planted?"

"Seven years. The espalier Apple and Pear trees, of which there are quantities, are broken by standards planted between. The walls were planted this spring with Peaches, Nectarines, Apricots, and Cherries. You may have observed that the construction of the fruit garden walls is in keeping with the remainder of the gardens, the house, and the cloisters. It is simple concrete, with a tiled coping, which projects over, so as to form an eave of about six inches. The face of the wall is just sufficiently plastered to give a smooth appearance on the concrete. The process we adopted is a very inexpensive way of erecting walls, as any rough material can be utilised for the purpose, and yet the appearance, when the walls are completed, is very solid."

"You have not mentioned the broad green glade, planted on either side by very large Yews, with Rhododendrons interspersed?"

"That is the glade which leads to the newly-erected brick pergola, adjoining which is an old Oak arch, covered with Ivy and Crimson Rambler Roses. Beyond is another glade, edged on each side by Golden Yews."

"Of which it might be said that their colour is gorgeous?"

"They are considered very effective. We planted them about two years ago. In the same direction is the cricket field, of three acres, which is regarded as a part of the gardens."

"Does Lord Battersea have the ground kept in order, then?"

"Yes; and he lends it to the village club. Several matches are played during the season. There is an entrance from the road. Speaking of entrances, there are several to the gardens,

The Cloisters, at The Pleasaunce.

some of which have massive iron gates, with brick and stone pillars."

"I conclude, from what I have seen and heard, that the soil is particularly good?"

"It is really splendid, and it suits Roses especially. By the way, I should mention that, looking seaward from the house, is an unbroken line of the Sea Bush Thorn, which, in the autumn, is one mass of berries. When the sun shines, the Thorns appear to be on fire."

"Are you a Norfolk man, Mr. Clements?"

"Yes; I was born at North Repps, and all my gardening experience, extending over twenty-three years, has been on the coast. Before I came here I was with Sir Samuel Hoare, at Cliff House, Cromer. The gardens are similar, but smaller, and there is more glass. I have made quite a study of landscape gardening on the coast."

"As the result of your study, do you mind giving me a few hints for the assistance of the uninformed?"

"The first thing to do is to take a rough bit of ground, and see what can be made of it. The difficulty which at once arises is how to obtain protection and shelter against the destructive gales from the sea. We find that the salt spray does more harm than any amount of frost to the foliage. In fact, we do not dread frosts—which are four or five degrees less than they are inland—nearly so much as gales."

"I suppose you have a considerable staff?"

"Fourteen men and boys. We have turned out several good men. One has laid out a garden for Mr. Gerald Balfour, at Woking. There is a bothy for seven men, and the quarters are very comfortable. Lord Battersea opens the gardens to visitors during the season here. They are generally admired, and I think that the name of the Pleasaunce, which was given to the house when it was rebuilt, is really appropriate. The Queen has been to see the 'Garden of Pleasure.'"

Alfred Wilcox.

MY SUBURBAN GARDEN.

HOW IT HAS BEEN MADE BEAUTIFUL.

(Continued from page 324.)

I DO not think I ever remember seeing the growth of outdoor plants, generally, so luxuriant at this season of the year as at the present time. This is, of course, owing to the frequent heavy rains, with warm intervals, but while, as a general rule, we experience hot and dry weather, accompanied by little if any progress in plants of most kinds (unless abundantly watered), in either July or August, this season one has only to plant out in the open ground the smallest of plants, or rooted cuttings, to find them, in the course of about a fortnight, quite respectable specimens, and in a month or so really big bushes!

Most fortunately, the Bank holiday was fine—gloriously fine, indeed—although the morning was lowering. It had rained, more or less, for some days previously, and nearly all the Sunday night it poured—gently, but steadily—but early in the forenoon it cleared up, and for once we enjoyed a rainless and almost perfect day. The morning was spent in potting and pricking off some plants that needed attention, and in the afternoon we went for a quiet ramble along some of the charming Kentish roads within easy reach, and found the gardens full to overflowing with growth and blossom—rather more of the former than the latter, to tell the truth—and such a wealth of rich and luxuriant tree-foliage in all the countryside as I have seldom seen before at this season of the year; to judge by the general appearance it might well have been June instead of August.

A very pretty and decidedly uncommon cool greenhouse plant now in bloom is Celsia arcturus. It is of the Mullein tribe, with arching spikes of rather large, flat blossoms of a soft yellow colour, with curious purple centres. The foliage is something like that of a Calceolaria, and the plant requires very similar treatment. It flowers freely with me during the summer months, though not in the winter or early spring, and emits a faint but delicate vanilla-like perfume, especially on fine mornings. I had a pinch of seed given me two years ago, and find that it produces seed freely, and that this grows with great certainty if kept cool and moist, plants raised early in the season flowering towards the end of the summer, while those from seed sown in July or August, and kept just moving through the winter, bloom beautifully all through the following season. It is, unfortunately, rather liable to the attacks of aphides, and to do well the plants must be kept clean, while a light shade from hot sun is also desirable. I find it also does remarkably well planted out in good soil and a lightly-shaded situation, especially in a season like this, when the soil seldom becomes really dry.

This pretty plant is frequently, if not generally,

Gladiolus Kelwayi.

known as C. cretica, and it was under the latter name that I received it, but the true C. cretica is a nearly hardy herbaceous plant, producing erect spikes of bloom, five to six feet in height. It is a biennial, with yellow blossoms somewhat, but not entirely, similar to those of C. arcturus, and also sweetly, if faintly, scented. Somehow it does not seem to thrive here—why I cannot say—frequently dying off in the winter, and never attaining the vigour and beauty of plants I have seen in a mild district further North. I fancy there may be too much lime in the soil, or water, to suit it, for when the plants get nothing but rain-water they seem to improve, to some extent.

By the way, this reminds me that I have discovered—or fancy that I have done so—that the shrubby Veronicas do not like lime either, and thrive much better without it; I wonder whether in their native home—New Zealand—they grow in a calcareous or non-calcareous soil—the latter I imagine. Salt and the salt sea breezes they revel in, undoubtedly, but I find that whether grown in pots, in tubs, or the open ground they succeed much better when receiving only soft or rain-water, instead of the hard London water from the mains. Some of these plants are very beautiful, and they are so valuable for autumn and winter flowering, both under glass and in sheltered positions in the open, that they are worth a little consideration and extra care.

The herbaceous Veronicas are quite a different class, and are even more easily cultivated than the others—certainly, near London, and in most other inland districts. They are some of the best of all hardy herbaceous plants for town or suburban gardens, a few of the best being V. spicata, with spikes of soft blue flowers, about eighteen inches high; V. s. alba, white, rather more dwarf; V. incana elatior, growing one and a-half feet high with violet blossoms; and S. tenerium, deep blue, two feet high—all these are of erect habit. Good dwarf or trailing kinds are V. prostrata, of an intense blue colour; V. pectinata rosea, rose-coloured; V. saxatilis, blue; V. repens, early-flowering, very free and fine, with nice, close foliage; and V. rupestris, clear cobalt blue, and extremely free and fine. Most of these last succeed well on rockwork.

The work of disbudding the Chrysanthemums now occupies a good deal of time, though, as the plants require comparatively little watering, one is given a freer hand for matters of this kind. The buds—all crowns, of course—are appearing thick and fast now, and I go over the whole on every fine morning, rubbing, pinching, or picking out by degrees the embryo growths that invariably appear just below these "crown" buds. I never disbud a plant all at once, for fear of imparting too great a check to the growth; but pick or pinch out part of the young growth-buds one day and remove the rest three or four days later. This, of course, is only done where fine flowers of something like exhibition quality are desired—the ordinary decorative or "bush" plants are much more lightly thinned, removing only some of the lower buds that would never come to much, and with good culture we often get four or five nice flowers on a single shoot. A number of strong cuttings inserted last month in a frame are now rooted, I see, and in the course of a day or two will be removed to a shelf in the greenhouse. Three cuttings were inserted, equidistantly, round the sides of several 3-in. pots, and when thoroughly established these will be moved bodily into 6-in. sizes, still keeping them on the shelf, with plenty of air. These will probably bloom when about eighteen inches high—though a little later than the old, large plants—and will come in very useful for the front of groups of these and other plants in the autumn, as well as for sitting-room decoration, etc.

My Bouvardias for winter-flowering are looking capitally, and I have never had them so fine before. There is no doubt that when a plant of any kind attracts one, and induces its owner to bestow a little extra care and attention on it, its individual peculiarities are soon fathomed—little by little its nature and requirements become understood, and under ordinarily favourable conditions success is almost certain. The Bouvardias have struck my fancy, and by means of a little observation I am succeeding better and better with them every year, and this autumn I hope to have quite a fine display of blossoms from some time in October till Christmas or later. The plants seem to enjoy the moist, growing atmosphere (although they are all under glass), and as on all bright days I syringe them freely overhead, once or twice at least, the foliage is beautifully clean and healthy. One half of the stock has been pinched back for the last time—these will flower rather early—while the shoots of the other half will be stopped once more, towards the end of the month, or as soon as the shoots have made three or four pairs of leaves again; these will follow the others, and should flower up to Christmas, at least. Some of the older plants are pushing up some very strong shoots from the base, which I take to be an indication of vigour. If these outgrow the

Gard. Chron., 1885

Mr. Peter Cliffe.

The subject of this notice had served the Egerton family (of Tatton) as gardener for nearly half a century, first as foreman in the gardens at Tatton Park, and eight years subsequently as gardener to Lord Egerton of Tatton, at Mere Hall, till his Lordship's succession to the Tatton estates and title in 1857, when Mr. Cliffe went with him, fulfilling his duties with great ability and faithfulness until his Lordship's decease in the beginning of the year 1883. The death of his employer was a severe blow to Mr. Cliffe, whose health had been failing for many years, the result of severe inflammation. He, however, was one of those old servants chosen by the present Lord Egerton to continue his services at Tatton Park, which he did until September last, when he was obliged by his failing health to retire from active life, and there is no doubt that his retirement affected him painfully in his then weak state. His Lordship kindly allowed him to retire on a pension of £1 per week. During the last few weeks of his illness Lady Egerton constantly visited him, which cheered him very much, bringing fruit and flowers.

CLIFF Thomas.
Personal Estate £125.

19 November. The Will of Thomas Cliff late of Runcorn in the County of **Chester** Contractor who died 6 November 1885 at Runcorn was proved at the **Principal Registry** by William Roach Clogger and William Betney Cooper both of Runcorn the Executors.

CLIFF William.
Personal Estate £50.

1 January. Oxford Dictionary of National Biography

Cobbett, William (1763–1835), *political writer and farmer*
by Ian Dyck
© **Oxford University Press 2004–14** All rights reserved

Cobbett, William (1763–1835), political writer and farmer, was born on 9 March 1763 in Farnham, Surrey, the third of four children of George Cobbett, publican and farmer, and his wife, Anne Vincent.

Early life and the army

As a youth Cobbett worked chiefly as a ploughboy and gardener: he frequently boasted in adult life that he was 'bred at the plough-tail' (*A Year's Residence in the United States of America*, 1818, general preface, paragraph 8). Although he vaguely recalled attending school for a brief period during his youth, Cobbett learned his letters at home, chiefly from his father. In 1783, longing for new horizons and adventure, he attempted to enlist in the Royal Navy, though by inadvertence he found himself in a marching regiment, the West Norfolk 54th foot. For the first year of his enlistment Cobbett was stationed at Chatham, where he worked at his military exercises and read voraciously: 'novels, plays, history, poetry, all were read', he later wrote, 'and nearly with equal avidity' (*Life and Adventures of Peter Porcupine*, ed. G. D. H. Cole, 1927, 33). Between 1785 and 1791, while stationed in New Brunswick, Cobbett put his knowledge of English grammar and letters to good effect, quickly becoming clerk to his regiment and rising from the rank of corporal to sergeant-major. In his office as clerk Cobbett believed that he encountered instances of peculation by the officers of his regiment, and upon returning to England and receiving his military discharge in 1791, wrote an anonymous pamphlet entitled *The Soldier's Friend* (1792), a passionate indictment of the harsh treatment and poor pay of the common soldier. At the same time Cobbett attempted to launch a court martial against the offending officers, and when this threatened to rebound on Cobbett himself, he and his new wife, Nancy Anne Reid (1774–1848)—an English woman whom he had first met in New Brunswick and married at Woolwich on 5 February 1792—fled to France for six months and subsequently to the United States, where they remained from 1792 to 1800.

In America, 1792–1800

For the first eighteen months of his American residence Cobbett was employed tutoring French émigrés in the English language, but in the summer of 1794 he ventured into the American public press by authoring a pamphlet that vehemently denounced the scientist and democrat Dr Joseph Priestley, who had recently fled Britain and been jubilantly received by republican and democratic supporters at New York. For the next five years, usually under the pen-name of Peter Porcupine, Cobbett wrote numerous pamphlets and newspapers articles (he subsequently collected and reprinted his American writings in *Porcupine's Works*, 12 vols., 1801) which vigorously condemned the French Revolution as well as other expressions of democratic and republican thought—he characterized Thomas Paine, for example, as 'an unconscionable dog', 'a wretched traitor and apostate', and 'a man famous for nothing but his blasphemy and his hatred of England' (*Porcupine's Works*, 4.79, 4.87; 5.165; *Political Register*, 8 Jan 1803, 2). As an anti-Jacobin polemicist, Cobbett identified his politics most closely with the federalists—the pro-British and

anti-French faction under the leadership of Alexander Hamilton—while taking angry aim at the pro-French, Jacobin-sympathizing democratic faction led by Thomas Jefferson. Yet despite his high profile in the United States, Cobbett always remained ambivalent towards American culture and society, and when pressed by a severe libel case in 1800, he and his family, which now included a daughter, Anne, and a son, William, packed their belongings and set sail for England. Cobbett's farewell message to Americans observed that 'when people care not two straws for each other, ceremony at parting is mere grimace' (*Porcupine's Works*, 12.109–10).

The Porcupine and the Political Register

The government of William Pitt, delighted with Cobbett's contributions to the anti-Jacobin cause, immediately offered him control over a government-owned newspaper, but Cobbett declined the offer, preferring to launch his own daily newspaper, and thus to maintain at least the appearance of independence. Cobbett's daily paper *The Porcupine*, bearing the motto 'Fear God, Honour the King', was duly launched on 30 October 1800, but circulation remained low, and late in 1801 he sold his interest in it. Within a few months, however, he began the *Political Register*, a periodical which was published, almost without exception, every week between January 1802 and Cobbett's death in 1835. Totalling eighty-nine volumes, or some 42,000 pages, the *Political Register* is the most important and detailed record of Cobbett's career. Most of his twenty books were serialized in the *Register* in whole or in part, and in almost each issue he set forth his political and social viewpoints in the leading article—an editorial innovation that Cobbett himself introduced to English journalism. Between 1809 and 1812 Cobbett was jointly involved in the editing and publishing of *Cobbett's Complete Collection of State Trials*, and between 1804 and 1812 he was active in collecting and printing parliamentary debates from the Norman conquest onward. Owing to financial difficulties he sold his shares in both projects in 1812 (as the purchaser of the latter was T. C. Hansard, it might be said that the official record of parliamentary proceedings that today is called 'Hansard' could justly be termed 'Cobbett').

Cobbett's political commentary in the early numbers of the *Register* was thoroughly anti-Jacobin, but by 1804 he began questioning the financial and political policies of the government. Under William Pitt's administration, Cobbett complained, the growing national debt and numerous awards of unmerited sinecures were beggaring the country and heightening animosity between those who paid taxes and those who lived off taxes. At first Cobbett's answer was to support the election of more independent country gentlemen to parliament, but by 1807 he was lending his support to Francis Burdett, John Cartwright, and other campaigners for parliamentary reform. At the same time Cobbett became increasingly obsessed with financial issues, especially the national debt and the government's increasing reliance upon paper money. He opposed these trends for the rest of his days, regularly decrying government debts and paper currencies in his writings, notably in his *Paper Against Gold* (1815). By the early 1820s Cobbett was convinced that the debt was too large ever to be paid off, and accordingly vowed to roast himself on a gridiron if the government could restore payment in specie without defaulting on the debt (henceforth Cobbett and his critics included sketches of gridirons in their writings and cartoons).

Cobbett and rural England

During the early 1800s the *Register* focused chiefly on metropolitan politics but gradually from 1805 onwards Cobbett became increasingly concerned with rural England, particularly the economic hardship of farmworkers. In 1805 he purchased a farm at Botley in Hampshire, and it was here that Cobbett (save for the years

1810–12, which he spent imprisoned in Newgate after he was prosecuted by the government for publicly criticizing the flogging of several militiamen at Ely), together with his wife and four children, made his primary residence between 1805 and 1817. Life at Botley was happy for the Cobbetts. Political reformers were frequent guests and the Cobbett family became deeply involved in Hampshire rural society and in the daily routine of farming. As Mary Russell Mitford observed in 1806, Cobbett's ready hospitality, together with his ruddy complexion, red waistcoat, ample mid-section, and twinkling eye, gave him the appearance ‘of a great English yeoman of the old time’ (*Recollections of a Literary Life*, 1883 edn, 200–01). Similarly, William Hazlitt saw in Cobbett a Georgian gentleman farmer who ‘speaks and thinks plain, broad, downright English’ (*The Spirit of the Age*, ed. E. D. Mackerness, 1969, 244–56). Cobbett's countryman appearance came as a surprise to some observers, such as the tory adversary at a Hampshire county meeting in 1813 who nearly mistook Cobbett for ‘one of the innocent bacon-eaters of the New forest’. Wisely, this same commentator went on to observe that ‘when I knew that it was Cobbett, you may believe I did not allow his placid easy smile to take me in’ (Letters of Timothy Tickler, esquire, *Blackwood's Edinburgh Magazine*, 14, 1823, 329).

Radicalism and its price

The years 1816–17 were important but difficult ones for Cobbett. The massive demobilization which followed the end of the Napoleonic wars in 1815, together with the disastrous grain harvest of 1816, brought acute hunger and unemployment to the countryside. Cobbett's response was to launch a mass-circulation, broadsheet edition of the *Political Register* (priced at 2*d*. it was derisively labelled ‘two-penny trash’ by its detractors, a title that Cobbett gleefully adopted for the new venture), in which he urged English workers not to riot but to pursue parliamentary reform as the great answer to their economic plight. The election of radical reformers to parliament, he argued, would ensure lower taxes, fuller employment, and increased earnings for all working people. The first cheap *Register* alone sold 44,000 copies in the first month, and Home Office records for 1816–17 indicate that its distribution was sufficiently widespread to cause great concern to the government, particularly to the home secretary, Lord Sidmouth, who early in 1817 rushed several acts through parliament in an attempt to reverse the growth of public support for parliamentary reform. Fearing incarceration because of the new measures, Cobbett set sail for the United States, and arrived in New York on 5 May 1817. Having taken a lease on a Long Island farm, Cobbett lived a quieter life than during his first American sojourn, but he continued the *Political Register* from abroad as well as writing more books and tracts, most notably the agricultural treatise *A Year's Residence in the United States of America* (1818) and his widely selling *Grammar of the English Language* (1818). This latter work, which Cobbett saw as a testament to the intellectual capacity of himself and of the common people as a whole, was intended especially for the use of ‘soldiers, sailors, apprentices, and plough-boys’; accordingly Cobbett cheekily drew his examples of faulty grammar from the writings and speeches of such renowned political leaders as the duke of Wellington, Lord Castlereagh, and George III himself. The English *Grammar* continued to be used in English schools into the 1920s and 1930s; Cobbett's *French Grammar*, first published in 1824, enjoyed rather less success, though even it had passed into fifteen editions by 1862.

When Cobbett returned from the United States in October 1819 his personal and political fortunes were at a low ebb. He was bankrupt and lost his farm at Botley as a result. The flight to America had damaged his relations with other leaders of the radical movement, most notably his erstwhile ally Henry Hunt, who had remained

in Britain during Sidmouth's repressions and stoically endured a prison sentence. None the less, Cobbett believed that he brought with him—in the form of the bones of Thomas Paine—a powerful and emotive symbol around which all parliamentary reformers could rally. But it was not to be. After the Peterloo massacre of August 1819 a new cast of radical leaders began to emerge, and Cobbett himself proved uncomfortable on the hustings during his unsuccessful candidacy in a Coventry by-election in March 1820. During the latter half of 1820, however, Cobbett's fortunes began to improve, chiefly because of the increased circulation of the *Register* which resulted from his involvement with the Queen Caroline affair. Cobbett devoted numerous *Registers* to Queen Caroline's cause as well as writing some of her public statements, including the letter to the king which was published in prominent newspapers shortly before her trial in 1820. Happier times were also ushered in when Cobbett resumed his gardening and agricultural interests by beginning a 4 acre seed farm in Kensington. At the same time he wrote several 'sermons' (so-called to avoid the stamp tax), which were in part intended as answers to the conservative and moralizing tracts of Hannah More and the Cheap Repository Tract Society, and also his little manual *Cottage Economy* (1821), a delightful and highly readable book which instructs English workers in how to brew their own beer, keep bees, and fatten hogs.

Rural distress and Rural Rides

The distressed state of English farming was Cobbett's single greatest concern throughout the 1820s. Sometimes to the irritation of local landlords and farmers, Cobbett would make uninvited appearances at county meetings, where he sought to convince landholders that the only solution to their post-war economic distress lay in a radical reform of parliament, which by 1820 he saw as entailing nothing less than universal manhood suffrage. It was partly to spread this message, and partly to strengthen his knowledge of rural England, that Cobbett now undertook his celebrated rural rides, most of them between 1821 and 1826. Describing his purpose as to hear 'what gentlemen, farmers, tradesmen, journeymen, labourers, women, girls, boys, and all have to say; reasoning with some, laughing with others, and observing all that passes' (*Political Register*, 14 Dec 1822, 686), Cobbett rode on horseback through most of the southern counties, attending county meetings, conversing with villagers, and then putting his observations into writing for the *Political Register*. A separate volume of his travel writings, entitled *Rural Rides*, first appeared in 1830 and the 'rides' have subsequently appeared in many different versions and editions on account of their accurate and colourful presentation of the English countryside and rural society of Cobbett's time. Late in the 1820s and early in the 1830s, Cobbett periodically ventured into the midlands, but owing to his frequently expressed disdain for 'northern' diets and Scottish 'feelosofers', he made only one trip to the north and only one to Scotland (he made his first and only trip to Ireland during the last year of his life). It was Cobbett's great boast that he was a 'South-of-England' countryman who disliked factories, industrial cities, and even the metropolis itself. He characterized London as the 'Great Wen' on account of its tendency to consume the lion's share of the produce of the countryside and, through its absorption of tax revenues, to deprive rural workers of their traditional fare of bread, bacon, and beer. Meanwhile, from 1827 Cobbett resumed large-scale farming upon leasing an 80 acre farm on the south side of the Thames at Barn Elms. Here he experimented with crops of maize (which he encouraged for human consumption) as well as growing a special straw, which he hoped would allow England to rebuild its straw-plait industry and thereby provide more winter employment for country workers. The results of his experiments are duly noted in his agricultural writing of these years, most notably *The Woodlands* (1825), *Treatise on Corn* (1828), and *The English Gardener* (1829).

Cobbett's rural involvements left him well placed to represent the interests of England's farmworkers, with whom he identified more and more closely during the last fifteen years of his life. It came to Cobbett's notice during his rural rides that the agricultural workers were barely subsisting, especially in the southern, south-eastern, and western counties. From 1828 until 1830 he frequently warned the government that a major rural revolt was in the making, and that steps should be taken to ensure that rural workers were amply provided with employment opportunities, a living wage, and the full protection of the poor law. True to Cobbett's predictions, the southern rural workers arose in rebellion during the Captain Swing disturbances of 1830–31. The new whig government of Lord Grey, suspecting that Cobbett had helped to foment the rising, put him on trial in 1831 for inciting rural workers to commit acts of violence and incendiarism. But Cobbett, conducting his own defence, received an acquittal when the twelve-person jury could not agree on a verdict. Cobbett's national reputation was now enhanced. Even some of his supposedly quirky opinions, such as his claim that the rural workers of southern England would rather be hanged than live on potatoes and tea, were now found to constitute part of the platform of the Swing rioters. Immediately in the aftermath of the revolt Cobbett used his political momentum to agitate for the Reform Bill of 1832, though on this matter he enlarged his constituency to include anyone—whether landlord, farmer, banker, or merchant (he worked closely in 1831–2 with the Birmingham banker Thomas Attwood)—who was prepared to support the terms of the bill, even though the proposed enlargement of the suffrage fell far short of what Cobbett and other radical leaders had hoped for.

In the Commons

The passage of the Reform Act in 1832 paved the way for Cobbett to realize his long-standing quest to be elected to the House of Commons. After unsuccessfully standing for Manchester in December 1832, he joined his friend and political ally John Fielden in a successful contest for the two seats representing the new parliamentary borough of Oldham. Cobbett had a short but distinguished career in parliament, frequently bringing on his head the ire of the house by such daring moves as his unsuccessful motion that the king be asked to dismiss Robert Peel from the privy council for gross mismanagement of the nation's finances. As he knew himself, he was more adept at representing the interests of southern agricultural workers than those of northern industrial labourers, a matter which brought praise from southern rural counties but complaints from some of Cobbett's Oldham electors. Opportunities to federate agricultural and industrial concerns were taken up by Cobbett from time to time, most notably in his support for the Tolpuddle Martyrs and in his unsuccessful but profound opposition to the Poor Law Amendment Act of 1834. The eventual passage of the Poor Law Amendment Act by the whig government demoralized Cobbett to the point where, for the first time in his public life, he called clearly and unequivocally for popular insurrection against the government. Two of his last books, *Legacy to Labourers* (1834) and *Legacy to Parsons* (1835), much like his earlier treatises *The Poor Man's Friend* (1826–7) and his best-selling *History of the Protestant Reformation* (1824–7), describe at length the means employed by the state to dispossess the English poor, beginning with the crown's appropriation of church lands during the Reformation.

Final years, death, and reputation

Cobbett, though, was nearing the end of his long and varied career. Plagued by unhappy conflicts with his wife and the rest of his family during his final years, he continued to write and to farm until his death. In 1832 he agreed to rent a farm of 130 acres at Normandy, near Ash in Surrey, some 7 miles from his birthplace at

Farnham. It was here, surrounded by family members, that he died on 18 June 1835. Nine days later, on 27 June 1835, he was buried in the graveyard of St Andrew's Church in Farnham. Leaving a bankrupt estate, Cobbett was survived by his wife, Nancy, three daughters (Anne, Eleanor, and Susan) and four sons (William, John, James, and Richard). There are no direct descendants remaining.

There are now a dozen biographies of Cobbett, and he has attracted interest and accolades from an enormous variety of thinkers and writers, including persons of such diverse political views as Karl Marx, Matthew Arnold, G. K. Chesterton, A. J. P. Taylor, Raymond Williams, Michael Foot, and E. P. Thompson. Cobbett's writings can appeal to both left- and right-wing thinkers on account of his populist style: he was conservative and backward-looking in many of his social and cultural ideals (one of his most resounding aims was to see a return to the rural England into which he was born in the 1760s) but at the same time he devised and fiercely promoted a thoroughly radical and democratic agenda in politics and economics. Unlike his mentor Thomas Paine, Cobbett was not interested in pursuing a republican programme for Britain; nor was he much interested in international politics. Cobbett was a 'Little Englander' who liked to boast that he was not a 'citizen of the world', for 'it is quite enough for me to think about what is best for England, Scotland and Ireland' (*Political Register*, 20 Aug 1831, 495). Never forgetting his origins as a self-taught ploughboy, Cobbett sought to rest his platform and writing upon popular English ideals, perhaps most notably in his enthusiasm for fair play, old-style hospitality, manly sports, and preference for a vigorous rural culture over the supposedly effeminate and degenerative environment of the towns. Cobbett retained to the last a strong sense of national identity, frequently chiding the United States and other rival powers that they had better not 'swagger about and be saucy to England' (*Political Register*, 2 June 1832, 545–6), and he stated that his attachment to the Church of England was partly motivated by the fact that it 'bears the name of my country' (*Life and Adventures of Peter Porcupine*, ed. G. D. H. Cole, 1927, 33). Altogether Cobbett wrote and published some 30 million words over the course of forty years (perhaps more than any other English writer), and while many of these words can be exposed as contradictory and self-serving, it can be said wholeheartedly with Karl Marx that Cobbett was 'a plebeian by instinct and sympathy' (K. Marx, letter to *New York Daily Tribune*, 22 July 1853).

For Cobbett the essence of England was its countryside, not the 'wen' of London or the industrial cities of the midlands and north. Although his agrarian and rural devotions sometimes drew criticism from even his fellow radicals, Cobbett's response was fair, simple, and personal: 'Born amongst husbandmen, bred to husbandry ... it is natural that I should have a strong partiality for country life, and that I should enter more into the feelings of labourers of husbandry than into those of other labourers' (*Political Register*, 5 May 1821, 343). Non-agricultural workers were also of concern to Cobbett, but it became his great mission to articulate the wants and aspirations of the 'chopsticks' (as he fondly called the rural labourers) because they were in his estimation, 'the very best and most virtuous of all mankind' (*Political Register*, 29 Jan 1831, 288). Numerous commentators during the past century and a half have sought to measure or understand Cobbett in relation to urban and industrial models of politics, culture, and society. As a result Cobbett has too often been presented as anti-urban, anti-industrial, anti-modern. He was, in some ways, all of these things, but he was also a positive and original writer who sought to unite English workers, whether of town or country, on a national reform platform that would bring about a new democratic order.

sion more deeply rooted in those who are connected with the tillage of the ground than in any other class. But if we are in England nearly as far from effective co-operation as ever, matters seem, curiously enough, to have progressed more rapidly in Ireland. An Irish weekly paper lies before me as I write. It is almost filled with the doings of horticultural and agricultural co-operative societies. Among other items of interest, I read that "the Co. Kerry Co-operative Fruit-Growers' Society has succeeded in getting top price for Apples marketed by them this season. The price of 2s. 3d. per dozen has been received by them for the produce of Kerry orchards, and when it is remembered that the season is a bad and a backward one, and that the Kerry orchards are still far from yielding either the quality or the quantity of Apples which their climate makes it possible for them to grow, it will be seen that they have a promising career before them in the south-west."

On turning to the market list, I am astonished to find that the wholesale price of home-grown Apples and Plums in Ireland is quoted per dozen. The equivalent price per bushel I cannot say, but 2½d. per Apple, wholesale, would probably mean at least 4d. per Apple retail, which certainly suggests that fruit-growing in Ireland ought to be a profitable business. No wonder that co-operative societies are multiplying there at a rapid rate, that new plantations are being made, that jam factories are being established, and that, in spite of bad seasons, all goes merrily as a wedding-bell. But, really, is it quite impossible for us in England to do something of the same sort? Must we always go tramping about the earth, cap in hand, begging for our food? The time must assuredly come when other nations will say, "Not another bite. I want all I've got for my own family, and more."

October 30th.—There is bound to be a heavy mortality among outdoor plants this winter. I do not utter this opinion in the spirit of gloomy prophecy, but with a view to taking such precautions as may be possible. As the result of the abnormal rainfall, plants growing in the open air have made a great quantity of weak, sappy wood, and, in consequence, when severe frost comes they must fall an easy prey. Ashes, straw, and leaves will be useful in many cases, but anyone who likes such plants as Wallflowers—and who does not?—would be wise to have a reserve of them in a cold frame. Cabbages, too, are likely to be scarce and dear next spring. The young plants are so soft that they can possess no powers of resistance to frost, and unless they are protected the majority are sure to perish during the winter. Forewarned is not always forearmed, but in this case it ought to be.

October 31st.—It requires a good deal of ingenuity to make climbers look unnatural, but still it can be done—most easily, I think, with arrangements with poles which are not uncommon in some gardens. No doubt, if the climbers were left alone they would in time remedy that, but as soon as they show a tendency to stray their wings are clipped, and they are left bound to their stakes. On a house, if they are given their liberty, the effect is always beautiful, whether they clamber all over it, as the Ivy and the Virginian Creeper will quickly do, or whether different species mount the walls according to their different capacities, and so present a rugged outline of many different hues. The effect is heightened when other plants are massed at their base, for that is Nature's method.

H. C. DAVIDSON.

(To be continued.)

LAST week, a monster Potato, measuring twenty inches in diameter, and eleven inches long, was raised in the garden of Mrs. Jones, of Plasnewydd Buildings, Abergele.

FAMOUS GARDENERS AT HOME.

No. 109.—MR. S. COLE, AT THE GARDENS, ALTHORP PARK, NORTHAMPTONSHIRE.

AMONG the historic houses of England, Althorp Park, the seat of Earl Spencer, K.G., occupies a foremost place. The stately mansion stands in a splendidly-timbered park of six hundred and forty acres, or just a square mile. It is surrounded by pleasure grounds of considerable extent and beauty, and the kitchen garden is remarkable both for its size and contents. Mr. S. Cole, the head gardener, is well known in the horticultural world for his signal success in the cultivation of fruit, vegetables, and Chrysanthemums, though, of course, at Althorp every branch of gardening receives careful attention. As, however, it was hopeless to attempt to exhaust its attractions, I expressed to Mr. Cole a desire that our attention should be concentrated on special features, and we appropriately commenced our rounds in one of the Vineries, which, at the time of my visit, contained a number of striking specimens of the Japanese and Incurved varieties of Chrysanthemums.

"But they are far fewer than we usually have," said Mr. Cole, as I paused to admire a perfect specimen of Bessie Godfrey. "This year there are only about two hundred, while, as a rule, there are quite six hundred."

"Why have you made such a reduction?" I enquired.

"Because the plants in their young stage suffered so severely from 'rust' this season, and, as I was anxious to get a clean stock, they had to be destroyed."

"And all remedies have failed?"

"I know of nothing to stop it. There is a fortune in store for the discoverer of a real remedy.

ALTHORP (NORTH AND WEST FRONT), THE NORTHAMPTON SEAT OF EARL SPENCER.

I have tried dressings of the strongest kind, but they are no use. The fact is that the 'rust' is in the sap of the plant, and must be driven out if the plant is to be saved. It is like a disease in a human being, and I doubt whether a cure will be found."

"Does it affect all varieties alike?"

"No; the Madame Carnot family escape. It is a remarkable fact that I sent some cuttings to a man near Bradford, warning him that they might have 'rust,' but the 'rust' never de- is a remarkable fact that I sent some cuttings to to me, and here the 'rust' developed quickly enough."

"Then it has something to do with climate or soil?"

"Undoubtedly. But I believe it is more climatic influences than soil, as growers near large towns invariably escape. It is not so bad here this year as in previous years, although we have the enemy still with us in a much weaker form, owing, as I mentioned before, to the reduction of all affected plants in spring, and by perpetually pinching off part of or all the leaves that showed any sign of disease through the summer."

"You do not advise amateurs to go in for the exhibition varieties of Chrysanthemums?"

"Not unless they are prepared to devote an immense amount of time and trouble to them. There are no plants I know of which require more time, care, and attention than the exhibition varieties of Chrysanthemums. If they do not get the right treatment at exactly the right moment, all previous labour will have been in vain. There is no royal road to success, and amateurs who take up Chrysanthemums for the purpose of showing must expect a lot of disappointment. For instance, the plants may be ruined by under-watering or over-watering. The most important point of all is to know when to stop each variety. Most varieties have different dates even in the same month. The best growers do not have all the results satisfactory, which is not surprising if you remember that out of three shoots there may be only one good bloom."

"Which do you include amongst the best varieties?"

"Bessie Godfrey, Mrs. George Milner, Mrs. Palmer, M. Louis Remy, Mrs. H. Wells, Australie, Mrs. Lewis, Godfrey's Triumph, Mafeking Hero, Queen Alexandra, Princess de Monaco, C. Penford, Ethel Fitzroy, Mr. A. Barrett, Madame P. Radaelli, J. R. Upton, and Mrs. Barkley, are some that occur to me. Duchess of Sutherland is one of the newest, which I am showing at Northampton. It is a lovely flower. So, also, is F. A. Vallis (yellow), which was introduced by M. Calvat, who, I think, continues to maintain his reputation."

As we passed out of the house, I asked how many bush Chrysanthemums were generally grown.

"Between two and three hundred," replied Mr. Cole. "In contrast to the exhibition varieties, the bush varieties are exceedingly simple to grow. You may practically treat them how you like."

"You have a nice batch of Crotons?"

"Yes; they were all struck in the spring. You see, too, that we have a few specimens of Clerodendron fallax. It makes a fine plant where there is room to grow it. In our stove we have the usual table plants, house and table decoration being really the primary object in view. The Palm house is filled chiefly with Kentias, which are the most useful variety, whether in a small or a large state."

"When did you take up Malmaison Carnations?"

"Only last year. But we were very successful, and they promise well for next season. We have many of the leading sorts, and I am particularly fond of Prince of Wales, Princess of Wales, Calypso (an improved form of Souvenir), Churchwarden, Prime Minister, Lady Grimston, Sir Evelyn Wood, and Maggie Hodgson, which is the darkest of all, and like the old Clove in colour. Several of our flowers last year were five inches across."

"Do the Malmaisons suffer from 'rust'?"

"In many places they do, but I am glad to say that ours do not develop it."

"Violets seem to be a considerable feature?"

"They have always been one of Lady Spencer's favourite flowers. We picked twenty bunches on October 16th of Lady Hume Compbell, which I consider the best of the double varieties. Marie Louise, which is a little later, comes next. We commence picking buttonholes of Violets in September, and go on right through to April."

"I suppose you supply Spencer House?"

"We send flowers and fruit a few times a week wherever Lord and Lady Spencer happen to be."

When we were going through some of the other Vineries, containing Lady Downe, Cooper's Black, and Appley Towers, Mr. Cole observed:—

"I do not recommend anyone to go in for Appley Towers unless there is plenty of room to grow them, owing to the distance of the bunches from the rod. On the other hand, Appley Towers is a very fine Grape, of good flavour, and keeps as long as any there is. Our early

MR. S. COLE.

Grapes include Buckland Sweetwater, Foster's Seedling, and Madresfield Court."

"I see that you have a few fine bunches of Muscats left. Has the crop been good?"

"Very good. There is no Grape like Muscat, but it takes the most doing. The Black Alicante thrives here, and the Vine is twenty-two years old. It has not missed yielding a good crop since 1882."

"How many varieties of Figs do you grow?"

"Only Brown Turkey and Negro Largo. Figs are Lord Spencer's favourite fruit. Brown Turkey is grown for general use, and Negro Largo comes in between the two crops of Brown Turkey."

The kitchen garden, or series of kitchen gardens, next claimed attention, and I was much impressed with the great number of Pears trained on the pyramid principle.

"There are about a hundred and twenty," said Mr. Cole. "Many of them were planted fifty-three years ago, and still bear grand crops, though this year, like other people, we have neither Pears nor Apples, owing to the weather."

"How many varieties are there?"

"From eighty to ninety. Here are a few of the best:—Beurré Diel, Conseiller de la C Pitmaston Duchess, Doyenné du Co Huyshe's Prince of Wales, Souvenir du Co Triomphe de Vienne, Durondeau, Beurré H Williams's Bon Chrétien, Rivers' Prin Doyenné d'Ete (the earliest we have), Fond d'Automne (one of the best), and Duc d'Angouleme."

"Is there anything special about your he ceous border?"

"I think we have the usual varieties. have just had Michaelmas Daisies and e flowering Chrysanthemums at the back, Gladioli, Ten-week Stocks, and Comet Aste front. One of the prettiest of Asters (or Mich mas Daisies) is Mrs. Rayner, which has orange centre and magenta border."

"You appear to be very rich in respect Sweet Peas?"

"Yes, they are a great feature, and we h fifty-two of the very best varieties. They g to a remarkable height, from twelve to four feet. I have made rather a study of S Peas."

"Have you raised many?"

"The only named one is the Coun Spencer, for which I received a first-class c ficate two or three years ago, but I have sev seedlings unnamed. The Countess Spencer distinct break away from all existing Sweet P and is quite unique in respect to colour formation. As you know, the ordinary S Pea has wings that turn down; the wings of Countess Spencer turn up. There are five flo on every stem."

"How wide is the flower?"

"Individually as wide across the standard a railway ticket. I did not know this un man who had measured it with his railway ti told me. The colour, as you see, is a deli shade of pink, and the variety is quite on the giant Peas."

"Have you been able to put it into comm yet?"

"No, unfortunately, though the flower is lific enough; but owing to the wet season t has not been enough seed."

"You might name twelve of your best va ties?"

"Miss Willmott and Countess Spencer (pi Dorothy Eckford (white), Salopian (dark c son), Honourable Mrs. Kenyon (yellow), B Knight (chocolate), Lady Grisel Hamilton best mauve), Navy Blue (dark blue), Triu (pink bicolour), Coccinea (cerise, though that point there is a difference of opini Gracie Greenwood (buff), and Prince of W (rose-red). Our collection includes the ne varieties, notably Gracie Greenwood, Dai and Jeannie Gordon."

"What is the extent of the kitchen garden?"

"Including the small orchard, where we now, fourteen acres. The Cedar in this orc is thirty feet high without a branch, and twe one feet round at the bottom. It should b the lawn to do it justice."

"Your Apples in the gardens are all on Crab stock?"

"Yes; I grafted all in this row when I w boy, twenty-five years ago. My father, wh succeeded, was at that time head garden Althorp. The Peaches on the walls were ru this year by the frost and wind, and the P never do so well on the walls as on standards."

"Did you have a large Strawberry crop?"

"I should call it a medium one. Our varieties are Royal Sovereign, James Veitch Joseph Paxton, The Laxton, Leader, Fillba and Latest of All, while, for preser Vicomtesse H. de Thury is the best-coloured for the purpose."

"Can you tell me how many canes there a your Raspberry bed?"

"Not far short of a thousand. We ha fair crop. The early variety grown is S lative. The bed, which is two hundred long, is under a north wall, and was establ

three years ago. The north is the best position for Raspberries."

"I must congratulate you upon the very thriving appearance of the Celery."

"We grow Celery for exhibition in London, and other places. The best varieties are Leicester Red, Sutton's A-1, Sutton's Solid White, and Major Clarke. In order to keep the exhibition plants clean, I put brown paper round them, and then a canvas cover. There are between four and five thousand heads in the main crop."

"Which variety of French Beans do you prefer?"

"Sutton's Best of All is *really* the best of all. It is a great cropper, and the Beans are of great size."

"You have a large quantity of Brussels Sprouts."

"There are from three to four thousand plants. I should call it a nice little break, but we grow in quantity whatever we think worth growing. There are, or have been, some fifteen hundred Cauliflowers. Veitch's Autumn Giant and Sutton's Autumn Mammoth are equally good, both being very white and clean."

Near the glasshouse I noticed a batch of young Himalayan Rhododendrons. These, Mr. Cole explained, were raised from seed brought by Lord Spencer from Darjeeling in 1896. There are about four hundred plants, and though none have been flowered yet, Mr. Cole judges, by their foliage, that there are three or four varieties. Lord Spencer also brought the seed of two Firs from Japan, and the seed of five others was obtained by him in the Canadian Forest when it was on fire.

"You have a show of outside Carnations," I continued.

"Yes. Some varieties will not answer, but others do well. Among the latter are Raby Castle, Uriah Pike, Duchess of Fife, Queen of the Yellows, Mrs. Eric Hambro, Duchess of York, Danger, and H. J. Cutbush (the new Carnation). This bed faces west. The Roses close by are German varieties. They flower much later than ours, but they are not superior to English varieties."

"What do you regard as the feature of the pleasure grounds?"

"The bedding-out, and, I suppose, bearing in mind that we are in the Midlands, the Conifers. Some of the Conifers were planted by illustrious personages."

"I notice that the fine specimen of Wellingtonia gigantea was planted by the King."

"Mr. Gladstone also planted one, and there is likewise a Pinus austriaca, planted in commemoration of a visit from the late Duke of Clarence. In the centre of the grounds there is a fine specimen of the variegated Wellingtonia (Sequoia albo spica). Of Abies there are several varieties, the best being Wellsiana, alba, Pinsapo, Douglasii, pyramidalis (excelsa, pygmæa), cephalonica, pectinata, Smithiana, orientalis, Nordmanniana, and canadensis (the Hemlock Spruce). There are also two fine specimens of Taxodium sempervirens, and Taxodium distichum pendulum, the deciduous Conifer. The Pinus, too, find a home here, and are represented by some noble specimens of strobus, excelsa, austriaca, macrocarpa, pyrenaica, and sylvestris. Cryptomeria japonica is a fine tree. The Cedars are rather fine, and there is a good specimen of a Cork Oak. The Limes, the Tulip Tree, and Copper Beeches are much admired."

"That is a pretty stretch of ornamental water with the island in the centre."

"All Lady Spencer's favourite dogs are buried in that island. We do not go in for Water Lilies."

"What is the system of planting in the Rosery?"

"Every bed is planted with one variety. The varieties include La France, Caroline Testout, Kaiserin Augusta Victoria, Merveille de Lyon, Madame Gabriel Luizet, Ulrich Brunner, Cheshunt Hybrid, Gloire Lyonnaise, William Allen Richardson, and Dr. Andry."

"As far as I have seen, you have no carpet bedding?"

"None at all. We used to have a great deal. But Lady Spencer abolished it some few years ago. Carpet bedding is pretty in public parks, but even there I think there are plants which the keepers could grow with more advantage so far as appearance is concerned. In the butterfly garden, at the west front of the mansion, the body is planted with Coleus, and the wings with blue Lobelias, with yellow spots of Crystal Palace Geranium. Other bedding plants used are Geraniums, Fuchsias, standard and dwarf Heliotropes, standard and dwarf Calceolarias, and Verbenas. On the north side of the mansion Rhododendron beds are a feature, and also the Yews, golden and clipped."

"How large are the pleasure grounds?"

"About thirty acres. The gardening staff consists of twenty men and boys. There is a bothy for two, and the others live in the village."

"Your own house is in a pleasant position on the top of the hill?"

"Yes; it is also very healthy."

"I believe you started gardening here?"

ROSE, MADAME FALCOT.

"I commenced at the bottom, in a stokehole, at the modest sum of five shillings per week. Then I went into the pleasure grounds to do the grass-mowing, and subsequently into the kitchen garden in order to learn the usual routine work. When I had finished my probation I went to The Mote Park, Maidstone, at that time the residence of Lady Howard de Walden."

"And to what branch was your attention especially directed?"

"For two years and a-half I had charge of the fruit. My next post was in charge of the plant houses and conservatory at Hawkston Park, Shropshire, and later I had experience in the scientific branch of gardening at the Botanical Gardens in Regent's Park. When I left Regent's Park I went to the Marquis of Waterford's place, Carraghmore, in Ireland, as general foreman, and there, for about three years, I added to my general experience of house and table decoration. Then I returned to London, and was for a time with Messrs. Simmonds Brothers, where I obtained an insight into many things. It is a good thing for a young man to get ideas of decorating rooms and tables for wedding breakfasts and dinners, bouquets, wreaths, etc., and attending market early in the morning proved useful to me afterwards."

"Where did you go first as head gardener?"

"To Tregothnin, Lord Falmouth's place in Cornwall. Conifers, Rhododendrons, and Camellias were a great feature, the Himalayan Rhododendrons being some of the finest in the kingdom. At the end of two years, or about eleven years ago, I was asked, on the death of my father, to come here as head gardener, and, though I was quite happy at Tregothnin, I naturally came. My father, among other things, made the east side of the pleasure grounds. I have been content to follow in his line, keeping up to date with everything, and introducing fresh varieties whenever it seems desirable."

"Finally, about your showing, Mr. Cole?"

"I have shown Chrysanthemums, fruit, and vegetables at Shrewsbury, Birmingham, Wolverhampton, Nottingham, Batley, Northampton, Leicester, and the Westminster Aquarium, and never without being awarded a prize. I have half a score of medals I have won. I have exhibited at Rugby, in addition to the other places, and been pretty successful. With regard to vegetables, I like to exhibit a general collection rather than a particular kind. As you are perhaps aware, I took two first prizes and one third at the last Royal Horticultural Show which will ever be held at Chiswick."

ALFRED WILCOX.

LETTERS FROM A LADY GARDENER.

No. 66.—BUTTONHOLE FLOWERS AND WINDOW BOXES.

DEAR KATE,—Now that all the greenhouse plants are housed, we have time to think about the borders, and plant biennials, perennials, Roses, flowering shrubs, etc., for this is an excellent time for this work. I know you have a weakness in the direction of buttonholes, and these are so much more satisfactory when culled from the garden than if bought in the street, that I should advise you to put in a few of the best "buttonhole" Roses for use next season, as few flowers can compare with a good Rose for personal wear.

Madame Falcot is, perhaps, the best of all of these, producing exquisite buds, both early and late; I have a plant of this Rose growing against the south wall of the conservatory, on a sheltered terrace, and it is seldom indeed that one can't cut a buttonhole from that plant from the end of April till nearly Christmas. Such lovely blooms, too, in creamy shell-pink tones, richer in tint towards the autumn than in the summer, and the crimson-bronze foliage adds a charm to the flowers. William Allen Richardson, too, grows near it, reaching the top of the house, however, and producing hundreds of its rich apricot blooms from June till the late autumn; these, too, are among the daintiest of buttonholes, the half-open buds being especially charming. Perle d'Or is a tiny but most perfect Rose of the Fairy Rose group; this is the favourite buttonhole for gentlemen who prefer them very small and neat; the colour is an indescribably beautiful shade of apricot, and rich pink in the centre, the petals being creamy-white at their edges, and the buds are simply perfect. Just inside the conservatory, growing in a border, we have a large plant of the snowy Rose, Niphetos, which is seldom without a few flowers, even in winter; and, trained under the glass, Reine Marie Henriette produces plenty of beautiful buds, in deep crimson, in March and April. Besides these Roses, we have pot-Roses, which bloom early and late, but these are not so floriferous, and are (though very decorative in the conservatory) seldom cut for a buttonhole, in consequence; but, of course, the border Roses

A MODEL SUBURBAN GARDEN: WALLACEFIELD, COOMBE LANE, CROYDON.

THE garden at Wallacefield, Coombe Lane, Croydon, which I explored on a pleasant spring afternoon, with the sun shining brilliantly, may be taken for a model for amateurs who desire to make the most of the space at their command, possess ideas of their own, and have the means to carry them into effect. The owner is a very busy man, but he is exceedingly fond of the garden, which was laid out under his auspices when he selected a charming position outside Croydon, and several hundred feet above sea level, for his residence six years ago. If the time he is able to spend in it is limited, his garden is the object of his constant study; he has a great love for flowers, and he personally affords every possible encouragement and assistance to his gardener, Mr. Coles, who combines with the utmost ardour the laudable ambitions of youth. The illustrations which accompany the text of the article were taken by the owner at different periods, and are admirable representations of some of the most interesting features of the place. Unfortunately, he was not able to be at home on the occasion of my visit, but Mr. Coles, who took me round, afforded me abundant information.

THE FRONT BEDS.

Starting at the entrance, which, though attractive, has the disadvantage of facing north, the decoration of the borders was the first subject of discussion. The borders round the house, and facing it, are planted for spring effect with Wallflowers Blood-red and Golden Yellow, in combination with a wide band of yellow Crocuses and clumps of double Daffodils and Narcissi. The flowering and ornamental shrubs behind include double Peach, Lilacs, Olearia Haastii, Ribes, Forsythia suspensa, and Spiræas.

"How do you fill the borders in summer?" I enquired.

"The first row of the ribbon border is filled with Geranium Paul Crampel, and the second with Flower of Spring, the edging consisting of a wide row of white Violas and blue Lobelias. The bed in front, now planted with double Arabis, and Tulips Belle Alliance, scarlet—to be followed in May by the Rev. Ewbank and Parisian Yellow—will, in summer, be occupied by Geranium Robert Cannell (salmon), and a border of white Alyssum."

"I see that in spite of the north aspect, climbers flourish on the house."

"Yes, the yellow Jasminum, Lonicera, and Ampelopsis in variety; while in the bay behind the borders such shrubs as Portugal Laurels, Box, and Golden Privet prosper. The Roses on the lattice fence are Dorothy Perkins; and the rock plants in flower in the small rockery near the entrance are Primula Cashmeriana, Anemone apennina, Grape Hyacinths, Scilla sibirica, Campanulas, Saxifragas, Sedums, Ramondias, and Aubrietias."

"But," continued Mr. Coles, "practically the whole of the garden faces south. Here the climbers on the house embrace Clematis Jackmanni, Choisya ternata, Ampelopsis in variety, Ceanothus Veitchiana, Magnolia, Escallonia macrantha, and Pyracantha. On the east side there is only Ampelopsis, and on the west Jasminum and Honeysuckles."

MR. W. COLES.

THE SUNNY SOUTH SIDE OF WALLACEFIELD.

"Shall we inspect the conservatory next, or the terrace bedding?"

"The conservatory is not very large, but it is always decorated. The Hyacinths have been in flower since the beginning of February."

AZALEAS AND AMARYLLIS.

"And the Azaleas in bloom?"

"Sir John Llewelyn, Simon Mardner, President O. de Kerchove, Professor Waters, Anthony Koster, Empress of India, and Niobe, one of the best whites. The Amaryllis in flower are unnamed seedlings; in the second year of flowering I crossed one with a deep red. The process of hybridising is very fascinating, and I hope to do a fair amount."

"The decorations include several thriving Orchids."

"They are chiefly Dendrobium nobile, Wardianum, and Sanderæ, and Cypripedium Countess of Carnarvon. The latter has this year, for the first time, thrown up two blooms on a spike. The fine white Tulip is Lady Boreel, and it is one of the best. Primula sinensis Princess Mary, has been in flower for eight weeks; the Duchess is an older but a useful variety. The flowers of Primula kewensis have been exceptionally good. Arum Lilies, and Lilies of the Valley, which we have had here since Christmas, do well, and so do Spiræas japonica, Washington, and Queen Alexandra. Palms and hanging baskets of Asparagus Sprengeri exhaust the contents of the conservatory."

A DISPLAY OF HYACINTHS.

Descending the steps from the terrace, which is embellished with green seats and Portugal Laurels in boxes, my attention was temporarily absorbed by a very striking display of Hyacinths, ten rows on each side, making up a colour group of red, white, and blue.

"These varieties," said Mr. Cole, "are La Grandesse, Gertrude, and Czar Peter. They will be followed by May-flowering Tulips, La Merveille, with a groundwork of double white Arabis. These two beds are always a feature in spring and summer, and we aim to make them as bright as possible. The May-flowering Tulips will be succeeded in their turn by Geraniums King of Denmark, Hermione, and Black Douglas, edged with Echeveria and blue Lobelia. Taking the upper lawn first, it would be convenient to go through the Rose pergola, the path of which was put down only twelve months ago. It was bought from Messrs. Cheal and Sons' exhibit at the International Exhibition, before the latter was opened, having previously been used round the 'Ideal Home,' at Olympia."

THE ROSE PERGOLA.

"Have you enlarged or extended it?"

"Yes, it has been extended, and is now eighty feet long and eight feet wide. The stone walk affords an admirable contrast to the grass on either side. There are nine arches at intervals of eight feet each, and the varieties of Roses are Crimson Rambler, Dorothy Perkins, Mrs. Flight, Hiawatha, and Carmine Pillar. On the pergola are also Clematis montana, Japanese Honeysuckle, Vitis purpurea, and Polygonum Baldschuanicum. The Daffodils in the bowl in the alcove at the end are Van Sion. This is an excellent variety, three bulbs having produced nine flowers. The Violas planted on each side of the pergola between the Roses are Maggie Mott. Most of these Roses are yellow, and we thus get a favourite combination of mauve and yellow."

Digitized by Google Original from CORNELL UNIVERSITY

"How do you fill the long border which begins just outside the pergola?"

"In spring with a mixture of Darwin Tulips, Wallflowers, Arabis (double), and Myosotis. As to summer effects, last year we had Antirrhinums, Dwarf Tom Thumb, Carter's Pink, Coral Red, Cloth of Gold, dwarf Marigolds Legion of Honour, and masses of Tagetes. I expect to repeat the Antirrhinums this year, only in different colours, and to improve upon the Tagetes and Marigolds. The soil is light loam on chalk, and this border is rather dry."

"What kinds of fruit do you grow on the fence behind the border?"

"Pears, Bon Chretien and Marie Louise; Apples, Ribston Pippin and Sturmer's Pippin. They do fairly well, and look all the better now for having been root-pruned last year."

THE DECORATIVE ORCHARD.

"You seem to have here a decorative orchard, which, with its grassy path and herbaceous border, must be extremely attractive later in the year."

"We certainly get a fine show of flowers in the herbaceous border, which does not suffer in any way from the shade of the fruit trees. The border is arranged in groups according to colour. For example, among the yellows are Heleniums, Doronicums, Helianthemums, Lupins, Viola King Cup, and Asters. The blue groups embrace Delphiniums, Anchusas, Larkspurs, and Iris Celeste. The whites include Chrysanthemum Mrs. Lowthian Bell and Scabious; the pinks Antirrhinums and Gladiolus America; the reds Potentillas and Pyrethrums; and the orange Montbretias and Phlox. While the grass path in the centre makes the walk through pleasant, the fruit trees planted on either side, both when they are in flower or fruiting, are very ornamental. They were planted soon after the garden was made. The Pears are Easter Beurre, Beurre Bachelier, and Conseilleur de la Cour; the Apples, Ribston Pippin and Queen Caroline; the Plums, Monarch. We got a nice lot of fruit last year, and in addition to ornamentation, the standard trees make an excellent screen."

"So do the shrubs."

"Both shrubs and Roses. As well as the shrubs already named, there are in this border Laurels, Bays, Cerasus, Prunus pissardi, Laburnums, Lilacs, Spruce, Deutzias, Berberis in variety, Hollies, and Veronica Traversii. The garden Roses in the border are Little Pet, Richmond, Irish Beauty, Dean Hole, Madame Leon Pain, La Tosca, and J. B. Clark."

ROCKERIES EVERYWHERE.

We next paused at one of the rockeries, with an eastern aspect, and Mr. Coles observed:

"It may be better, as we have rockeries in various parts of the grounds—the main one being on the lower lawn—to mention a few varieties which are now in flower. These include Saxifraga apiculta, Potentilla pyrenaica, Anemone fulgens, Aubrietias Graceanum and Fire King, Viola gracilis, Campanula muralis, Cistus crispus, Dianthus cæsius major, Iberis sempervirens superba, Gentiana acaulis (now in bud), Onosma tamice, Daphne cneorum major, and Hepatica triloba cœrulea, a mass of blue flower."

"The appearance of this part of the garden is improved by the hedge of Gorse and Berberis with the little banks of Thymus below."

"Yes, they help to decorate the tennis lawn, another feature being the picturesque summer-house clothed with Roses, chiefly Aimee Vibert. The bed under the Chestnut tree is now filled with Tulips Keizerskroon and white Arabis; in summer, pink and white Geraniums will take their place. The border behind, now filled with Tulips, Wallflowers, and Polyanthus, will be devoted in summer to Antirrhinums, Nemesias, Marigolds, Scabious, and for edging blue Lobelias. Practically, there are flowers in greater or less number all round the tennis-court. We have still a portion of the lower lawn to see, but it will save time to take the kitchen garden on the way."

POPULAR ANNUALS.

So through a rustic gate, divided by a bed of Thujias and mixed shrubs, we passed into the kitchen garden. Here one of the first objects which claimed notice is a wide border with patches of annuals from which flowers for table decoration are cut, the principal being Salpiglossis, Pentstemons, Cosmeas, Clarkias, Godetias, Heliotropes, Coreopsis, and Asters. On either side of the main path are long herbaceous borders.

"The borders," continued Mr. Coles, "are planned in clumps, and the varieties include Heucheras, Phlox, Iris germanica, Pentstemons Newbury Gem, Erigeron speciosus, and early-flowering Chrysanthemums. Just here we have some rows of Sweet Peas. We run them in all colours, pink, white, salmon, and blue. They were autumn sown, and stood all through the winter. Elsewhere there are more Sweet Peas planted to prolong the season, and these embrace some of Carter's best named varieties. One of the trial borders in the kitchen garden is made up of Pansies Carter's Intermediate. We have a number of these trial borders, from which we pick out the best, and transfer them into the flower garden. I never put anything fresh into the beds until I have tested it."

"Is that, do you think, the secret of your success in the flower garden?"

"I think it has a great deal to do with the result obtained. Here, you see, is a collection of Phloxes in pots, all named. They will be planted out, and I shall choose the best to use in the flower garden, working up a stock so as to secure a mass of colour. There are twenty-seven varieties, and before planting permanently in the border, it is essential to know whether they are true to colour. Sometimes you get a variety described as salmon, which, when in flower, is a magenta."

A BUSY DAY IN THE GARDEN AT WALLACEFIELD.

"I suppose you find your frame ground very useful?"

"It keeps the conservatory going. Just now the contents include herbaceous Calceolarias, Schizanthus, late Primulas, and Darwin Tulips; also a number of Chrysanthemums in the earliest stages."

"How many Chrysanthemums do you grow?"

"About a hundred Japanese and decorative, forty bush, and forty single. In the early winter we depend upon them mainly to decorate the conservatory."

"You have a considerable quantity of fruit in the kitchen garden?"

"The most noteworthy is the collection of espalier-trained Apples, of which the six best are Cox's Orange Pippin, King of the Pippins, The Queen, Allington Pippin, Beauty of Bath, and Court Pendu Plat. The Plums are Victoria and Greengage. There are three rows of Raspberries, which do remarkably well, and two Strawberry borders with about six of the leading varieties, including St. Antoine. The vegetables are on a considerable scale, special attention being given to Asparagus, Peas, Brussels Sprouts, Celery, and Beans."

A RARE NEW ZEALAND PLANT.

We next made our way into the two plant houses.

"Here," said Mr. Coles, "we have a collection of Amaryllis seedlings in pots, about one hundred and fifty altogether. There are five in a pot, and they will be shifted into single pots in the spring. I hope to flower them in three years. There are also a number of seedling Gloxinias, twelve months old. Some of these are named. They were all grown from a half-crown packet of seed. They flowered last year, and made a good display. In the cool house we grow a few early Roses, and also a number of Orchids, including Vandas and Odontoglossum crispum. You may like to note that we have in this house a rather rare plant, which came from New Zealand two years ago. It is called Arthropodium cirhatum. The flowers are white, and resemble Lilies of the Valley. They were first introduced into this country thirty years ago, but these are from freshly-imported seed. The only fruit grown in the houses are Melons, Sutton's Superlative and His Eminence."

Returning to the house, across the lower lawn, I noticed the large Rose bed, and Mr. Coles, in reply said,

"The bed is entirely planted with William Allen Richardson in standards and half standards. For groundwork in spring there are Daffodils Emperor, and these are followed in summer with Viola Maggie Mott. This faces the house, and is in close proximity to the sundial in the centre of the lawn. This double-oval bed above is at present planted with yellow and brown Polyanthus, and May-flowering Tulips Parisian Yellow."

"Are there any special varieties in the borders round the lower lawns?"

"An Aster called Saturn is largely used, Geum Mrs. Bradshaw, and Lilium candidum in clumps. The hardy and half-hardy annuals are arranged to a colour scheme with an edging of Mrs. Sinkins Pinks, and Alyssum minima. These borders at present are planted with Narcissus Pheasant's-eye, double Daffodils, Darwin Tulips, clumps of various kinds of Wallflowers, and Polyanthus. A suitable background is formed by trees and flowering shrubs, which

Digitized by Google Original from CORNELL UNIVERSITY

include double-flowering Peach, Copper Beech, and Maples."

"You have not mentioned the Rose bed planted with bushes?"

"The varieties are Hybrid Teas, Mrs. Waddell, Betty, Frau Karl Druschki, Lady Hillingdon, Avoca, Lady Pirrie, His Majesty, Dorothy Page Roberts, General McArthur, and Mrs. George Shawyer. There is yet another rockery facing the house, in which many lovely little Alpines are now in flower, and with this, I believe, the features of Wallacefield are pretty well exhausted."

"You appropriately finish with the Alpines, which contribute so materially to the beauty of the garden, and are represented by so many of the most delightful varieties. How long have you been in charge?"

"For two years. I was previously at Bromley, in Kent. In extent this garden covers about one and a half acres, and the two-fold purpose always kept in view is to make the most of them, and to invest them with every charm which can be produced by decorative effects. We try to have something in bloom in the beds and borders all the year round. Last Christmas Day twenty-four varieties of various flowers were picked outside in the open."

A GARDEN OF REST.

Reviewing the whole, it may be said that the prevailing note in this garden is one of restfulness—the kind of retreat which offers a marked contrast to the rush of the City. This 'atmosphere' is secured by the relatively wide expanses of smooth lawns, round which are grouped the flower borders already described. In laying out the garden, every care has been taken to screen the adjoining houses, and at the same time to keep open the pleasant vistas of a large private park opposite the house, the famous Croham Hurst, and the Fir-clad Ballards Hill. Although the garden is still in its early youth, the old Elm trees on the neighbouring properties have been skilfully worked into the garden plan, with a result which is distinctly satisfying to the eyes of the man who can appreciate the decorative value of big trees, especially when they do not encumber his own restricted acreage! ALFRED WILCOX.

NEXT week: The gardens at Holly Bush Lodge, Old Southgate, will be described.

CYCLAMEN FROM SEED.

IN recommending April sowing of Cyclamen seed, I know I am laying myself open to criticism, but I feel confident, from practical experience, that it is more favourable than sowing in July and August. Firstly, we are sowing the seed as soon as ripe, and consequently there is quicker germination; secondly, we have larger plants, so that there is no need for growing as many; thirdly, commencing so early in the year, we can grow our plants without having to subject them to high temperatures, thereby having foliage dwarf and strong, and thus better able to fulfil its functions, and allowing the flowers to stand well above the foliage, thus being more effective for decorative purposes.

SOW SEED WHEN RIPE.

To produce good plants of Cyclamen, seed should be sown as soon as it is ripe (which will be about the end of April), in pans containing a mixture of loam, leaf-soil, and sand in equal proportions. Place the seed one inch apart, and a quarter of an inch deep, and put them in a propagating case in a temperature of sixty-five degrees. They will germinate in two to three weeks, when they should be put close to the glass to prevent them becoming drawn. As soon as they have made two or three leaves, they are ready to move into a cooler house, where they can have more air, as when they are growing nicely, they must have plenty of air to keep them strong and sturdy. Spray them morning and afternoon, and shade from bright sun.

About the middle of July, the young plants will be ready for potting singly into thumb pots, taking care not to break the roots. Use a mixture containing a little more leaf-soil than for seeds. After potting they should be stood upon a bed of leaf-soil, slightly plunging the pots, as the retention of moisture by the leaf-soil is a great help to their growth, in addition to being a rooting medium for the young roots. From now onwards they will require careful watering, syringing, and shading. Avoid cold draughts when giving air.

Early in September they will be ready for another potting, which should be into 3-in. pots, using the compost somewhat coarser, and adding a dusting of bonemeal and sheep droppings, with one part coke breeze that has been passed through the ½-in. sieve. This coke breeze is a splendid aid to the production of fibrous roots, as they appear to delight in penetrating it, and, of course, anything that aids root production must show itself in the growth of the plant. After potting replace on the leaf-soil, keeping them in a temperature of forty-five to fifty degrees, and always close to the glass.

THE FINAL POTTING.

Here they may remain until the end of March, when they should be ready for another potting, which can be their final, into 6-in. size, or into 5-in. to be potted on into 8-in. I prefer to flower them in 6-in. pots the first year, repotting and flowering in 8-in. pots the second year. For this potting prepare a compost of lumpy loam, two parts; leaf-soil, sheep droppings, and coke breeze, one part each, with a dusting of bonemeal, soot, and sand, keeping the base of the corm level with the soil when potting is finished.

About the end of April place them in a shallow cold frame on a bed of ashes, being careful to see to the shading against bright sun. Allow plenty of air after they have been in the frame a little time, and syringe them twice each day.

Toward the end of June begin to leave a little air on the frame all night, gradually increasing the amount until August, when the lights can be left off all night, as the warm, moist evening is beneficial to them.

FEEDING THE PLANTS.

When they are nicely rooted into the soil, feed them with liquid manure made from sheep droppings, always being careful to use it weak. Give also an occasional application of some approved fertiliser.

About the end of September they require taking into the house, keeping a temperature of fifty degrees, and spraying with an insecticide. If all has gone well, the grower will be rewarded with a continuous display of flowers from the end of October till March, all plants carrying blooms of good size and in great profusion.

A. S.

THE GOLDEN DROP.

A CHARMING plant, truly, is the Golden Drop, as Onosma taurica is usually called. It is well named, as the clusters of yellow flowers are like bunches of old-fashioned ear-drops. Nor does the beauty of the flowers constitute their sole charm; for they are Almond-scented, a fragrance not too common among our hardy flowers.

This Golden Drop is peculiarly suited to the rockery. If planted behind a stone its flowers hang prettily over it, and the contrast of the hard, dark stone with the pleasing form and colour of the flowers is a perfect and satisfying one.

KEEP DRY IN WINTER.

Onosma taurica is only a few inches high, and is splendid for a dry and sunny place in light soil. Its pet abhorrence is winter wet, rain, sleet, snow, hail, and frost to, often telling so severely upon its rough foliage as to destroy the plants. Given, however, a moderately dry climate, or in lieu of that, some winter protection by a sheet of glass, Onosma taurica should pull through the most severe winters in nearly all parts of the kingdom.

It may be raised from seeds, which are sometimes procurable, but increase by cuttings is not difficult. After the plant has been flowered, branches, each with a heel of the old wood attached, may be taken off and inserted in sandy soil, in a pot surfaced with sand, watered, and placed under glass. They may also be struck without a "heel," but some cultivators do not find them root so well in this way.

S. ARNOTT.

CYCLAMEN WELL STAGED, WITH CINERARIAS FOR BACKGROUND.

William Coleman, Head Gardener at Eastnor

Gardeners' Chronicle 1875, n.s. 4

The Head Gardener's cottage at Eastnor

Mr. Coleman is known to the gardening fraternity as a constant exhibitor of fruit, which is always of first-rate quality, his name being familiar to those who scan the prize lists, and being generally found well to the front. Those who have the privilege of his personal acquaintance know him, moreover, to be one of the most unassuming, kind-hearted, and genial of men, and a thorough master of his profession in every department.

"I was born," he writes, "in 1827, at Rolleston, a well-kept domain in the eastern part of the county of Leicester. For more than half a century my father had the general management of the place, including the gardens, and I am indebted to him for my first three years' experience. He was an excellent cultivator of fruits and vegetables, and prided himself on his fine collection of old herbaceous plants.

Having attained the age of eighteen it was thought desirable that I should leave home for further experience. My first move was to Cole Orton, then, as now, under the able management of my kind friend Mr. Henderson. I went to him in 1848, but, unfortunately for me, the late Baronet died before I had completed my first year, and I had to leave. In 1846 I went to Lord Howden's, Grimston Park, Tadcaster, where I first experienced the fearful ravages of the Potato disease. I left in 1847, spent another year with my father, and through the agency of Messrs. Knight & Perry engaged as foreman of the hothouses at Pont-y-Pool. At that time Mr. Knight considered Pont-y-Pool one of the finest forcing places in England. The gardens were under the management of the late Mr. Drummond, who adhered too closely to the old system of maintaining fixed temperatures, independently of climatal changes. Pine- apples, principally Queens, were extensively grown on the three years' system. Enormous plants turned out of 18-inch pots into the fruiting beds produced good fruits; but I have since seen finer Pines cut from plants twenty months old, grown in 12-inch pots. This was the hardest place I ever lived in. My assist- ants, a day stoker and one apprentice, left the premises with the labourers, and returned with them the following morning. During their absence, the night firing fell upon the foreman. My young friends must bear in mind that the one-boiler system was then in its infancy, and seventeen fires frequently kept me constantly employed until the clock struck two.

Obliged by illness to give up my situation, I was advised to engage in outdoor employment. I accordingly gave up my favourite pursuit for a time to take charge of a large staff of men under Mr. Marnock, who was laying-out a beautiful place for a banker in Carmarthenshire. I left in January, 1851, and engaged as general foreman to Mr. Mackenzie, Crewe Hall, Cheshire, where I spent three years. Mr. Mackenzie was a good gardener; he always kept his place the perfection of neatness, and excelled in the cultivation of Pines and vegetables.

From Crewe I passed on to the Royal Exotic Nursery in March, 1854. My first interview with Mr. Veitch was satisfactory, he received me with great kindness, and I am proud to say I won and retained a highly valued confidence and friendship, which lasted until the day of his lamented death. In May he sent me to Ireland to act as gardener to the late Lord Cloncurry, Lyons, Co. Kildare. Lyons is a fine old place, beautifully wooded and watered, with a large flower garden stretching from the mansion to the lake. A lingering consumption of two years' standing having prevented my predecessor from taking an active part in the management, I found the kitchen garden and houses had fallen into disorder, but meeting with fair encouragement I set to work with a determination to overcome all difficulties. The Vines, originally well planted, lightly cropped with Grapes, but heavily laden with bug, received early attention, but instead of destroying them I tried my hand at resuscitation, and succeeded beyond my expectations.

Having established a good family character I returned to England in October, 1859, but before I reached London Mr. Veitch had given me the choice of two first-class situations. I engaged with my present noble employer, and entered on my duties on May 1, 1860.

On my arrival at Eastnor I found a fine collection of choice Conifers and ornamental trees arranged with much taste and judgment by Ills lordship, who is a great lover of trees, and a complete master of the art of pictorial planting. The memorable winter of 1860-61 having destroyed many of his finest Californian and Mexican specimens, he at once set about replacing them with the rich treasures sent home from Japan by Messrs. Veitch and Fortune, which up to the present time have passed through our English winters uninjured. The kitchen garden, although high above the level of the sea, is surrounded by hills, consequently we suffer from spring frosts.

The time for renovation having arrived, it was arranged that the alterations should extend over a series of years; and having told me he wished to have a useful fruit garden, his lordship generously allowed me to carry out my own ideas. All the glass structures have been rebuilt and efficiently heated, and new ones erected for various purposes. While giving my best attention to every department, I have paid special regard to the improvement of old Vines, lifting, extending, and assisting with new compost Vines of from twenty to fifty years of age. The satisfactory results which have followed convince me that only under exceptional circumstances should old Vines be destroyed.

Having a great demand for Figs, I have tried many varieties under glass, but for a continuous supply of choice fruit I have found nothing to equal the Brown Turkey, which is the only kind I now grow.

Since I have been at Eastnor I have received offers which might have induced some men to change, but so great has been the confidence reposed in me, and so uniform the kindness and liberality of my noble employer and his generous lady, that no monetary consideration could compensate for the loss of the pleasurable performance of duties which have long since merged into a labour of love."

DEBATING SOCIETIES.

SALISBURY AND DISTRICT GARDENERS'.—At the last meeting of the above society Mr. T. Challis, V.M.H., read a paper entitled "The Theory and Practice of Horticulture." The lecturer impressed upon the younger members the necessity of thought in conjunction with acting. He also gave them a simple code of rules by which they might safely be guided. It proved a highly educative paper and coming from one of the oldest members of the society was very heartily received. Mr. S. Tucker, vice-chairman, presided.

PANGBOURNE & DISTRICT GARDENERS'.—At the meeting of this association on February 5, Mr. F. W. Exler, The Gardens, Foxhill, Reading, read a paper on "Melons and their Culture." The paper gave rise to a good discussion, in the course of which much information was gained by the members. *E. W. D.*

BATH AND DISTRICT GARDENERS'.—There was an exceptional attendance at the meeting of this association held on February 13. The president (Alderman W. F. Gould) occupied the chair. Mr. T. Challis, gardener to the Earl of Pembroke, read a paper on the effects of climatic conditions on horticulture and the importance of the proper use of air, heat, and moisture for the successful growth of fruit and plants in the hothouse. The president, in thanking Mr. Challis for his excellent paper, spoke of his connection with Bath as a judge at its floral exhibitions for the past 40 years. Several new members were elected.

CROYDON & DISTRICT HORTICULTURAL.—At the meeting of this association held on Tuesday, February 18, Mr. H. Withers delivered a lecture on the life history of some of the most important insects found in the garden and field. Often, the lecturer explained, little friends in the insect world are destroyed through ignorance of their usefulness. Amongst those to be encouraged are the ladybird, whose larvæ feeds upon aphides, the golden-eyed fly, ants, and many of the Ichneumon flies. The lecturer remarked how interesting it was to watch the larvæ of the lacewing fly at work holding the aphis with its jaws and sucking the juices from the body. Unlike animals, insects had no lungs, but breathed through long tubes called trachea, running through the body and limbs, and in many instances ways had to be found for stopping these tubes, whilst other species were destroyed by poisonous juices placed in their haunts.

REDHILL, REIGATE AND DISTRICT GARDENERS'.—At the meeting of this association held on February 18, Mr. H. G. Cox, secretary of the Reading Gardeners' Association, delivered a lecture on "Primulas." The lecture was illustrated by means of about 60 lantern slides, many of them being coloured by hand. Mr. Cox had several specimens of Primulas on view, and gave many useful hints as to their culture. Ten new members were elected.

———At a special meeting held on Saturday, February 22, under the presidency of Mr. Bound, Mr. N. E. Brown, of Kew, gave a lecture on the proper pronunciation of certain names of plants commonly used by gardeners. Aided by a blackboard, Mr. Brown began his lecture by explaining the use of Latin and Greek roots, and the difference of the long and short vowels.

CHELMSFORD & DISTRICT GARDENERS'.—On Friday, February 14, Miss Philbrick, of The Cedars, Halstead, gave a lecture on "The Daffodil." The lecture-room was filled with a most appreciative audience, and the lecturer's treatment of her subject was enthusiastically applauded.

———On the 21st inst., members of the association numbering about 100 listened to a lecture on "Mendel's Law of Inheritance," delivered by Mr. F. J. Chittenden, director of the R.H.S. Laboratories, Wisley, and formerly lecturer in biology at the County Laboratories, Chelmsford. Members had long looked forward to this lecture, and a hearty welcome was given to the lecturer.

GUILDFORD AND DISTRICT GARDENERS'.—At the fortnightly meeting of this association, held on Tuesday, February 18, 57 members assembled, under the presidency of Mr. W. Hogsden, to hear a lecture delivered by Mr. W. Seaman, representative of the Redhill, Reigate and District Gardeners' Association, on "Vegetables for Exhibition." Mr. Seaman strongly urged the importance of deep cultivation and recommended that in order to produce the best results the ground for vegetable culture should be well trenched during the late autumn and winter. *J. G.*

CARDIFF GARDENERS'.—The fortnightly meeting of this society took place on Tuesday, February 18, when Mr. R. T. Went read a paper on "Forestry." The lecturer gave some very interesting and practical information upon the subject of sowing the seeds of various trees, preparing the ground as a seed-bed, the selection of seeds, sowing, transplanting, &c. The lecturer stated that more interest was being taken each year in forestry.

SCHEDULES RECEIVED.

Newcastle-upon-Tyne Summer Flower Show to be held on July 1, 2, and 3, 1908, in conjunction with the Royal Agricultural Society's exhibition in that city.

Croydon Horticultural Society's 41st summer show, to be held in a meadow adjoining Haling Park, Brighton Road, Croydon, on Wednesday, July 8, 1908.

Canterbury and Kent Rose Society.—The 30th annual show of this Society will be held on Tuesday, June 30. The prizes include a Challenge Cup of the value of nine guineas offered in a class open to nurserymen.

Women's Agricultural and Horticultural International Union's Show, to be held in the Royal Botanic Society's Gardens, Regent's Park, on Wednesday, July 15, 1908.

Obituary.

William Coleman.—The news of the death of this famous old gardener reached us just after our last issue was closed for the press. He passed away on Thursday, February 20, from heart failure, at the age of 81 years. His decease was very sudden, for about two hours previously he was engaged in his private garden. The late Mr. Coleman, although perhaps not so well known to the younger generation of gardeners, ranks high amongst horticulturists of the past century, and as far back as 1875 his portrait and an account of his life was published in the *Gardeners' Chronicle* as one of a series of articles on famous British gardeners. He was born in 1827 at Rolleston, in the eastern part of the county of Leicester, his father being gardener and manager on the estate at Rolleston for more than half a century. Leaving home for the purpose of acquiring experience, his first situation was at Cole Orton, and in 1846 he entered the service of Lord Howden at Grimston Park, Tadcaster. He also served at Pont-y-Pool Park, at that time one of the finest gardens in the county of Monmouthshire for the forcing of fruits and plants. Deceased also served at Crewe Hall, Cheshire, in the capacity of foreman, a place noted for its excellency in the culture of Pineapples and vegetables. After filling other situations, in-

THE LATE WILLIAM COLEMAN.

cluding employment at the Royal Exotic Nurseries, Chelsea. Mr. Coleman was appointed to the management of Eastnor Castle Gardens, entering on his duties there on May 1, 1860. The memorable winter of 1860-61 destroyed many of the choicest specimens of trees and plants at Eastnor, and Mr. Coleman immediately set about replacing them with the rich treasures sent home from Japan by Messrs. Veitch and Fortune. The glasshouses were all rebuilt under his supervision, and he arranged the planting of the pleasure grounds, in which he showed excellent judgment. After about 30 years of successful management of the gardens, Mr. Coleman was appointed by Lady Henry Somerset agent for the Eastnor estates, which post he well filled for about 12 years. Through failing sight he retired after 42 years of faithful service, which was greatly appreciated by his noble employers. Although relieved of his arduous duties as agent, Mr. Coleman was always active, and spent pleasant days in his beautiful little garden that contained rare specimens of Alpine and herbaceous plants. A noble, upright man of sound judgment, which was much sought after and appreciated, he will be sorely missed by those who knew him best. The funeral took place on Monday, the 24th inst., at Eastnor, and was attended by a very large number of friends. The deceased was held in the very highest esteem in that quiet country village, in which signs of mourning were everywhere apparent. It was the unanimous opinion of those present at these last rites that British horticulture had lost one of her best representatives, for no one had ever done more, both by hard work and by humorous pen, or were more successful as a gardener and administrator of horticulture.

The Marquis de Wavrin.—We regret to announce the death on the 24th inst. of the Marquis de Wavrin, Chateau de Rousele, Ghent, Belgium, one of the most enthusiastic and successful of Belgian orchidists. The late Marquis was a lover of Orchids, both species and hybrids, and was a successful raiser of good novelties, some of which he has exhibited at the meetings of the Royal Horticultural Society, as, for instance, the two forms of Cattleya Trianæ shown on the 11th inst.

ENQUIRIES AND REPLIES.

Sea Sand for a Bowling Green.—In reply to Mr. W. Davis respecting sea sand for bowling greens, I have for many years past used it as a spring dressing, and the results have been very satisfactory. Some of the finest bowling greens and lawns in the North have been made so by the discreet use of sea sand, but if, as Mr. Davis states, he has put tons of sea sand on a bowling green of ordinary size in the course of two years, I do not wonder at his grass turning yellow. Sea sand must be applied at the right time and with discretion. My practice is to obtain a waggon-load every spring, in time to arrive about March. This is put on the turf immediately we receive it at the rate of a spadeful to the square yard, for if sea sand is allowed to remain in the open for any considerable length of time, its stimulating properties are washed away. Any sand that is unused in spring is kept till about September, when it is used for mixing with the soil in frames, &c. Sea sand, besides being a first-class spring dressing for grass, has a wonderful effect in destroying worms, for by its use these creatures are completely eradicated from the turf in the course of a few years. To maintain a lawn in a good condition, some other fertiliser should be applied during the late autumn or winter. It must be remembered that the grass of a lawn will turn yellow through lack of effective drainage more than from any other cause. *Thos. Francis, 31, Turton Road, Bromley Cross, near Bolton, Lancs.*

GARDENING APPOINTMENTS.

Mr. Krumbiegel has been appointed Superintendent of Mysore State Gardens, Bangalore, India.

Mr. G. Charlton, for 5½ years General Foreman in Skelton Castle Gardens, Yorkshire, as Superintendent of the Kelvinside Fruit Farm, Dundee, Natal, South Africa. Mr. Charlton is leaving England in April to take up his new duties. (Thanks for 1s. which has been placed in the R.G.O.F. box.)

Mr. G. L. Evans, for more than 8 years Gardener to the late Major Corbett Winder, as Gardener to Sir H. M. Jackson, Bart., Llantilio Court, Abergavenny.

Mr. F. Honeyman, for the past 3 years at St. Marnocks, Dublin, and formerly an Inside Journeyman at Hallyburton, Coupar Angus, N.B., as Gardener to Lord Clarina, Elm Park, Clarina, Limerick.

Mr. J. Cook, formerly at Hallyburton, Coupar Angus, and until recently Outdoor Foreman at Stratton Park, Micheldever, as Gardener to Mrs. Hobhouse, Hadspen House, Castle Cary, Somerset.

Mr. A. Hall, employed for the past 2 years and 8 months a. Oakley Hall Gardens, Basingstoke, as Gardener to L. Phillips, Esq., Deane House, near Whitchurch, Hantst

Mr. A. J. Wells, for the past 3 years Foreman, and for some time in charge of the Gardens, Forde Abbey, Chard, as Gardener to Her Grace the Duchess of Wellington, at Ewhurst Park, near Basingstoke, Hants. (Thanks for your contribution to the R.G.O.F. box.)

Mr. Jas. Wadham, late of Sneyd Park House, Bristol, and previously 12½ years at Holmbury, Dorking, Surrey, as Gardener and Bailiff at Sir William Treloar's Cripples' Home and College, Alton, Hants.

Mr. J. A. Johnson, for the past 2 years Gardener to Her Grace the Duchess of Wellington, Ewhurst Park, as Gardener to A. C. Drummond, Esq., Cadland, Southampton.

Mr. R. Stanard, for 2½ years Gardener at Loseley Park, Guildford, as Gardener to Countess Cowper, Panshanger, Hertford.

Mr. Alexander Methven, for the past 2 years Foreman in Bothwell Castle Gardens, Bothwell, as Gardener to Miss Douglass Jackson, Millrigg House, Galston, Ayrshire, N.B.

COLEMAN Peter Byrne of Dunlavin county Wicklow died 26 November 1907 at Merrion-square Dublin Probate **Dublin** to Ellen Maria Lynch widow.
Effects £455 in England. Sealed **London** 28 March.

COLEMAN Richard Herbert of 94 Raffles-road Birkenhead Cheshire died 3 January 1908 at the Sealey Hospital Galveston Texas United States of America Administration (with Will) **London** 21 February to Eleanor Maud Coleman widow. Effects £244.

Effects £680 7s. 7d.

COLES Lucy of Burgess Hall Leeds Kent (wife of James Readman Coles) died 10 July 1908 Probate **London** 24 August to the said James Readman Coles of independent means.
Effects £226 10s.

COLES Margaret of 108 Brixton Hill Surrey widow died 4 January 1908 Administration **London** 13 February to Mary Janet Coles spinster. Effects £298.

COLES Mary of 51 Bridge-street Dover Kent widow died 8 February 1908 at The Union Infirmary Dover aforesaid Administration **London** 3 March to William Henry Coles licensed victualler. Effects £316 17s. 4d.

COLES Mary of 50 Welbeck-street Mansfield Nottinghamshire widow died 21 February 1908 Administration **Nottingham** 9 March to Frederick James Coles colliery banksman. Effects £21.

THE GARDENS OF THE EARL OF DARNLEY, AT COBHAM HALL, KENT.

BY the courtesy of the Earl of Darnley, I visited the gardens at Cobham Hall in August. Described by Repton at the close of the eighteenth century as a splendid palace of the date of Queen Eliabzeth, the great pile of buildings which forms the hall, and stands on several acres of ground, is one of the most noble of the historic seats of England, and is surrounded by a park and gardens abounding in charms. As a matter of fact, it stands about three hundred feet above sea level, but as it lies in a hollow of a hundred feet below higher ground, the spring season in the gardens is later than usual. On the other hand, for that reason in summer they are always cool and moist at night.

"This," said Mr. J. D. Colledge, who is in charge of the gardens and showed me round, pointing out, as we proceeded, their most characteristic features, "is, of course, a material advantage, of which I endeavour to make the most. You may like to note the original Hall, dating from 1300; and the wing known as the West Court, whose base was rebuilt from designs by Inigo Jones in 1662. The south wing is dated 1584, and the north wing 1594. The principal creepers on the walls are Magnolia grandiflora, which goes right up the house, eighty feet high; Pomegranates, Bignonia radicans, Roses Macartney (still in flower) and Fortune's Yellow, and Wistaria sinensis. Here, on the west wing, where it may be convenient to start, are two magnificent Magnolias, with grand foliage and flowers."

The Beds in the Quadrangle.

"What is the extent of the quadrangle, with the flower beds in grass?"

"About two hundred feet on each side. Four of the beds are filled with Lavender and Roses, edged with Mrs. Sinkins Pinks; and two with clipped design of variegated Kerrias, Rosemary, and dwarf Lavender. The hedge is of Yew, and in the small paved space is a vase and pedestal nine feet high. In an ordinary season, the effect is a blue mist, but the cold this year killed a lot of the buds."

"It none the less is very impressive. What is the scheme of colour on the beautiful south front?"

"Blue and pink all through. We aim to make it striking, but not glaring, and the bedding is renewed each season, instead of changed. You will observe that the design is a strip of beds, with two lines right through, with grass as a border outside, and double Lobelias inside. The beds at each corner are Roses, Caroline Testout in one, and Madame Resal in the other, with pale blue Violas as a groundwork. Four of the beds consist of Ageratum mexicana, the tall-growing variety, and the dwarf, both blue, with Geranium Mrs. Mappin, pink; and there are four beds exclusively filled with Rose Alberic Barbier. In the centre one, two lines of Blue Grass, with double Begonia Semperflorens, and Centaureas."

"Is the Rose garden cut out of the grass on the lawn a modern addition?"

"Yes, it was made in 1904 by Mr. Goldring, from a plan approved by the Countess of Darnley. The Rose beds are surrounded by a Yew hedge, which we are going to cut into shape, and the varieties in the beds, which in no case are mixed, are Frau Karl Druschki, Madame Abel Chatenay, Liberty, and Grand Duc de Luxemburg. The standard Ramblers in the centre of each bed are Hiawatha, Dorothy Perkins (pink and white), and Blush Rambler. There is not a better Rose for effect than Blush Rambler; it flowers before it has time to smother itself with growth."

The Value of Violas.

"The soil must be congenial?"

"Unquestionably it is, as constituted. The place lies on chalk, but we brought in heavy loam soil, without fibre, from the park,

MR. J. D. COLLEDGE.

and there is little chalk on the surface. The groundwork of Violas accentuates the beauty of the Roses. The four varieties are Dunkirk, yellow; Mrs. Lumley, white; Charity, mauve; and Liberty, dark purple. The sundial in the centre tends to give distinction to the whole. The fountain on the lawn is decorated with Ivy-leaved Geranium Madame Crousse, bronze Cannas, and Castor-oil plants, with Lilies in the water, a bronze and pink effect. In the stone vases are Marguerites and Ageratums as groundwork."

"You appear to have a succession of beds on the lawns?"

"They are, as far as possible, made up for colour results. For example, here is a combination of blue and yellow, embracing Ceanothus Gloire de Versailles, Nemesia Blue Gem, Calceolaria amplexicaulis, Anthemis Kelwayii, and Rudbeckia. By way of contrast in the vicinity is a Rose bed pegged down. The variety is Fellenberg, and it gives a mass of colour from June to October, or later. If I only planted one Rose I should choose Fellenberg. Then, there is a bed of Azaleas, with a frontage of Erica vagans alba, and Campanula pyramidalis planted through it. We grow a quantity of these Campanulas, nine feet high in pots, and they last a month in the house. Blue and yellow are represented in another bed by Delphiniums, Lupins, Œnotheras, Hypericums, and Isatis glauca (special variety). Earlier in the season there are Lilacs and white Spiræas, with Pyrus malus floribunda in the background."

"You have some large beds of Phlox?"

"We get two effects from Phlox—mauve on one side, and red and pink on the other. The former has a background of Rhododendron ponticum, and the latter of flowering Cherries and Ribes of great size. In the spring-time, a fine effect is produced by the Hollies surrounded by red Poppies. There are also Rhododendrons on this side. Rhododendrons are quite a feature of the gardens, and nearly three hundred have been planted in recent years. So long as there is no lime in the soil, it is not necessary to have peat. I have planted and grown Rhododendrons in sand. If they cover their own roots, they will thrive.

Three Effects from One Bed.

"Please describe a few more of the beds."

"They include one with Michaelmas Daisies sized to the back, and arranged to colour. I tried them in the kitchen garden first, and then transplanted them here. From another bed we get three effects. In spring, Azaleas and mixed Pansies. The Pansies are very fine, and last from spring to the end of September in flower. If they are manured and watered regularly, they can be depended upon to make a good show. These were only planted last autumn. In the early summer, Spiræas Bumalda and Liliums were a useful combination, and now, pink Ericas predominate, though Pansies still dispute the supremacy. Yet another bed is made up of white Agrostemmas, and a beautiful colour effect is produced earlier in the year by a bed of Rhododendrons Michael Waterer."

Pausing to inspect the border at the main entrance on the north side, where several trees, including a Spanish Chestnut growing right down to the grass, and two specimen Judas trees, planted in 1904, are conspicuous features, and a bank of Rambler Roses merits notice, we made our way into the new rock garden, designed by Lady Darnley, and planted last season.

"Lady Darnley," continued Mr. Colledge, "is very fond of her gardens. She not only makes many plans, but often works in the gardens herself. The rockery includes a Japanese temple, and a rustic bridge, at the foot of steps leading down to it by the side of a stream. Purbeck stone is used for vases to stand upon. In the water is a supply of goldfish, and the banks are clothed in the season with Irises. The collection of Alpines includes many of the latest novelties, of which you may care to mention a blue Pentstemon; Papaver Hildreckii, a lovely orange Poppy; and the Primulas, which are on a large scale, and include representative varieties. Adjoining the rockery is My Lady's Garden, with a handsome Copper Beech at the entrance. In this garden also is a specimen of Quercus ilex, seventy-five feet high; a Sophora japonica, eighty-four feet high, with girth at five feet, fifteen feet ten inches; and Maidenhair tree (Gingko biloba), seventy-three feet high, and girth at five feet, ten feet three inches. Roses roped along are one of the features of this garden, the varieties being mostly Wichuriana Polyanthas. At one end is a large Arbutus, and at the other a Pyrus, with a yellow Rose growing up it. The only Rose in the border is Charles Lefebvre, from which I get shoots five and six feet long. It flowers right along, and is fragrant as well as beautiful. I can recommend it for vases; it lasts a week in water. Facing the Rose bank is a Syringa hedge, over ten feet high, and about one hundred yards long, which, in the season, gives a mass of scented white bloom; and in front is a Thyme border."

Beyond the charming garden, on the slopes, is an arbour of Traveller's Joy and white Roses, intermixed with Dorothy Perkins; a couple of garden temples; a fine specimen of Magnolia

Digitized by Google Original from CORNELL UNIVERSITY

conspicua, planted in 1818; flourishing specimens of Bamboos; and a glorious specimen of Rhus cotinus."

"The Rhus continus," I observed, "seems like a great stretch of crimson cloud. Can you tell me its dimensions?"

"Its diameter is seven yards, and it is between ten and eleven feet high. The effect of colour is brought out more vividly in contrast to the Prunus Pissardi adjoining. We cut pieces of the Rhus cotinus for table decoration. Another excellent combination is made up of Wistarias and Laburnums; and the notable trees in this locality include a deciduous Cypress; Cedrus libanii, planted by the fourth Countess of Darnley in 1810; and Magnolia acuminata, planted in 1818. As to other trees, we shall see many in the terrace garden and upper shrubbery facing the north side of the Hall."

COBHAM PARK—SOUTH SIDE.

A Dickens Chalet.

As we climbed these beautiful banks, which in spring are adorned with thousands of bulbs, my attention was attracted by a real Dickens chalet, and I asked how it came to be erected in that conspicuous spot.

"It was presented by Charles Dickens when he resided at Gad's Hill, to the sixth Lord Darnley. He wrote many of his books in that chalet. In the upper shrubbery above the terrace garden, commanding striking views of the beautiful park, is Repton's seat, built by him at the time he planned the gardens. The most noteworthy trees are Liriodendron tulipifera, seventy-five feet high; Taxodium distichum, seventy-eight feet; Sequoia sempervirens, eighty-eight feet; Liquid-ambar, seventy-five feet; Quercus phellos, eighty-three feet; and two Cedars of Lebanon, respectively ninety-nine and eighty-six feet high. The tallest trees, however, are in the park, one of the Limes being one hundred and four feet, and two of the Ashes, one hundred and sixteen and one hundred and twenty-eight feet high. There are many representatives of Abies, Pinus, and Beech. Pines, especially, are represented by the Californian, the Italian, the Scotch, and the Silver Dutch. You may perhaps like to add that Ivy grows up the Firs from sixty to seventy feet high."

Millions of Hollyhocks.

"A feature of another kind is the remarkable border of Hollyhocks and Lavender immediately facing the mansion."

"With Roses on the wall behind. The border is three hundred feet long, and the Hollyhocks are all seedlings, representing, I think, every conceivable shade of colour. During the flowering season, I suppose there are millions of flowers. I do nothing to the plants, but as soon as there is a gap I put in others. The Fig-leaved Hollyhock does better than the other variety."

There was yet another flower garden to see, namely, the original Rose garden in front of Mr. Colledge's house, which has quite recently had its paths changed from gravel to grass, with most satisfactory results. Here, too, close to the house, is a remarkable yellow border, consisting of yellow Marguerites, Geum Crystal Palace Gem, yellow Antirrhinums, Violas, Pyrethrums, and Golden Privet. Finally, we entered the kitchen garden, with its range of houses.

THE ROSE GARDEN AT COBHAM PARK, MADE IN 1904 BY MR. GOLDING.

"The kitchen garden," said Mr. Colledge, "is upwards of two acres in extent within the walls, and, in addition, we used to have two acres for vegetable cultivation at the home farm. One of the features here is the blue border, one hundred feet long, with a companion border of pink, also one hundred feet long. The annuals are so timed that they flower all together, and you can imagine it took some time to accomplish this feat. In the blue border are the Larkspur, the Cornflower, the Nigella, the Asperula, the Phacelia, and the Nemophila. In the pink border are Larkspurs and Cornflowers in pink shades, Clarkias, Larkspurs, and Cornflowers in pink shades, Clarkias, double Godetias, and Eschscholtzias, finishing up with a seedling Poppy of the same shade of pink, which I have been selecting for years. Behind one of the Vineries is a long border of early-flowering Chrysanthemums, chiefly the Masse family and its varieties, all about the same height."

A Splendid Vine.

"And inside the houses?"

"First of all the four Vineries. One splendid old Vine has a house to itself. It is a Black Hamburgh, and has over two hundred bunches, most of them rather fine. We have to manure and water a quarter of an acre of gravel, as there is no border, and the roots travel a long distance. Two houses are devoted to Carnations, of which two thousand are grown. Malmaisons do particularly well. Other plants include Begonia de Lorraine, some of them three feet through; Gloxinias, which do especially well; and some fine varieties of Amaryllis. A long house is devoted to Ferns, and another to Palms. Then there are two Peach houses. In the great Peach case we get about two thousand Peaches and Nectarines in the season, and it supplies us with a good many hundredweights of Tomatoes. About one thousand Strawberry plants are forced here, and Beans, Peas, Lettuces, Cauliflowers, and Carrots, in succession."

"What about Strawberries outside?"

"One square of one hundred feet is taken up with small bush fruits, all young plants, put in four years ago, which always produce good crops. A similar square is confined to Strawberries, of which a quarter is trenched and replanted every year. The varieties are Royal Sovereign, George Monro, Laxton's Latest, Givon's Late Prolific, and Hericat de Thury. There is a long stretch of Raspberries in the dampest part of the garden, which never fails to give a splendid crop."

"Have you anything special to say about vegetables?"

"There are some very good beds of three-

Digitized by Google Original from CORNELL UNIVERSITY

year-old Asparagus, which is sunk instead of being raised. By this means they get full benefit of all that is given them, whereas raised beds are apt to run off water. This year I am trying Cabbage and Savoy Sprouts. I am very fond of the old-fashioned way of gardening, and appreciate grafting, budding, and propagating, which is now so little done in private gardens. Celery, Seakale, and Broccoli are grown in abundance, and there are several rows of Maize for cooking in the cob. This is a vegetable not much seen at present."

"How long have you been gardener at Cobham Hall, Mr. Colledge?"

"Six years. My previous experience has been chiefly in Scotland and Ireland. In Scotland it included Philiphaugh, Selkirkshire, and in Ireland I was at Drumcar, in Co. Louth, Lord Rathdonnel's place, and Glenveagh Castle, in Co. Donegal, with Mrs. Adair."

ALFRED WILCOX.

NEXT week's interview will be with a Sweet Pea Amateur, Mr. Alfred F. Blades, of Rookfields, Reigate.

VIOLETS IN EARTH FRAMES.

EARTH or turf-built frames should be more numerous in gardens than they are. A neatly-constructed turf frame is not at all objectionable to look at, and far preferable to the rotting wooden frames one often sees. It lasts for many years if well built, and, owing to the even moisture arising from the turves, the plants growing near the sides are as healthy and robust as those grown in the centre. This is not always so in the case of wooden frames. The glass lights should rest on boards one and a half inches by four and a half inches, laid on the turf walls.

Hotbeds Unnecessary.

Violets do remarkably well in turf frames during the winter months. It is not at all necessary to make up hotbeds for these plants; good compost averaging one foot to fifteen inches in depth, and made rather firm while the soil is moderately dry, is best for them. They should be lifted now with nice balls of soil adhering to their roots, and be planted in the prepared frames about sixteen inches apart. The large-leaved varieties, such as Princess of Wales, for instance, should be put in two inches further apart, as over-crowding of foliage leads to damping.

All side runners should be pinched off at the time of planting, and any others that grow must also be removed as soon as they are large enough to handle. The leaves, when the plants have finally settled in the soil, should almost touch the glass. Give a thorough watering, and see that the plants never suffer through lack of it, but take care not to sour the soil by giving small surface waterings very frequently.

When the weather is fine enough, remove the glass lights, and at other times, except when fogs or frost prevails, tilt the lights to admit air.

In turf frames, Violets may be successfully grown in winter without glass lights if a mat be spread over the plants in frosty weather.

DELAMERE.

FRUIT CULTURE FOR AMATEURS.

INEXPERIENCED cultivators are generally very eager to gather the fruits, and store them. When quite ripe, they should be gathered and very carefully stored, but premature gathering results in the shrivelling of the fruits, and, in many cases, in decay, also. The fruits of early varieties do not, as a rule, keep long, so that ordinary storing is sufficient; but those of the late varieties keep, or should do, for a long time, if carefully stored.

The store room cannot be too clean. It should be cool and dry, and the internal temperature must remain pretty even without the aid of any fire heat.

?

WHY WAS THE TEA ROSE SO NAMED?

APPARENTLY, the gardeners were responsible for this, the name being bestowed on a semi-double, blush-coloured China Rose, which had a "most delicious fragrance, strongly resembling the scent of the finest green tea." French growers were also imbued with this idea, or else adopted our name, calling it Rose a Odeur de Thé, or Rose with the scent of tea.

Several names were given by botanists to the original Tea Rose, all indicating that it was sweet-scented. The oldest is Rosa indica fragrans, meaning the fragrant Indian Rose. R. indica odorata (scented), and R. indica odoratissima (sweetest-scented), are other names applied to it.

The yellow China Rose (R. i. ochroleuca) was said to be one of the parents of the varieties that have since arisen, but whether or not this was scented is not recorded. It was introduced in 1824, but the Tea-scented Rose was probably much older, since there were fifty-one varieties in 1844.

Why was the wild type named R. indica (Indian), seeing that it came from China in 1789? Well, Linnæus and other botanists of those days had a habit of calling everything Indian that came from the east of the Cape of Good Hope.

A building with a north aspect is most suitable. Elaborately-built structures are not necessary. Some ventilation must be given, but if the interior is open to the tiles or slates, it is a good plan to place outside on the roof straw, litter, or Fern quite one foot deep, then in cold, frosty weather, the temperature will not be suddenly lowered.

The fruits are best stored on clean lattice-shelves or stages, the very choice ones in single layers only, and the others in two or three layers, if space is restricted, but where it is ample, single layers for all should be the rule. Straw must not be used, either for laying the fruits on, or for a covering to them.

If there are two store rooms available, one a little warmer than the other, place the Pears in the warmest and the Apples in the coolest. Or, if only one store room, place the Pears at the warmest end, and the Apples at the coolest.

When the fruit parts easily from the branch, it is ready to gather. Every specimen should be carefully laid in a shallow basket or box, in which some soft hay or straw has been put, and as carefully placed on the shelves in the store-room. Bruised fruits will not keep sound long. After being in the store-room for a couple of weeks or so, the Apples and Pears will commence to sweat, and a dull-looking, sticky substance will cover them. Many amateurs wipe this off with a cloth, but wiped specimens will not keep. The sticky substance helps materially to preserve them.

Ripening Late Grapes.

A moderate temperature, and a warm, buoyant atmosphere, are absolutely essential if Grapes are to be well coloured and ripened. The month of August was a very bad one for their good colouring. Early in the morning the cultivator must open the ventilators several inches at the top and the front of the house. If the sun is shining clearly, and the weather is calm, pretty full ventilation is required by half past ten o'clock. Begin to reduce the amount at three o'clock in the afternoon, and by five o'clock have only one inch in front and two inches at the top of the structure; this amount must be left on all night.

The pipes must be warmed at night, but allowed to cool again by three o'clock in the morning, if the weather is dry, but kept warm if it be wet or foggy.

Bunches containing many berries, must be carefully examined every day, as some may burst owing to the wet weather—the soil is very wet, still—and even one cracked berry, left in for two or three days, may cause the loss of a dozen, and so spoil the whole bunch.

G. G.

THE DICKENS' CHALET AT COBHAM PARK.

This chalet, in which Charles Dickens wrote many of his works, was presented by him to the contemporary Earl of Darnley.

Digitized by Google Original from CORNELL UNIVERSITY

But it can hardly do so, I think, in every case. About a month ago I found a young bird in a hedge-sparrow's nest. I watched its growth with interest, but one day, when I went to see how it was getting on, it made no movement on my approach, and I saw it was dead. Probably some misfortune had befallen its foster-mother—I had several times noticed a cat not very far away—and it had died of starvation. It was nearly old enough to leave the nest, but even then it might have died from the same cause,

Mr. J. Comber.

for the young cuckoo seems to be very slow in discovering how to feed itself. A lady who tried to rear one in captivity tells me she always had to feed it, and, in consequence, she was unable to keep it alive. In the case of swallows, the young birds are said to be the first to migrate, but this can scarcely apply to the cuckoo. At any rate, if the bird I found had lived, it would not have yet been strong enough on the wing to have undertaken a long journey.

July 28th.—Are Potatoes as a profitable crop played out? Certainly new varieties are not, as the extraordinary prices obtained for some of them during the last few years testify. Even the growers of the ordinary eating varieties may do fairly well, as is shown by the experience of an Irish farmer. The figures are given in an agricultural paper. The crop of early Potatoes weighed four and a half tons per acre, and it realised £12 per ton, which is equivalent to £54 per acre. That by itself would be a very fine return, but it is by no means all. For on the same land Turnips have since been planted, and in this way the grower expects to increase the amount to about £75 an acre. Of course, these are gross returns. No figures are given which would help in reducing them to net, and, as expenses differ widely in different districts, it would not be safe to attempt to do so. But one thing is clear—the profits must be very large. In other cases, the returns were between £40 and £50 an acre. Many of the Cork farmers have lately taken to growing early Potatoes for the English market, and this is the result. If it is followed up on a large scale, as it probably will be, it will bring about a lowering of prices in future years, which should be good news for the consumer.

July 29th.—The Judas-tree (Cercis siliquastrum), shown in the photograph, was a wonderful sight towards the end of May. It was then so completely covered with its bright purple flowers that the branches could scarcely be seen. I believe there are other varieties with pink and white flowers, but I have never seen them. It is one of the finest of garden trees, and possesses the advantage that, if raised from seed, it will flower in three or four years. It is quite hardy, but in the North is best grown against a south wall.

H. C. Davidson.

Famous Gardeners at Home.

No. 200.—Mr. J. Comber, at the Gardens, Nymans, Crawley.

There are so many notable features of the gardens at Nymans that, on the occasion of my visit, in the middle of June, it was not easy, in the time at my disposal, to do more than form a fair idea of them. The beautiful residence of Mr. Ludwig Messel is five miles from a railway station, just beyond the village of Handcross, the drive from Crawley station being through a very lovely part of Sussex. The situation of Nymans, which faces the Downs, is also delightful, and Mr. Comber, the head gardener, enjoys the advantage of living in a pleasant house commanding a similar prospect. As it is close to the kitchen garden, of which there is a walled-in portion, and additions enclosed by hedges, we commenced our round by looking at some of the fruit trees.

"We grow a good breadth of the new Black Currant, Boskoop Giant," said Mr. Comber, "which you will notice bears fruit at the end nearly as large as at the base. It is a good variety, and the trees are free from the mite, which has caused so much havoc in some quarters. We also grow the new Red Currant, Comet, whose racemes, like those of Boskoop Giant, are long. The crop of fruit this year is excellent. As to other bush fruit, the Strawberries are Royal Sovereign, President, and Countess."

"And the wall fruit?" I inquired.

"It is bearing a good crop, especially the Figs and Greengages, the young wood of which is trained in systematically, like a Peach, not spoon-pruned, and the trees bear regularly."

"Which do you consider the most prolific Plum?"

"If I were a cottager, and going to plant one Plum, I should choose the Czar."

"Have you anything special in the way of vegetables?"

"The Asparagus is earthed up, like Potatoes, in order to get it long and white, and it is grown in single rows."

"You seem to have a number of shrubs in this section of the garden. Are any of them rare varieties?"

"Some are rare, and several are comparatively new, while all are on trial. Carpenteria californica and Olearia nitida will most likely prove too tender, but some, such as Grevillea rosmarinifolium and G. sulphurea, may succeed on southern slopes, and in the shelter of low walls."

"What are your most important glasshouses?"

"There are two large fruit-houses, containing standard trees, trained Greengages, and trees in tubs; and two Vineries (early and late), whose produce is well known in the neighbourhood. One house is devoted to Strawberries, which are followed by Figs in tubs. There are also a Fig-house, a Melon-house (Sutton's Triumph is one of the best), a Tomato-house (in which Malmaison Carnations, chiefly Princess of Wales and Churchwarden, are grown), and a late Peach-house."

"You have a splendid crop of fruit in the late Peach-house?"

"Yes, but it is not beyond the average. The

Nymans Mansion.

"You have a fine old specimen of Brunswick Fig?"

"Yes, it has a span of thirty-three feet. The Brown Turkey close to it has a rather better flavour."

trees are trained in the ordinary manner, and the varieties are Violette Hative, Barrington, Pineapple, and Humboldt."

"I see that here you have a cluster of Apple trees in a bed?"

"They are all Worcester Pearmain, a fine dessert Apple, which crops well."

Then we entered a tall, span-roofed house, containing Peaches, grown on large, untrained standards, and I inquired the age of the trees.

"They are about nine years old," rejoined Mr. Comber. "I planted them a year after I came to Nymans, and they are about eighteen feet high. The varieties are Belgrade and Pineapple, and the fruit obtained from them is well up to exhibition standard."

"What are your principal varieties of Grapes?"

"Alicante, Muscat, Gros Colman, and Madresfield Court. The average weight of the bunches of the last three is three pounds. In growing Vines I make it a point to allow four feet between each. Very often too little space is allowed. Plums (Jefferson) are grown in pots, and Early Rivers Nectarines, as standards, with Greengages in front of them."

Then, with a glance at a bed which had been gay with Daisy Alice, and a pretty enclosure for Roses, including the best of the Ramblers, we proceeded through the park to the pleasure grounds. The view of the surrounding country from this point is grand, but I had hardly expressed my admiration before we arrived at the Heath garden, which immediately claimed my undivided attention. This is one of the more remarkable features, and I was amazed to learn that it was only made four years ago, although portions of the wild garden had been previously planted with Ericas.

"It was designed," said Mr. Comber, "by Mr. Messel, who takes the utmost interest in his gardens, and often assists me with his advice. We had no plan, but I got it out to scale, and, Mr. Messel having approved, we carried out the idea together."

"Have you any notion as to the number of varieties?"

"There are about fifty. Here are the best:—Erica australis, rosea, arborea, ciliaris, cinerea, rubra, codonoides, mediterranea, tetralix rosea, tetralix Mackiana, vagans purpurea, and alba; Callunas vulgaris, Hammondii, carnea, suprea, Alportii, flore pleno, and Foxii (dwarf); Menziesia polifolia, atropurpurea; and Bryanthus empetrifolia."

"The natural walks and undulations enhance the effect, but the Heaths themselves grow splendidly."

"Yes, the sandy loam suits them. As you observe, dwarf Rhododendrons and other plants suitable for mixing with Heaths are grown in this garden, such as Rosa microphylla lucida, Andromeda cassinefolia, and the new Azalea, Vasseyii, a soft shell-pink colour."

The Heath garden is divided by the Heath walk, and on the side of the hill is the croquet-lawn, the slope being covered with rock plants instead of with barren grass. Close by is an imposing pergola, which Mr. Comber informed me was only built two years ago.

"It is seventy-three yards long; the piers are of sandstone, large Larch trees being laid from pier to pier, with crosspieces of the same material, and Oak lattice-work. The creepers grown on the pergola are Actinidia Kolomicta, A. polygama, and A. Chinensis; Caprifolium giganteum, and C. periclymenum of sorts; Clematis montana, and the new variety, C. M. rubrens, Cœlestris scandens, Forsythia suspensa; Polygonum multiflorum, and P. Baldschuanicum; Vitis Coignetiæ; Wistarias sinensis, s. alba, and multijuga; Roses, Wichuriana, multiflora of sorts, and Polyanthus of sorts. As the Wistaria grows, it is to be permitted to cover the whole pergola."

"Who constructed the rockery of natural sandstone rock?"

"Messrs. Pulham and Sons. A feature of the rockery is a series of steps leading to the croquet lawn."

"Which do you consider your best Alpines on the rock wall?"

"They include Helianthemums, of all colours, and Lithospermum prostratum. Then there are carpets of such plants as Arenarias, Thymes, Cerastium, Saxifrages (especially Guildford Seedling), Aubrietias, Antennarias, and the smaller Campanulas."

"And the larger masses?"

"Gentiana acaulis, smaller Rhododendrons (ferrugineum and others), Genistas of several kinds, Phlox setacea in many colours, Æthionemas, and Alyssum gemonense sulphureum. On a sandy bank there are Cistuses formosus, algarvensis, lusitanicus, salvifolius, and undulatus. Other dwarf plants suitable are:—Juniperus tamarixifolia, Cotoneaster horizontalis, Escallonia valdavensis, Cotoneaster congesta, Diplopappus chrysophyllus, New Zealand Veronicas, V. buxifolia, V. carnosula, V. Hectorii, V. salicifolia, V. salicornioides, V. Traversii, V. cupressoides, dwarf Abies, Spiræa crispifolia, Genistas radiata, sagittalis, prostrata, and pilosa, and Philesia buxifolia."

"Which are the rarer plants?"

"Haverlea rhodopensis, Ramondia pyrenaica, Trilliums grandiflora and erecta, Iberis gibraltarica (growing on sunny slopes), Linnea borealis, and Epigea repens (in company in damp place). Nepeta glechoma variety succeeds outside, scrambling over rockwork. The rarer Alpines also include Cypripedium spectabile, Onosma taurica, Shortia galacifolia, Dianthuses glacialis, alpinus, and neglectus, Armeria setacea, Asperula suberosa, Acantholimon venustum, Primrose Miss Massey, and Androsaces sarmentosa, Chumlyii, lanuginosa, and others."

"I conclude that the mound adjoining the rockery is artificial?"

"It was made of soil excavated from the rockery, and modelled as a rough knoll on a Heathy common, with Rosa Wichuriana in many varieties on the base."

From the rockery we went to the lawn, which has a good background of trees and the older hybrid Rhododendrons, twenty feet high, well grouped. The specimen trees are chiefly Picea morinda (with drooping branches), Pinus excelsa, groups of Magnolias, and Azaleas (old Ghent, over fifty years of age), Prunus, Cryptomeria japonica, Padus, and a fine Araucaria imbricata. The Rose garden contains five vases of carved Istrian stone in the centre.

"And the varieties?"

"Hybrid Teas, of which the best are Antoine Rivoire, Belle Siebrecht, Caroline Testout, Enchantress, G. Nabonnand, Gruss an Teplitz (planted in masses at corners), Hon. E. Gifford, Jules Finger, Kaiserin Augusta Victoria, La France, Madame A. Chatenay, Madame Jules Grolez (very good), Madame Lambard, Marquise Litta, Madame Cusin, Madame de Watteville, Souvenir de President Carnot, and Souvenir C. Guillot. The climbing Roses include Euphrosyne, all the Wichurianas (except new seedling varieties of 1904), Reve d'Or, Carmine Pillar, and Polyanthus of different kinds."

"What are the creepers on the mansion?"

"Pomegranate, Passiflora cœrulea, Banksian Rose, Forsythia suspensa, Wistaria, Clematis montana, and Ceanothus Veitchiana."

"You have some fine specimens of Araucaria excelsa in the conservatory."

"Yes, and, as climbers, white and red Lapageria, Tecoma grandiflora, Streptosolen Jamesonii, and Geraniums. The other notable plants here include Musa japonica and Strelitzia regina."

We next inspected the new orchard, the paths of which form a cross, with a sundial in the centre. On each side is a noble herbaceous border, a hundred yards long and twelve feet wide.

"The trees look healthy," I remarked.

The Gardener's House at Nymans.

"There is no doubt that they are thriving. The dessert Apples are Worcester Pearmain, Sussex Forge (a great favourite with Mr. Messel), Beauty of Bath, Cox's Orange Pippin, Blenheim Orange, Scarlet Pearmain, and Sturmer Pippin; the cooking varieties, Lord Suffield, Warner's King, Lord Derby, Wellington, and Scarlet Pearmain, which is used for both cooking and dessert."

"When was this drive made?" I inquired, as we arrived at another feature, with groups of shrubs.

"Only last year. The more rare shrubs in the new drive are Magnolias stellata and stellata rosea, in groups of fifty, mixed; a group of thirty-six of the new Cherry, James H. Veitch; a group of thirty-six of Cistus Præcox; the same number of Prunus triloba: and a group of fifty of the double-flowering Sloe."

"Can you tell me the names of the principal families grouped together in your great collection in the Pinetum?"

"There are very numerous choice varieties. The best of the Pinus are:—Avacahuite, aristata, Banksiana, Coulterii, densiflora, flexilis, Jeffreyii, Koraensis, ponderosa, palustris, monophylla, sylvestris argentea, Sabiniana, Thun-

bergii, and Torreyana. The other varieties include Prumnopitys elegans, Sciadopitys verticillata; Sequias g. pendula, g. aurea, sempervirens, sempervirens pendula, and gracilis; Taxodium distichum, Taxus (in rare varieties), Thuias orientalis (in fourteen varieties), Thuia japonica, Torreyas grandis and nucifera, and eleven varieties of Tsuga."

"Then, there are the Cupressus family?"

"They are a very large quantity, including Cupressus macrocarpa, lutea, Milford Blue Jacket, Silver Queen, Allumii, versicolor, Wissetii, Triomphe de Bosskoop, arizonica, Crippsii, C. Goveriana, and Stewartii. The Junipers are chinensis aurea, chinensis albo var., japonica, aurea, communis pendula, communis hibernica, communis nana, recurva, drupacea, and virginiana in variety."

"What about Cedars?"

"The principal are Cedrus atlantica glauca, C. a. aurea, C. deodara aurea, C. d. erecta, C. d. robusta, C. d. Sargentii, and C. d. viridis. In the Pinetum are also Cephalotaxus pendunculata, Cryptomeria japonica arachnoides, C. falcata, C. monstrosa, C. pungens, and C. Lobbii; Retinosporas lycopodioides, tetragona aurea, compacta nana, filicoides, pisifera (in variety), and squarrosa sulphurea; Fitzroya patagonica; Ginkgo biloba; and Larix leptolepsis."

When we had spent a couple of minutes in the temple at the upper end of the Pinetum, which commands a very extensive view, we descended the hill to the Lily pond. Here I saw a fine collection in vigorous health.

"There are nine inches of good loam at the bottom," observed Mr. Comber, "and I make a yearly division. Masses of Gunnera, Spiræa, Arundo, Giant Hemlock, Japanese Flag Iris, and Iris siberica are also grown here."

"I should like the names of the Nymphæas."

"Caroliniana, N. c. nivea, and N. c. perfecta (which are specially good), N. marliacea albida, N. m. carnea, N. m. chromatella, N. colossea (the largest of all), N. Elliscana, N. gloriosa (very good), N. Laydekerii lilacea and N. L. purpurata, N. lucida (very good), N. odorata, N. o. rosea, N. o. Luciana, N. o. Exquisita, and N. o. suavissima, N. sulphurea and N. sulphurea grandiflora, N. pygmæa and N. p. helveola, N. Robinsonii, N. Seignourettii, and N. tuberosa Richardsonii. In the lake further down, which covers about three acres, with an elegant boat and bathing-house on the shore, we plant the surplus Water Lilies."

"Although we cannot get a glimpse of the Arboretum, you might name some of the young specimens growing there."

"Acer miyabœ, Acer Nickoense, Betula Maximowiczii, and others. We have recently planted there, as an experiment, Eucalyptus rostrata, coccifera, amygdalina, cordata, rezinifera, ficifolia, Gunnii, coriacea, and Resdonii."

Retracing our steps, we passed along the back drive, and here the Scotch Rose thrives, while irregular beds contain Rhododendron hirsutum, Kalmia angustifolia rubra, and Spiræa Antony Waterer."

"And you have been at Nymans ten years?" I said, when we got back to Mr. Comber's house.

"Yes, and most of my time has been spent in Sussex, which is my native country. After being for three years journeyman at Tilgate, and half that time in the same capacity at Ashby Lodge, Rugby, I was for three years at Drinkstone Park, Bury St. Edmunds, under Mr. Palmer, now superintendent of Hampstead Heath and Golder's Hill. Then I was foreman for some time at Longford Castle, under Mr. W. H. Ward, who has now a nursery at Raleigh, in Essex. My first post as head gardener was at Bignor Park, and at the end of two years I was recommended by the late Mr. J. H. Johnstone, M.P., to Mr. Messel, coming here in 1895 with the best wishes of the family at Bignor. We do not show, but we keep on making improvements, and do the best we can to render all departments of the gardens attractive."

ALFRED WILCOX.

Letters from a Lady Gardener.

No. 156.—LILIES IN THE GARDEN.

DEAR KATE,—The Lilies in my cool greenhouse are out, and those in the shady peat borders at the end of the lawn will soon follow, for they are covered with fine, swelling buds. I think I mentioned, a few weeks ago, that Lilium Henryi was growing enormously tall and strong in the open border, and it is now five feet six inches high, with twenty-three buds, and a girth near the soil of about four inches. There is also a secondary spike, which is flowering, and another smaller one, so that I think this Lily, from the mountains of Northern China, is making itself pretty well at home in British soil. I bought the bulb seven years ago (for half a guinea!). It was a miserable specimen, having had all its roots cut away before it left China, and, consequently, its first flowers (two) were very poor. I kept it in a pot for two years, however, and took great care that it never became very dry, nor yet was soaked with water when dormant in winter, also it was well top-dressed in spring, and not given much fire-heat. It recovered a little, and formed fresh lower roots, and the second spring I planted it in the border, which is of well-drained, gravelly soil, with a good mixture of peat and leaf-mould, in a position half-shaded by distant trees. This evidently suited the Lily, for it has grown stronger, and produced more flowers each year. We cover the bulbs for the winter with a conical pile of fine coal ashes, taking these away in April, when a flat mulch of rich soil is substituted for them. With this precaution, we find no difficulty in growing Lilies out of doors (except, of course, L. Harrisi, and L. neilgherrense, which we keep under glass in winter); but the bulbs must have their lower roots intact to survive the first winter. Without these, they invariably rot, unless kept almost dry in a pot, and out of the way of frost and rain. Yet Lilies must never be "dried off" and "put in a bag"—that terrible fate (so unnatural, for Nature keeps no paper bags!) is responsible for many of the failures to bloom from which our friends'

A FINE SPIKE OF LILIUM AURATUM.
Everyone admires this grand Lily, and the picture shows how to grow it.

it does not pay to send empty pods to market and to attempt to sell them as Peas. Or will he need a few more lessons?

July 17th.—Another result of the wet weather is that most lawns are in perfect condition this year. They have, of course, required a good deal of mowing, but that we must expect if the grass is to be green and vigorous. Where the soil is

MR. T. F. CONWAY.

sandy, however, the moisture soon drains away, and the lawn is apt to turn brown, even in the dampest summer. A correspondent has been writing to the Secretary of the Royal Horticultural Society about such a lawn, and the advice given him may be useful to others. He is recommended to dress the lawn in showery weather—or, failing that, to water afterwards—in early April, the middle of June, and the middle of August, with one ounce of nitrate of soda, one ounce of sulphate of ammonia, and two ounces of bonemeal to every two square yards. If that should not prove completely successful, he is told to try one ounce of muriate of potash, two ounces of superphosphate of lime, and one ounce of sulphate of ammonia or nitrate of soda, applied at the same rate and the same times. Of course, anyone beginning now would begin with the August dressing, and go on with the other two.

July 18th.—Experiments are being performed all over the globe with a view to testing the relative values of different chemical manures and dung. They are of the greatest interest for the horticulturist, and already some general principles seem to be emerging. In some Belgian experiments in connection with vegetables, several plots of ground were treated with dung, others with superphosphate of lime, sulphate and nitrate of potash, and others, again, with dung, combined with the chemical mixture. As the result, the best crops of Spinach, Onions, and French Beans were obtained with chemical manure alone, but all other vegetables, in almost every instance, yielded larger crops when dung was combined with it. Here is an indication of the direction in which economy may be effected by market growers, and other large (and even small) users of manure. For dung costs much more than its equivalent in chemical manure, and the substitution of the latter for a portion of the former would mean a considerable saving.

H. C. DAVIDSON.

(To be continued.)

FAMOUS GARDENERS AT HOME.

No. 94.—MR. T. F. CONWAY, AT THE GARDENS, HAM HOUSE, PETERSHAM.

AN adequate sense of the beauty of the gardens at Ham House, the historic residence of the Earl of Dysart, cannot be obtained by a passing glance from a river steamboat. The real charms of this glorious place lie behind the mansion, which dates from the time of the Stuarts, and has not much changed in appearance since the Earl of Lauderdale, who married the widow of Sir Lionel Tollemache, made alterations. It has always been the policy of the owners to maintain their old-world character, and Mr. T. F. Conway, who is now in charge of the gardens, has faithfully adhered to traditions. Nothing strikes one more in wandering through this sylvan paradise, so near the busy scenes of men, and yet apparently so far removed, than the fact that every feature is in keeping with the fine old mansion—the famous archaic iron gates, the avenues of noble trees, are carefully preserved. And yet, wherever you go, there are indications that nothing escapes the eye of Mr. Conway and his staff. The element of order is as strongly in evidence as that of antiquity, from the magnificent lawn (three acres in extent), in front of the house, to the delightful spot which, though known as the Wilderness, because everything in that part of the gardens is allowed to grow wild, has no weeds in its mossy paths.

"Now," I said to Mr. Conway, as we started on our rounds, "tell me, please, whether there are any special characteristics of the gardens, as, if so, I should like, in the limited time at our disposal, to pay particular attention to them."

"Of course," he replied, "we try to do our best with everything, but fruit and vegetables for use are the subjects of our chief concern, and I endeavour to make them a special study. For instance, in the Lodge garden, where we now are, I grow Strawberries in frames on the annual system, planting them about eighteen inches each way, after the soil has been well prepared and manured."

"When do you layer them?"

"In June, in 'forty-eights,' when they make very strong stuff. I plant them in August. I let them remain all through the winter, and in the early part of March I put some lights on, and give them a little air in favourable weather. By this system I get a good crop of fruit about the end of April and in May, at a time when there is a gap in the fruit supply, and Strawberries are very acceptable."

"How many plants did you have this year here?"

"About five hundred. I use Noble only for this purpose. I tried Royal Sovereign, but it did not do; there was too much foliage. But I think of trying Fillbasket next season, with Noble. This year I divided the frames into three sections. I have a flow and return hot-water pipe in the earliest season. By starting this section in February, the second section early in March, and the third at the end of March, I had a regular supply of fruit from April 28th to June 15th. Had I been without pipes in the earliest section, the late frosts would have probably destroyed the crop. As it was, they were a great success, and we picked eight or nine pounds of Strawberries a day when they were worth five shillings a pound."

"I see that the frames now contain Tomatoes?"

"Yes; as soon as the Strawberries have finished fruiting, I chop them out—I grow others outside to layer from—then I plant Tomatoes. Winter Beauty is the only variety grown in these frames. As soon as the Tomatoes are over, I shall put in Strawberries again."

Close by is the Cherry house, and Mr. Conway mentioned that for six or seven years in succession there has been a splendid crop of fruit.

THE TERRACE, HAM HOUSE.

"Do you force them rapidly?"

"No; we bring them on gradually. Cherries will not stand hard forcing. When first the Cherries were started, it was thought that they would be a failure, but after a year or two they began to thrive exceedingly, and now we start picking about the middle of April, getting a regular supply for five or six weeks."

"Which do you consider the best varieties for house culture?"

"Black Eagle, Bigarreau Napoleon, and Knight's Early Black are the best in flavour, and May Duke the most free in fruiting. Other good varieties are Bigarreau De Schreken, Bigarreau Cleveland, Bedford Prolific, and Early Rivers."

Passing into the Fig house, Mr. Conway observed that there had been an excellent fruit crop.

"What about the second crop?"

"We do not trouble about a second. I want the trees to make strong, short-jointed growth, so I keep full air on night and day. If I kept the house warm now, we should have not only a second, but a third crop. That would be at the expense of next year's fruit crop, which we value most. Brown Turkey only is grown in this house."

"You have some fine Nectarines in your early Peach house?"

"Yes; Cardinal and Early Rivers are among the best. But the finest in respect to size is Goldoni. The Alexander Peach is grown here, and Winter Beauty Tomato, in pots. The second Peach house contains Stanwick Elruge Nectarine, which can always be relied upon for a crop, together with Humboldt and Rivers' Early Orange Nectarines, and Exquisite Peach."

"And the late Peach house?"

"The Princess of Wales' Peach; and the Nectarines include Pitmaston Orange, Rivers' Orange, and Humboldt."

Then we went out of doors, and Mr. Conway pointed out that there would have been a very good crop of Apricots on the walls if the frost had not killed them.

"What is your system as to Cauliflowers?" I inquired, noticing some healthy-looking plants.

"I sow them in January, and then pot them up into 'sixties,' planting them out directly the weather is pretty open. This year it was the end of March. I find it better to sow in January than in the early autumn, but there must be no starving of the plants. These early Cauliflowers are sometimes badly attacked by maggot and finger-and-toe. To prevent this, I mix with the soil, about the roots when planting, a trowelful of the following:—sifted leaf-mould six parts, fresh lime and soot one part each. I mix the whole together, and let it stand a few days before using, otherwise the lime will burn the roots. This year, out of about two thousand plants, we have not lost one. I sowed four varieties together, Sutton's First Crop, Sutton's Magnum Bonum, Universal, and Veitch's Autumn Giant. Magnum Bonum is not easy to beat."

"Have you anything to say about dwarf Peas?"

"Some of them want knowing; they would then be more largely grown, I feel sure. I have Sutton's Harbinger, Sutton's Seedling Marrowfat, and Sutton's Green Gem. All these are good Peas, far better than the old American Wonder."

"Strawberries, I observe, are also a big feature out of doors?"

"Yes; we go in for them largely. Laxton's Fillbasket is an enormous cropper, and a very good flavour. We plant eighteen inches apart for the first year, let the plants fruit, and, after they have fruited, cut out every alternate row, and every alternate plant in the remaining rows, so that they are left three feet apart. This is not too much space for such strong growers as Fillbasket and President. Being so close to the river, the Strawberry plants have a tendency to get mouldy, and if they are only two feet apart the foliage overlaps. Nor does every variety do well here, Royal Sovereign, for example. I think that Mentmore is about our best Strawberry here."

"Here," continued Mr. Conway, as we came to the Apple trees, "is another proof of the damage done by the frost. About eighty per cent. of our Apples were killed before the buds opened. The only Apple which came through safely is Worcester Pearmain, and it seems as if it were a frost-resister. The frost also destroyed the Peaches grown as bushes."

"They are rather a novel feature. What varieties do you grow on bushes, and how do you treat them?"

"Alexander, Hale's Early, and Condor. I restrict them in size by pruning root and branch. Two years ago the trees were unprotected, and then I decided to have frames, so that lights could be put up. I give the trees plenty of loam. This year, up to April, they were in good condition, but just as they were passing out of flower the frost killed them."

"How many trees are there altogether?"

"A dozen; and I have had seven dozen Peaches from each tree. The great advantages of this system are that if there is a little fly the lights can be closed and the trees fumigated; and, by closing early in the afternoons, after the fruit has stoned, it ripens earlier, and is much finer than fruit from trees on outside walls. I syringe my Peach and Cherry trees on the walls in the winter with a solution of caustic soda. This destroys all the eggs of aphis which may be harboured in the crevices of the walls."

As we made our way into the west garden, Mr. Conway called my attention to evergreen Oaks, and the old Scotch Firs, which are said to have been planted about 1650. The west garden is given up to herbaceous plants, and flowers can practically be gathered nine months in the year. The varieties are numerous, and include many of the most popular.

But," as Mr. Conway remarked, when we arrived at the south front of the mansion, "the place being old, we do not go in for gorgeous bedding, though the border on the south terrace, from the end of June, is generally very effective."

Herbaceous beds are, again, quite the feature of the east garden, which, however, looks its best in August, when the Phloxes, Solidago, Lilium tigrinum, etc., are out. At the time of my visit, Delphiniums were in great force, and the flowering Seakale distinctly ornamental. At the north front, facing the river, the fine Bays, entirely unprotected, claimed attention, and then we strolled into the frame yard, where Melons and Cucumbers are grown.

"Here, likewise," said Mr. Conway, "we force Tulips, Hyacinths, Azalea indica, Spiræa, and other things, until we can cut from the outside."

"Do you grow Tulips largely?"

"Yes. Amongst the best are Picotee, Gesneriana major, Golden Crown, and Bouton d'Or. After that we have Gladioli, including Colvillei (red and white), which are very fine for cutting. The Blushing Bride, a variety of Gladiolus nanus, is very charming. The cultivation involves considerable trouble. The nanus should have lights put over them as soon as they are planted; some litter, or leaves, should be thrown on the lights; and occasionally a little air given. Practically, they want much the same treatment as Calceolarias in frames. They will stand a low temperature, but not frost. If they can be preserved through the winter, they are beautiful. I have a collection of twelve varieties, including Sarnian Gem, Salmon Queen, Faust, and General Grant."

In the kitchen garden, to which we came next, is the principal range of Vineries, and here I was at once impressed by the Muscats, which were equal (if not superior) to any I have seen.

"What is the secret of your success in fertilising Muscats?" I asked.

"I attribute it largely to syringing," replied Mr. Conway. "Some years ago we moved an old Muscat, and the next year I did not intend to fruit it. But in order to induce it to grow, I kept it syringed frequently, and two or three bunches that showed on it set as freely as an Alicante. This gave me the idea. William Speechley, gardener to the Duke of Portland, writing in 1789, recommended a very moist atmosphere at the time of flowering of shy-setting varieties of Grapes. It seemed to me that if moisture was an aid to fertilisation then, it would be more so now, with our modern heating appliances."

"But you do not rely entirely upon syringing?"

"No; though I am inclined to do so. Temperature is another important point. I keep the house from sixty-five to seventy degrees at night, and do not damp it down in the morning. About 12 o'clock I go over the bunches with a rabbit's tail. At 2 p.m. the house is shut, and the Vines are syringed with soft, tepid water. I have always had a fine set since I commenced syringing three years ago."

"You put written instructions in the houses for the men to work by?"

"Yes. I have done that for some time, and I think that it is a good plan. It leaves no room for making mistakes, and, in early forcing especially, there is urgent need for keeping the temperature exact."

"Do you syringe other varieties than Muscats?"

The Gardener's Lodge at Ham House.

"Some of them, such as Madresfield Court. Syringing is a great aid to fertilisation. Our earliest Grapes include Foster's Seedling and Black Hamburgh, as well as Muscats. Other varieties are Diamond Jubilee, Lady Hutt, Muscat of Alexandra, Mrs. Pince's Black Muscat, and Appley Towers. In the newly planted house the Vines are about four feet apart. I put in supernumeraries, so that I may be able to secure a crop off them next year, and a crop from the others the second year."

"Is it your experience that Muscats fail on the Lady Downe's stock?"

"They failed here. But they did well on the Alicante stock. So, by degrees, I am taking out the Muscats on Lady Downe's stock, and substituting Vines on their own roots."

"You are very fond of Grape-growing, I imagine?"

"I have always been so."

"Perhaps you would say a little more about your treatment?"

"In December I take away the surface soil from the border until I come to the roots. Then I top-dress them, the winter top-dressing consisting of equal parts of fresh horse-droppings, cow manure, and turfy loam. I mix with each bushel four pounds of the following mixture: bone-meal two parts, sulphate of potash one part, and gypsum one part. I apply the whole two inches thick, not later than December. Directly the Grapes are thinned, I apply a pound of bone-meal per square yard, wash it in with water, and mulch with quite fresh horse-droppings. If this treatment is followed up year after year, the roots are kept well up on the surface, and there is nothing in the ingredients used that they will not face. They require no further manure. When I crop them, I crop heavily."

Passing out into the open again, I noticed some beds of Alpine Strawberries, and Mr. Conway said,

"We have these up to the end of September. Though small, the Alpines are of very good flavour, but few people cultivate them."

"Are they difficult to cultivate?"

"Not at all. They should be sown every year about the beginning of April, in heat, in a shallow pan, pricked out in boxes as soon as ready, and planted out about the end of June. They should, by this time, be nice plants, with six or seven leaves. Plant in well-manured ground, about two feet apart each way. All the runners should be pinched out, and the flowers also, until the end of May. Otherwise, the crops would come on at the same time as other Strawberries. In a dry summer, water should be applied frequently. I do not advise anyone to go in for them in small quantities. As the fruit is small, a fair-sized piece of ground should be assigned to them."

"How many plants are there in your piece?"

"About three hundred. They are Sutton's Large Red Alpine. We have also, as you see, a bed of St. Joseph, which is an intermediate Strawberry, between the Alpine and the large varieties. It is grown on the annual system. We lay a bed out each year, pinch out the flowers at the end of May, and in August we get a grand crop, the fruit being almost as large as the main crop."

"How many years have you been head gardener at Ham House, Mr. Conway?"

"Six years, last March. I was previously foreman for between two and a-half and three years. Before I came here I was foreman for three years at Buckminster Park, Leicestershire. Houses were the chief feature there."

"I suppose that some changes have been made under your auspices?"

"Several. I laid out all the straight beds in the west garden. Also I did away with the large shrubberies near the house, which were out of character with it, and substituted grass."

"You have not touched the old trees?"

"No; they are one of our great features. The Juniperus Virginiana, near the Orangery, is very old, and is greatly admired. In addition to the gardens, I look after the avenues. This means a good deal of work, and, altogether, our twelve men are kept fully occupied. Unfortunately, the Elm bark beetle (Scolytus destructor) has destroyed many of our best Elms, and we have decided not to plant any more. Limes are taking their place."

"I believe you do not show much?"

"No; only at local shows. I have very little time for exhibitions."

ALFRED WILCOX.

LETTERS FROM A LADY GARDENER.

No. 51.—TABLE DECORATIONS AND LILIES.

DEAR KATE,—So you are going to give a luncheon party, and want to know how to decorate the table, etc.? You know it is the fashion to keep the decorations low, nowadays, and I think the Anglo-Indian plan of table-decoration will suit you best, as you say you have not silver bowls or antique china to display. When I was in India I used to admire the

A SIDEBOARD BOUQUET.

work of the native servants in this line very much; they have so much taste, and they don't mind what trouble they take; but then, of course, there were plenty of them, and each man had his own work.

They decorate the table in the way I am going to describe for each meal, every day; and clear away the flowers with the table-cloth, afterwards. But then, again, the gorgeous East is full of flowers—just like a great hot-house—and it is one servant's work to keep the house supplied with them.

First, they lay down flat wreaths of light greenery—Smilax, Asparagus plumosus (don't oh! don't call it a "Fern!"), Selaginella cœsia, a lovely thing, with metallic-blue leaves, or any light green leaves or Fern fronds, flat on the cloth, surrounding the central dish, or lamp, and extending from that in a sort of star, or scroll, to surround the bon-bon dishes, etc., in any direction that seems necessary. Having made this pattern quite straight and even on each side of the table, they lay down flowers lightly on the cloth, along the greenery, at intervals of two or three inches, so as to form a sort of flat wreath; Pansies, Sweet Peas, Roses, Marguerites, or many other flowers are suitable for this, but the stems should be cut short, and the ends can be hidden under the greenery. In hot weather it is desirable to put the flowers in water for an hour or two before using them, but this is such a quick and easy way to decorate a table that it need not be done more than an hour before the guests arrive, if you get all the things ready for it beforehand. The corners can be done to match the middle of the table, and you can use a table-centre, or not, as you like. The silver basket of fruit in the middle is wreathed with Smilax, to match the table, and the flowers used in the photograph I send you are pink Sweet Peas, with Roses at the corners and in the middle. The table-centre is painted on chiffon, over pink satin. Then, for the side-board, you will need a tall bouquet, as (this being at a distance from the table) low and small flowers would not show at all. We find that useful invention, called "Floral Aid," so nice for these bouquets; you can put the thing into a bowl, and arrange any tall flowers you like, with the help of this, without any chance of their toppling over, as they always do without it. Gladioli, white Foxgloves, single Pæonies, Day Lilies, Madonna Lilies, and blue Delphiniums can all be managed quite easily in this way. The bouquet I send is of Bride Gladioli, pink Shirley Poppies, and Sweet Peas, to match the table decorations, and I think you will do well to keep to one colour only (though you may use different shades of it), with any amount of white blossoms, Ferns, and Grasses, or Gypsophila, which is so light and elegant, with the flowers.

Be sure to make the whole effect light, for this is the special aim of modern table-decorations. The colour you choose should harmonise well with that of your dinner service and dessert china, or the effect of the whole may be spoiled. The bowl holding the tall bouquet is in white Coleport china, which I find very useful, as it looks well with all colours. Of course, if you care to make your table-decorations more elaborate, you can add ribbons, twisted amongst the greenery and flowers on the table, but I think they look quite as well without it, if arranged with taste, and you have plenty of flowers.

We always have a supply of Sweet Peas and other flowers, in the kitchen garden, for cutting, and it is a good thing to gather all kinds of blossoms before they drop, for seed-bearing exhausts the plants much more than blooming, and when they have ripened seed they seem to think their duty is done, and produce no more flowers, whilst they will go on blossoming much longer if the blooms are regularly cut. This is specially true of Sweet Peas and Tea Roses, also of Shirley Poppies, but you should cut these before they are quite expanded, in the early mornings, for, if once the bees have visited them, the petals will drop very soon, although they will last for days if cut just as the buds show signs of opening.

I am so sorry to hear of your disappointment about your Madonna Lilies, which you say have died, though you planted them with care in the autumn. Unfortunately, many of these bulbs are afflicted with a disease which has attacked them of late years, and that may be the cause; but it also may be that you did not know that these lovely Lilies (L. candidum) are different from all the rest, as they form a clump of leaves directly after flowering, and if these are interfered with, the bulbs are apt to disappear. So that the best time to put them in is just now (or early in August), and I advise you to get some bulbs from a good source, where the Lily disease is not known, and try again. But they seldom do much the first year after moving, for they like to be quite left alone, when they grow into great clumps, and have from ten to twenty blossoms on each stalk. All they need is to be well planted, and mulched with rich soil early in the spring. As your soil is rather heavy, it will be as well to make a hole for them eighteen inches deep and wide, and fill this to the depth of six inches with broken crocks (I don't doubt your servants keep you well supplied with these, as mine do) and ashes. Then mix the soil you have taken out with a 6-in. flower-pot full of soot (which can be brushed from your chimneys by

made for the side, would not they, after they had exhausted the soil there, draw their subsequent supplies from that in the centre? I am merely suggesting a possibility, not making a statement. I have seen hundreds of excellent Chrysanthemums with which the usual practice was not followed. To save trouble, they were moved into their flowering pots from small pots (sixties), and when they were turned out at the end of the season, though the roots were, of course, most numerous round the outside, the centre was also full of them. This does not prove that there is no gain from gradual

MR. H. COOK.

shifts, but it raises a doubt as to whether some of them may not, in certain circumstances, be omitted with advantage.

THE ORIGIN OF SOME PLANT NAMES.

April 23rd.—The transposition of a letter often makes a surprising difference in a word. How many persons associate Borecole with the Dutch boer? Yet it is really Boer-cale, that is, Peasant's Cabbage, and therefore easily expressed by our Cottagers' Kale. Kale is derived from the Latin caulis, a stalk, and appears in various forms—in Cauliflowers, Colewort, Kohl Rabi, and so forth. Cabbage has been curiously altered in its passage from language to language. From the Latin caput, a head, comes the Italian capuccio, a little head, and then the old French cabuz, and finally the English Cabbage. Such changes were often the result of ignorance. An old gardener of mine always used to speak of a well-known Rose as "Glory D. John," and in earlier days such a name might easily become stereotyped.

WHY NOT GROW SALSAFY?

April 24th.—It is not easy to understand why Parsnips should be so common in gardens, and, in comparison, Salsafy so rare. The latter is much the better vegetable; though, perhaps, if it is to be at its best, it requires more trouble in cooking. That may be the reason for its scarcity, for the cook has more to say in what shall be and what shall not be grown in the garden than would be imagined. A mistake not infrequently made with Salsafy is to sow it too early; it is then sure to run to seed. The end of April or the beginning of May is quite soon enough. Afterwards it should be kept supplied with plenty of moisture.

H. C. DAVIDSON.

Specimen copies of GARDEN LIFE will gladly be sent to any reader who will distribute them.

Famous British Gardens.

CAPENOR, NUTFIELD, near REDHILL.

Interview with Mr. H. Cook.

FROM Redhill the road winds slowly upward to the little village of Nutfield, some five hundred and sixty feet above sea level. At the summit is Capenor, the handsome residence of Mr. H. B. Brandt. This, from its position at the head of the valley, commands a glorious panorama, extending over a wide range of country, with the South Downs in the distance and Ashdown Forest a little nearer. Altogether the estate comprises about two thousand acres, split up into various farms; the gardens and pleasure grounds, which are under the charge of Mr. H. Cook, cover twenty acres.

It was towards the end of January when, by its owner's courteous permission, I paid a visit to Capenor. The weather for the preceding week had been balmy and springlike; but on this day, as though to show how bad it could be, the rain descended in a steady, persistent downpour, while the wind, undecided from which quarter to blow, at times seemed to blow from all quarters at once. The distant views were consequently blurred and indistinct, though nothing could entirely mar the beauty of the outlook. But the contrast between the wild conditions outside, and the feast of colour in the corridor into which Mr. Cook at once led me, was most marked—and not unwelcome. This corridor is about a hundred feet in length, and runs transversely to the range of greenhouses, each of which has a door opening into it. Poinsettias had been brought from a warm house, and the crimson bracts were very effective. Then there were large plants of Wistaria, which had been in their pots for seven years, and were now in full bloom. The yellow of the Daffodils served to tone down the vivid scarlet of the Zonal Pelargoniums; Cinerarias were in many colours, with blue predominating; and some especially fine Arum Lilies caused me to inquire as to their origin.

A GOOD VARIETY OF ARUM LILY.

"They are Godfrey's variety," said Mr. Cook, "and are much better than the ordinary form, giving at least three blooms to the other's two. Some of them carry half a dozen blooms each. All the plants in this corridor are used for house decoration."

"Do you make a display for each season?"

"Yes. This corridor is a feature, and is always gay with flowers. As one thing goes off another comes on. In spring we shall have Schizanthus, Clarkias, more Pelargoniums, and plenty of bulbs and other subjects. Then in summer we have Bougainvilleas, the pillars decorated with Plumbago, Cassia fulva, and Streptosolen Jamesonii, while other plants in bloom are brought in from the houses. With autumn we have other changes."

Having gone the length of the corridor, we retraced our steps, and entered the first of the houses. The plants were of varied character, miniature Hyacinths, many coloured Primulas, and large plants of the blue Coleus thryrsoideus being especially noticeable.

"The Coleus," said Mr. Cook, "is very useful, for we have no other big things of this colour which will bloom at this season. The miniature Hyacinths have come in very well, and fill in the gap between the Romans and the large-flowered type. They could have been had in bloom by Christmas, but they were not wanted then. The white variety is L'Innocence, and the soft rose, Lady Derby. Another large plant which I find very handy for big work is Begonia fuschioides, a dainty thing in its way. The standard Heliotropes will be used for bedding later on."

WINTER FLOWERS WITH LITTLE HEAT.

Perpetual-flowering Carnations occupy a section of the next house, among the chief varieties being Triumph, Mary Allwood, May Day, Britannia, Lady Alington, R. F. Felton, and Baroness de Brienen; and beyond these I noted a nice batch of Cyclamen in bloom, and Schizanthus coming on for spring.

"One of the lessons we learned through the war," Mr. Cook remarked, "is that we can have plenty of flowers in winter without a high temperature. There are many beautiful plants, such as Clarkias, Schizanthus, Primulas, Perpetual-flowering Carnations, and various

others, which are available for winter decoration, and require very little heat. Even plants that had been held to be tender have, in many cases, been found to be as well, or better, without so much fire heat."

"Do you grow many Streptocarpus?" I asked, seeing some plants on the staging.

"Before the war we went in for them largely, and gained a silver medal for a group at Chelsea; but they had to be dropped, and I am now working them up again. They are Carter's strain, as also are the Cyclamen and Primulas."

A visit to the Peach houses came next. The early house, which had just been started, has Early Rivers and Cardinal Nectarines, and Peregrine and Dymond Peaches; in the second are Barrington and Duchess of Cornwall Peaches, and two Stanwick Elruge Nectarines.

The next range is the orchard house, a well-built structure with admirable ventilation. The fruit trees are Apples, Plums, Pears, and Figs.

BEES AS FERTILISING AGENTS.

"The trees are so forward," Mr. Cook explained, "that I was afraid the birds would attack the buds, so I have brought them in. Two years ago I was able to supply the house with dessert fruit from August to Christmas."

"How do you fertilise the blossoms?"

"I have tried all ways, but find nothing answers so well as bees, so a hive is brought in when the buds open. It can be done with a rabbit's tail tied to a cane, but even with this you must be very gentle, or the buds may be damaged."

"What do you put in here after the fruit trees go outside?"

"This house is filled with Chrysanthemums in autumn. We grow fifteen hundred, mostly Singles and Decoratives. They are inserted three of a kind in 3-in. pots, to save time and labelling. The large varieties are taken as soon as we can get cuttings, and struck singly in small pots."

"You also have Sweet Peas in the border?"

"Yes; I find them very useful in spring for table decoration."

HOME-GROWN BANANAS.

From the orchard house we made our way to the stove. Here were many interesting subjects, but none more so than a large plant of Musa Cavendishii.

"Do you manage to get fruit from this?" I asked.

"We get a good bunch of Bananas every year, and one season had a bunch weighing just over a hundred pounds. The plant, as you see, makes huge growth, and is worth cultivation for its leaves alone. After it has fruited and the stem is cut, it throws up several suckers, and I take one and grow it on, throwing the old plant away. I took one at the beginning of January, and this will replace the parent plant later on."

Then, after noticing a very fine batch of Clivias, we passed into what used to be the Palm house. A miscellaneous collection is now staged, a large and well grown specimen of Acacia armata being a feature. Four plants of Coelogyne cristata were indicated, and concerning them Mr. Cook observed:

"Coelogynes do not like to be disturbed. These plants were repotted last year, and consequently did not flower. This year they are very profuse. Cypripedium insigne combines well with Roman Hyacinths for table decoration. There are also a number of seedling Cypripediums; and other Orchids here are Cattleyas and Oncidiums. This Begonia Rex growing under the staging was frozen when the heat was cut off owing to the shortage of fuel, and I thought it was killed; but it has come up again. The Anthuriums suffered badly, and so did Clerodendron Balfouri."

GOOD MELONS AND CUCUMBERS.

The greenhouses having been visited, and the rain still pouring outside, we now made our way to the Melon houses, where Hydrangeas, Spiræas such as Queen Alexandra, Dicentra spectabilis, and other plants were undergoing gentle forcing.

"Are these houses used for Melons and Cucumbers now?" I inquired.

"Yes," said Mr. Cook, "we managed to get two crops of Melons last year. The first house has Melons, the second Cucumbers, and the third Tomatoes. The Melons are Hero of Lockinge and Blenheim Orange. Then we grow Melons in frames, and get good results with very little heat. The two best varieties are King George and Little Heath, which, by the way, is not a small Melon. We also grow the Canteloupe in frames."

"What Cucumbers do you prefer?"

"We have only two varieties—Carter's Model, a very handsome variety, and Lockie's Perfection, an old sort, but really good, especially for winter work. As to Tomatoes, Carter's Sunrise and Ailsa Craig are our two principal red varieties; and Carter's Golden Sunrise is the only yellow."

"Do you find the yellow Tomatoes as good for cropping as the reds?"

"Quite, and also as good in flavour. There is one other variety we grow, Red Cherry, which is especially liked for salads. The fruit is small—about the size of a Cherry—and is put in whole."

MUSA CAVENDISHII BEARING A BUNCH OF BANANAS.

"Then I see you have a lot of Regal Pelargoniums coming on here."

HOW REGAL PELARGONIUMS ARE GROWN.

"There are many named varieties, and we make rather a feature of this flower. I hope to be able to stage a collection at the Chelsea Show this year. Among the best are Sir Trevor Lawrence, Eventide, Queen Mary, John Bright, and Ethel, which is the finest pink."

"Do you follow the usual method with these plants—ripening and drying off after flowering, and then cutting back?"

"No; I have what I think is a new idea. The plants are struck in small pots, and then moved into forty-eights. In these they flower. Then, instead of ripening them off, they are grown on, and in August or September are potted on into 6-in. pots. When they have rooted nicely—not before—the old plants are cut back. The treatment after this is to spray lightly, and pinch or stop the new growths until about this time, towards the end of January. After that they are allowed to grow on, and they make plants two feet across, and are in flower by May, earlier than the others."

The Vinery, which we next visited, is a three-quarter span structure, and in its two sections there are no fewer than seventeen varieties.

SEVENTEEN VARIETIES OF GRAPES.

"It is not often that you find so many different varieties in a Vinery such as this," said Mr. Cook. "The borders are all inside, which is an advantage where there is little or no heat. In the early house there are Muscat of Alexandria, Bowood Muscat (which is similar, but earlier), Madresfield Court, Foster's Seedling, Black Hamburgh, and Buckland's Sweetwater. We were practically without heat last year."

"Did you manage to finish the Muscats without heat?"

"No; we used just a little to finish them, but none to start them, merely closing the house. In the other house there are Black Alicante, Appley Towers, Diamond Jubilee, Lady Downe's, Mrs. Pince, Golden Queen, Lady Hutt, Gros Maroc, Mrs. Pearson, Melton Constable, and Prince of Wales. Appley Towers makes a good companion to Black Hamburgh, and Prince of Wales is a grand Grape; but I would not advise anyone to grow Diamond Jubilee, which is mealy or turnipy."

A lull in the rain came opportunely, and we made a hasty trip round the gardens, leaving the kitchen garden, where the Vinery is, until our return. The lawns are of considerable extent and undulating character, and to keep them in order three men and a boy are constantly working. A three-foot motor lawn mower is used for some parts.

"During the war," I was told, "the lawns had to go, but we are now getting them back, though some will perhaps never be restored."

Approaching the house—which is sheltered from the north by a rise in the ground, and by many handsome trees, beneath which I noticed bulbs by the thousand, already pushing up their green blades—a couple of long, herbaceous borders are a feature in summer. In January they were little else than bare soil, but, thanks to the mild weather, it had been found possible to remake and replant them.

The path here leads down to the terrace walk, facing south, from which grand views are obtained across the valley. Off to the left is a wild garden, and half-way down the sloping lawn is a "ha-ha." In the loggia, which opens on to the terrace, Camellias are trained on the wall. There were buds in plenty, and some were already open. A well-made rockery is in front of the loggia, and runs along by the house, while on the other side of the terrace path is a long border, filled in spring with bunch Polyanthuses, the colours ranging from white to yellow. Already there were abundant indications of the glorious display that would follow later. Juniperus sabina tamariscifolia gives a nice bit of green colouring. In summer these are replaced by Heliotropes, whose fragrance is wafted through the open windows of the house. Another plant in bloom thus early was Rhododendron præcox, and here and there I caught a glimpse of the yellow of Winter Aconite. That birds are not forgotten was shown by the half-coconuts suspended here and there for the tits.

We did not linger on the terrace, however, but making our way to the right, walked round a very large plantation of flowering and foliage shrubs, where Dogwoods, Willows, and others gave a touch of colour even in the depth of winter.

THE ROSE GARDEN.

Still farther round, across another lawn, we came to the Rose garden, filled with modern varieties, in groups to colour. The walk here takes us under a fine rustic pergola, with Wichuraiana Roses on the sunny side, and Clematis, Honeysuckles, Wistarias, and Ampelopsis on the other. Here are four large beds, filled respectively with Roses Prince de Bulgarie, Mons. Joseph Hill, General McArthur, and Caroline Testout.

"We cannot do without Caroline Testout," said Mr. Cook. "It is such a good, all-round Rose. Other Roses we find do well here are Lady Hillingdon, Madame Ravary, Lady Pirrie, Mrs. Aaron Ward, Pharisäer, Mrs. Theodore

Roosevelt, Ophelia, George C. Waud, Warrior, and Rayon d'Or."

"Is the soil good for Roses?" I asked.

"It is very mixed. In places it is fairly good; but in others fuller's earth is found a few feet down, and so we cannot get good drainage. Much of the soil has to be made up, but fortunately we can get plenty of manure."

There are some very fine specimen trees on the lawns, Hollies being especially handsome. Araucaria imbricata also gives a good account of itself.

A HARD TENNIS COURT.

Before turning to come round by the other side of the house, we made a diversion to see the hard tennis court. This, which was constructed by En-Tout-Cas, Limited, has the advantage that it can be played on directly rain has ceased, and no matter how heavy it has been.

"It is perfectly resilient," said Mr. Cook, "and is the only thing we have found to answer the purpose. We tried other forms, such as asphalte and concrete, but they were too hard, and not satisfactory. Frost is the only thing that affects it, and it is not advisable to play on it soon after a hard frost. It required no special drainage—just three inches of clinkers, and then a thick layer of the specially prepared red earth, which is rolled down well."

Retracing our steps, and making now for the other side of the house, I noticed, immediately in front, a very large bed of Ghent Azaleas, full of bud, and in a hollow a little way off an equally large bed of Rhododendrons, which I was informed are all Pink Pearl, and furnish a grand sight in May. Other large clumps of Rhododendrons are also to be seen in different parts of the lawns.

As to bedding on the lawns, Mr. Cook said:

ANNUALS FOR SUMMER BEDDING.

"At present the beds are filled with such things as Forget-me-not Sutton's Blue, Aubrietias, Wallflowers, and bulbs. A pretty effect is produced from a bed of Darwin Tulips carpetted with Limnanthes Douglasii, seed of which is sown in September. In summer we make good use of annuals, such as Clarkias, Stock-flowered Larkspurs, Lavatera rosea, giant Candytuft, Mignonette, and others. Some, such as Shirley Poppies, Nigella Miss Jekyll, Nemophila, Limnanthes Douglasii, and Sweet Peas, are sown out of doors in autumn. Zonal Geraniums are not much in favour, but good use is made of Begonias, and plenty are raised from seed. We also raise large numbers of Antirrhinums and half-hardy annuals, which not only give colour in the beds, but provide quantities of flowers for cutting."

Many other features of interest were to be noted, but we hurried back towards the kitchen gardens, of which there are two, covering a total area of three acres. In the one nearest the house, all the paths are edged with Pinks, Catmint, and similar subjects. Three-stemmed, upright cordon Gooseberries occupy a large fruit cage, which has ordinary wire netting round the sides, while the top is covered with ordinary tanned netting, which is taken off when the fruit has been gathered, and so saves the trouble of breakage through heavy snow, or with drip falling on the plants.

The orchard is some distance away, and as rain now recommenced in earnest—it had not actually ceased at any time—we did not go there, but adjourned to the shelter of the greenhouses again. Here, in reply to my questions, Mr. Cook said:

"The best Potato of all with us is Eclipse. The soil seems to suit it, and it comes like the old Early Rose, and can be kept for a long time. British Queen will not do at all, but gets streaky. Another good early variety is commence lifting this as soon as the tubers Epicure, which is a wonderful cropper. We are large enough. Our two best maincrops are King Edward—which is very good if kept till after Christmas—and Arran Chief. We grow a lot of Peas, but we do not go in for the large marrowfats. The ideal is the Petit Pois type, small and round. For the earliest we have Little Marvel and Carter's First Crop; and follow these with round-seeded varieties like Fillbasket. We finish with Latest of All, a grand Pea, absolutely mildew-proof."

GOOD WINTER GREENS.

"And the Cabbage family?"

"In this, again, we grow a lot, and have a good supply for winter. There is one that I think is not sufficiently known, but which I cannot praise too highly. This is Couve Tronchuda, or Portugal Cabbage. As a winter Cabbage, lasting well up to Christmas, it is the best I have ever tasted. The leaves are good as greens, and the midribs can be cooked like Seakale. We also grow Russian, Scotch, and Cottager's Kale, and a couple of rows of Perpetual Kale, which is very similar to Thousand-headed Kale, and is very useful in a hard winter. Then we sow Savoy Tom Thumb and Rosette Colewort in the middle of June, and late-plant them to fill in any vacant spot. These will give us a cutting up to the end of January. Another Savoy much liked is Dwarf Green Curled. For Broccoli we start the season with Carter's Autumn and Sandringham Winter White, which are followed by Veitch's Self-protecting and Snow's Winter White. For spring use the varieties are Knight's Protecting, Penzance Early, Late Queen, and Model. The Cauliflowers are Snowball for early work, and Autumn Giant for maincrop. Cabbages are Ellam's Early and Flower of Spring; and Brussels Sprouts Carter's Exhibition and Dwarf Gem."

BEANS FOR DRYING.

"Beans, of course, are another important crop with you?"

"For early work indoors we grow only two varieties—Osborne's Forcing and Canadian Wonder. The Runner Beans are Carter's Scarlet Emperor and Giant White Runner, of which we saved some seeds to use as Butter Beans. As Haricots we have tried many sorts, and the best of all is Dickson and Robinson's Canterbury. It is sown direct in the bed, pulled, and ripened in the Vinery. Both as a cropper and for flavour it is perfection."

"Then as to Carrots and Turnips?"

"We go in for Carrots very largely, and have young ones for pulling all the year round. We sow from January to the middle of August, starting with Early Shorthorn and Carter's Golden Ball in frames. For early summer use we have Carter's Summer Favourite, and for maincrop Carter's Red Elephant. Our Turnips are Red Globe for winter, and Jersey Lily for summer. We also grow the garden Swede. But we grow Kohl Rabi largely in place of Turnips. It is a good stand-by in a dry summer, and the leaves are delicious as a vegetable just now. Ailsa Craig is our principal Onion, and for the latest we rely on Bedfordshire Champion, and James's Late Keeping."

Mr. Cook, who has been at Capenor for seven years, commenced his gardening career at Southampton, going from there, in succession, to Midhurst, Petworth, and Harrow. His first place as head gardener was at Rogate Lodge, Petersfield, where he stayed for six years, and he was for a similar period at Bryony Hill, Witley, which he left for Capenor.

W. J. CHITTENDEN.

AN ARBOUR IN THE GROUNDS OF SHERBORNE CASTLE, DORSET.

Pope is said to have written much of the "Essay on Man" here, hence it is called Pope's arbour.

THE TAMARISKS.

The Tamarisk of Homer's Iliad and Scripture fame is well worthy of attention where something out of the ordinary is looked for. Tamarix hispida æstivalis is a most beautiful tree, producing masses of slender twigs, and branches clothed with delicate, sinuous foliage in silver, green, gold, and red, with clouds of feathery pink flowers that shimmer in the lightest breeze. Add to this an entrancing perfume of honey, and the drowsy hum of myriads of unseen bees that raid the golden plunder, and you have an idea of the beauty of the trees from which it is said Solomon chose the ornamental wood that adorned the temple of old.

The Tamarisks thrive best in sandy soil, hence they are often seen in seaside gardens. They also form splendid, thick-set hedges.

T. gallica is not particular as to locality, but though it bears masses of rosy-tinted flowers, it is not in any way equal to the roseate magnificence of æstivalis.

R. D. P.

DRUMHEAD KALE.

Just a pinch of seed of Drumhead Kale sown in the open ground in April or May will provide a number of plants that, if put out in well manured ground, will give splendid vegetables by October. It is not always appreciated that this dwarf-growing Kale takes up little room, and most of the leaves are edible. It is worth bearing in mind now, and will prove very welcome in the late autumn. Try it!

frequent cause is the dragging of a heavy roller on to the lawn from the path, a thing which should never be done without first putting down a wedge-shaped piece of wood to help it up and to protect the edge of the grass. But where these deep indentations do exist they should be filled up. The common method of removing them by taking a new line inside and cutting away turf beyond is sheer folly. It is mischievous folly, too, as anyone can test for himself by setting to work to put a new edge to his lawn, a task which will give him plenty to do for some time to come. The shapeless beds in so many lawns have had the same cause—the reckless use of the edging iron. They began as circles or squares, or some other definite

Mr. W. A. Cook.

shape, but it would puzzle anyone to know what to call them now. They should be cut afresh, or filled in—in most cases, I think, filled in.

March 17th.—In a lecture on "Fruit Culture at the Cape," delivered before the Horticultural Club, Mr. H. E. V. Pickstone gave a very interesting incident in the career of the late Cecil Rhodes, which seems to have escaped the notice of the daily papers. At least, I have never seen it in any of them. "I met him up there," says Mr. Pickstone, referring to a fruit farm at Wellington, in Cape Colony, "and he was very much interested in the whole procedure, and took some time asking all sorts of questions. On leaving, he asked me if I had the same confidence in the possibilities of fruit-growing at the Cape as I had always had. On my replying 'Yes,' he asked me to come down to Cape Town to see him at an early date. I went, and he said, 'Look here, you have always believed in this fruit business. You have a farm in Drakenstein Valley. I want to buy the whole valley; how much would it cost?' As it is twenty miles long by ten miles wide, and contains a number of farms and a small village, you will understand that the order was a big one, and I did not know how to take it. I said, however, that I thought it might be bought for a quarter of a million. He simply replied, 'Then go and buy it.' That is the way that the Rhodes' fruit farms were started." If our cousins across the sea often do this sort of thing, it is not surprising that they are driving us out of Covent Garden. Yet there is still money in fruit-growing at home if money is put into it, and put into it in the right way.

March 18th.—A failure of Carnation cuttings has been brought to my notice. In every case the cause is the same, all the stems being much too woody to form roots. The cuttings, being more or less dormant, have lived through the winter, but since the rising temperature has started the leaves into activity, and as there are no roots to supply their requirements, a complete collapse has been the result. There is no great difficulty in striking a fair percentage of Carnation cuttings if they are properly chosen, but they must be taken off above the hard wood. In other words, the stems must be herbaceous.

H. C. Davidson.

(To be continued.)

Famous Gardeners at Home.

No. 129.—Mr. W. A. Cook, F.R.H.S., at Shirley Park Gardens, Croydon.

Although Mr. Cook only took up his residence as head gardener at Shirley Park Gardens last autumn, he is well known in horticultural circles, and has held two very important appointments, one of them for several years. The post which he now fills comes under the same category, for Shirley Park is a notable historic place, and the pleasure grounds and houses are on an extensive scale, with many features of much interest. Colonel R. H. Simpson, who has a lease from the family of Lord Eldon, has carried out many improvements since he became the tenant. He has put down a very fine electric plant, driven by a pair of fine engines, established telephonic communication with every room in the house, also with the stables and the head gardener's house, put in a complete set of hydrants and fire escape, etc., and introduced a perfect system of sanitation. Colonel Simpson is extremely fond of the gardens, and very anxious that they should be kept up to the highest possible standard.

"In fact," said Mr. Cook, after we had spent our available time in looking round, "Colonel Simpson encourages me, in every way, to turn my experience to the best account."

"I believe that you have enjoyed a rather wide experience?"

"Well, I have certainly been in various parts of the country, and carried on gardening operations under differing conditions."

"Where did you start?"

"I was apprenticed for three years under the head gardener at Sherfield Manor, Basingstoke, Hampshire. Then I went to Rayners, in Buckinghamshire, the seat of Sir P. Rose, Bart., where the gardens (which are very fine) had just been made. I was next at Wooburn House for about three years. Fruit was a great feature under glass. I suppose we had two hundred trees in one house, and we had also a fine range of Vineries, and also grew Pines. From Buckinghamshire I went to Wiltshire, and was at Norman Court, Salisbury, the country seat of the Baring family, a grand old place, for two years."

"Where did you go at the end of that time?"

"The Pineapple nursery in Maida Vale, which is now extinct, and afterwards I was with Mr. Rochford at Page Green, and then with his son at Turnford. My next post in private gardens was at The Cedars, East Sheen. When I left The Cedars I went to the Crystal Palace as foreman for a few months, and thence as head gardener to Lady Wells, at Holme Wood, Huntingdonshire, a very pretty place, famed for herbaceous plants and a collection of stove plants. I returned to Wiltshire, before the end of three years, in order to take up the position of head gardener at Compton Bassett."

"How long did you remain there?"

"Thirteen years. The pleasure gardens at Compton Bassett are on a considerable scale, about twenty acres. Nearly all the houses were new, and were built by Gray of Chelsea, and we had one of the best collections of Peaches and Pears in the West of England. Peaches were largely grown in the open. There were also five acres of kitchen garden, all walled in."

"Did you do any showing?"

"Yes; I began my showing experience there, and succeeded in taking many prizes at the county and local shows, for collections of fruit and vegetables, stove and greenhouse plants, and Chrysanthemums. I also used to frequently act as judge at the shows, where there was always something interesting to learn, and nearly always something new. After I left Compton Bassett I was head gardener at Earlstoke Park, also in Wiltshire, for nearly a year.

Shirley Park, Croydon.

Earlstoke is rather famous, as well as a big estate, and one of the features is a series of lakes (eight in number), with a cascade and waterfall—in fact, it has been one of the prettiest spots in the country."

"Then you came here?"

"Yes, just after I had been elected a fellow of the Royal Horticultural Society. I hope to exhibit here occasionally, and commenced in the autumn at the Croydon Show, where we got first, second, and third prizes for a collection of fruit and for Chrysanthemums."

"What is the extent of Shirley Park Gardens?"

"The pleasure gardens, kitchen grounds, and houses cover upwards of sixteen acres, but the Park is about two hundred. There are several miles of shaded walks through shrubbery, Pine trees, etc."

"Shall we take the houses first?"

"There are five Vineries. As you have seen, the Vines in one of the early houses are just flowering. The varieties in it are Black Hamburgh and Foster's Seedling. In the second-early houses there are Muscats and Black Hamburgh. Of the remaining houses one contains Black Hamburgh and Madresfield Court; and another Alicante, Muscats, Black Hamburgh, Duke of Buccleuch, and Gros Colmar. The fifth house is devoted to seedlings. We had a lot of them until nearly the end of February, when the rats got in. They are a great pest in a Vinery, and we had considerable difficulty in getting rid of them."

"How did you manage it?"

"We took up a portion of the floor in the fruit-room, and let traps down level, and covered them over with bran. After doing this we were successful the first night. When setting traps for rats one should always use gloves, as the rat is so cunning he can detect by smell at once the presence of traps."

"What varieties of Peaches do you grow in the range which is devoted to them?"

"Royal George, Early Alexander, Hale's Early, and Dymond. The Nectarines are Pine Apple and Humboldt. If I grew one variety of Peach only, I should choose Dymond, both for inside and for outdoor cultivation. It is of very fine flavour, a beautiful cropper, and a lovely colour."

"As to the range of plant houses," continued Mr. Cook, "there are now in flower several of the best varieties of Amaryllis, to which we give special attention, Begonias, Cypripediums of several varieties, Masdevallias, of which M. Veitchi is conspicuously fine, and Azaleas."

"You have a large variety of Azaleas?"

"Yes, the mollis, indica, and pontica are all represented. Also Fielder's White, which, I think, is about the purest white. It is a very old variety, one of the easiest to force, and not particularly expensive. The flowering house also contains Lilies of the Valley, Hyacinths, Cannas, Spiræas in variety, Cyclamens, Dendrobium nobile, Begonia Gloire de Sceaux (a fine winter-blooming variety, as also is Royalty), and a number of Ferns."

"The stove house, I notice, has Orchids on one side and stove plants on the other."

"That is our plan. The Orchids now in bloom include Cattleya Schroderæ and Trianæ, Dendrobiums nobile, thyrsiflorum, and Wardianum. On the Orchid side are some nice specimens of Cocos Weddeliana, Pteris Childsii, Cheilanthes elegans, Davallia Veitchi, and other varieties of choice Ferns; while on the other side are quantities of Crotons, Horas, Dracænas, Gardenias, Dieffenbochias, Asparagus, small Palms, and other decorative plants. In the second stove house one side is full of Eucharis, with Palms interspersed, over which is a fine Stephanotis of the Elvaston variety."

"Do you regard that variety as exceptionally good?"

"The best there is. The plant is exceedingly floriferous, and the perfume of the flowers is very sweet. On the other side of this stove are Crotons, Dracænas, and small Orchids, also Pandanus in variety, and Acalypha Sanderiana. The house next is devoted to Cucumbers, and the one beyond it to plants at one period of the year, and later I hope to fill it with Tomatoes. Carter's Duke of York is, I think, one of the best Tomatoes, whether in respect to flavour, colour, or shape—the three essentials. In this house, Leeks, Celery, and Cauliflowers are pricked off in boxes, subsequently transferred to cold frames, and thence to open ground."

"What about the dark house under ground?"

"That is used exclusively for forcing vegetables, and we are growing there just now Rhubarb, Seakale, Dandelions, Chicory, and Endive."

"You have done a good deal in the way of forcing vegetables?"

"Yes, and I think it is of great importance that forced vegetables should receive attention, owing to the fact that the demand is increasing so steadily, and that one's own are better and fresher than those bought from the shops. In the heated frames outside we force Potatoes—Sharpe's Victor is the only variety—Carter's Forcing Radish, and Carter's Early House Carrot. We keep two batches of Asparagus going."

"What do you grow in the other frames?"

"Bulbs, a large number of Freesias, Chrysanthemums, and Lilies. There are about two thousand Freesias, so nice for sprays and buttonholes. We have a few of the red variety, but refracta alba is better. There are also some Callas, black and yellow."

"With regard to Rhubarb, when do you begin to force it?"

"As soon as ever it can be got out of the ground. It is wise, however, to leave it out for a week or ten days before taking it inside to force, because then there can be no doubt that it has had a thorough rest and check, which is so necessary. We force Early Champagne, and The Sutton."

"How long do you continue forcing?"

"Until we get it outside. As a rule, Rhubarb can be brought on outside as early as the end of March, or, if means are not to hand, can be forced on the ground where grown quite as easily by Christmas by covering it over with boxes, tubs, baskets, or pots. The great thing is to keep the crowns protected. One drawback to taking up Rhubarb to force it very early is that an extremely large stock is necessary. After it has been taken up to force in a house it is not much good afterwards, and had better be thrown away. The stock must be made up by propagating annually, providing seedlings, or buying in established crowns. We forced more than a hundred plants this year."

"Should Seakale be treated in a similar manner?"

"Yes, the methods are nearly identical. Seakale should be taken up as soon as the foliage has somewhat died down. The roots require to be exposed, in order to receive the check which is essential. They may either be put into pots, or planted out in a bed of soil."

"Perhaps you would give me a few hints about Asparagus?"

"As soon as the foliage has been cut away Asparagus should be taken up, and it is an advantage to leave the crowns exposed. While Seakale has to be grown in the dark, Asparagus needs the light. It should be put into frames, the crowns placed together as thickly as possible in about six inches of soil, and after the frame is filled with roots they should be covered all over with finely-sifted soil to the depth of two inches. The temperature of the frame should be fifty-five to sixty degrees, and plenty of air should be given on all favourable opportunities."

One of the Lodges at Shirley Park Gardens.

"Do you go in largely for Chicory?"

"Considerably, as it is always valuable for salad. It is taken up and stored the same as any other roots, and may be planted in a large pot or in boxes. As long as the roots have enough heat to start them, they are sure to be satisfactory. Chicory must be kept in the dark, in order that the plants may be bleached perfectly. The treatment of Dandelions is much the same."

"How do you treat Endive?"

"It has, first of all, to be sown out of doors, either late in the summer or early in the autumn. Or on the approach of frost, it should be taken up and laid closely together in frames. Then the plants should be tied up in small bundles, and introduced into a warm house as often as may be necessary to keep up a succession."

"I suppose you force a quantity of Mustard and Cress?"

"We need to do so, for Mustard and Cress is put on the table every day throughout the year. My plan is to sow seed every week, in a box, a couple of boxes of each. The seed is sown on the top of the soil, and pressed down with a slate or piece of wood. A good big piece of

slate is kept over it for a couple of days till the seed begins to germinate. Then it is tilted, to let in a little light, and subsequently the Mustard and Cress are put in a position near the glass, in just a growing temperature."

"When should Leeks be sown?"

"In January. They should be pricked off, as soon as ready, in the middle of February, gradually hardened off, and planted out in April. The best Leek is Carter's Holborn Model. Celery (which should be sown at once) should be pricked off into other boxes as soon as it can conveniently be handled. Our early Cauliflowers are already planted out. I have several lots in different stages of growth."

"How many do you grow?"

"About two thousand. The Brussels Sprouts (about a thousand in number) are also all up. We grow about fourteen hundred Broccoli."

"Now, about the fruit in the kitchen garden?"

"We grow a number of Peaches, including Amsden June, Hale's Early, Bellegarde, Early Silver, Noblesse, Barrington, Salway, Sea Eagle, Alexander, and Dymond. The Nectarines are Lord Napier, Early Rivers, and Cardinal."

"And Pears?"

"The principal Pears are Duchesse d'Angouleme, Jean de Witte, Louise Bonne of Jersey, Beurré Clairgeau, Jargonelle, Beurré Diel, Williams' Bon Chrétien, Marie Louise, Pitmaston Duchess, Doyenné du Comice, Catillac, Uvedale's St. Germain, etc."

"Gooseberries seem to be a great feature with you?"

"Yes, we have many varieties, of which Whinham's Industry is one of the best. Other varieties are Crown Bob, Keepsake, Whitsuntide, White Eagle, Lancashire Lad, Warrington, Fascination, Jenny Lind, Golden Drop, Albion, King of Trumps, Beauty of England, and May Duke. As you see, we use nets freely."

"Are the birds troublesome?"

"Very. The netting is put high up on the poles, in order that we can walk underneath, prune, gather, or mulch the fruit. I introduced it since I came here. We also net the fruit all round the walls, as soon as it shows colour, in the autumn. The birds will always take the best. In this part of the kitchen garden we have had a quantity of Gooseberry and Currant bushes, also Plums, Peaches, Nectarines, and Pears."

"How many varieties of Strawberries do you grow?"

"The best of them are British Queen, Laxton's Leader, Fillbasket, Royal Sovereign, Trafalgar, Veitch's Prolific, Vicomtesse Hericart de Thury, Climax, Waterloo, and Monarch. We force a good many Strawberries, and begin to get fruit about Easter."

"Which do you consider the best of your large collections of Apples?"

"Among the best are Cox's Orange Pippin, Bismarck, Peasgood's Nonsuch, Ribston Pippin, Blenheim Orange, Lord Suffield, Twenty Ounce, Hereford Queening, Mason's Codling, Dutch Codling, Norfolk Beaufin, Wellington, Fearn's Pippin, Devonshire Quarrenden, and a fine lot of Winter Queening. We picked the last up to the first of March. Altogether we have about two hundred trees, and they are grown according to every system—espalier, pyramid, cordon, and standard."

"You might mention the principal Plums?"

"Greengage, Jefferson, Victoria, and Oullin's Gage. We have five or six Fig trees, Brown Turkey; and also a few Medlars, Chestnuts, Filberts, and Cob Nuts."

"What is the width of your herbaceous border in one of the kitchen gardens?"

"Ten feet, and a hundred yards long. We have most of the best varieties in the border. Perhaps, before leaving the kitchen garden, I should mention that we grow an acre of Up-to-Date and Windsor Castle Potatoes out of doors. They are the two best here."

"I should like to add some details of the outside flowers?"

"We have a very good collection of Chrysanthemums, some of which are bush varieties. The indoor varieties, about 700, are Japanese and Incurved; and all the best sorts of Border Carnations are grown, while the Malmaisons include Calypso, Mrs. Trelawny, Mrs. Martin Smith, Madame de Satge, Churchwarden, and Prime Minister."

"Your Rosery, with its summer house, must date back a good many years?"

"I believe that, like the mansion, it dates back more than two centuries. There are between twenty and thirty beds in it. We have another bed of Tea Roses near the mansion, and a number dotted about in the borders."

"Do you do much spring bedding?"

"A fair amount. The Crocuses just now are a feature; they look very attractive. By the end of March we shall have cut Hyacinths, Tulips, Irises, Narcissi, Ranunculi, Daisies, Pansies, Auriculas, and single and double Wallflowers."

"What is your programme for the summer?"

"Our summer bedding will include a lot of Begonias, Heliotropes, Calceolarias, Gladioli, Lobelias, and Geraniums. This year I am introducing Salvia patens and Salvia Bluebeard, also Lobelia cardinalis in quantity."

"There is no conservatory attached to the mansion?"

"No; but there are big groups of plants just inside the front door, thirty plants in vases in the dining-room and drawing-room, and flowers are placed in all the corridors and on all the landings. Moreover, the dinner-table is always decorated with fresh flowers and foliage. The electric light has a bad influence on florists' flowers, which means that the supply has to be larger than would otherwise be the case."

"Is there anything remarkable about the shrubs?"

"Near the lake there is an acre or two of Rhododendrons, many of them named. There are several very fine specimens of trees, notably American Oaks, Planes, Beeches, Pinus, Wellingtonia, Cupressus, Bays, etc., and Mountain Ash by the score."

"How many men are there on the gardening staff?"

"Nine, and they are all good men, from the foreman downwards. There is a bothy, and Colonel Simpson is a very kind and considerate employer. I make it a point to have everything, from fruit trees to small plants, labelled, whether indoors or out of doors. The names are interesting as well as useful. Another and most important point is cleanliness. There would not be half the number of insects about gardens and houses which there often are if more attention were paid to cleanliness. I impress upon everyone the need of it, and I am sure that it cannot be too strongly insisted upon."

Alfred Wilcox.

Letters from a Lady Gardener.

No. 86.—ANEMONES, FUEL, AND BULBS.

Dear Kate,—What a comfort it is to see the sun at last! All the flowers, which have been dawdling along for want of sunshine, have suddenly hurried up, and rushed into blossom in a wonderful way lately. My garden is bright with Crocuses in all sorts of tints, purple, white, and orange; Anemones, in scarlet, pink, etc., Daffodils all over the place, Violets galore, in purple and white masses, and the lovely azure blue of Chionodoxa luciliæ, with Erica carnea, Lenten Roses (hybrid Hellebores), etc., etc. What a splendid blaze the intense scarlet of Anemone fulgens gives! And the French hybrid varieties of A. coronaria are very beautiful; L'Oracle du Siècle is one of the prettiest, with semi-double blossoms in salmon-pink, with a circle of carmine rays. There is something particularly fascinating to me in the Windflower, and it is so easily grown that everyone should have plenty of Anemones in the garden.

Anemone Coronaria.

If you want to have a good variety of spring flowers you should get some first-rate seed of A. coronaria in April; it is very woolly, and needs to be rubbed between the hands in sharp sand or dry soil (you can wear thick gloves, you know) until every seed is separate from the rest.

Then get a box, eighteen inches square, and about eight inches deep, drain it well with crocks and ashes, and fill it to within an inch of the top with good loam, with sand and charcoal, the uppermost inch being put through a fine sifter. You must then hammer the seed-bed down till it is quite firm, then sow the seed, and just cover it (no more) with fine, sandy soil. Make it firm again with the back of the trowel, and sprinkle the whole lightly with tepid water from a fine-rosed can till it is quite moist. The box can stand in a shady place in the greenhouse (not over the pipes), or in a frame, or, if you wait till the end of May, out of doors; it should be covered with a piece of brown paper to exclude the light for about three weeks, when the seedlings should be just visible, after which you should take off the paper and give them more light and air, placing the box out of doors as soon as the little Anemones are well up.

Don't plant them out until the autumn, but you can give them two or three light mulches of fine, rich soil at intervals, and they must be kept moist all the summer.

What do you burn in your stove? I don't mean the small one in your greenhouse, which is, of course, heated with paraffin, but in the large stove for your Vineries? We have given up using coke, in favour of anthracite coal, which, though it is a little more expensive at first, gives a far steadier and hotter fire, which lasts much longer, too, so that, it is probably cheaper in the end to burn anthracite. Besides this, the cinders from the coal can be riddled, and used again, when they will last as well as the coal; there are also no "clinkers" in it, and every bit can be reduced by this double burning to the finest ashes. But the greatest improvement of all in the change of fuel is that there is no smoke. My stokehole is near the house, and though it looks like a bower of creepers outside, it used to be quite a nuisance when the fire was made up in the late afternoon, when the wind often blew that horrid "coke-smoke" right into the house, and all over the

are consequently put to the unnecessary labour of elaborating them afresh when next they begin to grow. This might be given as a reason why Raspberry canes should not be cut down as soon as they have fruited. If, however, they are examined then, or very soon afterwards, they will be found to be practically dead. Most, if not all, of the changes mentioned have already occurred in them, and even if they have

MR. A. V. COOMBE.

not there is another consideration. If the young canes are to fruit well they must have light and air to ripen the wood, and when they are crowded by the old canes, as must almost inevitably happen except in new plantations, the old canes must go as soon as they have served their purpose.

THINNING FRUIT.

August 2nd.—It is sometimes said that when fruit trees are over-loaded they can be thinned in a rough-and-ready way by shaking them, and so bringing down all blighted and useless fruits. But does this help? The mere fact that such fruits are ready to fall shows that the sap has ceased, or nearly ceased, to pass into them, so their removal can benefit very little, if at all, the fruits that remain. There is a natural reluctance to thin because it seems to be waste. But if immature Pears cannot be used for any purpose, young Apples, if not too small, can be cooked, and so can young Plums, even when they are quite hard. A good deal of the Greengage jam on the market is made of green Plums. It is certainly a mistake to let fruit get wedged together in tight bunches, for under such conditions it is impossible for satisfactory growth to be made. Thinning requires care, otherwise the spurs are liable to be dragged off. H. C. DAVIDSON.

At last week's meeting of the R.H.S., the Hon. Vicary Gibbs' gardener, Mr. Edwin Beckett, brought up from Aldenham a large group of plants of Pelargonium crispum variegatum. This is a sport which Mr. Beckett found, and has successfully propagated. The grey-green leaves have a distinct margin of creamy white, and, as in the type, are sweetly scented. They are densely arranged and finely crisped. The new variety achieved the honour of a First-class Certificate.

FAMOUS BRITISH :: GARDENS. ::

RAMSEY ABBEY, HUNTINGDONSHIRE.

Interview with Mr. A. V. Coombe.

THERE was a time when Ramsey Abbey was of considerable ecclesiastical importance, for it was the second largest establishment of its kind in England. This was before the dissolution of the monasteries in Henry VIII.'s reign, when it was already venerable with age, its foundation dating back to Saxon times. Two of the ancient buttresses are incorporated in the present building, and the old guard house also remains; but most of the vast pile has disappeared, though pieces of masonry are occasionally dug up when the soil is trenched. Nowadays, Ramsey Abbey is famous for its gardens and pleasure grounds, which extend to about twenty acres, and are under the charge of Mr. A. V. Coombe.

When, by kind permission of Lord and Lady de Ramsey, I visited the gardens a few days ago, the Rambler Roses were at their best, and provided a wealth of colour and beauty of form such as pen cannot describe nor pencil depict. Nor are the Roses the sole attraction: the herbaceous borders are a strong feature; the rock garden contains much of interest; while many of the trees are of majestic proportions and great age.

Mr. Coombe's house, whence we started on our peregrination, is some distance to the north of the mansion, and close to the walled-in kitchen garden. On the outside walls are trained fruit trees, and the borders all round are occupied with herbaceous and other plants. Facing us, under the west wall, the border was filled with broad plantings of blue and yellow.

EFFECTIVE HERBACEOUS COMBINATIONS.

"This used to be entirely a blue border," said Mr. Coombe; "but we felt that it needed brightening up, so now, between the clumps of Delphiniums, Anchusas, Pentstemon heterophyllus, and other blue flowers, we have masses of Anthemis tinctoria Kelwayi and yellow Antirrhinums, which have greatly improved the general effect. When the weather is dull an all blue border seems to lack life, although it is very cool and pleasing in appearance in bright sunshine."

On the opposite side of the path the border has for background a tall hedge of the Wichuraiana Rose Paradise, a pretty shade of pink which replaces Crimson Rambler.

THE EAST FRONT OF RAMSEY ABBEY, WITH THE TWO ANCIENT BUTTRESSES.
Standing on the lawns are Hydrangeas in tubs.

At the end of the path we turn under a Rose-covered arch, and see on our left a wide Rose border running the full length of the kitchen garden wall, and on our right a short border where good use is made of the salmon-scarlet Phlox General van Heutz, with rich blue Delphiniums at the back. Beyond these is a very effective combination of Lychnis chalcedonica, whose scarlet flowers blend well with the pale mauve of Erigeron Quakeress, while in front is the vivid crimson of Agrostemma coronaria (Rose Campion) above soft grey foliage. Interspersed amongst them are bold clumps of Verbascum, and fragrance is added by Madonna Lilies.

This border is continued for some little distance, and behind it is the Rosery, a large space with climbing Roses on arches and posts running round the outside, and numerous others on pillars. Rubin, a fine rich crimson, was very striking; and Tausendschön, a wonderful mass of rosy pink, well deserved the English translation of its name, Thousand Beauties. Another that was very attractive was Blush Rambler. As to the beds, most of which were newly made last year, they are cut in grass, and each is filled with a separate variety, among which I noted Ophelia, Louise C. Breslau, and

Mrs. Bertram Walker as being especially satisfactory.

"You have many new Roses here?"

"We try practically every new variety that comes out. Altogether we have somewhere about three hundred different sorts, and have probably discarded as many during the last few years."

"And the Madonna Lilies do well with you?" I asked, the border round this garden having a large number of them.

"We have no trouble with them. A few years ago the Lily disease appeared; but we sulphur them now when we are replanting, and that keeps them healthy."

"Do you replant the borders very often?"

"Almost every year we make some changes. For next year, this herbaceous border that we are now approaching will be made into a Rose border, and herbaceous perennials will take the place of the present Rose border."

We had now left the Rosery, and returning to the herbaceous walk, Mr. Coombe pointed out some of the combinations as we went along:

"This clump of Chrysanthemum maximum," he said, "is Kenneth, a great improvement on the older variety Mrs. C. Lowthian Bell. The Pentstemons in front make a nice contrast. Here is a plant, Salvia turkestanica, which always catches the eye of visitors because of its peculiar colour, a sort of greyish pink. It has a by no means pleasant smell, however. These crimson Ten-week Stocks show up well in front of the bright yellow Anthemis; and here is more of the Rose Campion, whose vivid colour goes nicely with the yellows and blues behind."

BORDERS OF HARDY PERENNIALS AND OLD ENGLISH FLOWERS AT RAMSEY ABBEY.

GOOD COLOUR SCHEMES.

At this point we look down a path at right angles, running along the east of the kitchen garden wall. The border just under the wall is a study in yellow and purple, with the yellow predominating. It is a long border, and among the tall, yellow-flowered plants are Verbascum olympicum, Œnothera Lamarckiana, and Rudbeckia laciniata, with Coreopsis, Chrysanthemum Morning Star, Rudbeckia Newmanni, Cheiranthus Allioni, and Isatis glauca giving dwarfer plants. There are other yellow flowers, also; but the purple is restricted to Clematis Jackmanni on posts, and strong clumps of the annual Larkspur, which is sown in boxes in September, and stood in a cold house for the winter. "Rain is likely to rot it," said Mr. Coombe, "if it is sown outdoors in autumn."

The colour-scheme is highly successful, and so is that on the other side of the path. Glancing along the border, the eye takes in the bright scarlet of the clumps of Lychnis chalcedonica, which stand out at regular intervals; between them are equally large plantings of Delphiniums; while in front, and dividing them, is seen the soft green foliage of the Montbretias, whose display is to come later. The effect, as the sun shines along the row is remarkably fine.

THE ROCK GARDEN.

But we do not pursue this path, however, for the rock garden claims our attention. This, which has been constructed during the last five years, is approached by a broken paved path, edged with the lavender-blue Nepeta Mussini, over which which flowers standard Roses Hugh Dickson, to give a warmer touch of colour. At the beginning of the path are two handsome fifteenth century Italian pillars and a well-head. The rock garden is sunk in parts, and is reached by rough stone steps, while it has for background many majestic old trees, chiefly Elms.

In the lower parts of the rockery, which is often under water in winter, is a good collection of Japanese Irises of the newest varieties, and the best of the moisture-loving Primulas. The Saxifrages, Gentians, Alpine Phloxes, Pinks, Lithospermums, and many other favourites—which do well here in their seasons—were, of course, over; but patches of deep crimson were provided by Dianthus Napoleon III. (surely the best of the Mule Pinks); intense scarlet by the creeping Verbena chamædrifolia; reddish mauve by Pentstemon Bridgesii, which is hardy here; crimson and scarlet respectively by Potentillas Miss Willmott and Gibson's Scarlet; and other colours by Heucheras, Rock Roses, Aubrietias, and Astilbes Salmon Queen and Ceres.

Passing from this garden towards the main path leading to the east side of the mansion, I remarked on the splendid old trees which towered towards the sky.

"There are magnificent trees of many sorts here," said Mr. Coombe; "but Elms are most numerous. There are some fine specimens of the Huntingdon Elm, which I have not seen elsewhere. They have a straighter bole than the common Elm; and they are not subject to attack by the larvæ of the goat moth, which work havoc with the others."

Hereabouts are tall, neatly clipped Box and Yews, with Tropæolum speciosum climbing over them; a fence of Laburnum, with Rose Albéric Barbier presenting a sheet of yellow and white in front; a little farther on, a row of Prunus Pissardii, whose deep purple foliage contrasts well with the silver and green of the Japanese Maples planted alternately with them; and a pretty arbour is formed by a Weeping Elm.

On either hand, as we go on, the beauty of the Ramblers, and their varied forms, makes a swelling note of colour, which reaches a crescendo on the front lawns.

A sheet of crimson, shading down to rose, is made by La Flamma and Mrs. F. W. Flight, trained on wires in the shape of a circular table. Near by is a "basket," the outlines and handle formed by the Wichuraiana Paradise, the inside by General McArthur—a happy blending of blush and crimson-scarlet. In the background, against the dark green foliage of Abies Pinsapo, a weeping standard of the crimson Excelsa shows up well. Next we stop to admire a "balloon" of Evangeline, a single-flowered variety in white and pink, and the deep salmon-pink François Juranville, which is seen all too seldom.

At right angles to us runs another path, across which are the chief lawns, on the edges of which twenty-four tubs of Hydrangeas are stood out.

RAMBLERS AT THEIR BEST.

The principal front of the house, which we now reached, faces south, and is clothed with Ampelopsis Veitchii. On a sheltered eastern corner, near the old buttresses, Solanum crispum finds a home, and was already giving promise of the sheet of mauve it would become later on.

"Before the war," said Mr. Coombe, as, standing with our backs to the house we looked across the lawns, "we were noted for summer bedding; but we have now grassed down sixteen beds, and replaced them with weeping standard Rose trees."

"You seem to have a large number of varieties?"

"As with the bedding varieties, we try almost every new one as it comes out, and those that are not satisfactory we discard."

"Are they then thrown away altogether?"

"No; they are planted on the outskirts, as hedges and fences. We have several fine Roses that do not seem to be generally known. Here is Robert Craig, after the style of Albéric Barbier, and quite as free, but with more yellow in it. Chatillon Rambler is another. It is near the colour of Dorothy Perkins, but the petals are very prettily crinkled, and it is, I think, a finer flower."

On the lawns, as we crossed them, fresh combinations came into view. Single specimens as weeping standards, balloons, tents, and pillars, were in profusion, and the beds were harmonies in pink, and crimson, and white Roses, with here and there other subjects to give the necessary relief. A bed of the dark crimson Princess de Sagan had an edging of white Violas The Queen; another combined the dwarf Polyantha Orleans with standards of Jessie. A "tent" of Tausendschön has a border of dwarf Hybrid Teas; a "basket" of the single Rose, Mrs. Rosalie Wrinch, has its carmine-pink beauty enhanced by Delphiniums, which form the groundwork; while pillars are adorned with Lady Godiva, Dorothy Perkins, American Pillar, Excelsa, Paul's Scarlet Climber, Lemon Pillar, and others, which likewise figure in groups, and in some cases as weeping standards. One Wichuraiana there is which, though pretty when at its best, does not open properly, and is to be relegated to the outer gardens—this is Coquina, a single flower of blush pink.

SOME ATTRACTIVE BEDS.

But there are many other beds and specimens in addition to the Roses. Earlier in the year standard Wistarias, dotted here and there, are

Public Domain in the United States, Google-digitized / http://www.hathitrust.org/access_use#pd-us-google

smothered with their fragrant blossoms; a large, round bed has in the centre Castor-oil Plants and Maize; the groundwork is Centaurea dealbata, with grey, finely cut foliage; standards of the Lemon-scented Verbena, Aloysia citriodara, break up the flatness of the bed; and an edging of the dwarf Polyantha Rose Jessie gives it a finish.

A large blue and mauve bed is made up with Nepeta Mussini on the outside; next to that comes Erigeron Quakeress, and behind these are Delphiniums; while in the centre are crimson Roses on pillars and arches. On another part of the lawn a bed filled with Ceanothus Gloire de Versailles, above the blue of which rises a pillar of the crimson Excelsa as a centrepiece.

"The Ceanothus is pruned back every year," Mr. Coombe explained, "to keep it dwarf. This bed is one suggested by Lady de Ramsey, who is a keen gardener, and a good judge of colour effects. Many of the combinations in the beds and borders are from her suggestions."

Cut in the turf near each path are narrow beds, not more than two feet wide, but running almost the full length of the lawn. In these are planted vigorous-growing dwarf Roses of the Hugh Dickson and J. B. Clarke type, which are trained along ropes looped to meet standards. The first crop of Roses was over, but sufficient remained to show how decorative these edgings are when at their best.

Then there are the shrubs and trees. Close to the path, near the west side of the house, is a small lawn, backed by flowering shrubs—Philadelphus of sort, Lilacs Marie Legraye and Souvenir de L. Spathe, and others. Then there is a fine specimen of the rare tree, Davidiana involucrata, fully twenty feet high, which flowered well last year, but for some reason has not done so this season. Near this is a bed of Pæonies, with posts of American Pillar and the uncommon climbing Polyantha Rose, Baronesse van Ittersum, a bright crimson on orange, which keeps in flower for a long time.

A PATRIARCHAL CEDAR.

At the end of the lawns are many grand forest trees, one old mountain Elm being particularly fine. Nearer the centre, and almost facing the entrance to the Abbey, there was, until a couple of years ago, a Cedar which was said to be one of the finest in the country. It was also believed to be one of the original Cedars first introduced from Palestine. Now, as the result of a stroke by lightning, it lies prone, but its trunk and many branches attest its majestic proportions.

Other trees of especial merit to which Mr. Coombe called attention included a beautiful Service Tree, Sorbus domestica; Pavia macrostachya, whose branches droop all round, and root where they touch the ground; Weeping Birches and Copper Beeches, and a fine example of Laburnum Watereri, which carries longer racemes than the ordinary form.

Before leaving the lawns, we walked across to the far side, towards the tennis courts, at the end of which is another rare and exceedingly beautiful Walnut, Juglans adiantifolia, the foliage suggesting that of the Maidenhair. We measured the spread of this tree, and found it to extend to fifty-four feet each way. It bears plenty of fruit, though this is not edible.

Beyond the pleasure grounds a walk, known as the Coronation Walk, has been made by Lord de Ramsey, the trees including Catalpas, Laburnums, pink Hawthorns, and others of similar habit, which in time will grow and meet overhead. The ground beneath them is planted with bulbs, Primroses, and other spring flowers. This walk is of considerable length, and partly encircles the grounds.

ROSE RAYON D'OR AND SHADE.

And now we turned our faces towards our starting point, but following a different path, on the outskirts of the grounds, where the trees were more numerous. Here we came across more Rose beds, as before, each planted with one variety. Lady Pirrie, Madame E. Herriot, Prince de Bulgarie, and Mrs. Wakefield Christie-Miller are among the best; but most interesting of all was to note the sturdy growth and healthy appearance of Rayon d'Or.

"You seem to have no trouble with Rayon d'Or here," I observed.

"None whatever," replied Mr. Coombe; "and, as you see, it flowers very freely. There is another bed a little farther on which is just as good. The plants were first grown on the front in full sun, and were so wretchedly poor that they were going to be thrown on the rubbish heap. However, I thought I would try them here, where they get a little shade from the tall trees, and since I moved them they have done excellently, and make earlier and much stronger growth, which ripens in good time. It is evident that they perfect their growth when not in the full glare of the sun."

THE ROCK GARDEN AT RAMSEY ABBEY.

"You have here, too some uncommon Roses?"

"Yes; there are several. This weeping standard with pale pink, fully double flowers, is Dr. van Vliet. It has been in bloom for several weeks already. On this pillar the single Rose is Sarah Bernhardt. The colour, rich crimson, is much liked, and the flowers are as large as those of Mrs. Rosalie Wrinch."

Arrived at the orchard, which is three-quarters of an acre in extent, and lies at the back of the kitchen garden, I inquired as to the fruit prospects this season.

"Apples should be very good," I was told. "Pears are generally good, and Plums an average crop. Peaches are good, but Apricots are a failure. We grow all the best modern varieties of each section, also some very old Apples, such as Sleeping Beauty—a pale green fruit of indifferent quality—and London Pippin. To make the most use of the ground we crop with greenstuffs under the fruit trees."

"And what is grown on the walls of the kitchen garden?"

"Outside, on the east wall, there are mainly cooking Pears; but the soil generally is too heavy for Pears, which lack flavour. On the inside east wall the trees are practically all Apricots. On the north walls are Morello Cherries, which are apt to die away in parts unaccountably. It is not the lack of lime in the soil, for plenty of that is given. On the south wall outside are two old Peach trees, Dymond and Dr. Hogg, and two of Early Alexander, only four years old, but carrying good crops of fruit."

A FRUIT PERGOLA.

A substantially built Apple pergola, running right across the kitchen garden, is one of the most striking features, and, as Mr. Coombe said, is beautiful in spring, when the trees are in bloom, and again in autumn when the fruits are colouring, which they do well on this soil.

"We grow all the usual vegetables here," he went on, "but, of course, not many Potatoes. I might mention, however that last year I grew five rods of Windsor Castle here, carrying out a spraying experiment for Mr. Rogers, of the Board of Agriculture, and when the crop was weighed it worked out at the rate of twenty-four tons per acre."

We next visited the greenhouses, the first two containing Peaches Cardinal, Early Rivers, Early Alexander, and Amsden June. Then came the Melon house, where Sutton's A 1 is grown, with Carter's Model Cucumber on the back. Then passing through another Peach house—the varieties are Dymond and Dr. Hogg—we came to the longest house, where Malmaisons are staged when in bloom. Brown Turkey Figs, carrying nice crops, are in the next house, with a few Maidenhair Ferns.

"The Maidenhair Ferns were caught by frost last winter," said Mr. Coombe; "for we had no fuel. They have not yet recovered. You will notice in this next house that Tomatoes are grown in front of the Peaches. The two lower tiers of the Peaches are never any good, as they do not ripen properly, so I stand pots of Tomatoes on the border, stopping them before they go high enough to shade the Peaches."

In the course of further conversation Mr. Coombe informed me that he carries out a system of intensive cultivation, as he can get plenty of manure, and he grows quantities of early vegetables in heated frames. He has been in the service of Lord de Ramsey for sixteen years, the last seven years at Ramsey Abbey, the previous nine at Haviland, Norfolk, in both places as head gardener. He has also been at Longford Castle; the Orchid houses at Tring Park; and was in with Messrs. Veitch and Son for a short time.

W. J. CHITTENDEN.

Next week.—A well-known Sweet Pea raiser and exhibitor: Interview with Mr. George Herbert.

COOPERIA CHLOROSOLEN. GREEN-TUBED COOPERIA.

****

Class and Order.

HEXANDRIA MONOGYNIA.

(Nat. Ord.—AMARYLLIDEÆ.)

Generic Character.

Scapus cavus. *Germen* erectum. *Perianthium* tubo erecto cylindrico ore ampliato, limbo albo regulari $1\frac{1}{8}$ unciali sub sole patente. *Filamenta* decurrentia, subæqualia, apice ad faucem tubi libera. *Antheræ* subulato-lineares, (dein lineares) erectæ, non versatiles, a tertiâ parte inferiore dorso affixæ. *Pollen* difforme (quod in *Zephyranthe* acutè ovale). *Stigma* crassum trilobum vix trifidum. *Semina* complanata testâ tenui nigrâ. *W. H.*

Specific Character.

COOPERIA *chlorosolen;* scapo ultra-pedali viridi, infra rubescente; foliis sesquipedalibus, $\frac{1}{8}$ unc. latis, canaliculatis, tortilibus, acutis, viridibus; germine sessili; spathâ $1\frac{1}{2}$ unciali tubatâ, apice fenestrato; perianthii tubo $4\frac{1}{4}$ unciali viridi limbo $1\frac{1}{8}$ unciali albo, sepalis viridi-apiculatis, extus viridi-lineatis; filamentis $\frac{1}{8}$ unciæ liberis; stylo incluso semiunciam vel ultra tubo breviore. *W.H.*

This singular plant, the second species of the Genus that has flowered in this country, was sent, as well as COOPERIA *Drummondi* from Texas by DRUMMOND. It flowered at Spofforth in the greenhouse at the beginning of January, and differs from COOPERIA *Drummondi,* which had bloomed in the autumn at Wentworth House, in having a much larger limb, the tube green, and the sepals lined with green on the outside, the leaves longer and wider, the filaments free

free from the tube one-eighth instead of one-sixteenth, and the style shorter than the tube. They both differ from the Genus ZEPHYRANTHES, in having anthers subulate before their inversion, erect, and not versatile, and in the deformity of the pollen, which in ZEPHYRANTHES is acutely oval. The remarkable long tube which distinguishes these two species, is perhaps not essential to the Genus; and ZEPHYRANTHES *candida* (supra 2607) which refuses to breed with ZEPHYRANTHES, differing from it, and agreeing with COOPERIA in the more important points, will probably be found to belong to another section of this Genus. COOPERIA *Drummondi* has the leaves twelve or thirteen inches long, about one-twelfth wide; the tube four inches and a half, red; the limb five-eighths, lined with red on the outside; the filaments free, one-sixteenth only; the style longer than the tube, shorter than the anthers.

There is a third COOPERIA amongst DRUMMOND'S bulbs, which has not yet flowered; and it is uncertain whether it will prove different from C. *chlorosolen* or not. There is also a ZEPHYRANTHES, of which the flower is known by his specimens, which it is proposed to call *Texana*.

Z. *Texana*, foliis viridibus, rectis, infra lineam latis, flore pedunculato luteo, extus cupreo.

The Genus COOPERIA is named, in compliment to Mr. COOPER, who has during a very long course of years had the superintendence of the rich collection of plants which he has brought together at Wentworth House, the seat of Earl FITZWILLIAM, in Yorkshire.

The point of the perianth was not naked at the first appearance of the bud, as seems usual with ZEPHYRANTHES: it was yellowish before it acquired its full size, turning gradually to clear white. *W. H.*

Fig. 1. Stamen. 2. Style. 3. Pollen, *magnified*. 4. Petal and Stamen. 5. Back of a Sepal.

flower from which the sketch was made flowered in the collection of Earl Fitzwilliam at Wentworth House, under the care of Mr. Cooper, who received it from the Botanic Garden at Glasgow. Mr. Cooper is one of the most zealous and successful cultivators of rare plants in this kingdom, and has with unremitting exertion brought together the fine collection of plants now at Wentworth, by a liberal system of exchanging his superfluities for those of other persons. He has now for above twenty years had the management of the Botanic Garden at Wentworth, and few cultivators deserve better the compliment of having his name handed down to posterity, as engrafted in our botanical nomenclature. It seems that bulbs of this singular plant flowered about the same time at the Botanic Garden at Edinburgh, and at Mr. Dickson's nursery, but Mr. Cooper was at least one of the first who brought it into flower, and, as the name Drummondia is preoccupied, the genus is named after Mr. Cooper. It is possible that the plant may be found to endure our climate, as the frosts are severe in Texas, but as it pushes its leaves in the autumn, it probably grows in a temperate situation and would be injured by our winters, and at present it must be considered as a greenhouse or frame plant. It is nearly allied to Zephyranthes. Two successive one-flowered scapes were produced, the first of which ripened seed that readily vegetated. The limb expanded quite flat. The pollen viewed in the microscope is difformed like that of Zephyranthes candida, and not of the usual more regular and oval form that prevails amongst the genera allied to it. It is doubtful whether Z. candida, ought not to be generically distinguished by that and some other features from Zephyranthes."

1. The back of a petal. 2. Ditto of a sepal. 3. Stigma. 4. Ripe seed. 5. Pollen magnified. 7. Inside of the mouth of the tube, shewing the sessile anthers.

Mr. Herbert speaks of another species, nearly akin to this, which has flowered in the greenhouse at Spofforth, equally from Texas. This plant has at this time (beginning of January, 1836) three leaves nearly a foot and a half long, and may be distinguished by the following name and character.

"Cooperia *chlorosolen;* foliis sesquipedalibus, $\frac{1}{8}$ unc. latis tortilibus acutis viridibus; germine sessili; spathâ $1\frac{1}{2}$-unciali tubulosâ apice fenestratâ; perianthii tubo $4\frac{1}{4}$-unciali viridi, limbo $1\frac{1}{8}$-unc. albo sepalis viridi-apiculatis extus viridi-lineatis; stylo semunciam vel ultra tubo breviore."—W. H.

The Gardens of MR. GEORGE CADBURY, J.P., at Manor House, Northfield.

INTERVIEW WITH MISS GERTRUDE COPE.

ALTHOUGH Northfield is only a short distance from Birmingham, the residence of Mr. George Cadbury, Manor House, is in the heart of picturesque country. Visiting the gardens on a dripping wet day in September, I was none the less impressed by the beauty of the drive approaching the summit on which the house stands, and the charms of the situation. Some recent additions to the gardens, made under the auspices of Messrs. J. Cheal and Sons, first claimed attention, Miss Gertrude Cope, who has sole charge, pointing out a glorious herbaceous border, facing three fine tennis courts (two grass and one asphalte), with Sweet Peas behind, to hide the bare trellis. From the end of the wide path between the border and the tennis courts are delightful views of the park, with a large croquet lawn intervening.

"What is the length of the border?" I asked.

"Seventy-five yards, and four yards wide. It is intended," continued Miss Cope, "to train Roses up each pillar of the trellised wall behind this border, and between them Clematis, Vitis, Jasminum, and Lonicera in variety will find place on the trelliswork. The Sweet Peas, which are mixed, are a temporary expedient. The plants in the border are in clumps, not arranged for colour, but mixed. In front are such flowers as Violas, double Pinks, Phlox Drummondii, and Nemesias (mixed), while behind, Campanulas persicifolia, Doronicums, Pæonies, Iris, Œnothera, Lupins, Phlox, early-flowering Chrysanthemums, Hollyhocks, and Dahlias (Cactus and Pompones) are conspicuous. The early-flowering Chrysanthemums are Ralph Curtis, Horace Martin, Marie Masse, Crimson M. Masse, Firefly, Polly, Harrie, Market White, and Jennie."

"Is there any special point in Dahlia cultivation?"

"No, we grow from cuttings, and the tubers are put into heat in February to start them. With regard to Pompones, they are grown in order to send blooms to Mr. Cadbury's adult school on Sunday for buttonholes."

"How many blooms are required for that purpose?"

"The average is five hundred. We begin early in September, and go on to the commencement of November, or until the frost cuts off the flowers."

"Are flowers supplied for the Sunday class at other periods of the year?"

"Yes, before the Dahlias, we cut Sweet Peas and Roses, and in the spring, Daffodils. After the Dahlias are over, we do the best we can with Chrysanthemums. From January until the beginning of April, we have little to send, but from April to the end of December the supply is well kept up."

THE MANOR HOUSE FROM THE LAWN.

Favourite Blooms.

"What varieties of Pompone Dahlias do you find most useful?"

"Red Indian, George Brinckman, Amber Queen, Sunset, Mars, Captain Boyton, Thalia, and Kitty Barnett. Of Sweet Peas, which are grown in clumps, the best are Constance Oliver, Countess Spencer, Edward VII., Jeannie Gordon, Evelyn Hemus, Lady Grisel Hamilton, James Grieve, Miss Willmott, Mrs. Collier, Lord Nelson, John Ingman, and Helen Pierce. The Daffodils, which are grown in a little fruit orchard near the wild garden, are chiefly Sir Watkin, Golden Spur, Beauty, Glory of Leyden, Emperor, and Empress."

Lenten Helleborus.

"You have borders also on each side of the walk near the rock steps leading up from the drive to the tennis courts."

"Yes, and on the side of the steps we are going to have Lenten Helleborus. We had a border of them, and I know they do well here. They do not have any very special treatment; but spring or early summer planting is preferable to autumn. I have also found that they grow better in heavy than in light soil. They flower in March, and last for a month. In the two long borders leading from the terrace to the new garden are principally clumps of Sweet Peas, Dahlias, summer-flowering Chrysanthemums, Phlox, Pyrethrums, Asters, Iris, Hollyhocks, and annuals in variety."

The Hollyhock Pest.

"Do you escape the Hollyhock pest?"

"Not quite. I gave up growing them for three or four years because of the pest, and have only just started again. There are some seedlings in the long herbaceous border, but these here are last year's plants. The latter are very little infested, and the seedlings are doing very well."

"You stake them?"

"Always. In fact, we have to stake almost everything, because we are so windswept. Even Stocks are staked. Among the annuals, there is a pretty blue corner, consisting of Nemesias Blue Gem, with Cornflowers behind; these are followed by Gladiolus Brenchleyensis. Now we come to the Italian Rose garden, which was recently made out of an orchard."

The Italian Rose Garden.

"How many beds are there in it?"

"Sixteen of one variety each, and four with four varieties in them, and a weeping standard in the centre. In the beds the best are Richmond, General McArthur, Mrs. Stewart Clark, Empress Alexandra of Russia (fine colour, quite distinct), Frau Karl Druschki, Grace Darling, Warrior, Lady Ashton, Gustave Grunerwald, Lady Roberts, Avoca, Corallina, Mrs. E. Mawley, Bridesmaid, and Gruss an Teplitz. These Roses were only planted in June, but the season has been favourable to them."

Digitized by Google Original from CORNELL UNIVERSITY

"They are looking extremely well. What is the soil?"

"All clay. Roses like a clay subsoil, provided that it is well drained, but we plant them in ordinary loam from the field."

THE PAVILION AND ROSE GARDEN, MANOR HOUSE, NORTHFIELD.

The Wild Garden.

Proceeding along a wide path, we arrived at the wild garden, which was recently transformed, and the croquet lawn, which was made a little more than a year ago. This, as all the ground slopes, was a considerable undertaking, but the result is very satisfactory. From this high point, protected by trees, may be seen the ornamental pool. The wild garden itself is notable for three separate beds of Scotch Roses (white, yellow, and rosy-pink), and large beds of Ericas and such flowering shrubs as white and Spanish Brooms, double Deutzias, double red Thorns, and ornamental Brambles. Close by is the effective and skilfully arranged rockery.

"When was it made?" I asked.

"The original portion three years ago," rejoined Miss Cope, "but this year it has been made quite half as large again as it was. The new portion is not yet planted, but I am now beginning, and shall finish in spring."

Features of the Rockery.

"Is the rockery all your own work, then?"

"The original part was, and I think that the great point in a rockery is to grow individual plants. I have pursued that system."

"Tell me, please, some of the contents?"

"There are Saxifrages Guildford Seedling, Hostii, Greisbachi, apiculata oppositifolia, and Burseriana major. Gentiana acaule usually flowers well. Primula rosea grows and flowers splendidly in a peaty bed. Anemone apennina sows itself, and comes up everywhere. Anemone pulsatilla makes a very fine clump. Shortii galacifolia flowers well, and the colours of the leaves are beautiful. It is planted facing south-east, and is rather shaded by rocks. Curesia coccinea has just found a home, shaded by a rock, and has started to grow flowers well. Anthyllis montana was specially good this year, and attracted the attention of many visitors. Lithospermum prostratum makes a splendid mass of blue. Other varieties which flourish are Acantholimon venustum, Synthris reniformis, Cyclamen neapolitanum, Silene Schafta, Narcissi minor, minimus, and cyclamineus, Azalea rosea, Iris reticulata, and I. cristata, Phloxes Vivid and G. F. Wilson, and Soldanella alpina."

"You mentioned visitors. Do you have many?"

"A great many in parties all through the summer. Three times a year, in the Daffodil, Rose, and Chrysanthemum seasons, the gardens are thrown open to the public on a Sunday afternoon for two or three hours."

"How large are the gardens?" I enquired, as we walked in the direction of the Bamboo dell, between the two drives.

"Not less than twenty acres, which includes a little golf course of three holes, where Mr. Cadbury plays every evening and Saturday when he is at home. The Bamboo dell was originally a pool, and was drained between three and four years ago. The centre was then planted with Bamboos, and the sides with hybrid Rhododendrons, Royal and Lady Ferns. The soil was light and had a good dressing of farm manure and leaves before planting, and afterwards it was well mulched again with farm manure."

Passing the manor house, I observed a bank of Rhododendrons in front of the terrace, and asked about the varieties.

"They are Cynthia, Stella, Alarm, Mrs. Russell Sturges, Sapho, Mrs. W. E. Gladstone Kate Waterer, Mrs. John Waterer, Mr. John Spencer, and Pink Pearl. The soil being so heavy, special beds have to be made for these, but as there is practically no lime in it, there is not that difficulty to contend with."

Chrysanthemums and their Cultivation.

"The conservatory appears to be in the centre of your range of houses."

"Yes, it is, but before we go into the conservatory, we might look into the Tomato house, which is full of Chrysanthemums."

"You go in largely for Chrysanthemums?"

"We have always done so, and they are spread over a long season. My predecessor here used to show, but though I do not show, we grow now three times as many. I said that I do not show, but we send a group of foliage and flowering plants to Bournville three times a year, to the village show. We never show for competition."

"Which do you consider the best varieties of Chrysanthemums for big blooms?"

"Miriam Hankey, Buttercup, Mrs. A. T.

THE HERBACEOUS BORDER.

Digitized by Google Original from CORNELL UNIVERSITY

Miller, F. G. Oliver, F. S. Vallis, Mary Donnellan, Mrs. Norman Davis, W. R. Church, Valerie Greenham, Algernon Davis, Mr. W. Knox, Kimberley, W. H. Lincoln, and Louise Giles. Of Singles, I find that the best are Mrs. E. Roberts, Mary Richardson, Mr. R. A. Parkinson, Bronze Edith Pagram, Mrs. S. A. Ball, Mr. Austen Chamberlain, Stella, Oldfield Glory, and Elsie. The Decorative varieties are Niveus, Western King, Mrs. W. J. Scott, Madame Oberthur, Tuxedo, A. J. Balfour, Monsieur Bachman, Safeguard, and Allman's Yellow."

"Which do you grow for specimen plants?"

"Charles Davis, Viviand Morel, Lady Hanham, Madame Oberthur (specially good, late), Queen Alexandra, Baron Hirsch, Phœbus, Guy Hamilton, and Miss Evans."

"Do you observe any special points with regard to cultivation?"

"I suppose we grow them in the same way as most people do. Our main object is to have them in bloom as long as possible. The early-flowering varieties flower in the greenhouse in September, and the late ones last till the end of January. By that time, bulbs of different kinds, and the Arum Lilies, are well in flower, and we welcome a change. We take cuttings of all the varieties of Chrysanthemums as soon as we can get them good. They are struck in a warm brick pit, and, as soon as they are rooted, they are taken into a cool, dry, airy house, and potted on as required. The stocks of those varieties wanted for specimen plants are selected as early as they can be cut down. They are shaken out, and potted into 7-in. or 8-in. pots. When these are full of roots, and the plants are growing well, they are put straight into their flowering pots, according to the size they grow. The final potting soil consists of a mixture of good loam, leaf-soil, sand, stable manure (well rotted), oyster shell, charcoal, bonemeal, and patent manure."

THE ROCKERY AT MANOR HOUSE GARDENS, NORTHFIELD.

The Cocoa Tree Fruiting.

"What Tomatoes do you grow in this house?"

"Carter's Sunrise and Holmes's Supreme. We have grown the same varieties out of doors, and usually get a good crop outside. We plant them out when they are just starting to fruit."

"I see that in the stove there is a Cocoa tree."

"Yes, and it is fruiting. We have had five pods on it altogether. It was planted out in the border five years ago, but did not fruit the first year. We are trying to fruit one in a pot, but it remains to be seen whether we can succeed. Nepenthes are another feature in the stove. We do not treat them in any special way, but when the growths become too straggly, we cut them back. They are basketed in fibrous peat, sphagnum, and charcoal. Cuttings of the three varieties we grow root readily enough in the propagating frames."

The Blue Pea.

"Then you have a nice show of Ixoras."

"These have been here ever since I came. In the spring they are given clean pots, and the drainage is seen to. Fed with liquid stable manure, and well cleaned, they usually flower well. You will like to make a note of the fact that we have the blue Pea from Jamaica. It is a perennial, and, as a rule, it flowers in the summer, from June onwards. Allamandas are grown simply for covering the roof, and for specimen plants. In their season, we have a quantity of Calceolarias and Cinerarias. At the Royal Horticultural Society's meeting in June, we showed a new seedling Calceolaria."

The New Calceolaria.

"What is its colour?"

"Yellow, with crimson spots, an intermediate between the herbaceous and ordinary golden bedder. It is very good for the greenhouse, and nice for bedding. Outside, the habit is dwarf; inside, it will grow three feet high, and three feet through. With regard to treatment, I propagate from cuttings taken in the autumn. The seedling was raised four years ago, and I am going to show it again."

"Have you anything special in the Fernery?"

"The varieties of Nephrolepis are very useful for mixing with other plants in the house. We make a point of growing plenty of green for using in the house and conservatory. Palms are a feature of the Palm house and conservatory, but, of course, the contents vary according to the seasons. Just now they include some nice specimens of Fuchsias, including Marinka (almost of self colour), and Mrs. George Rundle (pink and white). The climbers are Roses (Niphetos, Perle des Jardins, and Devoniensis), Plumbago capensis, Solanum Wendlandi, and S. jasminoides, Tacsonia exoniensis, Lapagerias, and Jasminum grandiflora."

Flowers in the Kitchen-Garden.

"What are the creepers on the Manor?" I said, as we left the houses.

"Jasminum, Pyrus japonica, Clematis Jackmanni, and Rose Claire Jacquier. Here is another little flower garden, which, before the alterations, was within the kitchen garden. We call it the Yew garden. It includes some mixed Rose beds, such varieties as Madame Jules Grolez, Viscountess Folkestone, Princesse de Sagan, Laurette Messimy, Pharisaer, and La Tosca. In the centre of the kitchen garden is another herbaceous border, and the pergola is covered with Clematis and Roses in variety. Jersey Beauty forms an arch by itself, though a part of the pergola, and other climbers are Dundee Rambler and Tea Rambler. The latter is very useful for table decoration. In a small border each side of the vegetables we grow Rose Pæonies and blue Iris; both flower together early in June, and make a striking contrast. They last for about three weeks; the Pæonies require to be staked. Near this border in the spring is a long one of Narcissus Pheasant-eye, which looks very nice when it is in flower, and next season we are going to have a long border of Roses to cut from. They will be the newest varieties, and will be just behind the trellis, so that they can be seen from the pleasure grounds. On the inside pillars of the trellis, early dessert varieties of Apples are grown as single cordons."

"You have a large collection of fruit and vegetables."

"A fairly large one. The dessert Apples are King Pippin, Cox's Orange Pippin, Worcester Pearmain, Mr. Gladstone, Irish Peach, Ribston Pippin, and Annie Elizabeth. Apples are grown on espaliers in the garden, and on standards in the fruit orchard. Some varieties keep splendidly till June, amongst the cookers being Newton Wonder and Reinette du Canada, and amongst the dessert, Winter Peach and Annie Elizabeth."

How to Treat a Famous Plum.

"What about Pears?"

"We have only a few varieties grown on fan-trained trees on the wall, and espaliers. The varieties which ripen well are Louise Bonne of Jersey (particularly good), Doyenne du Comice, Beurre Diel, Duchess d'Angouleme, Souvenir du Congres, and Marie Louise. The Plums on the walls are Jefferson's Gage, Pond's Seedling, Guthrie's Late Greengage, and Coe's Golden Drop. The last does not usually ripen on the trees, but is picked, each Plum wrapped in tissue paper, and put in a dry, airy place, to finish. Treated in this way, the Plum is delicious. Victoria and Pershore are grown in the orchard. Of Peaches, Hale's Early is decidedly the best. You will have noticed that we have no fruit houses."

"Do you do much root-pruning?"

"Yes, we do. The soil being strong, the trees run to wood most frightfully, and root-pruning is constantly necessary to keep them bearing. We always try to do it in October or November, but sometimes it has to be done a little later. Top-dressings of stable and farm manure are given in the winter; walled trees are well watered during the summer, and liquid stable manure administered."

"When do you start picking Strawberries?"

"At the end of June, and continue to August. All bush fruit is netted, and sweet and Morello Cherries are grown on the wall. The only variety of Melons is Cantaloupe; it is grown in frames, and we get ten or twelve good-sized fruits in the season from a two-light frame."

Peas and Celery.

"Just a few questions about vegetables. Do you go in largely for Peas?"

"We do not pick them much before July,

Digitized by Google Original from CORNELL UNIVERSITY

because we are cold in the spring and early summer; but we can keep on until the end of the first week in October. The first lot is started in boxes with movable bottoms, in heat, and planted out when nine to twelve inches high. We sow Carter's Early Morn in this way; it is also sown outside, to follow on. Carter's Eight Weeks, sown on a south border, is not far behind those sown inside, and it is a very useful dwarf variety. Only two varieties of Celery are grown. It is sown in January and February, pricked off into boxes, then planted in cold frames on a bed of well-rotted fat manure. When wanted for final planting in trenches, this manure is cut through between the plants, so that each plant can be lifted with a ball and without disturbing the roots. Constant dressings of soot and lime over the leaves keep the Celery-fly in check. Potatoes have always been grown in the field, and this year, owing to the kitchen garden being made smaller by alterations, none have been grown here."

Miss Cope's Career.

"How long have you been in charge of the gardens, Miss Cope?"

"Six years. Before I had charge of everything, I had the flower and fruit garden under my care, then the wild garden, and eventually, on the death of the old head gardener, the entire place. I was trained at Swanley for two years, and then for two years at Kew. After I left Kew, I was three months head gardener at a physical training college at Halesowen, and while there I was asked to come here. As to assistants, Miss Hutchings, who was trained under me, works in the flower and fruit garden, and eight men and a boy form the rest of the staff."

"During your experience, have you had any difficulty with the men?"

"Practically, none at all. They have worked extremely well since I have had charge, though most of them were here before I came. I have only had to dismiss one man for incompetency."

ALFRED WILCOX.

The Interview next week will be with Mr. William Sydenham, of Kings Newton, Derbyshire, on "The Cultivation of Violas and Early-flowering Chrysanthemums."

Work Under Glass.

THE PEACH HOUSE.

THE final pruning of the trees and the washing of the house may be taken in hand at the earliest opportunity after the leaves are all down. Very little cutting will be required upon Peach trees at this season, if disbudding was properly carried out in spring, beyond the removal of old fruiting wood. Indeed, much of the latter might be taken out immediately after the crop is gathered, thus giving the furnishing shoots the benefit of more light and air during the maturing season of autumn.

Fruiting Growth.

When pruning Peach trees, it should be remembered that the fruit is borne upon the growths produced the previous year. For this reason, the main branches should be disposed fan-shape, and as much of the current season's wood should be trained between as space will allow, without overcrowding.

The disbudding performed in early spring ought to have provided a well-placed shoot near the lower extremity of every two-year-old growth, besides, perhaps, two or three others at regular intervals higher up. In all cases, this lowest shoot must be retained to take the place of the spent fruiting growth from which it sprang, but it is very probable that any others upon that same growth cannot be accommodated in the allotted space. Where such instances occur, do not hesitate to cut the superfluous wood clean out, as near as possible to the base of the shoot which is to be preserved.

Dead portions of the tree should be removed, the pruner taking care to cut back into live wood. A small saw is a very handy tool for severing branches of several years' growth, the wounds being afterwards pared smooth with a sharp knife. When all is completed, and the trees again in position upon the trellis, next year's fruiting wood should not be less than four inches apart.

Circumventing Insect Pests.

Immediately after pruning, all ligatures should be cut, and the branches thoroughly washed with insecticide, applied upon a soft but good-sized paint-brush. For many years we have used Gishurst compound for cleansing fruit trees of insect pests, and, if a really hot solution is worked well into all cracks and crevices, we have great faith in its efficacy as a winter dressing. The older parts of the trees will require the most careful treatment, as they afford many lurking-places for insects and depositories for their eggs.

THE COCOA BEAN.

If red-spider, mealy-bug, or scale has been especially persistent during the season, give two or three dressings on successive days, taking care to wet every part and to dislodge every insect seen. The glass, woodwork, etc., should be scrubbed down, using hot water and plenty of soft soap, and the walls should receive a coat of hot limewash. Prunings and other rubbish should be raked off the border and burned.

J. E. S.

Early Carrots.

THAT the supply is not at all times commensurate with the demand should be sufficient to induce the possessor of a few frames to undertake the cultivation of this almost indispensable vegetable. To begin, a large hotbed should be made up; do not stint the manure, for if an insufficient quantity is used, the heat will probably fail before the crop is ready for pulling, and extra trouble will be entailed in removing the old material and substituting new therefor. When the hotbed is ready, place the frame in position upon it, and spread finely-sifted and rich soil to the depth of about ten inches.

Maximum Temperature.

The first sowings can be made in November, and further sowings for succession at intervals as required. The seed should be sown broadcast, and covered with a thin layer of the soil. The lights may then be put on, but must be opened a little whenever the temperature in the frame rises to higher than sixty-five degrees, which should be the maximum heat. Thin the young seedlings out as soon as they can be conveniently handled, giving a space of, say, three inches every way between each. On all fine days, and whenever the surrounding conditions are favourable, raise the lights, to give as much air as possible; but keep them close during severe weather, and always at night. If frost threatens, it is well to throw matting, old sacks, or suchlike, over the frames, as a protection.

Outdoor Sowings.

By the beginning of March, or a little earlier in mild localities, the first of the outdoor sowings may be made. The ground should have been prepared some time beforehand. A light, sandy soil, in a position receiving a good amount of sunshine, is essential to success. Only well-decayed manure should be used, and this must be dug in deeply. The ideal plot for raising Carrots is one that has been well manured previously, and on which another crop has first been grown.

Mis-shapen and forky roots are results attending the use of fresh and rank manure, or planting in heavy clay soil. Where the latter predominates, the usual plan is to make fairly deep holes in the ground with a dibber, and fill them up with fine soil, to which some sand has been added. Seeds (say three) are then placed in these holes, and are thinned out later to one apiece. This method of culture is too cumbrous and troublesome where Carrots are wanted in any quantity; but good specimens are frequently raised in this manner where the soil seems altogether unpromising.

Thinning-out.

The seed should be sown thinly in narrow drills, the rows being about nine inches to a foot apart. Owing to the lightness of the seed, it is usual to mix with it some dry sand or earth. It is thus more easily sprinkled in the drills, after which it must be covered with some fine soil. As the weather at the time of these earlier sowings is apt to prove inclement, it is wise to afford some protection until the seedlings are strong enough to dispense with it. Thin out as the young Carrots grow. If care be used in this thinning, it is possible to obtain some small but tender roots before those remaining are full-grown. When finally thinned out, there should be from six to nine inches between each plant, according to the variety. Keep the space between them free from weeds.

Among the many good varieties suitable for early culture may be mentioned Golden Ball, the roots of which are almost as round as a Turnip, but are of excellent flavour; Inimitable Forcing, one of the earliest varieties on the market; Early Gem, producing thick roots about four or five inches long; and French Forcing, which, as its name implies, lends itself well to forcing.

ILEX.

WHERE it can be obtained close at hand, or without much trouble or expense, a good supply of the dead fronds of the common Bracken (Fern) should be procured at once. It is very light and soft, and makes an excellent protecting material for plants of doubtful hardiness, Chrysanthemums, etc., as well as Potatoes and other things.

THE GARDENS AT KEMNAL MANOR, CHISLEHURST: A GREAT REVIVAL.

FOR five years Kemnal Manor was closed, and when Mr. Rosenthal purchased the property little more than twelve months ago, it presented a sadly neglected appearance. Weeds had not only assumed the form of giants; they had taken possession of the pleasure grounds. But it was obvious that there were possibilities of restoration. Delightfully situated in the midst of typical Kentish scenery, the estate is about a hundred acres in extent, and previous owners must have derived much enjoyment from the gardens, the shrubberies, the orchards, and the woods. Mr. Rosenthal, no doubt, realised, that in spite of seeming obstacles, the expenditure of time and money might easily revive all the glories of the place. When I saw Kemnal, on a pleasant March afternoon, the revival had to a very large extent been realised, though, as Mr. Corke, who is in charge of the gardens, informed me soon after my arrival, there are many more improvements still in contemplation. Anyhow, no one would now imagine that Kemnal had ever been a scene of desolation. The manor house has been rebuilt, and is a charming modern residence; the gardener's cottage is attractive to look at, as well as comfortable inside; the entrance lodge conveys the impression that there are things worth seeing beyond. And this expectation is not disappointed. The drive to the house does not exceed a hundred yards in length, but the surroundings are picturesque, and the outlook from the sloping lawns is charming. Just outside the front door are fine clumps of ordinary Rhododendrons, backed by Laurels, but these are to give place to choice varieties such as John Waterer, John Walter, and Cynthia. Among the original features, with which it is not intended to interfere, are numerous fine specimen trees, including Cedars, Cupressus Lawsoniana, Scotch Firs, Oaks, and Araucarias. These are in different parts of the lawns, which run round three sides of the house, and tend to invest it with distinction.

MR. G. CORKE.

Discussing the flower beds, I asked if the Rose beds had been in existence for some length of time.

"Yes," replied Mr. Corke. "They were here when Mr. Rosenthal came; but it is proposed to shift them. At present they are grown mixed, the old varieties—several of them very old, with no clue to their names—being supplemented by Lady Ashtown, Lyons, La France, White Killarney, Frau Karl Druschki, Caroline Testout, Madame Ravary, and Betty. The beds are edged by Myosotis and Arabis now, and Ageratum for summer."

"I see that the Narcissi are beginning to bloom in some of the Rose beds."

"Yes, they precede the Roses in certain beds, and Tulips in others. Kaiserskroon is the variety, and it promises to do well. The other feature of spring bedding is the Wallflowers, which occupy seven beds. The varieties are Blood-red, Primrose Dame, and Cloth of Gold. The edging is Myosotis and Arabis."

SUMMER BEDDING.

"And the summer occupants?"

KEMNAL MANOR, CHISLEHURST.

"Geraniums Double White, Paul Crampel, Henry Jacoby, and Ivy-leaved Madame Crousse, edged with Candytuft and dark blue Lobelia growing close to the turf. The largest of the beds is filled with Geum coccinea, edged with Candytuft and Lobelia, thus making up a combination of red, white, and blue."

"Do you edge the standard Roses close to the house?"

"Yes, we have Pansies King of Blacks below them; and Ghent Azaleas between the standards. Underneath the windows of the billiard room are two beds of Ericas. Carnea is one of the best of a collection of fifty varieties."

"What is the natural soil?"

"Mainly clay, but near the house it is gravel. We have put fresh soil in two of the Rose beds, and are waiting to see the results. The climbers on the house are Roses, Red Gloire de Dijon, William Allen Richardson, and Dorothy Perkins on the south and west; Wistarias on the south; and Pyracanthas on the north. These, I think, will make a nice show in time. One of the additions to be made next autumn is a tennis-court in the field adjacent to the summer-house."

SHRUBS IN THE WILDERNESS.

From the front we proceeded to the Wilderness, and here shrubs are strongly represented.

"The Wilderness," continued Mr. Corke, "has been greatly changed. Many trees have been cut down, and a rockery is the latest innovation.

"I should like to know the names of some of the shrubs which you have planted. They will help to guide other people in choosing under similar conditions."

"Andromedas; Aucuba japonica; Azalea mollis; Acer negundo variegata; Bambusa nitida, japonica, aurea, fastuosa; Berberis dulcis; Baccharis patagonia; Buddleia globosa; Sweet Bay; Choisya ternata; Chamærops excelsa; Cryptomeria elegans; Coronilla glauca; Deutzia hybrida Lemoinei; Dracæna australis; Eleagnum Simonii and pungens aurea; Eulalia japonica; Eurybias Gunneria; Escallonia candidissima alba; several forms of Erica, Forsythia suspensa; Garry elliptica; Hydrangea amœna hortensis; double Lilacs; Laburnums; Olearia Fosterii, macrodonta, and Haastii; Pampas Grass; Photinia serrulata; Pernettya speciosa; Phormium tenax; Retinospora aurea, ptarmica, and squarrosa; Salix rubra; Sambucus argentea; Spiræa Reevesiana; Tamarisk africana and gallica; Viburnum lucidum; Veronica Traversii; and Kalmia latifolia. For further decoration, we have introduced blue and white Agapanthus, Ferns in variety, including the Royal Hart's-tongue, Osmundia regalis, Hypericums, Sedums, Lupins, and Tree Lupins, and Primula japonica. These, with others added hereafter, will materially add to the beauty of The Wilderness."

"Which will also gain in interest by the addition of the rockery. When was it commenced?"

"At the end of October only; and when we began it, the place was in a shocking condition."

THE PLAN OF THE ROCKERY.

"Was it designed by an outside expert?"

"No; I planned and arranged most of it, subject, of course, to the approval of Mr. Rosenthal. As you see, the rockery is surrounded by water supplied by a running stream, which rises some distance away. The water first enters a small pond, made in order to collect all silt. From that point it flows for about twenty yards with the Lily pond. Thence over a miniature waterfall it proceeds under the path, round the rockery,

Original from CORNELL UNIVERSITY

and winds away through the Wilderness. The stream is spanned by three rustic bridges; and the water travels round the rockery by means of two small weirs, which divide the water so that the large quantity flows in one direction and the smaller in the other."

"You have managed already to get together a good assortment of rockery plants?"

"The principal are Aubrietias; Alyssum saxatile and montanum; Arabis, single, double white, and variegated; Silenes, Saxifrages arctioidis, umbrosa, rahi, palmata, Wyncote, camposil, retusa, longifolia, and marginata; Sedums aboreum, Ewersii, and populifolium; Campanula carpatica; hardy Cyclamen in variety; and Irises, blue and white Flag, English, and Spanish. On the banks of the rockery we grow Flag Iris on one side and Ferns on the other. The present work is to extend and develop the Wilderness, this being the most popular portion of the grounds, though the far wood, which is some distance from the house, runs it closely. Next month the Bluebells will give it a carpet of dazzling blue."

"How large are the gardens altogether?"

"With two orchards, the woods, and the kitchen gardens, one inside the walls and one out, quite twenty-five acres."

THE WILDERNESS, KEMNAL MANOR.

THE CULTIVATION OF PRIMULAS.

Retracing our steps we entered the kitchen garden inside the walls, and made a tour of the plant and fruit houses. In the flowering house, Cineraria sinensis was still in flower, and Primulas obconica and sinensis also showed masses of bloom.

"My method of cultivation is to sow and grow in cold frames until the end of September, when the plants are brought into heat. Begonia Gloire de Lorraine is grown from leaf cuttings, which I take at the end of March. With these I sow the seed in heat."

"You have a nice show of the Bridal Wreaths."

"Just about two dozen, and I am so well pleased with the Francoas that another year I shall probably increase the number. The more prominent of the rest of the contents are the Azalea mollis, a batch of Arum Lilies, and a batch of Coleus thyrsioides. The creepers on the roof are Stephanotis, Hoya, and Bougainvillea."

"Do you cut from the Fernery?"

"Quite freely; Ferns are grown for that purpose rather than for the decoration of the house. Here we flower the bulbs grown in pots. The Daffodils are Sir Watkin, Golden Spur, Empress, Henry Irying, and bicolor Horsfieldii. The varieties of Narcissus are three, namely, Diadem, Alsace, and Irene. In addition to Kaiserskroon we grow Tulips Canary Bird, Yellow Prince, Vermilion Brilliant, and Potterbakker (white). The Hyacinths are Pelissier, White Voltaire, Baroness van Tuyll, King of the Blues, La Grandesse, and Macaulay. The Hyacinth season lasts from the beginning of January to the end of March; and before we flower these varieties we have the white Roman. The next house, which we are now about to enter, is devoted to Orchids."

"Were these here when you took over the place?"

"Some of them, but others have been bought. The former include the beautiful variety which you see now in flower. Those blooms have been in evidence for six weeks already, and look as if they would last some time longer. We have no idea what the variety is, but the shape is very fine, while the mauve and gold centre, with the three petals shaded with maroon, and the white edging, make up a very attractive whole. Cattleyas are the favourite Orchid, and other sections embrace Dendrobiums, Vandas, Odontoglossums, Cypripediums, Oncidiums, and Calanthes. With these sections we have flowers all the year round."

THE ROCKERY.

FRUIT UNDER GLASS.

"What are the Grapes in the two Vineries?"

"Black Hamburgh, Gros Colmar, Alicante, and Foster's Seedling. The Vine border is outside. In the two Peach cases, which are not heated, the varieties are Barrington, Dymond, Waterloo, Amsden June, Hale's Early, Early Alexander, Early Grosse Mignonne, Royal George Peaches, and Lord Napier, Darwin, and Cardinal Nectarines."

"Do you combine Melons and Cucumbers in the same house?"

"No; the varieties are Melons Superlative, and Cucumbers Telegraph and Satisfaction. Tomatoes are grown in one of the Peach cases, the varieties being Comet and Best of All. There is a good collection of Violets in the frames. These were here when we came, and so you may be quite sure was the Magnolia grandiflora, which adorns my cottage. It is an excellent specimen of considerable age."

"I should like a few details respecting the hardy fruit?"

"The Pears on the walls are Jargonelle, Pitmaston Duchess, Marie Louise, Doyenne du Comice, Brown Beurre, and Duchess de Bordeaux; the Apples are Cox's Orange Pippin, Peasgood's Nonsuch, and Ribston Pippin; the Cherries Morello, White Heart, Black Heart, Early Rivers, and Waterloo; the Plums Victoria and Coe's Golden Drop; Apricots Moor Park, Early Peach, and Hemskirk."

"And the standards in the kitchen garden?"

"The best of the Apples on standards are Lord Derby, Lord Suffield, Allington Pippin, Cox's Orange Pippin, and Peasgood's Nonsuch. Of Red Currants we grow La Versailles, Red Dutch, and Fay's Prolific; Black Currants, Boskoop Giant and Black Naples; Gooseberries, Whitesmith, Lancashire Lad, Golden Drop, Cousin's Seedling, White Lion, and Whinham's Industry. The walls are well covered. We have root pruned them to see whether they will fruit. If they do not bear crops this year, I shall take them out and put in new ones. But they look like cropping. All the named varieties were planted since we came. In the orchards, Apples, Pears, and Damsons are the principal fruits. The Apples include Blenheim Orange, Beauty of Bath, Kentish Fillbasket, King of the Pippins, Wellington, and Ribston Pippin. The Pears are chiefly Pitmaston Duchess and Bon Chretien; we are very uncertain as to the identity of the others. The Cherry Apple tree is rather a feature in the meadow. The fruit is like Cherries, and last year we picked many baskets full off one tree, which made very nice jelly."

A USEFUL SALAD.

"Have you anything special to say about vegetables?"

"We go in a little for Potatoes, the varieties being May Queen, Ringleader, Epicure, Ideal, Abundance, and General Roberts. For early work I am using Green Gem, Harbinger, and Ideal Peas, and in succession Prizewinner, Duke of Albany, Standwell, and Ne Plus Ultra. For a late crop I like Harbinger. My experience is that Peas do much better if the sticks are as wide apart at the top as at the bottom; and I always put in sticks slanting. When Lettuces are scarce, I use Dandelion and Chicory blanched for a salad. They are easily blanched in boxes eighteen inches deep, with the light excluded by a piece of slate on the top. We also grow Kohl Rabi. It stands drought better than Turnips, though the flavour is not so good. But it is appreciated for the table in winter, and is very hardy."

"Have you held any previous appointments as head gardener?"

"No, this is my first appearance in that capacity. I was previously with the Hon. A. Grosvenor, at The Cottage, Seal, and then at Henley-on-Thames for a short time. I came to Kemnal Manor as second, and have had entire charge of the gardens for the last six months. I do not intend to show. It is necessary to devote undivided attention to the ordinary and extraordinary work in the gardens. My employer and Mrs. Rosenthal give me every encouragement, and take the keenest interest in the supervision of everything that is done."

ALFRED WILCOX.

NEXT week: Incidents in the Lives of Well-known Horticulturists—Mr. Owen Thomas, V.M.H.

PERPETUAL-FLOWERING CARNATIONS.

PROPAGATION FROM SEED.

FEW amateur Carnation growers are content until they have tried their hands at raising their favourite flower from seed, and the many disappointments and difficulties encountered only serve to make them keener. In raising seedlings, many of the plants will turn out singles, whilst misshapen flowers and split calyxes will be still more plentiful; a few, however, may prove to be well worth retaining.

WHEN TO SOW.

Growers differ as to the correct time for sowing the seed, but in order to raise strong, sturdy plants for flowering the same season, it should be sown early. Personally, I prefer January, as the plants can then be had in bloom during July and August, where space is plentiful.

The seed should be sown in shallow pans. The potting soil should consist of two parts fibrous loam, one part sand or clean road grit, and one part well-decayed leaf-soil, the whole, after mixing, being passed through a fine sieve. Scatter the seed very thinly on the surface, and only slightly cover with the very finest soil. Water with a fine rose can, cover the pan with a sheet of glass, and place in a warm spot in the greenhouse. When germination takes place —which is generally in about ten days—remove the glass, and place the seedlings in a light position, care being taken not to allow them to become dry.

GROW WITHOUT A CHECK.

When the first pair of leaves appear, the young plants should be pricked out into small "thumb" pots or shallow boxes, and placed on a shelf in a light, airy position, where a temperature of about sixty degrees can be maintained. As soon as well rooted, they should be potted on into small "sixties," and more air and a lower temperature should be given. The seedlings, being very vigorous, must be kept growing on without a check, in which case it is extremely unlikely that they will be attacked by any disease.

Although doubtless about a third of the plants wll turn out singles, and of the remainder, probably more than half will be no good, the grower must not be disappointed, as it is possible that amongst the few good ones there may be one or two of exceptional merit, which will amply repay him for all his disappointment.

J. SMITH.

STREPTOCARPUS HYBRIDS.

THESE greenhouse plants have been so much improved during recent years by hybridising and selection, that they bear little resemblance, either in foliage or flower, to the original species, or even the first hybrids raised at Kew from S. Wendlandii, with its one

PERPETUAL-FLOWERING CARNATIONS—SOME PROMISING SEEDLINGS.

massive leaf, and S. polyanthus, with its numerous but somewhat inconspicuous flowers. The present race of garden hybrids, among which the achimeniflorus varieties—so called owing to the widely-opened flowers somewhat resembling Achimenes—are conspicuous, are so free-flowering, and so easily grown, that they are most useful subjects, either for the amateur or the gardener with restricted greenhouse accommodation, as they are easily raised from seed, and flower continuously over a very long period, in many cases from the July or August in the year they are sown till late in the following summer.

COMPOST FOR SEED-SOWING.

Seed should be sown thinly (it is very small, and requires careful handling), in well-drained pots of fine, light soil, made up of about equal parts of sweet loam, leaf-mould, peat, and sharp sand passed through a ¼-in. sieve, the actual surface being made a little finer. Make the soil firm, sow thinly, and give one good watering, or, if preferred, the pots may be well watered an hour or so before the seed is sown. It is not necessary to cover the seed, the pressing or watering in will bury it quite deep enough. Cover the pot with a piece of glass to check evaporation, and with brown paper to protect from sunlight, and place in a temperature of about sixty degrees Fahr. No further watering should be necessary until after the seed has germinated, which should be in about fourteen days, but should it be advisable to give more water, it is best done by soaking the pots in a deep saucer of water, to allow the soil to be moistened without wetting the seed.

The greatest danger in the early stages is from "damping," and care should be taken to give air every day by removing the glass and wiping it clean of the water which collects on it by evaporation from the soil. The seed may be sown at any time from the middle of January till the middle of March, and many growers also sow in July or August to obtain small plants for decorative purposes.

As soon as the seedlings are large enough to handle, and making their second leaf, they should be pricked out, in pots or pans, about two inches apart, in similar soil to that used for seed sowing, but a shade coarser in texture. Should this operation be delayed too long, there is a great risk of loss through "damping."

SIZES OF POTS.

As soon as the plants in the pans become crowded, they should be potted off separately into 3-in. pots, using similar compost passed through a ½-in. instead of a ¼-in. sieve. When they have been potted up a short time, and become established, a temperature of fifty to fifty-five degrees will prove quite high enough —in fact, very little artificial heat is necessary when once the seedlings have made a good start.

Later on the best plants should be potted on into 4½-in. or 5-in. pots, and these should prove large enough for the majority to flower in for a lengthy period, though, where there is sufficient room, a few plants potted on again into 6-in. pots will give even better results.

At the final potting the compost should consist of equal quantities of good, rough, fibrous loam, sweet leaf-mould, and peat, with a sprinkling of sharp sand and a small quantity of a compound fertiliser and broken charcoal. Firm potting, clean pots, and good drainage are essential throughout, and when the flower spikes begin to lengthen, or when pots are filled with roots, weak liquid manure should be given two or three times a week. The rule should be, fairly frequent weak stimulants in preference to occasional concentrated ones.

To encourage flowering over as long a period as possible, faded flowers should be removed to prevent seed forming, which naturally gives a check to flowering.

INSECT ENEMIES.

Streptocarpus are, on the whole, generally free from serious pests, the worst being a small "mite," similar to that which attacks Begonias and Gloxinias. The best method of dealing with this is to grow the plants all through in a fairly moist atmosphere, frequently syringing between the pots, and occasionally overhead on the plants during bright weather, when slight shade is also advisable, as this pest, like red-spider, revels in a dry atmosphere. Fumigation with tobacco compound has little, if any, effect on it, but syringing occasionally with tobacco washes will readily destroy it.

An occasional fumigation will, however, keep in check the other two pests to which Streptocarpus are sometimes liable, viz., green-fly and thrips. Mealy-bug, which was formerly a serious pest when these plants were grown in the stove, is rarely seen on them under cool greenhouse treatment.

Among the best varieties are Achimeniflorus albus (pure white), A. giganteus (mauve with light throat), A. roseus (pink with white throat); and among the varieties with ordinary shaped flowers there are fine types of violet, purple, white with different markings, and several shades of reddish magenta-coloured flowers.

C. J. GLEED.

PENZANCE BRIERS are very strong growers, and do best when allowed to grow at will. If they become crowded, cut away some of the oldest stems or branches entirely.

dener would like to have an answer. When the answer comes it may revolutionise our horticultural methods.

May 14th.—Faked flowers are an abomination. The artificially-coloured monstrosities sold in the streets, and even in some florists' shops, are not an atom better than a milliner's imitations. They have nothing to recommend them—at least, to the lover of flowers, for I admit that beauty is

MR. JAMES CORNFORD.

apt to alter with the standpoint of the observer. A town-bred servant, hearing the cuckoo for the first time, was delighted, because it imitated her grandmother's cuckoo-clock, and the highest praise that another could bestow on some Shirley Poppies was that they were as beautiful as those in her Sunday bonnet. And, really, if you didn't know——Ah, there's the rub. We do know, and we can't forget, and the ever-present fact compels us to detect what is not genuine. To be strictly logical, perhaps, we ought to extend our condemnation to forced and retarded flowers, and I don't think there can be much doubt that plants growing naturally in the open air are preferable. But these artificial processes have at least this advantage—that they give us beautiful flowers at seasons when they would otherwise be unobtainable. Nevertheless, I hope the barbarous method devised by M. Renault will not come into vogue. He has found that if the Lilac is stripped of its leaves in August, and watered abundantly afterwards, it will flower within a few weeks. From a botanical point of view the fact is interesting, but if any cultivator attempts to put it into practice, I trust he will kill his Lilacs. I think he will, for plants have a way of securing the prevention of cruelty to themselves—by dying.

May 15th.—Though mealy-bug is a terrible nuisance in some Vineries, I am thankful to say I have never been troubled with it. Still, as one never knows what may happen, it is always well to make a note of a remedy when one comes across it. I see that, at the Agricultural College at Wye, fumigation with cyanide of potassium has been tried with success, the proportions being twenty-seven ounces of cyanide, forty ounces of acid, and sixty ounces of water. Of course, extreme care is required, the cyanide being a deadly poison, and the house should be quitted as soon as the mixture is made, and not entered again until the following morning. It is stated that, while the foliage was uninjured, all the insects were killed.

May 16th.—At this season the Vines need perpetual attention, training and stopping taking up a good deal of time almost daily. Here, as elsewhere, there are gaps—spurs, or remains of spurs, not carrying a single shoot. This is not as it should be; yet the reason is not far to seek. In some previous year there were, no doubt, many shoots on the dead spurs, and they were in each case thinned out to a single shoot. Some accident afterwards befell it—in all probability, it was carelessly tied down to the wires, and snapped off—no others came to take its place, and the spur died. That has happened within my experience. To prevent such a misfortune, it is advisable to leave a second shoot on each spur until the selected one is quite safe. At the same time, greater care in tying down is necessary. The shoots themselves will stand a great deal of bending without injury, but if it is done in such a way as to throw the strain upon the junction with the old wood, they immediately give way at that point. It is very rare for them to give way at any other. If that fact is borne in mind, it is not difficult to avoid these annoying accidents.

H. C. DAVIDSON.

(To be continued.)

FAMOUS GARDENERS AT HOME.

No. 86.—MR. JAMES CORNFORD, AT THE GARDENS, QUEX PARK, BIRCHINGTON.

THERE are no gardens so beautiful and so extensive in the Isle of Thanet as those of Quex Park, which are under the capable and experienced control of Mr. James Cornford. Major Powell Cotton, the owner of the estate, which is some 3,000 acres in extent, gives Mr. Cornford a free hand, and a rapid inspection of the houses and grounds warrants an expression of the opinion that the confidence reposed in his judgment and discretion is abundantly justified. The number of houses is seventeen, and, in addition to these, there are several pits and frames. At Mr. Cornford's suggestion, we first went into the Vineries, which have lately been rebuilt, with all the recent improvements, in teak.

"In the early house," said Mr. Cornford, "you notice that we grow Black Hamburgh, Foster's Seedling, and Buckland Sweetwater; in the Muscat house, Muscat of Alexandria, Madresfield Court, Black Hamburgh Muscat, and Cannon Hall; and, in the late Vinery, Cooper's Black, Mrs. Pince's Black Muscat, Diamond Jubilee, Appley Towers, Alicante, and Gros Colmar."

"Have you any opinion to offer respecting these varieties?"

"Black Hamburgh Muscat is, I think, the best Grape there is, but it is rather difficult to grow. I cannot say much in favour of Cooper's Black; Mrs. Pince is doing well, and Diamond Jubilee is satisfactory. My experience of Gros Colmar is that the flavour is much improved by being inarched on the Black Hamburgh. I do not care to grow it on its own roots."

"I see that your two Peach houses are on very modern lines?"

"Yes; they are in teak, and, like the Vineries, were put up by Messrs. Weekes and Co. They are also the same size, thirty feet by seventeen. In the early house we grow, of Peaches, Hale's Early, Rivers' Early York, Diamond, and Early Alexandria; and, of Nectarines, Rivers' Early, which I regard as a grand Nectarine, Cardinal, and Lord Napier. Condor, a very good Peach, is grown in the second house, also the Late Devonian, Princess of Wales, and the Nectarine Peach. The varieties of Nectarine are Stanwick Elruge, Spencer, and Pineapple, which is still one of the best in flavour. Strawberries are forced in these houses, on the shelves, and also, if required, in the Vineries."

"How many Strawberries do you grow in pots?"

"About a thousand. The varieties include Keene's Seedling (for first-early), Royal Sovereign (the best for forcing), President, Auguste Nicaise, the Laxton, and Sir Joseph Paxton. We have also a large Peach case, a hundred and sixty feet long, in two divisions, heated, where Figs are grown."

QUEX PARK, BIRCHINGTON.

"You have a considerable collection of Orchids, including a number of Dendrobiums?"

"Yes; Dendrobiums are rather a feature. There are about fifty plants of Dendrobium Phalænopsis Schrœderi. There is a very fine piece of D. Dalhousianum now in flower. We have had seven spikes, with six or seven flowers on each spike. I attribute my success in growing it to the fact of its being placed over a hot-water tank in the stove. The steam seems to suit it. The collection includes different varieties of

Cœlogyne, Calanthes, and Lælias, notably L. purpurata, L. anceps, and L. Dayana. The last is very nice for the buttonhole. Cattleyas are largely represented by fine specimens of the following:—Bowringiana, Gaskelliana, Guttata, Mendelii, and Labiata autumnalis."

"What about Odontoglossums?"

"The cool Orchids do well here. Of the Odontoglossum species, Alexandræ and Pescatorei are specially good. We grow a considerable number of Cypripedium Chamberlainianum, and I find C. insigne Manleyii an improvement on the old variety. C. concolor also does well."

"Do you use Belgian leaf-soil for potting?"

"Very considerably; and it has an exceedingly good effect upon some of the Odontoglossums, Cœlogynes, and Cypripediums."

From the Orchid houses we proceeded to the Fernery, which has been recently built, and is very charming. The roof is festooned with Ficus repens, which has an admirable effect, and there are a number of baskets of Asparagus Sprengerii and Maidenhair Ferns. The rocks are covered with Lycopodiums and Selaginellas, and Phlebodium areum was doing remarkably well. Altogether, the result of the various mixtures is most satisfactory.

The roof of the show house was covered with Asparagus plumosus, Rhyncospermum, and the dark variety of Bougainvillea.

"In this house," proceeded Mr. Cornford, "we have several nice pieces of Humea elegans, and a large quantity of Amaryllis. I grow about five hundred of A. aulica, and they flower all through the winter. I have grown some five hundred of the hybrid variety. Azaleas and Cinerarias are grown in this house."

"And the stove?"

"In the stove about a score of varieties of Crotons are represented. I think Lady Zetland is one of the best, and Mrs. Dorman, a narrow-leaved variety, thrives here, also the Princess of Wales. Caladiums, including many of the newer varieties, are grown in the stove. Silver Cloud and Comte de Germany are two that merit mention. I also grow a large quantity of Argyrites, and its companion, Minus erubescens, which is very useful for decorative purposes, with a number of Aralia Veitchi, Gleichenias, and Dracænas. There are some nice pieces of Acalypha Sanderiana, a plant that came out about three years ago, hanging down; and the roof of the stove is covered with Stephanotis, Allamandas, Dipladenias, and Cissus discolor."

"Your Palm house seems to suffer from a plethora of Palms?"

"That is so. But we are going to make a winter garden between the dining-room and the museum of curiosities, and the Palms will be removed there. The collection embraces some fine specimens of Kentia Belmoreana, Fosteriana, Cocos Weddeliana, Cocos plumosa, and Areca lutescens, etc. In the winter garden the Palms will have the ample space which they require."

"What are the principal varieties in the Rose house?"

"Maréchal Niel, Climbing Niphetos, and Sunset. I am very fond of Sunset, which is greatly in request for buttonholes. Mrs. W. F. Bennett is a fine scarlet Rose, with the habit of Niphetos."

"You have a fine show of Eucharis and Pancratiums?"

"We are hardly ever without Pancratiums. There are about two hundred plants, and I find that by giving a portion of them rest we can nearly always obtain flowers. The stock of Eucharis is generally considered fine. I have about a hundred in pots. They are absolutely free from the mite. Hence, their healthy and flourishing appearance."

"You might give me an idea of the contents of some of your pits?"

"The heated pits contain Cucumbers in full bearing, Melons coming on, and Tomatoes quite set; while other pits include a large stock of Begonias for bedding (about two thousand of which are planted out), winter-flowering Zonals, just being put into "fifty-four" pots, and most of the up-to-date Malmaison Carnations."

"Now we come to the Chrysanthemums, with which I know you have made a reputation."

"It is seventeen years since I started growing Chrysanthemums for exhibition. During that time I have been very successful, and have taken over three hundred prizes, including three silver cups and seven medals. Last year I won the Isle of Thanet Chrysanthemum Society's challenge cup, a very handsome one, valued at fifty guineas. It was presented to the society by my employer, Major Powell Cotton, for the best group of Chrysanthemums, thirteen feet over, to be won three successive years by the same competitor. I have always taken the keenest interest in Chrysanthemums and their culture. In fact, the man who wishes to win prizes must be prepared to give them great attention, and to study their various wants."

"How large is the collection at Quex?"

"There are upwards of 1,500 plants, which include many of the best of the old and new varieties."

"I should like to have a few names."

"Here is a list of some of the best for grouping, struck in March, April, and May, single stems, and grown in "thirty-two" pots:—Mrs. Greenfield, Madame Gabrielle Debrie, Lady Hanham, Viviand Morel, Miss Alice Byron, Mrs. Coombes, Lily Mountford, Simplicity, President Nonin, Madame Carnot, W. R. Church, Mrs. J. I. Thorneycroft, Charles Davis, Mrs. J. C. Neville, Matthew Hodgson, Madame Gustave Henry, Mons. Chenon de Leche, Mr. W. Seward, Miss E. Pilkington, Exmouth Crimson, Mrs. W. Mease, Godfrey's Masterpiece, and Lord Alverstone."

The Gardener's Cottage at Quex Park.

Then we rambled into the beautiful flower garden, and Mr. Cornford pointed out that the walls were covered with Roses and Clematis.

"Also," he said, "Bignonia cherere flowers well on the west wall. The border, which runs round the lawn and the pleasure grounds, contains Tea and other Roses, with herbaceous plants, such as Pæonies, Delphiniums, Ranunculus, and Pyrethrums (single and double). The scarlet Anemone fulgens does exceedingly well here. This is probably due to the fact that the bulbs get so well ripened upon the chalk soil. In most places they die back in two years. With us they last for a long time."

"You might indicate some of your favourite bedding-flowers?"

"Begonias I bed extensively. Also the scarlet and white Verbenas. Seedlings of Verbenas come true, and are much less trouble than cuttings. They are easy to grow, and flower luxuriantly in a dry soil. I also bed about five hundred Cannas, which flourish in the sunk garden, where, as you observed, there is plenty of water. Other beds contain Zonal Geraniums, Calceolarias, and Fuchsias, which do better on this soil than the Zonal Geraniums."

"There are some fine trees on the lawn."

"Notably, I think, the specimens of Evergreen Oak. The Cork tree also thrives here. A Wellingtonia gigantea has already reached sixty-five feet in height, but our finest specimen is Cupressus macrocarpa lutea, which has been at Quex at least a hundred years. Pinus Normanianum is our best Pine."

"I suppose that trees are not very easy to grow in the Isle of Thanet?"

"No; and they are seldom of any height, because of the prevalence of cold winds from the North Sea."

"How do you treat the front of the mansion?"

"We have always a big show of yellow and white Banksian Roses, and on the Solanum jasminoides, which reaches the top of the house, there are hundreds of beautiful white berries in the autumn. The Clematis, Duchess of Albany, which was planted two years ago, is now about twenty feet high. Other portions of the house are covered with Ampelopsis Veitchi, Wistarias, and various creepers, such as white Jasminum and Pyracantha coccinea."

Before we went into the kitchen garden, Mr. Cornford explained that four years ago the old kitchen garden was thrown into the lawn, part of it being laid out with Begonias, and the other part used as a croquet lawn and bowling green. The improvement is obvious, even to those who are not familiar with the former arrangement. The new kitchen garden is upwards of a quarter of a mile from the mansion, and is about four acres in extent. It has been most adroitly planned, and the 14-in. wall has all been wired.

"You prefer the wiring?" I enquired.

"I think that it is a great improvement on the system of nailing. As to the fruit grown on the walls, there are all the best varieties of Peaches, Nectarines, and Apricots on the south wall; on the east wall are Cherries and Plums; on the west late Peaches, late Plums, and early varieties of Pears; and on the north are Morello Cherries and cordon Gooseberries, which are exceedingly valuable late in the year for dessert. I started them with this garden, and, by netting, can keep them as late as I like."

"I see that you grow Apples and Pears on the fine arch down the centre?"

"Yes; and they will look lovely when they are all in flower. Among other points of the garden are the terra-cotta coping along the top of the walls, which acts as a screen to protect the flowers, and the large tank in the centre, which furnishes the water supply. There are several hydrants in different parts of the garden, and this dry soil makes them very necessary. We have Apples, Pears, and Plums, on both the pyramid and cordon system. I think highly of the cordon system, whether for growing out in the garden or on the walls. The Apples are on the Paradise, and the Pears on the Quince stock."

"Have you any drawbacks in the cultivation of fruit?"

"Except the drought in the Isle of Thanet, which is proverbial, only the birds. They come to our trees from all parts of the island, and I have to use a great quantity of netting in consequence. Moreover, I am a great exhibitor of fruit, and, in any case, should net things in order to show fine specimens."

"You take a special interest in fruit-growing?"

"I have made it a study, more particularly in recent years, with the result that I am not a believer in the old trees. I am clearing them away gradually and putting in young ones. The kitchen garden also contains a large assortment of useful vegetables, in season and coming on. With the view of saving time, all the paths are six feet wide, and tiled, so that a cart can be brought round."

"Did you come here as head gardener, Mr. Cornford?"

"Yes; and I shall have been at Quex twenty years in November. I was previously at Sevenoaks. Since I came here, the whole of the gardens have been remodelled, all the old houses have been cleared away, and several new drives have been made. As to exhibiting, I have taken quite a thousand prizes, chiefly firsts, for fruit and flowers, during the twenty years. The number of men employed in the gardens when I came was six; now it is seventeen. That will give you a fair idea of the growth of the place."

Finally, Mr. Cornford showed me his own pretty house, and the commodious bothy which has just been finished; the famous bell tower, which contains the only private peal of bells

THE GARDENS AT UPPER GATTON PARK, MERSTHAM.

Interview with Mr. H. Cornish.

IT is a steep ascent from Merstham station to the residence of Mr. A. Benson. But the position of Upper Gatton Park is delightful, and the views of the surrounding country from its well-kept lawns are amongst the finest to be obtained even in the loveliest part of Surrey. Mr. H. Cornish, the gardener, in showing me over the pleasure grounds on the occasion of my visit on a bright afternoon in March, happily free from wind, confessed that the elevation of six hundred feet above the sea level involves difficulties of cultivation, and imposes limitations. If, however, there are certain shrubs that will not thrive, and certain plants that will not flower under such conditions, it is obvious that plenty of both find them congenial. Close to the mansion, for example, is a border with Hollies, varieties of Cupressus, and Rhododendrons, which cold not be in better health.

"All these," said Mr. Cornish, as I commented on their satisfactory appearance, "were thinned out two years ago, and the result has been a great improvement. The Hollies have just been clipped; among the varieties are Golden Queen and angustifolia. I will tell you more about the Rhododendrons when we cross over the cricket ground to the Conifer beds."

"The cricket ground must surely be one of the best private grounds in Surrey."

"I have heard it said that it is equal to some of the county grounds. Mr. Benson is greatly interested in cricket. He also takes a personal interest in Conifers and shrubs. At the far end of the cricket ground, you will notice that there are large clumps of Privet, Laurels, and Portugal Laurels. These were planted in order to hide a shed. But the beds near the two pavilions, which later will have Hydrangeas in tubs in front of them, are specially devoted to choice shrubs."

"Rhododendrons being one of the features?"

"Yes, there are many choice varieties, including Pink Pearl in quantity."

"I notice that the foliage of Pink Pearl is exceptionally good. Do you put peat in the soil?"

"None whatever; only heavy loam. Amongst the shrubs that do particularly well are Aucubas. They stand the winter out. Sycamores, Berberis in variety, Lilacs Charles I. and Madame Lemoine, Cupressus Nootkatensis, MacNabiana, and Crippsii, Retinospora aurea, squarrosa, and pisifera, Libocedrus decurrens and chilensis, all seem to find the climate and soil suitable to their needs. To keep up a constant supply, we have a large nursery bed of shrubs at one corner of the cricket ground, from which we choose the best to plant elsewhere as required.

A Collection of Majestic Cedars.

Pursuing our way on to the lawn south of the house, several magnificent Cedars at once attracted my attention, and I asked Mr. Cornish their circumference.

"One is twenty-seven feet nine inches; another twenty-one feet one inch, and the three others are respectively twenty-one, twenty, and eighteen feet four inches round. The circumference of some of the branches of the largest Cedars, which are propped up, is from nine to fourteen feet, with a spread of one hundred and five feet. These trees date back quite two hundred years. There is a fine Copper Beech near the house, but the Cedars overshadow all the other trees in majesty."

Mr. H. Cornish.

"The bedding seems to be confined to Roses," I said, as, noting the croquet and tennis lawns, we strolled to the terrace.

"Yes, we used to have bedding plants, but five years ago we converted them into Rose beds. There are a score, and the beds are mixed, the Roses being grown as standards, half-standards, and bushes. Most of the Roses were replanted last autumn, but the semi-standards are new. When we re-made the beds, we put a little extra clay at the bottom, but practically they are grown in natural soil. It is a rather bleak situation for Roses, but they make splendid growth. This applies also to Dorothy Perkins, grown as specimens in weepers. You will observe, there are Roses on the railings of one side of the mansion, and Clematis on the other side. The house itself is fairly covered with Ampelopsis Veitchii."

"Hydrangeas do not seem to be injured by exposure?"

"The long, winding border, to which you allude, enjoys a certain amount of protection from the Portugal Laurels planted behind. They were brought from the nursery bed on purpose. The varieties of Hydrangeas are mainly paniculata and Dr. Hogg. We began planting them out seven years ago, but the border was extended in 1908. Most of the plants were grown in pots. They remain in flower for quite a couple of months."

After we had spent some time in exploring the long shrubbery border on the way to the West Lodge, which is adorned in ordered disorder with Azaleas and Rhododendrons and decorative shrubs, with Snowdrops and Crocuses for spring groundwork, we went back to the south walk, one of the prettiest portions of the gardens.

"On one side of the walk," continued Mr. Cornish, "we grow annuals, with a few Delphiniums, Alstrœmerias, and tall-growing Campanulas at the back. The annuals are planted in clumps. Earlier in the year there are Tulips, Hyacinths, and Myosotis. On the wall behind these, Wistaria sinensis, Magnolia grandiflora, Cistus, and Clematis flourish. Later in the season, Fuchsias, Heliotropes, and Streptosolen Jamesonii as standards, grown in

Upper Gatton Park.

Original from CORNELL UNIVERSITY

pots, make an effective show. The Fuchsias are Manor Beauty, Grand Duchess, Ballet Girl, Brilliance, Virginalis, and The Clipper. On the other side, planted at intervals in the grass, are numerous specimen shrubs. The south wall looks its best in July."

The Herbaceous Border.

"It looks quite charming now," I rejoined, as we turned through a handsome gateway into the kitchen garden, which also has features of beauty, as well as of utility.

"We try to make the kitchen garden pleasing to the eye. The wide grass path, eighty yards long in the centre, has herbaceous plants and annuals on each side, with Roses on chains behind, from end to end. The varieties are Crimson Rambler, Dorothy Perkins, Lady Gay, F. W. Flight, and Carmine Pillar. Roses and Delphiniums mixed also form the background of the borders. We start the latter with Snowdrops, and go on to Tulips, chiefly Darwin and Gesneria; and later the principal varieties include Pyrethrums, Irises, Tritomas, Campanulas, Liliums, Pæonies (a few Trees), Phlox in variety, Hemerocallis, and Asters."

"What about Sweet Peas?"

"They are in rows this year; last season we had them in clumps. I take out deep trenches, and fill in with a mixture including loam, soot, and bonemeal."

"You have some useful Pear walls in the kitchen garden."

"Yes, and we grow most of the Pears on cordons. They fruit more quickly than on the fan-trained system. Some of these cordons were only planted last winter."

The Renewal of Cordons.

"How often do you think cordons require renewal?"

"Most Pears on cordons need renewal at the end of ten years, or twelve at the most. Some of the Pears are not cordons, and several are old trees. There is one of Marie Louise one hundred years old, which still bears well."

"Do you find it equally advantageous to grow Apples on cordons?"

"They are not so profitable as the standards or pyramids. We planted these about four years ago. The varieties embrace The Queen, Lane's Prince Albert, Cox's Orange Pippin, and Newton Wonder. Two years ago we planted on cordons Cox's Orange Pippin and Charles Ross, which does well on the walls."

"Does your Plum wall face east?"

"Yes. The north wall is covered by Morello Cherries."

"Do you go in largely for bush fruit?"

"It is pretty well represented. Facing the Plum wall is an old plantation of Gooseberries, with a few standard Apples, Cox's Orange Pippin and Allington Pippin. The Gooseberries are in variety, for cooking purposes. The dessert varieties, which were much more recently planted, are Rough Red, Wilmot's Seedling, Moonshine, Smuggler, Highwayman, and Warrington. Red Currants include a very old variety, Victoria Red; and lately we have planted Dutch Red and Houghton Castle. I am almost perpetually taking out old fruit trees, and putting new ones in their places."

A Walk in the Grounds, Upper Gatton Park.

"How do you treat your Raspberry plantation?"

"I mulch the canes every year, and the result is very satisfactory. The only variety is Superlative, which is used largely for jam. You may like to know where I get my material for mulching. I make up a hotbed for sowing Lettuce, early Carrots, Cauliflowers, Radishes, and Brussels Sprouts. After the vegetables are done with, it is wheeled away to a heap, left there for two years, and then brought to the Raspberries. It must be thoroughly rotten before it is used, and it wants turning occasionally."

A Giant Cedar at Upper Gatton Park.

"I see that you use a good deal of lime to your fruit trees."

"I put it on the walls during December in order to kill the moss. I also put lime and paraffin on the Currant trees, which effectually keeps the birds away. Great care must, however, be taken not to use too much paraffin."

"How frequently do you make new Strawberry beds?"

"Nearly every year, and generally with the plants I have forced in pots, I keep none of the plants more than three or four years. The varieties are Royal Sovereign and British Queen."

Spinach All the Year Round.

"Speaking of forcing, do you force many vegetables?"

"Not a great number, but I get a good many early crops. Last month I turned Cauliflowers out of the frames into the border, protecting them with pots over them. As a rule, I am able to cut in the middle of June. Spinach is grown under glass, and we cut it all through the year. I strongly recommend The Carter, but it must be sown at the right time—about the middle of August, as a rule. If it is sown too early, it will run to seed; it really depends on the season. Broccoli is also forced, and we cut for ten months in the year. Lettuce Tom Thumb is sown in January on a hotbed, and protected by glass."

"Do you care to say anything on the principles of vegetable cultivation?"

"I ridge the ground in the autumn, which I find is better than digging, leave it ridged till early spring, then fork it over, and level down. This applies generally, but I trench a small portion each year. Savoys and Asparagus Kale are grown in the borders, and sometimes early Coleworts. Last year I had a long row of Sutton's A1 Scarlet Runners, some of which were twelve inches long. This year I am trying Carters' Red Giant, Scarlet Emperor, and Jubilee."

"Have you anything special in Peas?"

"We grow Peas on turf, cut about a foot square, and make a small trench in the middle for the seed. The turf is put in the trenches about the middle of March, the trench being just deep enough to lay the turf on. By this process we usually begin to pick Peas the second week in June."

"What are your chief varieties?"

"The earliest is Gradus, and then follow Chelsea Gem and Langley Gem, grown as dwarfs. Dwarfs do as well as tall ones for small borders, and have the recommendation of not taking up so much room. We also grow Veitch's Main Crop, Carters' Daisy, Ne Plus

Digitized by Google
Original from CORNELL UNIVERSITY

Ultra, Century, Torpedo, Gladstone, Duchess of Albany, Carters' Exhibition, and Autocrat."

"What about Potatoes?"

"We do not go in largely for Potatoes, a great many being bought. May Queen is grown for early use, and the other varieties are Sharpe's Victor, Royal Kidney, and Sutton's Ashleaf."

Carnations Outside.

"There remain the houses, in which, I gather, Carnations are largely grown."

"About five hundred Malmaisons and two hundred and fifty Trees. The former are Lady Coventry, Princess of Wales, Duchess of Westminster, Maggie Hodson, and Lady Grimstone. The latter include Duchess Consuelo, Uriah Pike, Enchantress, Britannia, White Lawson, Rose Dorée, Winsor, Harvard, Rose Enchantress, Fair Maid, Helen Gould, and Melody. We cut blooms practically all the year round. Outside these houses Border Carnations, Old Clove, Raby Castle, and a few seedlings are grown."

"Do you go in for the large blooms of Chrysanthemums?"

"No, our varieties are chiefly singles. We grow about five hundred. As to other flowers, there are eight big lights of Violets, Marie Louise, Mrs. J. J. Astor, Neapolitan, and Princess of Wales."

A Collection of Zonal Pelargoniums.

Entering the Palm house, Mr. Cornish said, "Here we grow Gloxinias, and Abutilon Savitzii in pots. The latter we use for decorative purposes with Begonia Gloire de Lorraine, and they make a very pretty combination. Another combination is Begonia Gloire de Lorraine and Asparagus Sprengeri in baskets. In the greenhouse, Schizanthus will be followed by Zonal Pelargoniums, of which we have a large collection. The favourite variety is Sir Thomas Hanbury, which is so useful because of its long stalks. The other varieties include Mikado, Dryden, King of Denmark, Lotos, Mr. R. Cannell, Lady Rosebery, Goodwood, The Sirdar, Barbara Hope, Countess of Jersey, and Hatfield. Arum Lilies are grown for use in tall vases, and Lilies of the Valley, Lilacs, and Azalea mollis are forced in pots."

"Then there are the fruit houses?"

"In the Peach house, Nectarines rather than Peaches predominate, and you will note that the arches are not too high, so that the back wall gets plenty of sun. In the Vineries, one house is entirely devoted to Muscat of Alexandria, and another to Black Hamburgh. In the late house, some of the Vines have been only planted three years. Lady Hastings is a Grape of very good flavour, but not a good grower."

"Do you show much fruit, Mr. Cornish?"

"I have shown fruit and flowers occasionally, and have been pretty successful. In addition to local prizes, I have a few firsts for Grapes, from the Royal Horticultural Society, and a second for dessert Pears. At the county and local shows I have done well with Peaches and Nectarines, and also with Begonias."

Alfred Wilcox.

Next week's interview will be with Mrs. Atkinson, hon. secretary of the National Gladiolus Society.

Prince's Feather is a hardy annual kind of Amaranthus, closely related to Love-lies-bleeding. Its crimson plumes are very effective, and appear among brown-crimson leaves, the height of a full-grown specimen often attaining three feet. Bottom heat hastens the production of plants.

Perilla nankinensis in all varieties, will make the best crimson foliage show indoors, but must be given bottom heat if there is no warm greenhouse in which to sow it. Perilla n. laciniatus has leaves much divided, so is Fern-like, while the Crisped-leaved species has crimped foliage of deep browny-red.

The Hotbed and its Uses.

The hotbed is one of the best means of raising seedlings, and also for growing on these and other plants afterwards. It is a nearer approach to a natural condition than is generally recognised. The temperature of the surface soil on a hot summer day is between seventy and eighty degrees Fahr. In hotter climates the surface soil temperature would be considerably more.

The Advantage of a Hotbed.

In most cases, greenhouse temperatures are higher than the soil in which the plants are growing. I have known the temperature of the soil in a greenhouse to be fifteen degrees lower than that of the atmosphere at six feet above the soil when the house has been artificially heated by hot-water pipes. This is one reason why plants do not thrive so well in the spring until the sun has power enough to warm the soil in the borders and pots, and also to permit a fair amount of ventilation, so that the difference in the temperature of the soil and that of the atmosphere is not so great.

Hotbeds have the opposite effect, the soil often being much warmer than the atmosphere above it. There are also other advantages, such as the humidity and the gases, which may be more or less beneficial.

The hotbed and frame are perhaps of rather more use to the man who has not a greenhouse to raise and grow plants in; but I always used the hotbed when I had a considerable number of greenhouses, and found I could succeed much better by its help in raising seedlings.

How to Make the Hotbed.

Some people do not succeed with hotbeds because they do not make them properly. Fresh stable manure is the best, and this should be thrown up into a heap to ferment. As soon as the steam is seen coming out at the top the manure should be turned over, putting the outside into the middle, and shaking out all the lumps. If the manure is quite dry in any one part, water should be thrown on it as it is being turned over. It should never be allowed to heat itself dry and white after being put into a heap, as this is a loss of heating power.

The idea of throwing the manure together, and turning it a few times, is to drive off the offensive gases which would be injurious to the young plants in the frame, and have been known even to kill them. It is sometimes necessary to turn the manure as many as four times before it has become sufficiently sweetened to be made into a bed, but two or three turnings are generally sufficient for the purpose. One can judge of its sweetness while the last turning is being done. When all the rank smell is gone out, and the manure has a smell something like Mushrooms, it can safely be made into a bed.

The Quantity of Manure.

The quantity of manure and the height of the bed required depend upon the time of the year and the purpose for which it is used. If raising seeds, a small quantity only is required; but when it is wanted for growing Cucumbers or Melons, it is best to have a bed from two to three feet high even for this time of the year, because such a bed may retain its heat for several weeks to keep the plants growing. The bed should be made two feet wider than the frame, and two feet longer, and should be trodden during the process of making, but the treading should be in acordance with the height—the higher it is made the firmer it should be trodden. A small amount of manure should be beaten down lightly with the back of the fork instead of treading it. Early in the season the beds are often five feet high.

If Oak or Beech leaves can be procured, these should be mixed with the manure while it is being sweetened, using the same quantity of leaves as manure. A hotbed of leaves and manure is often valuable the following season for mixing with the soil in potting plants, and similar purposes; so that while it is doing service in rearing and growing plants, it is also in preparation for further services in an entirely different way.

Roseum.

Renovating Lawns.

Now that "the sweet o' the year" is upon us, the work necessary to put our lawns in order must proceed apace. Much of this is often done earlier; and where is has been held over, a lot must be crowded into the next few weeks.

A frequent cause of failure is the unevenness of the surface. It may be taken for granted that no lawn can be kept in good condition where unsightly depressions and swellings prevail. To remedy the sinkage, the turf should be raised, and the hollow filled to the required level with fine soil. Swellings may be sometimes reduced by ramming firmly, without taking up the turf; but if that is of no avail, then it will be necessary to have recourse to this operation. The tools used are a turf cutter and a turf raiser; but an ordinary spade, used with care, will answer very well. Cut to a depth of two or three inches, and about a foot wide, and roll it up until the work is finished. When filling up hollows or lowering hillocks, be sure to consolidate the soil thoroughly before replacing the turf. Should there be a slope from one side or end of the grass plot to the other, if very slight it may be remedied by sprinkling a layer of fine soil on the lower part.

Moss and Weeds.

Moss is a concomitant of poor soil and insufficient drainage. To correct the former, a top-dressing of a good compost, to which is added some well-rotted manure, should be given as early in the year as possible. If not done before, it had better be done now. Rake off the moss before doing it. A little later on an application of guano, or one of the advertised lawn fertilisers, should be used.

Basic slag is invaluable where the grass suffers from excess of moisture. It may be sprinkled over the surface, at the rate of about four ounces to the square yard, and is best applied during the winter. Another good fertiliser is nitrate of soda, which can be given as a liquid at intervals during the spring and summer. One ounce to the gallon of water is the right strength for the solution. Kainit, also, may be recommended. It is quick acting, and need not be used till spring.

Weeds and coarse grass must be grubbed up, and the holes filled with finely-sifted soil. Some of the strong-growing weeds, such as dandelion and dock, are very tenacious, and it is advisable, after cutting off the crowns, to drop lawn sand or weed-killer on the stumps. Lawn sand is best used in dry weather.

Renovating the Turf.

When these measures have been carried out, it will probably be found that there are bare patches to be seen here and there, and to cover these, grass seed may be sown thinly Half a pint will be sufficient for, say, ten square yards. Rake the ground over carefullly, and after scattering the seed, sprinkle a little fine soil over it, roll it two or three times, and, should the weather be dry, give a good watering once or twice. Birds have a partiality for the seed, and to circumvent them, stretch black thread over the surface in different directions, tying it round short, stout pegs.

When the new grass is about four inches high it may be cut; but, if possible, avoid using a lawn mower for the purpose, as the young roots are liable to be torn or dragged up. A scythe or shears is to be preferred for the first two or three cuttings, or until the grass is thoroughly established. Roll frequently, and give water during hot, dry weather.

Rhus.

Percy Corps

A Lovely Garden in the Suburbs of Leicester: Brookfield, Stoneygate.

LEICESTER is not known as a garden city, but one of its suburbs has a lovely flower garden, which, thanks to the courtesy of its owners, Mr. and Mrs. Fielding Johnson, I had the opportunity of seeing when it was looking its best. The suburb of Stoneygate is high above the town, and Brookfield, which is situated in a commanding position

SOME OF THE BEDS AT BROOKFIELD, STONEY GATE, LEICESTER.

at the top of the hill, may be shortly described as *Rus in urbe*. This is true, not only in respect to its general appearance, but in detail; and the Alderney cows grazing in one of the fields adjoining the pleasure grounds, are quite in their element. The agricultural aspect of the places also accentuates the effect of the display of bedding, of which, indeed, glimpses are obtainable from outside. But not more than enough to whet curiosity, and suggest that the visible charms are merely indications of the invisible. The gardens, laid out with good taste and skill, have been maintained in such a manner that the progress of time has developed and enhanced their beauty. Though quite on modern lines, and entirely in keeping with the comfortable and attractive residence, there are plenty of fine old trees in evidence, and the natural slopes have been made the most of I had the pleasure of meeting Mrs. Fielding Johnson, who derives the keenest enjoyment from her garden, and subsequently Mr. Percy Corps, the gardener, gave me the fullest information.

A VENERABLE WISTARIA.

To start with, we inspected a splendid Wistaria sinensis, which covers the south side of the house.

"It is upwards of seventy years old," said Mr. Corps, "and does just as well in dry as in wet seasons, foliage and flowers alike being always ornamental. I only prune it, and protect it from the birds with cotton. So far it has no signs of decay. There is Clematis in variety on the east wall, but nothing else comparable to the Wistaria."

"I observe that the borders on either side of the front windows are different."

"You will find the same principle prevails throughout the pleasure grounds. One of the borders has Abutilons, pink Geraniums, and golden Calceolarias; the other Kochias, Fuchsias, and Begonias. The border on the south side has in front Heliotropes Lord Roberts, Begonias Fairy Queen, Petunias Rosy Queen, and Alyssum Winconsin, behind these being tall Alstrœmerias. We depend very largely upon regular and abundant watering. Fortunately, the supply is practically inexhaustible.

"Under the windows on the east side of the house are Scarlet Verbenas, while the entrance is a combination of Cannas, Fuchsias Cloth of Gold, pale blue Nemesias, and Lobelias."

"A very successful combination. Do you have a spring display?"

"In the immediate vicinity of the house, the spring bedding is composed chiefly of Tulips and Violas; and in the beds double Arabis, Myosotis, Aubrietias, and Polyanthus. Four years ago the Lily pond was added to the east side, with fountains in the centre. It is worked by an electric motor in the house. There are three white and three rose Lilies. The two grand Copper Beeches on the lawn fit in very nicely with the new addition.

SLUG-PROOF SUBJECTS.

"We are rather troubled by slugs," continued Mr. Corps, "and the contents of the border outside the conservatory are chosen with a view to reduce the trouble to a minimum. At the back are scarlet and white single Dahlias, and in front light yellow Antirrhinums, grown from cuttings, with Salpiglossis in many shades of colour, also mixed Nemesias, and a variety of Brachycome, with flowers similar of those of Cineraria stellata. The yellow Rose climbing on the conservatory, and blooming freely on each side of the door, is Gustave Regis, and it is an excellent foil to the blaze of scarlet supplied by means of Paul Crampel Geranium, and the masses of blue contributed by Dobbie's Sapphire Lobelias.

"Taking the beds as they come, the first is a Rose bed filled with fifteen plants of Gruss an Teplitz, with a fine specimen of Dorothy Perkins on either side. The Old Clove Carnations in the adjacent border are so hardy that they often withstand the frost, and keep in flower through October. Behind the Carnations is a border of mixed Ferns, and close by a bed of the Lyons Rose, with them standards in the centre of the bushes, and a border of Violas Lemon Queen. This is the second crop of flowers, but it is not so good as the first."

"Rhododendrons seem to thrive in the soil of Brookfield."

"They make such a show in June that on three Sundays the gardens are thrown open to the public in the afternoon and evening. The privilege is taken advantage of by big crowds of people. The natural soil is heavy clay, and there is little surface; we plant in peat. The varieties are not named, but there are many different shades of colour. You will see

THE FOUNTAIN AND LILY POND AT BROOKFIELD, STONEYGATE, LEICESTER.

numerous clumps of Rhododendrons, and several beds of Azaleas. Here is one of the latter, notable for rich colours and fragrance."

A RAISED BED OF HERBACEOUS PLANTS.

"One of the clumps of Rhododendrons forms a background on a mound, with herbaceous plants in front, the varieties being chiefly Phlox, Michaelmas Daisies, Delphiniums, Heleniums, and Campanulas, and a

Digitized by Google Original from CORNELL UNIVERSITY

number of small-flowering Lilies. We grow Rambler Roses largely on iron trellis, and Crimson Rambler, Dorothy Perkins, Tea Rambler, Allister Stella Gray, Philadelphus, Hiawatha, and Blush Rambler all do well on it.

"The two beds, resembling in shape a Strawberry leaf, were replanted a year ago, and both contain Delphiniums, Michaelmas Daisies, and Helianthemums. The feature of the next bed is the white Chrysanthemum William Robinson, with its fringed foliage and wealth of flowers. It is associated with Phlox in variety, Anchusas Dropmore variety, Salvia patens, tall-growing Pentstemons Miss F. Hope, salmon-coloured Clarkias, Campanula persicifolia, and an edging of mauve Violas.

"Between these beds is a plantation of shrubs of different kinds, and in the centre are blue and white Campanulas and Helianthemums. They last about a month in flower, and would last longer, but the bees fertilise them and limit the duration of the season. The shrubs include Austrian Pines, Berberis, three standard Chestnuts, and Hollies. All over the grounds there are Hollies; they are not named; but many are very fine specimens. Both the situation and soil suit them. Here is a little border which gets scarcely any sun, and the flowers are accordingly selected on account of their ability to do without it. There are Columbines, white and purple Stocks, pink Geraniums, Tagetes, Calliopsis, and Antirrhinums Orange King, grown from cuttings. The last will grow either in the shade or in the sun.

"Facing the sunless border, on the other side of the path, is a Rose bed eighteen yards long, with mixed varieties of Hybrid Teas, and a groundwork of Violas Mrs. Felton. This bed is raised a little, and the effect is improved by a number of shrubs in close proximity."

"Then there are the beds with the sundial in the centre?"

"They are identical—Hollyhocks being a leading feature, and the colours embracing two dark crimson, apricot, two pinks, and a lighter shade of crimson. Hollyhocks are very fine here. The other varieties in these beds, which are exclusively herbaceous, include Golden Rods, Delphiniums, Bartonias, Œnotheras, Phlox in variety, white Galegas, salmon Clarkias, Godetias, Pentstemons, and Scabious caucasica, the whole edged by mauve Violas Mrs. Paxton. The Scabious is raised from seed, sown in March, pricked out in boxes and planted out at the end of May or beginning of June."

ROSES AND VIOLAS.

"Next we come to three Rose beds, each containing one variety. In the first there is Lady Faire, a very good light pink variety; in the second, Ecarlate, two shades of scarlet; in the third, Mrs. David McKie, one of the most fragrant varieties, and a very fine Rose. The first bed is edged with Violas Mrs. Felton, the second with Black Prince, and the third with Cloth of Gold.

"And the beds under the shadow of that magnificent Cedar."

"This is a case of 'We are seven,' but all different. The combination consists of standard Fuchsias Mrs. Rundle, a groundwork of Begonias Crimson Gem, and edging of Alyssum minimum; Lobelia cardinalis, white Verbenas, and dark blue Lobelias; standard Heliotropes, and Fuchsias Cloth of Gold, with edging of Alyssum maritimum; Cannas Alphonse Bouviere and groundwork of Sibthorpia, with edging of Begonias Fairy Queen; standard Fuchsias Mrs. Marshall, groundwork of Ageratums, with Alyssum maritimum; standard and groundwork Geranium Madame Crousse, edged with blue Lobelias; variegated Eulalias as dot plants, with groundwork of Salvias Pride of Zurich, edged with Alyssum minimum.

"Between the beds of shrubs, with a few Alpines at the base, is a fine old Ash, and amongst the best of the shrubs are Golden Privet, Berberis Langleyensi, Wegelias, Philadelphus, Tritomas, Arbutus, and Magnolias. The Alpines are chiefly Aubrietias, Saxifraga, Thymus, Cistus, Dianthus, and Daphnes. Facing the Alpines is a mixed border of herbaceous varieties and annuals, containing a few Asters, Chrysanthemums J. J. Hart, Lilium candidum, blue and white Lupins, and Larkspurs. The Roses are Hiawatha, Dorothy Perkins, and Alberic Barbier. Last autumn we extended the Rose border, which now runs the whole length of the grounds. The border is planted in clumps as much as possible. It faces east, but catches the sun up to midday, and though sheltered is not bleak. In addition to the varieties already named there are in this border Pentstemons Newbery Gem, Shirley Poppies, Nigellas, Verbenas Miss Willmott, Sweet Williams, scarlet, pink, and white, single Marguerites, which give two crops of flowers, Geraniums Harriover, and Fuchsias gracilis."

Proceeding to the kitchen garden, we passed on our way several beds of mixed Roses edged with Violas, and close to the garden itself is a great show of Hiawatha and Crimson Rambler on iron trellis. Roses and Sweet Peas are grown in the kitchen garden for cutting, but, as Mr. Corps explained, the object is to supply the house with fruit and vegetables.

THE KITCHEN GARDEN.

"I see you have a useful plantation of Apples."

"Yes, and we get excellent crops of Keswick Codling, Wellington, Lane's Prince Albert, Bramley's Seedling, Golden Noble, and Cox's Orange Pippin. The Plums are Victoria and Monarch, with very fair crops. Currants and Gooseberries also do tolerably well. We had an extraordinary crop of Strawberries, and picked Royal Sovereigns every day for five weeks in succession. The other varieties are Vicomtesse Hericart de Thury and Givon's Late Prolific.

"With regard to vegetables, we grow a little of all kinds, and by the aid of plenty of manure we produce a considerable quantity. If the weather is open we pick Peas up to November. Asparagus is at home in the soil, and Potatoes, Celery, and Onions are exceptionally satisfactory. There are still the houses and the conservatory. In fact, the range begins with the conservatory."

"I must congratulate you upon its arrangement, which I should like you to give me in detail."

ZONAL PELARGONIUMS.

"The centre is occupied by a fine Kentia Palm, which has been lowered in consequence of growing too high for the building. There is a rockery running round the centre, with a show of Campanulas and Coleus in pots, with Ferns planted out. Then there are Verbenas and Petunias, also in pots. Hanging from the roof are baskets of Achimenes in four varieties, tuberous Begonias, scarlet double Begonias Gladys, mixed with trailing Sibthorpias. The only plants growing here are two Heliotropes and a couple of Taxodiums. But on the shelves there is a collection of Zonal Pelargoniums. Fine trusses of flower are given by Hermione, Enid, Gertrude Pearson, Rev. Dr. Harris, Raspail, Eric, E. Dicks, King of Denmark, Ian McLaren, Katherine Morton, and A. Laing. We, as far as possible, bank up the flowers in an artistic style, the Coleus in particular being very effective.

"As to the other houses, of which there are five, the Vinery contains four varieties of Grapes, Madresfield Court, Foster's Seedling, Black Hamburgh, and Muscats. We have had nine bunches of Muscats weighing over 2½ lb. In the Peach house the varieties are Diamond and Royal George Peaches; Lord Napier and Elruge Nectarines. Here are some of the large-flowering Chrysanthemums."

"How many do you grow?"

"Two hundred of the decorative and quite sixty varieties. I only get two or three of a sort, but I have any new variety which seems worth a trial. In the stove are a number of seedlings of Streptocarpus, which I saved in pots, they represent many shades of colour. Tomatoes are also grown in this house, the varieties being Earliest of All and Up-to-Date. Sutton's Abundance does well outside. In the grotto, which forms the background to the conservatory, is a collection of choice Ferns, including The Royal, Osmunda, regalis, Adiantums, Tree Ferns in variety, and Begonia Rex."

"Can you give me any idea of the number of plants you put out in all the beds in the pleasure grounds?"

"Between two and three thousand plants are used for bedding."

"How long have you been in charge at Brookfield?"

"I came here on April 8th, 1912. I started gardening with my father at gardens near Liss, in Hampshire, and subsequently I have been at South Leigh, Havant; Hylands, Chelmsford; and foreman for eight years at Beau Manor, near Loughborough." ALFRED WILCOX.

"A Garden in a West London Suburb" will be described in next week's interview.

At the annual meeting of the National Sweet Pea Society last week Mr. Hugh Dickson was chosen for president for the ensuing year. Owing to pressure of business, Mr. C. H. Curtis was obliged to resign the honorary secretaryship, and Mr. H. D. Tigwell was finally elected to the post, which now carries with it a salary of £50 per annum. Mr. Edward Sherwood still remains treasurer, and Mr. R. Gluyas auditor; while Mr. F. W. Harvey was elected chairman of committee.

Digitized by Google Original from CORNELL UNIVERSITY

May 22nd.—I see that growers of Clematises are having some trouble in consequence of the stems splitting, and the cause is attributed to excessive quantities of water. But is that sufficient? It is not easy to think that the stems of the Clematis are liable to split under natural conditions. That they should persistently absorb water until they split is about as likely as that wireworms would continue to eat oilcake until they burst. It is, however, quite a different matter if they are compelled to absorb

MR. HERBERT COSTER.

water in excessive quantities, and, as the majority of Clematises are grafted, this might easily be one of the results when the stock was more vigorous than the scion. At any rate, splitting is not uncommon among grafted fruit trees. I have never noticed it among those on their own roots. There is in my garden a grafted Apple tree, which splits every year, but the amount of splitting has been considerably reduced by root-pruning, thus proving that the cause is the excessive root-action of the stock.

A Handsome Shrubbery Plant.

May 23rd.—The Euonymus, when the capsules split and display the coral-red fruit in autumn, is one of the handsomest plants in the shrubbery. Now that it is in flower, it is not very attractive, for the flowers are small in size and greenish-white in colour, and they have an unpleasant smell, a sure sign that flies, and not bees or butterflies or moths, assist in their fertilisation. The name is supposed to have originated with some old humorist who called it Euonymus—that is, of good repute—because every part of the plant, when bruised, gives off a fetid odour. The Euonymus is common in most European countries, and, though it does not appear to be a native of Great Britain, it must have been brought here at an early date—possibly by the Romans, who used it for various purposes, especially for spindles. Hence its popular name, Spindle-tree. Until comparatively modern times the wood was also largely employed in making skewers, but whether it is still utilised in this way I do not know. Probably, the various species are now grown solely for ornament. Dumont, in the courtly language of long ago, says of them, "They spread, by their numerous pendent capsules of a bright red colour or pure white, and their white and orange-coloured seeds, some rays of brilliance over the departing season, and recall the remembrance of the fine days of summer." What more could any plant do than this?

May 24th.—Towards the end of summer a fine Magnolia grandiflora is a magnificent sight on the south wall of a house, when the large deep green leaves are starred with white, lemon-scented blossoms. There are, however, several other Magnolias, scarcely less beautiful, which flower in spring before the leaves. M. conspicua is the best known among them, but M. Campbelli (though not quite hardy) and M. stellata are also worth growing. Another is M. acuminata, a native of North America, and probably the hardiest of all. Magnolias, after they have once been planted, should not be disturbed. If the conditions suit them, and they are left alone, they grow fairly rapidly.

H. C. DAVIDSON.

The Gardens of the Marquis of Bristol.

INTERVIEW WITH MR. HERBERT COSTER, AT ICKWORTH PARK, BURY ST. EDMUND'S.

"YOU could not have come to Ickworth on a better day than this to see it in its natural beauty," said Mr. Coster, the head gardener to Lord Bristol, on my arrival from Bury St. Edmund's early on the morning of April 20th, and I speedily understood the meaning of his greeting. Ickworth is, of course, a famous and historic seat, with many interesting features and associations. But in the lovely sunshine nothing more beautiful greeted my eyes than the magnificent displays of spring flowers naturalised in all parts of the demesne.

Millions of Flowers.

"They are now at their very best," said Mr. Coster, as we strolled along the sequestered walks and glades which render the old pleasure grounds so attractive. Wherever we went there were Daffodils, Primroses, Scillas, and Forget-me-nots, the first, in their golden glory, greatly predominating, but not obscuring the delicate charm of the others.

"There must be millions of Daffodils," I said, as we paused to look down one of the winding grassy paths which enhance the beauty of the place.

"I suppose there are," rejoined Mr. Coster. "Of course, the work of naturalisation has been done gradually, but now the number of flowers is practically countless. Our earliest guest, by the way, is the Aconite, which is followed by the double Daffodil of one variety, Van Zion, and then there come the naturalised singles."

"Which are the best varieties for naturalising?"

"I think that perhaps the three best are Barrii conspicuus, Autocrat, and Empress, but, with a little care, all of them will do. I mean that the bulbs must not be thrown in anywhere. It is necessary to stir the soil, and give them a chance to root."

The Oak Walk.

Oaks are in great force at Ickworth, and the Oak Walk, which brought us close to the imposing mansion, was enriched by an amazing wealth of bloom. Here, on the north side of the mansion, are some splendid Cedars, and under their imposing shadow is a pretty little flower garden, chiefly consisting of herbaceous plants. In one corner are Roses as standards, with dwarfs at the foot; and on the wall are Fig trees, Forsythia, Ceanothus, and Jasminum. Then, there is the Oak garden, with a Quercus of vast size and age in the centre, and a number of surrounding beds, with Hyacinths, Dog's-tooth Violets, and Hepaticas. The fine conservatory is a continuation of the corridor, and the arrangements are remarkable for absence of stiffness. The sides were banked with Amaryllis, Azalea, Cinerarias, Coronillas, and other decorative flowers.

"How do you fill the beds on the lawn in summer?" I inquired, when I had noticed the double Peaches in bloom.

"Chiefly with Geraniums, Heliotropes, Phlox, and Zinnias. But the bedding is not strictly formal. In fact, there are only two small pieces of formal bedding."

"What is the length of the terrace, and therefore of the Box hedge which runs all the way?"

"A quarter of a mile. The Box is four feet through at the bottom, and three feet high. The few Bays, and the vases (which later on will be filled with Geraniums and Lobelias), accord, I think, with the dignity of the building."

"If you lack formality, you seem to abound in surprises?" I said, as we suddenly came to a Magnolia garden.

"Yes, we rather go in for variety, as you will see better presently. We are growing the Fellenberg Rose in another corner; but, when you have had a glance at the Cypress Walk, with its Roman Cypresses, we must make our way along the Albana Walk to the kitchen garden."

A Beautiful Kitchen Garden.

The Albana Walk, I found, is distinguished by lovely views of country more like Devonshire than Suffolk, and here, in addition to the never-ending colonies of naturalised Daffodils, were many choice flowering shrubs, with a number of noble specimens of trees, Oaks always being to the fore. while Box grows up quite twenty feet high. Passing the church, we soon arrived at

THE DOME AT ICKWORTH.

the kitchen garden, which, however, is at least as remarkable for its beauty and its size as for its utility and order.

"Shall we take the fruit under glass?" asked Mr. Coster.

"Are you very keen on fruit?" I asked, as we entered a house devoted to Peaches and Figs.

"Yes, I am very fond of growing fruit, both under glass and out of doors. The Fig trees are Brown Turkey, and are about thirty-five years of age. We always get two crops, and the flavour is very fine. The Peaches were replanted about 1899; the varieties are Violette Hative, Hale's Early, and Grosse Mignonne. The only Nectarines are Lord Napier and Early Rivers."

"I see you have a good spring batch of winter-flowering Carnations."

"We grow more for the winter than for the spring, but I am very fond of all the new American varieties; some of the best are Prosperity, Enchantress, Mrs. Lawson, and Floriana. With regard to treatment, I am not a great believer in excessive heat. I believe, rather, in plenty of fresh air."

"The Vines in your late house are looking remarkably well."

"They were planted in 1898, and the varieties are Alicante, Appley Towers, Lady Downe's Seedling, and Lady Hutt. The variety of French Beans in this Vinery is Ne Plus Ultra, which I have grown for some time. In fact, when I know I have a good thing, I stick to it, and before I do away with a tried variety in favour of some novelty, I test the latter well. I pursue the same policy with regard to Strawberries, and force four hundred of one variety only—Royal Sovereign. We began to pick fruit on April 1st.

"You must have a large number of Violets?"

"About thirty-two lights. The varieties are Lady Hume Campbell, Marie Louise, Princess of Wales, J. J. Astor, and Miss Rothschild. I like the last best of the singles. Here is a batch of Zonal Pelargoniums, which we appreciate in winter. The varieties are chosen for the colour, which we like to be bright, but not glaring. The next house is a newly-planted Vinery."

An Ideal Place for Ripening Freesias.

"When was it planted?"

"Last year, and only with Muscats. The Alicantes and Lady Downe's in the next Vinery were planted in 1902, and another Vinery is being replanted bit by bit. I cannot afford to lose the supply. This house contains Black Hamburgh. You will see, as we proceed, that all available space in the houses is turned to account, for the simple reason that winter flowers, winter fruits, and winter vegetables are required in large quantities. As to winter flowers, I may mention that the Freesias are grown from bulbs that I found here sixteen years ago. There were a few pots behind a wall, and I have kept increasing them, and now we grow two hundred and fifty in 6-in pots. I started cutting on New Year's Day, and was never without blooms until the second week in April, cutting constantly all the time. I consider the top shelf of a Vinery an ideal place for ripening them. The variety is refracta alba. My impression is that the original bulbs date back twenty-five years."

A Constant Supply of Carnations.

"You devote a house to Border Carnations?"

"Yes, we grow them in two batches, one to flower in May, and the second to keep up the succession until the outside plants flower. The varieties are chiefly Martin Smith's, Hildegarde (white), Mrs. Tremayne (yellow), Eugene Sorrel (crimson), Daughter of Heth (fancy), Lady Hermione (pink self), Lady Bristol (yellow-ground), Cecilia (yellow), and Goldilocks (golden). A few Malmaisons are also grown in this house, including Mrs. Trelawney, Baldwin, Sir C. Freemantle, and Lady Grimston. After we have finished with the Border Carnations outside, the Trees keep us going until the Borders come on again. We have never been without Carnations all the year round for ten years."

THE GRASS WALK IN THE KITCHEN GARDEN AT ICKWORTH.

Experiments With Schizanthus.

"What do you do with your herbaceous Calceolarias?"

"We use them for the conservatory. There is a rage for cut flowers, so they are now somewhat out of date. I am growing a number of Schizanthus Wisetoniensis for a single plant for a vase. There are nearly one hundred; they begin to flower in April, and keep on for eight weeks. I am going to have various trials to see if they can be made to flower in February and March. These plants were grown from seed which originally came in an ordinary sealed packet. Pelargoniums are a little old-fashioned, but very useful, and I fill quite half a house with them. Some of the vest varieties are Decorator, Duchess of Fife, Rosy Morn, Princess May, Duchess of Edinburgh, H. M. Stanley, Princess Alexandra, and Edward Perkins, the last a very good Pelargonium, crimson with pink."

"Is there anything special in the stove?"

"Yes, a batch of Cyclamen. We go in very largely for these, which make an attractive show in the winter. They are Sutton's strain, the varieties being chiefly Vulcan, Giant White, White Butterfly, Giant Pink, and Salmon Queen. Then, to finish with the houses, we grow two beds of Mushrooms, and are very rarely without them."

A Brilliant Border.

"How large is your kitchen garden?"

"Between five and six acres. You will notice that, though called a kitchen garden, it is gay with flowers, as I think a kitchen garden ought to be."

"I see you have a brilliant show of Aubrietias in one corner."

"They are not grown so much as they ought to be, considering their merits. They come into flower early in April, and brighten a good many corners. The varieties are Dr. Mules, Fire King, Pritchard's A1, Lemon Queen, and Moerheimi. Under the south wall I am growing Gentians. In some places they grow like a weed, but here I had a little difficulty, because the soil is a heavy loam. However, I mixed some light soil with it, and the plants put in eight years ago are now doing well."

"You have a brilliant border of yellow and red under the east wall."

"You mean the Daffodils and Anemone fulgens. By the way, Anemones dearly love a piece of fresh ground, and I move them every two or three years. The May-flowering Tulips facing the border are rather a point with us."

"They are very beautiful. Are they chiefly Cottage varieties?"

"Yes; among Darwins we have Loveliness, Clara Butt, Europe, Galatea, Phœcia, and Bartigon."

The Rose Walk.

"You seem to have a number of delightful walks in your kitchen garden, with grass in the centre, and flowers and fruits at the sides."

"It took me ten years to get enough Anemones of various colours for the walk we are now looking at. It is called the Rose Walk, but the aim in this, as in other cases, is a mass of colour in spring and summer. Hybrid Tea and Moss Roses are planted the whole length of the walk, with fruit trees behind them, the borders consisting of Daffodils and Anemones in three colours, crimson, mauve, and pink. The Rose Walk is one hundred and thirty yards long."

A Delightful Picture.

The next surprise that awaited me was an enclosed garden with a tea house, in front of which is a border containing Hyacinths in variety, while, later, Roses such as Gloire de Dijon and La France will beautify it. In the morning sunlight the scarlet Anemones and the blue Aubrietias, with the lake below, and the deer in the park beyond, formed a delightful picture.

"We are always trying," continued Mr. Coster, "to make the kitchen garden beautiful. Thus, the Sweet Peas, forming a border thirty-three yards long, autumn sown, in clumps of different varieties, were chosen for the colours to harmonise. Below the Sweet Peas is a border of mixed Tulips and Spanish Iris."

The Tulip Walk.

"Then you have a Tulip Walk?"

"Yes, we call it that, but the Apples, espalier-trained, are also a feature. The Tulips and Apples flower together, and the effect produced is very good. I may say that all the walks have been relaid, and made to run at a natural gradient. We have also made recent additions, such as the Water Garden we are now approaching."

"With Daffodils naturalised on the banks of the brook feeding the lake."

The Island.

"We are also going to have Water Lilies. The little island beyond, planted with trees in the centre, and Aubrietias, Arabis, and Primroses round, is a recent addition. Two years ago I

converted a Nettle bed close to the private entrance in the kitchen garden into an ornamental bed with coloured Thorns, Laburnums, Lilacs, and Spiræa, Daffodils being also freely used. The fence of some length opposite I have planted with Lady Gay Roses, and on the banks by the rustic bridge Primroses are planted."

The Daffodil Walk.

"Now," I said, as we returned to the kitchen garden proper, "what are the varieties chiefly used in the Daffodil Walk?"

"We call it the Daffodil Walk so long as the Daffodils are in flower, but afterwards it will have another name. Some of the best of the Daffodils are Glory of Leyden, Lulworth, Gloria Mundi, Blackwell, Minnie Hume, Palmerston, Stella superba, Duchess of Westminster, Sir Watkin (big batches), Magdaline de Graaff, Victoria (a specially good trumpet), Emperor, Horsfieldii, Mrs. Langtry, Gwyther, King of Netherlands, Madame de Graaff, Empress, Barrii conspicuus, and Autocrat. They are all planted in batches of one variety, and I think the grass walk between the borders with the wind from the lake blowing among the flowers render them additionally attractive."

"You are making even the Gooseberry quarters look beautiful."

Hyacinths Amongst Raspberries.

"They certainly, I think, look all the better for the Parrot Tulips and Wood Anemones planted between them. Three years ago I planted Hyacinths (in various colours), and Narcissus poeticus ornatus between the Raspberries. I have already commenced Tulips among the Currants. The Tulips are the variety with the swan neck, Syvestris, having double flowers on a stem. I put in a dozen bulbs, and propose to try them for naturalisation."

"You have more Tulips in other beds?"

"Yes, they are species, and they are very attractive, and begin to bloom in March, the varieties being Kauffmanniana, Eichleri, Præstans, Wilsoniana, and Daisy Stemon. Close to these Tulips is a variety of Anemone named Blanda, which flowers remarkably early."

The System With Apples.

"When did you begin to grow your fruit on the present system?"

"In 1898. I started with Apples, planting the trees six feet away from the walk, forming a border all round the garden, and across walks. As to the varieties, I got the best collection I could buy, including, of kitchen varieties, Peasgood's Nonsuch, and Newton Wonder. The dessert varieties include Cox's Orange Pippin, Allington Pippin, Margil, Beauty of Bath, Lady Sudeley, and a very old Ribston. Every Apple tree is labelled and dated, and, in fact, so is all the fruit."

A Pear Wall.

"What about Pears?"

"I have just planted on the west wall a number of varieties, training them at an angle of sixty degrees, as single cordons. The varieties are Winter Nelis, Bergamotte Esperen, Le Lectier, Thompson's, Combat Lessier, Alexander III., Fondant d'Automne, Marie Louise, Beurré Diel, Beurré Superfin, Beurré Rance, Beurré Bosc, Emile d'Heyst, Doyenné du Comice, Beurré Easter, Winter Orange, Princess, Louis Pasteur, and Krull. Before planting, I mixed all the soil, it being necessarily made lighter than it naturally is. I consider that the Pear wall will now be good for a long time."

"There is one other feature of beauty which ought to be mentioned. I mean your Roses on poles."

"When they are in flower they show up well. They are chiefly Wichuriana varieties, Gloire de Dijon, Hiawatha, Crimson Rambler, and Dorothy Perkins."

As we proceeded towards the handsome stables for the trap, Mr. Coster said, "You see, we decorate our stables with flowers, growing Roses Gloire de Dijon on the walls, and Hyacinths in the centre of the yard. In the summer there will be Ivy-leaf Geraniums in boxes growing up the walls, Mr. Hithcath, the coachman, being a keen gardener and lover of flowers."

"You have told me a great deal about the manner in which you beautify your gardens, but nothing about yourself."

"There is nothing to say on that point, except that I have been here sixteen years, and am a native of Hampshire. But that is a short period compared with the time put in by a veteran on my staff, who has been at Ickworth Gardens sixty-three years, and has served under three Marquises and four gardeners only."

ALFRED WILCOX.

Letters from a Lady Gardener.

No. 251.—RARE BULBS AND THEIR CULTURE.

DEAR KATE,—I think there is a special fascination about bulbs. You buy a little dry, brown thing, and put it into the earth, hiding it for a time; but sooner or later a green sheathe appears, soon rapidly opening to show you the lovely flower which all the time was there in embryo, only waiting until Nature should perfect its beauty, and the sunshine should call to it.

Unfortunately, few of us recollect that Nature is never idle, and that, as soon as the blossom is over (unless seed has to be ripened), she sets to work to form flower-buds for the next season, and therefore the plant must have care and consideration at that time, uninteresting as it may look on the outside; for, without care (i.e., enough water to prevent the leaves from drooping, with plenty of sunshine to ripen them away gradually, and fresh air), they cannot do any more for us, and fail to bloom again.

SEEDLING HIPPEASTRUMS.

Bulbs After Flowering.

The foliage of a plant stands in much the same relation to it as our lungs do to us; without its leaves the plant cannot possibly inhale the life-giving oxygen and nitrogen, etc., which it must have to live and be healthy, so that it is the height of folly in us to deprive a bulb of its leaves either by withholding water suddenly, or by cutting them off. But it needs but little water after flowering, as it is not making any fresh greenery, and we must not, therefore, soak it when already damp, or it may rot, for it specially needs warmth just then. Many an ignorant gardener will neglect a bulb which has flowered in a pot, or cut off the foliage of those which grow in the border or the grass—thinking that the leaves are no good when the flower is past; but this is a sad mistake, which accounts for many a disappointment during the following season, when leaves indeed, weakly and poor, may appear, but there will be no flowers. Another thing to be avoided (if you want flowers) is to allow seed-vessels to remain on a bulb. Every green herb is under its Creator's orders to "replenish the earth," and when a plant has obeyed the mandate, and feels that its duty is done, it will not struggle to live, besides which seed-bearing exhausts it far more than producing flowers; moreover, no embryo flowers can be formed in the centre of the bulb whilst seed is ripening.

So the right thing to do is to cut down the flowering stem (as far as it has no foliage) directly the flowers fade; but to continue to supply the roots with sufficient water to allow the leaves to ripen away gradually, with abundance of sunshine and fresh air. Treated in this way, even bulbs which have been forced into early bloom will recover their tone in a year or two; Hyacinths will form flowers yearly, which may be small indeed the first year after forcing, but will increase in size each season until the third year the bulbs will have recovered, and the trusses of bloom in the sunny open border will be as fine as ever. But to-day I am going to tell you of a few uncommon bulbs, for I like to add some new varieties to my collection every year, as they give so much interest to the garden, and you may wish to do the same.

Some Beautiful Species.

Just now, the tall, elegant-flowering stem (crowned with an umbel of pink Lilies) of Amaryllis (syn. Crinum) longifolia is in full beauty, and the pure white flowers of Crinum capense album are also open. They are in large pots and tubs in the cool porch, but they have been started in warmth since February, for they do not blossom so early as May, unless they are repotted (in good loam) early and placed in a temperature from fifty-five to eighty degrees, when they suddenly spring into life, and need a lot of tepid water. They spent the winter under an open shed (for they are nearly hardy, and we are glad to have their room and not their company when dormant), protected with mats raised over them on stout sticks; and, after flowering, they stand in the full sunshine out of doors, until their foliage has gradually disappeared. But large bulbs of these plants will throw up several flowering stems during the season, if started in February; and without any fire warmth at all they will blossom in the autumn in a verandah or a greenhouse; so that most of us might grow Crinums if we wanted to.

The grand flowers of Amaryllis Hippeastrum, too, can be grown in the same way, and wintered in any dry, frost-proof place; their magnificent blossoms, from eight to nine inches across, are unique in size and colour (deepest ruby-red to carmine and white), and it really is astonishing that they are so seldom seen. I admire all the Amaryllis, they are so elegant and so richly coloured, besides which most of them are easy to grow. I have a quantity of Amaryllis Belladonna bulbs flourishing on the warm south border under the conservatory wall; they are planted close to it, and enjoy the baking they get from the sunshine in summer.

Near them the Nerines grow, and both are left undisturbed for years, when they become very fine and strong. Each year, at this time, they

It is added that if the soil is deeply dug and well manured, Hollies, far from being slow growers, make surprisingly rapid progress. Evelyn states that with young seedlings, four inches high, collected in the woods, he made hedges "full four feet high in four years." There is certainly no finer hedge than one formed of Holly when well grown. It is evergreen, very ornamental, quite impenetrable, and can be kept in order at a minimum of trouble.

Early Bulb Planting.

September 20th.—I accidentally turned up some Daffodils about the middle of August, and found that they already had a considerable number of roots. Yet many people who intend to buy bulbs for planting are still waiting. Such delay cannot but be prejudicial. If there is one point more important than another in the cultivation of bulbs, it is that the roots should be allowed to get a good start. The longer the interval between the commencement of root growth and the commencement of top growth, the better. If planting is delayed until late in the season, roots and leaves will begin to grow simultaneously, or nearly so, and as the latter draw their nutriment from the bulbs, which are not fed in their turn by the roots, the bulbs must dwindle away. It will probably be found that this has something to do with the not uncommon failure of certain bulbs in sandy soils. In such soils, unless they are planted deeper than usual, they are much more under the influence of light and air than they would be in heavy soil, and this influence stimulates top growth. In such cases it might be advisable to try deeper planting.

A Remedy for Gumming.

September 27th.—It was stated some time ago, in an article in "Le Jardin," that Sorrel leaves are used for curing gumming in Plums and other stone-fruit trees. The practice may be common in France, but I have never heard of it in this country. If it is beneficial there, it should be beneficial here. The gum is first scraped away, and then the leaves are applied to the wound. The efficacy of the treatment depends on the fact that oxalic acid which they contain destroys the bacteria which are the cause of the disease. A French botanist proposes to carry this method still further. He says that if a weak solution of creosote is injected under the bark of a tree, it is rendered immune against the attacks of insects. He dosed a Pear with pyrophosphate of iron and soda, and found that, while the branches on the opposite side were attacked by an injurious fungus, those on the same side as the hole through which the dose was administered were perfectly healthy. He thinks that food might be given in the same way. H. C. Davidson.

Famous Gardeners at Home.

No. 270.—Mr. Stephen Couling, at the Gardens, Cæsar's Camp, Sandy.

As its name denotes, Cæsar's Camp is situated on the site of an old Roman camp. From Sandy station to the residence of Mr. C. Guy Pym there is a steep ascent, the house being on the summit, more than seven hundred feet above sea level. The slopes are very picturesque, and the Pines surrounding the pleasure grounds—which run in three terraces, the top being devoted to flower beds, the second to a croquet lawn, and the third to tennis courts—greatly add to the charms of a novel and attractive position. As I strolled up the pretty slopes with Mr. Couling, the head gardener, on the occasion of my visit early in August, I was very much impressed with the effective manner in which the outskirts leading to the woods are embellished.

Charming Features.

Thus, raised on two tiers of stone, at one point was a group of Fuchsias, Abutilons, Petunias, Gnaphaliums, and Tagetes, with tall scarlet Geraniums, and at intervals all along the winding walk, intermixed with flowering shrubs, were various plants in flower. Another feature was a number of beautifully-arranged baskets at the end of the croquet lawn, with a fine display of salmon and pink Geraniums, about five to six feet high, and three to six feet through.

"Everything," said Mr. Couling, as we proceeded, "takes a great deal of feeding, owing to the poverty of the soil. We have to use a quantity of artificial as well as of ordinary manure."

"Are there any shrubs that do particularly well with you?"

"The foliage of the Sycamores (variegated, white and purple), and of pseudo Platanus, Maple Schrœderæ, and Prunus Pissardi, all tall standards, is much admired. In the next row are half-standards of Maple, negundo variegatum, argenteum, aureum, marginatum, and californicum aureum. On the lawns and their surroundings are fine specimens of Wellingtonia, Cedrus deodara and C. atlantica, and Limes. The principal bedding is in front of the house, the only other beds on the lawns being at the corner. Montbretias are largely used for these."

Mr. Stephen Couling.

Cæsar's Camp, Sandy.

The Flower Beds.

"You have a fine show of colour in front of the house. What is the scheme?"

"The design is a combination of circles and incurved squares, all the beds being cut on the grass. As to colour, I have aimed at a combination of scarlet, yellow, purple, and white, for summer bedding. Would you like to know how the different beds are made up?"

"Very much, indeed. Shall we take the centre bed first?"

"The substance consists of Geraniums Flower of Spring (white foliage), double Geraniums, Raspail (scarlet), and double white, with golden Harry Hieover (bronze, with scarlet flower), and Iresine (purple foliage), and the rest is made up of Lobelia speciosa, Geraniums Harry Fish (yellow and scarlet), small white Geraniums with white foliage, Lobelia compacta, Geraniums Swanley Gem, and Ageratums. The four incurved squares are composed of Geraniums golden Harry Hieover, Swanley Gem, Ageratums, and Henry Jacoby Geraniums. The four

large circular beds outside contain yellow dwarf Zinnias, double white Geraniums, and Eulalia japonica variegata, with small white Geraniums, Iresine, a row of Kochias round the centre, Geraniums Raspail (double scarlet), dotted with Ivy-leaf Geraniums Charles Turner."

"And the four small circular beds?"

"They comprise white Lobelias, yellow dwarf Zinnias, double white Geraniums, and Castor-oil Bronze King. Celosias, yellow and scarlet, are also employed in the scheme. There are nineteen beds, the centre bed being twenty feet across, and sixty feet round."

The Spring Bedding.

"I should like to know how you plant these beds in spring."

"In the centre I use Wallflowers (Cloth of Gold and Blood-red), blue Myosotis and double white Arabis, filling in with dark Polyanthus. For the large circular beds, Polyanthus of dark colour, and double white Arabis, filled in with dark Wallflowers, are used. The four incurved squares are entirely composed of Primroses mixed in colour, and the four small circular beds of blue Myosotis, filled in with new ivory-white Wallflowers. In order to make the colours more distinct, red, white, and yellow Tulips, and white Narcissus are introduced. I find that the Pottebakker Tulips are the best."

A Handsome Rosery.

"How long has your Rosery, with its fine pergola, been established?"

"The Roses were planted early in December, 1905, the design being one registered by Messrs. Boulton and Paul, of Norwich. This year I have growths already reaching over twelve feet. As you may notice, there is a Wistaria growing up the centre pole, and when it reaches the top I intend to trail it down any chain which the Roses have not covered."

"Which varieties do you find answer best?"

"Aglaia, Aimée Vibert, Allister Stella Gray, Ards Rover, Blush Rambler, Bouquet d'Or, Carmine Pillar, Céline Forestier, Cheshunt Hybrid, Claire Jacquier (this does particularly well), Captain Christy, Devoniensis, Niphetos, Mrs. W. J. Grant, Papa Gontier, Perle des Jardins, La France, White Pet, Crimson Rambler, Dorothy Perkins, Euphrosyne, Felicité Perpetué, Fortune's Yellow, Gloire de Dijon, Lady Waterlow, Leuchstern, Longworth Rambler, Abel Carriére, Psyche, Madame Bérard, Marie Lavally, Reine Olga de Wurtemburg, Reine Marie Henriette, Reve d'Or, Tea Rambler (exceptionally good), The Garland, and William Allen Richardson."

"I suppose you grow different varieties in the perennial borders round the outside of the ground?"

"Yes, all Hybrid Perpetuals, of which the principal are Ulrich Brunner, Suzanne M. Rodocanachi, Madame Victor Verdier, Prince Arthur, Mrs. Sharman Crawford, Mrs. John Laing, Merveille de Lyon, Marie Baumann, Alfred Colomb, A. K. Williams, Baroness Rothschild, Ben Cant, Captain Hayward, Charles Lefebvre, Crown Prince, Duke of Wellington, Duke of Edinburgh, Dupuy Jamain, Fisher Holmes, Frau Karl Druschki, General Jacqueminot, and Margaret Dickson. I grow about two hundred plants, and try to arrange the varieties in different positions in order to prolong the period of flowering. The Teas and Hybrid Teas are grown in pots, about fifty, as time will not allow me to look after them on this hot soil."

Annuals and Herbaceous Plants.

"You have an admirable arrangement of annuals round the Rosery, growing, I observe, in rows of different varieties."

The Pergola Leading to the Kitchen Garden at Cæsar's Camp.

"The front row consists of Gnaphaliums and Lanata tomentosa; the second of striped Petunias; the third of tall Ageratums, and the tall yellow Tagetes; the fourth of tall Zinnias, Stocks and Asters alternating; the fifth of Salpiglossis, African Marigolds and Coreopsis; the sixth of Nicotiana, including the new variety, and Cosmeas mixed; the back row consisting of various shades of Helianthus."

"We might mention here, I think, some of the herbaceous plants grown in the borders."

"One of the best of these is the Anchusa, the tall variety, a lovely blue, which was brought out by Messrs. Sutton. Alyssums are used as a border on a small bed. We have about twelve varieties of Carnations, and choice seedlings; Chrysanthemum maximum, and all the early-flowering varieties; Dianthus, which last about four years from one sowing; Doronicums in three varieties; Gaillardias, the perennial hybrids grown from seed; the white and blue Galegas; white and pink Mallows; the Evening Primrose (Œnothera); a choice selection of Pæonies; Salvia Patens, which lasts for several years in a warm spot; and about twenty-five varieties of Asters. We also grow," continued Mr. Couling, "Anemones, Aquilegias, Arnebias, Bocconias, Campanulas in variety, Chelones, Christmas Roses, Coreopsis grandiflora, Dielytra spectabilis, Echinops, Erigeron, Eryngium (Sea Holly), Farfugium, scarlet Geums, Gypsophilas, Hedysarums, Heleniums in variety, Helianthemums in variety, Hemerocallis, Hypericum, Candytuft, Inulas, Irises in quantity, Kniphofias, Mertensias, Phloxes in variety, Physalis, Potentillas, Rudbeckias, Pyrethrums, Saxifrages in variety, Scabiosa (white and blue), Silenes, Solidago, Spiræas, Statice, and Tradescantias. A number of Foxgloves and Hollyhocks are used at the back of the borders, and Pampas Grasses form a finish to some of the borders. I plant Delphiniums on the shady side of the garden, but they dry up rather quickly on this soil, and Pentstemons soon die out. Bulbs are largely used for the borders, and in bare places various annuals are planted, so that I can cut flowers nearly all the year round."

Fruit in Different Forms.

The kitchen garden is most conveniently situated, and is approached from the lawns through an arch of Roses and a pergola of Apples and Pears. The pergola, in fact, goes round the garden, and includes two Apricot trees, which do well, whereas Apricots will not grow at all on the walls."

"You grow Apples and Pears both as pyramids and cordons," I said.

"Yes, the cordons were only put in a few years ago, and, though not more than fifteen inches from the ground, fruited the first season, and fruit well every season, as many as forty to sixty dessert Pears on a tree. The varieties include Louise Bonne of Jersey, Beurré d'Amanlis, Catillac, Marie Louise, Glou Morceau, Souvenir du Congres (which ought to be grown in every garden), Doyenné d'Ete, Beurré Hardy, Beurré Superfin, Beurré Rance, Winter Nelis, and Knight's Monarch. I may say that our plan is to grow fruit in various forms, as I find that, if I fail in one, I can succeed in another."

"How long ago was the garden made?"

"Only ten years since; at least, all the planting has been done in that period. One of our difficulties is that the trees on the east and south side prevent the sun from entering the garden early in the morning, and we have to use a quantity of bees for fertilising the flowers."

"What Apples do you grow as pyramids?"

"Peasgood's Nonsuch, King of Pippins, Worcester Pearmain, Wellington, and Lady Sudeley. As cordons we grow Scarlet Nonpareil, Court Pendu Plat, and Lady Sudeley, which is a special favourite. I keep the dwarf cordons well nipped back, and prune them in June and August. In addition to the other fruit, Plums are grown on the arches, the varieties being Coe's Golden Drop, Reine Claude Violet, Golden Gage, and Victoria. Both Victoria and Smith's Early Prolific are grown as pyramids."

Wall Fruit and Vineries.

"What about wall fruit?"

"Peaches, Rivers' Early, Barrington, Alexandra, Grosse Mignonne, Royal George, and Noblesse, and Nectarines of one or two varieties. The two Fig trees were planted five years ago, and we get very good crops of Brown Turkey."

"Do you make a point of growing all the bush fruit in the most shady part of the garden?"

"Yes, and to save them from the depredations of the Nightingale, Raspberries, Currants and Gooseberries are all netted under a large cage."

"Your Vineries are surely more than ten years old."

"Considerably; in fact, quite fifty years old. I run rods up every other year, with the result that I get the fruit to stay. The old rods are gradually being cut out, but this, of course,

takes time. The varieties grown are Black Hamburgh, Buckland's Sweetwater, Muscat of Alexandria, and Alicante. This being the only glasshouse, all the bedding plants have to be brought on here, including five thousand Geraniums."

"You use a portion of the kitchen garden for growing flowers?"

"As much as I can spare. For instance, I grow a quantity of Polyanthus of different colours, double Arabis, and Myosotis, for spring bedding, in a shady corner where nothing else will grow. We manage to have Violets throughout the year, except June, July, and August, the varieties being Princess of Wales, Princess Louise, and Czar."

"I suppose the soil does not suit all kinds of vegetables?"

"No, for example, we grow a few Ashleaf Kidneys, but the soil does not suit them. On the other hand, we get May Queen, at the end of May, in good form; and other Potatoes that answer fairly well are Epicure, Scott's Triumph, and Duchess of Cornwall."

"Which of the early varieties of Peas do you prefer?"

"Sutton's Early Giant; we can crop it earlier than even American Wonder. Sutton's Continuity is also a very good Pea, and we grow, in addition, Alderman, Duke of Albany, and Latest of All. Directly the early Peas are over, I plant out Wallflowers for spring bedding."

The Cultivation of Salsify.

"Have you commenced cutting Cauliflowers?"

"Yes, this week, and also Scarlet Runners and Marrow. The varieties of the former are Early London and Giant, and of the latter Canadian Wonder, Runner Bean, and Mammoth White. Of Carrots, we grow Early Gem and Model; of Beetroots, Favourite and Blood-red, and we have a large bed of Musselburg Leeks. Salsify is a very good vegetable when it is cooked properly."

"Perhaps you can tell me how it should be cooked?"

"It should be boiled like Beetroot. Care should be taken not to bleed it, and not to take the skin off until cooked. It should then be rolled in the white of an egg and bread-crumbs; fried in butter it makes a delicious dish. Salsify comes in from October to March, and serves excellently as a second vegetable. It is very easy to cultivate, and should be sown about the same time as Carrots."

"Do you grow many varieties of Asparagus?"

"Only Conover's Colossal. I put in some new beds of another variety, but it was too tender, and died off in the early spring. We do not get Celery before the end of September, but it does well from then until June; the only variety we grow is Sutton's Pink."

How to Get Early Vegetables.

"How many sowings of Onions do you go in for?"

"Three, starting the first in February. I put them in heat until they germinate, and then sow in the ordinary way. This I consider a point of great importance where early Onions are wanted, because, if you get the seed to germinate, it seldom dies. The varieties are Bedford Champion, Ailsa Craig, and Brown Globe. Whether Peas, Beans, or Onions, we try to get them as early as possible. Carrots I treat in the same way as Onions; also Peas, Broad, Runner and Dwarf Beans, in fact, all vegetables required early. In proof of the success of this treatment, I may tell you that the night after I had sown Carrots this year there was a severe frost, but they came on all right, and I pulled them three weeks earlier than if they had been grown in the natural way."

Shallots and Scarecrows.

"You have a nice crop of Shallots?"

"I am rather proud of that crop, because it is the first time I have grown Shallots here. They were grown from seed which was sown in February. My experience is that Shallots will succeed where Onions fail."

"There is one feature of your kitchen garden which ought not to be omitted. I mean the two old men fixed up as scarecrows."

"Formerly we found it impossible to keep the pigeons and jays in the woods away from the Peas, and at last tried the effect of these 'old men.' The result has been all that we could desire; since we put them there, the birds have not ventured near the Peas."

"What was your previous experience before you came to Cæsar's Camp, Mr. Couling?"

"I started at Albany House, Surbiton, my next situation being at Croome Court, Worcestershire. Then I went to Preen Manor, Shropshire, and at the age of twenty-four became head gardener at Shillingstone Hall, Stamford. At the end of five years I came here. I am on the committee of the Sandy Horticultural Society, whose annual show is held at the end of August; but practically all my time is devoted to the care of this garden."

ALFRED WILCOX.

Letters from a Lady Gardener.

No. 269.—LILIUM SULPHUREUM, AND OTHER LILIES FOR THE GARDEN.

DEAR KATE,—If you want to enlarge your stock of Lilies, you should get a bulb of Lilium sulphureum, as well as the more ordinary Japanese Lilies, L. auratum (and its varieties platyphyllum and rubro-vittatum), and the lovely speciosum Lilies in pink, white and crimson.

LILIUM SPECIOSUM RUBRUM.

The Sulphur Lily.

The Sulphur Lily (L. sulphureum) is a grand flower eight inches across, and ten inches in length. It is in creamy-white, with a yellow throat, and the stem is about five feet in height. It is not at all delicate, and will grow in the open border; but it blossoms so late (in that case not until the end of September, or early in October) that it is really better in a pot, as the storms of autumn may otherwise harm it. It is one of those Lilies (like the Tiger Lily), which produces little bulbils on its flowering stem, and these we are treating like seeds, *i.e.*, sowing them in a well-drained pot of loam, peat, sand, with a little charcoal dust. We place the bulbils two inches apart, and right side up, covering them with half an inch of fine soil, and pressing them down firmly.

The best place to put the pan or box containing them is a cold frame, which, however, should be covered over with a mat in severe weather. The little plants will not start until the spring, and must not be kept too warm in the winter, yet they should not get frozen. If you have not room in a frame, you can keep them in a spare room; but they must not be overwatered, yet should never get dust-dry.

A soaking with tepid water, given in mild weather, when there is sunshine, and you can give them plenty of air, will last them a long time; but they must not be forgotten altogether. This Lily (sulphureum) starts late in the spring, so don't give up hope of seeing the little plants if they don't appear before May. Tiger Lily bulbils, and those of the splendid apricot Lilium Henryi, can be treated in the same way, and by this plan robust and hardy plants may be raised for our gardens, which will do much better than any imported bulbs.

These are so spoiled by the horrid habit which the importers have of cutting off the lower roots before packing the bulbs, that they are usually quite crippled the first year after they arrive; and, for this reason, we find it best to grow them in pots for eighteen months, planting them in the borders early in their second spring in England, when they do well, and grow finely from year to year, having made fresh roots below the bulbs. These fleshy roots (which are perennial, and should never be injured in any way) must not be confused with the whorls of fibrous roots which grow one above another on the flowering stems of many Lilies; these are annual, and they shrivel away with the stem after flowering is over; but neither must be hurried in the process of ripening off, which is very gradual, and, in the case of Lilium sulphureum, will last for many weeks.

Cultural Requirements.

Lilies should stand in the full sunshine during their ripening time, and receive enough water to prevent their leaves from drooping, though they will not require such frequent supplies as when in full growth. As the buds for next season are formed in embryo during that time, you will easily see the need for care then, and will recognise the foolishness of starving the plants, which cannot possibly do their work without their foliage. When all the grass has ripened away gradually, and become brown, the bulbs may be repotted, if necessary, and, after that, wintered in a cold frame, with a covering of fine ashes two or three inches deep over them.

Do not bury the pots too deeply, or the spring growths will be weakly, and, as soon as the points of the shoots appear, take the pots out of the frame, remove the ashes, and give the plants a little top-dressing of rich soil instead, around the stems, taking care to leave plenty of room for an ample supply of water and liquid manure, which can be given as soon as growth is active.

We do not pot our Lilies every year, however, because we find they do better undisturbed for

block the stomata, and so interfere with transpiration, with the result that in bad cases the leaves turn yellow and wither. This happens most frequently with the delicate leaves of greenhouse plants, unless the spray is afterwards washed off with clean water. It is less common with plants in the open air, partly because they are hardier, and are seldom sprayed so thoroughly, and partly because the washing off is done by rain and dew.

A GRAFT-HYBRID.

March 21st.—One of the most singular plants in existence is Laburnum Adami. It is called

THE LATE MR. C. GUY PYM.

a graft-hybrid, and was originally obtained by a French gardener, Jean L. Adam, by grafting Cytisus purpureus on Laburnum vulgare. Some branches bear the flowers and foliage of C. purpureus, others the flowers and foliage of L. vulgare, and others, again, are intermediate in character. It was as much a surprise to M. Adam as to everybody else, and not understanding what he had done, he seems to have made no further experiments in the same direction. Of late years, however, several investigators have turned their attention to the subject, and it has been found that if, after a graft has been effected, the scion is cut back close to the junction, it and the stock make in some cases a sort of compound growth, with a similar result to that seen in L. Adami. In other words, the young shoot which is to develop into the future stem contains within its envelope of bark fibro-vascular bundles of both the scion and the stock, and some of these bundles presently separate to form branches like either the scion or the stock, while others remain associated, and thus produce intermediate characters. Some day we may have many more of these graft-hybrids.

THE COMMON LABURNUM.

March 22nd.—The common Laburnum, when in flower, is one of the most effective trees in the garden, and thoroughly deserves its popular name of Golden Chain; but for a long time afterwards, with its great clusters of brown seed-pods, it looks very untidy. Seedlings generally spring up around it, but as compared with the number of pods they are surprisingly few. The seedlings, if not interfered with, begin to flower at a much earlier stage than most trees, often in four or five years.

H. C. DAVIDSON.

FAMOUS BRITISH GARDENS.

CÆSAR'S CAMP, SANDY, BEDS.

Interview with Mr. Stephen Couling.

ON the hill—the highest in Bedfordshire—which overlooks the straggling little town of Sandy, Cæsar is said to have had an encampment, and evidence for this, in the shape of Roman coins, still occasionally turns up in the course of digging the soil. It is from this that Cæsar's Camp, which was erected between fifty and sixty years ago, takes its name. Standing on the summit of the hill, upwards of seven hundred feet high, it is approached by a winding path which makes the ascent less difficult, and as this path leads through woods of Pine and other coniferous trees, it is at once a picturesque and a pleasant walk. On one side the woods come up almost to the house, and in no case are they so far away that the value of their shelter is lost. They open out somewhat to the west, giving charming views over a wide stretch of country; though views are also obtainable from other aspects.

It was after the property came into the possession of Mr. C. Guy Pym, who has recently died, that the gardens were laid out; and to that gentleman and his able gardener, Mr. Stephen Couling, is to be credited the conversion of a very ordinary and commonplace area into one of the beauty spots of the county. Between them they planned and made the terraces and the lawns, the Rosery and the Fernery, the rock garden and the shrubberies, the pergolas and arches, the "wishing well" and waterfall, Mr. Pym, up to the last, finding in the gardens a principal source of interest and pleasure.

The estate, including the woods, is about twenty-five acres in extent, and there are between seven and eight acres of lawns, chiefly on the west front of the house. These lawns are in three terraces, and twenty-three years ago, when Mr. Couling went to Cæsar's Camp, they did not exist. The ground was rough and uneven, and covered with coarse shrub and grass. One of the first tasks was to level and slope the terraces—a large undertaking, involving the removal of many tons of soil and stone, which went to the making of other parts of the garden. On the first lawn are the flower beds; the second and third are used for croquet, tennis, and other games, including golf. The ground falls away gently from the house, but rises again as the end of the farthest lawn is reached. This lawn, as I saw when Mr. Couling showed me round a few days ago, has been ploughed up, and has carried crops of Potatoes and Cabbages, but now that the necessity has passed, he is going to restore it to its former condition. We were standing on the verandah overlooking the lawns, and I was fain to admit that the appearance of the ground under vegetables altogether spoiled the effect.

"It will be a big job to get it back again," he said; "and it will not be quite right this season, but I shall 'chit' the seed before sowing, and the grass will come up quickly."

"You have no spring bedding this year?" I asked, looking at the beds just in front of us.

"No; we have been unable to do any spring bedding, owing to scarcity of labour. I shall have some next year, however, and have already planted out a lot of stuff in a nursery bed."

CÆSAR'S CAMP, SANDY.

"What will the summer bedding be like?"

THE SUMMER BEDDING.

"The colour scheme will be in salmon, pink, and blue, which make a good combination. You notice that the beds have been altered in shape from what they are in the photograph. They used to be in circles and curves, now they are squares and oblongs. There are four divisions, each containing nine large beds. The corner beds will be filled with Ageratums and Geranium Flower of Spring, a silver-edged variety. Other beds will have Marguerites, pink and blue Asters and Stocks, Ageratums, Lobelias, salmon and pink Geraniums, Heliotropes, the blue Salvia patens, and standard Fuchsia Rose of Castile, which is the only one that lasts on this hungry, sandy soil."

Before crossing the lawn we turned to admire the old Wistaria, with its twisting and twirling stems completely covering the verandah; and then entered the conservatory (unheated), where a bright show of flowers was given by Cinerarias, Primula malacoides, Genistas, and

Azaleas. Arum Lilies were getting past their best. The back wall is clothed with yellow Jasmine, and climbing Roses are trained over the roof.

Then, coming out, and descending the gently sloping banks of the sunk lawn, we walked round some of the beds, which are of large size.

"How many plants do you use to fill these beds?" I asked.

"They take at least ten thousand," was the answer.

"And these large tubs at the end—are they also to be filled with flowers?"

"Yes; there are eighteen of them, here and round about, and they will have salmon and pink flowers to harmonise with the bedding. They are old paraffin tubs cut in half, and covered with virgin cork. Each takes about fifty plants. In the middle I shall put tall Fuchsias, and surround them with Ivy-leaf Geraniums, which will hang down, completely draping the cork, and also be trained up almost to the height of the Fuchsias."

VARIED FOLIAGE.

The second lawn is less regular in outline, opening out wider, and curving at the sides, where good play is made with different coloured foliage. Acers of various types—green, bronze, purple, and variegated—occupy the foreground; behind them come standards of the related Sycamores, with white leaves, Prunus Pissardi, silver Poplars, and silver Birches, while in the background are tall Firs, whose dark green makes an effective foil to the dwarfer plants in front of them. Across to the left a graceful Cedar (Cedrus atlantica) is seen, and farther round the bluish tinge of C. atlantica glauca, and the yellowish green of Cupressus macrocarpa lutea, give diversity of colour. Two Cedars of Lebanon are on the opposite side of the lawn, and at the bottom is a Wellingtonia. Near by, Crimson Rambler, Dorothy Perkins, and Lady Gay Roses climb round the trunk of an old Plane tree.

A HANDSOME ROSERY.

Up a few steps to the right, a graceful Larch on each side marks the entrance to the Juniper Walk, a short, broad path leading to one of the most striking features of these gardens, the circular Rosery. The inner portion is made up of twelve light arches of iron, connected by chains to a central pillar, which rises to a height of twenty feet. It is fashioned after the style of Queen Alexandra's Rosery at Sandringham, but is on an even larger scale. Trained on the arches and along the chains are Roses of the best varieties, which meet overhead and form a canopy of foliage and flowers which in the summer must be an entrancing sight. The posts, which mark the outer limits of the Rosery, are connected along the top by thick ropes, which also join to dwarf posts in front of the border, and are carried along on loops. Here, again, climbers are trained, and in the spaces between the ropes are dwarf Hybrid Teas, with weeping standards under the loops at the back.

"The idea Mr. Pym and I had in mind when designing this," said Mr. Couling, "was the old nursery rhyme of 'A ring o' Roses,' with the drooping shoots of the climbers in the middle to suggest the refrain 'all fall down.' Surrounding this garden, as you see, are tall shrubs and Conifers, which rather shade it in parts, but the Roses do fairly well, considering the light soil."

"The soil is not really suitable for Roses?"

"It is too light and poor. All the soil in these gardens is of the same hungry nature, and will take any amount of feeding with organic and artificial manures. Anything planted here has to be, as it were, naturalised. The first year is the critical time: if it comes through that the plant will generally thrive afterwards; if not, then it is no good. The Roses generally make splendid growth—you can see that some of these climbers have made fifteen feet this last season, but they do not last long, and have to be often renewed."

Just behind the Rosery one gets a glimpse of another very fine specimen of Cupressus macrocarpus lutea, its bright foliage lighting up amidst the dark green of the surrounding Conifers.

A RUSTIC PERGOLA.

Leaving the Rosery by way of a handsome rustic pergola, the upright posts of which are extremely stout—being, in fact, trunks of fairly large Pines felled on the estate—and calculated to last for a couple of generations, we passed through an extensive shubbery skirting the third of the lawns. Among the shrubs that do especially well I noted Choisya ternata, the Mexican Orange, and Deutzia crenata, with growths more than ten feet high; many Thorns, and the Maidenhair-tree, Salisburia adiantifolia. It is this lawn which was ploughed up, and Mr. Couling informed me that he purposes making a new perennial border, six feet wide, right across it, to give a good breadth of colour that will be visible from the house.

"But this year, of course," he said, "the perennials will not be sufficiently established to be effective, as the border is not yet made, so I shall fall back on annuals. Sweet Peas, of which I have sown a lot in pots, will come in useful here, and I shall also have Asters, Stocks, Antirrhinums, and other showy subjects."

Having walked round the lower end of this lawn, we came to a junction of two paths, the lower having another rustic pergola, with two short arms, giving it the shape of a cross. This is covered with different forms of Ivy and Honeysuckle. Following this path brought us to a cosy summerhouse, damp and draught proof, and looking down into a well-wooded valley, with good views across to Hitchin and other places, Biggleswade being in the middle distance.

Then beyond this, approaching nearer to the house, we came to the extensive rockery.

THE ROCKERY.

"This, unfortunately, has had to go," said Mr. Couling; "but I hope to get to work on it soon, and even if it cannot be brought back this season to what it was, it will at least be presentable, and next year should be quite restored to its old state. Weeds have flourished, and some of the stronger plants have grown too rampantly. Among the plants are some of the best Alpines. We have all the good varieties of Aubrietias, many Saxifrages and Cyclamen, perennial Candytufts—in fact, a representative collection of rock plants. On the higher parts, and at the top, are shrubby Spiræas, Brooms, flowering Cherries, and Hawthorns. Hardy Azaleas do well, and so do hardy Hydrangeas. Dwarf Junipers make a home in some of the deep pockets, and shrubby Veronicas come through the winter unharmed—perhaps because they are on a warm slope, so that the soil is well-drained, and they get protection from cold winds behind them."

"What is the nature of the stone used in making the rockery?"

"It is the natural stone which we took out when levelling the lawns, and is of volcanic origin, somewhat resembling lava. There are also many round and pebble-shaped ironstones, which when broken are found to contain sand inside. The stone is often perforated and hollowed out, and so the roots of the plants find many cool places, and therefore thrive here."

THE WISHING WELL.

Presently, in following the path, we came upon the Wishing Well, a large, circular recess, with Ferns growing in the stones of the walls.

THE FLOWER BEDS AS THEY USED TO BE AT CÆSAR'S CAMP.

"This," said Mr. Couling, "we made about eight years ago. The inscription on the stone at the head of the well was written by Mr. Pym, and reads: 'The King—God save him. The People—God protect them. The Empire—God preserve it.' Those who drink at the well are supposed to express this wish. The gardens used to be thrown open to the public regularly once a week, and visitors were numerous. Of course, they all made a point of seeing the Wishing Well, and the children, especially, had to drink here."

The Fernery adjoins the rock garden, and, like that, is made of the stones and soil taken from the lawns. There are upwards of a hundred and twenty varieties of hardy Ferns planted in pockets and between the stones, and the walls are a delightful picture of cool, rich greenery, which is not lacking even in winter. Ornamental grasses and other pretty foliage is also seen here, and on the higher parts are Bamboos of many sorts. Following the path we come to a small dovecote, and in another place is a waterfall, also designed and constructed by Mr. Pym and Mr. Couling.

Then, pursuing our walk, we made our way towards the kitchen garden. The approach to this is under another pergola, clothed with Clematis, Roses, and Honeysuckles, while, rising above these on one side, is a fine specimen of the evergreen shrub, Azara microphylla. This pergola might almost be said to extend

Original from CORNELL UNIVERSITY

into the kitchen garden itself, for here a series of light iron arches cover the principal paths. The area of this space is a little less than an acre.

"The soil here," said Mr. Couling, "is like the rest of the garden, very light and hungry. But it has one advantage—things mature quickly, so I can get three crops at least in a year."

"You have a good breadth of bush fruit in the cage."

A PLACE FOR NIGHTINGALES.

"Yes, we have all the usual bush fruits and Loganberries in this cage. We are obliged to net everything, as birds rob us of all fruit, and also destroy the buds. This is a wonderful place for nightingales, which seem to feed on Currants. Although we have wire netting all round, the nightingales get in and out between the meshes, and exact full toll for all their singing. They are not the shy birds some people believe—at least, not here. The netting overhead will have to be renewed, for the great fall of snow we had a little while ago broke a lot of it down."

"How does the soil suit the wall fruit trees?"

"I find it too hot and thin, so that they do not thrive as I wish. On the south wall there are Peaches Early Rivers, but they are not very good. Peaches, in fact, do better as standards in the open. Here is one, Alexander, which grows as vigorously and fruits as freely as an Apple. In a good season we get a barrowload of fruit from it. It is less trouble than a wall fruit tree, as it practically requires no pruning beyond cutting to keep it within bounds."

"Does the fruit ripen properly?"

"Yes; it becomes quite ripe, but owing to the nature of the soil, which has so much iron in it, there is a slight acidity about the flavour. Still, it is excellent when bottled."

"Have you any Apricots?"

"The Apricot is a tree that will not grow here, but there is a lovely little Peach-Apricot, called Early Purple, which does well as a standard. The fruit is the colour and flavour of the Apricot, with a Peach skin, and it bears very regularly."

"You have a very promising Fig on the wall in this corner?"

THE PRUNING OF FIGS.

"This tree is very reliable, and as you say, it is carrying plenty of fruit buds for this coming season. The Fig is a tree that many amateurs mismanage; then, when they do not get fruit, they blame the tree. It fruits on the young wood, and the pruning consists in thinning out and cutting away the old and useless growths; instead of this, too often the young wood is cut away as well, and with this goes the fruit buds."

"What are the varieties of Strawberries?"

"There are three—King George, Royal Sovereign, and Utility. King George is a beautiful Strawberry on this soil, and comes in before Royal Sovereign; while Utility is a good late sort. We had fruit for seven weeks last year from these three varieties."

"How do the espalier Pears bear?"

"These three double espaliers, with the very thick trunks, are old trees, and do little good, but we keep them because they are ornamental. The low cordons on the French system, however, are very satisfactory. They are only fifteen to eighteen inches high. The varieties are some of the best, such as Doyenne du Comice, Beurré Hardy, Marie Louise, Thompson's, and Beurré d'Amanlis."

"CHITTING" SEEDS.

We here stepped aside and entered the Vinery, which has Gros Maroc, Black Hamburgh, Madresfield Court, Muscat of Alexandria, and Black Muscat.

"You do not waste space," I remarked, noticing the staging was filled with seed boxes, cuttings, and growing plants.

"No," was the answer. "We have not much glass, so I use this as a nursery, and raise my seedlings here. I should like you to make note of this system of 'chitting' seeds, which I have adopted for many years, and which some of the market growers in this neighbourhood now follow. By this method you save a lot of time, and avoid the risks of mice and birds taking the seeds."

"How is it done?"

"I sow the seed in shallow boxes of leaf-mould—sand or coconut fibre will also serve—covering it over with a piece of glass. Then, as soon as it has germinated, or 'chitted,' it can be sown out of doors in the usual manner. In this box I have in separate compartments Peas, Carrots, Lettuce, Spinach, Broad Beans, Sweet Peas, and one or two others. They were put in five days ago, and have already germinated."

ITS ADVANTAGE.

"The Peas and Beans can be dropped in the soil easily, but how would you treat Carrots and small things generally?"

"Simply sow them on the top of the ground, as you would ungerminated seeds, and draw the rake over them. If the weather is such that you cannot sow, they can be put in a cooler place to retard them, and they will take no harm from the delay, so long as they do not get too dry."

"Are they not more susceptible to frost?"

"No; once they have started frost will not harm them. This is one of the advantages of this method. The seeds germinate quickly in the warmth, whereas, if sown out of doors, they may lie for a long time before moving, if the weather is unfavourable; while should there be a lot of wet, the seed may rot, and in either case much time is lost. Mice, too, will not take the seed as they do before it has started, and birds will also leave it alone, as it is beyond the state in which they like it. Of course, when it is shooting up it must be protected in the usual way."

"How much time does this method save?"

"As much as three weeks or more. The seedlings will not make much progress if the weather is too cold, but as soon as the conditions are favourable they commence to grow away, and have not first to germinate. Another advantage is that you can sow so much more thinly, as you are sure of germination. Amateurs who have no greenhouse could 'chit' the seed in an ordinary kitchen."

An inspection of the next house, occupied by Peaches, was made, and then we came once more into the kitchen garden, where Mr. Couling showed me a border of early Peas, the seed of which had been "chitted."

After this we made our way towards the north-west front of the house, where some noble trees are growing on the lawn. One of these, a Douglas Fir (Pseudotsuga Douglasii), is about seventy-five feet high, and is beautifully feathered, the bottom branches resting on the ground. Near by is a magnificent Cedar (C. deodara), even taller, and as well-grown, with no gaps or breaks anywhere; while in another corner a Portugal Laurel arches over a rustic seat, and forms a natural arbour. The creeper on this front of the house is Ivy. The new drive by which the house is approached is planted on each side with Larches, Beeches, and other trees, and in front of these are choice varieties of Rhododendrons and other shrubs, some of which, such as Laurustinus and Flowering Currants, were bright with bloom. The handicap of the soil is overcome by taking especial care to water them for the first few seasons, until they are well established.

Mr. Couling, who has been at Cæsar's Camp for twenty-three years, does not exhibit, although he is a member of the committee of the show which used to be held annually at Sandy in pre-war days, and was one of the most important in the country. During the war he has acted on the panel of the R.H.S. experts.

W. J. CHITTENDEN.

Worth Knowing!

THE CONSTITUENTS OF WOOD ASHES.

A bushel of wood ashes, weighing about fifty pounds, will contain 4.6 pounds of potash; 1.47 pounds of phosphoric acid; 21.77 pounds of lime; and 0.21 pound of oxide of iron, all valuable plant manures, generally necessary to apply artificially. Other constituents, not so valuable, are magnesia and manganese, usually plentiful in all good soils.

BEE FLOWERS.

Those who keep bees should grow such flowers as Mignonette, Canterbury Bells, Campanula persicifolia and its varieties, French Honeysuckle, Sweet Scabious, blue Cornflowers, Sweet Sultan, Wallflowers, Erysimum Perofskianum, Anchusa italica and its varieties, Thyme, Lavender, Aubrietias, Candytuft, Centaurea montana, annual and perennial Sunflowers, and Evening Primroses.

SPARROWS AND GOOSEBERRIES.

In some gardens sparrows destroy the buds on Gooseberries and Red Currants. They do not like the oily glands on Black Currants. To check the birds, spray the bushes with strong soapy water, and then dust them with lime. Half an ounce of cayenne pepper to the gallon improves the soap suds.

POTATOES FIFTY-ONE YEARS ON THE SAME BORDER.

There is a garden in Cumberland where the same variety of Potato has been grown in the same border for over fifty years. This should encourage those who have to grow Potatoes on the same ground for some years in succession. The site should be deeply dug or trenched and manured in the autumn. Trenching renews the soil.

HORSE MANURE AND AMMONIA.

When horse manure is obtained fresh, and cannot be dug into the soil for a week or two, it is liable to get very warm, and its ammonia passes into the air, thus depreciating it fertilising properties. This can be prevented by spreading it out in a flat heap eighteen inches by twenty-four inches deep, and covering it with a few inches of soil.

PEA WEEVILS.

During April, when Peas are shooting up from the ground, the leaves get gnawed round the edges in a mysterious way, and to such an extent that their growth is badly crippled. Careful examination will show that Pea weevils (Sistones crinita and S. lineata) are the culprits. When disturbed they drop to the ground and feign to be dead. If the foliage is sprayed with arsenate of lead at the rate of one ounce to one and a half gallons of water, it will poison them.

IRIS UNGUICULARIS.

As early in April as possible, old plants of Iris unguicularis should be lifted and pulled into pieces of moderate size. Select a light soil, giving it a good dressing of old mortar, broken finely. Plant the pieces quite shallowly, and tread the soil very firmly about them. The foot of a wall facing south, or round to west, is the best position for this Iris.

WORMS UNDER PATHS.

When soil occurs at a short distance beneath gravel, or where the latter is old and largely mixed with soil, worms are very troublesome by throwing up their casts. They can be brought to the surface quickly by watering it with a solution of half an ounce of corrosive sublimate in eight gallons of water. Do this while the paths are moist, so that the liquid may sink in rapidly.

J.A. Cox

THE GARDENS OF MRS. McINTOSH, AT HAVERING PARK, ROMFORD.

IT was on a breezy day in the summer that I visited the gardens of Mrs. McIntosh, at Havering Park, which, less than a century ago, formed part of Hainault Forest. The process of development was not accomplished all at once. The original residence, built about seventy years ago, was a comfortable farmhouse, which has been extended and converted into a mansion of importance. The estate altogether, since the late Mr. McIntosh purchased it, has been greatly improved, while as to the pleasure grounds, new features of interest, and fresh elements of beauty, have been constantly introduced. These were pointed out by Mr. J. A. Cox, the head gardener, under whose guidance I explored the domains of which he is in charge. But, first of all, my attention was centred on the immediate surroundings of the house, and I asked the contents of a very pretty terrace border, quite fifty yards long. "It consists of six rows," rejoined Mr. Cox, "made up of Nicotiana affinis, Geum coccineum, Lobelia Sutton's Carpet Blue, Alyssum maritima, Perilla, and Echeverias. In spring we have two rows of Wallflowers Purple Queen, two of Fairy Queen, and a thick band of Crocus Cloth of Gold."

"You must be several hundred feet above sea level," I said, as we strolled on the terrace, and surveyed the magnificent prospect.

"Yes, we are on high ground, and can see the Thames, with Shooter's Hill on the other side. The terrace faces south, so that we get the maximum of sun, but the soil, which is gravel and sand, constitutes a difficulty."

Notable Combinations of Colour.

"Whatever your difficulties, you have some very effective combinations of bedding on the terrace."

"There is no special design, but we do the best we can to obtain masses of bloom, both in summer and in winter. Thus, the beds which are dominated by Geranium Paul Crampel, with borders of Alyssum, have on each side hybrid seedling Pentstemons. The latter came from Aldenham. Then, there are beds of Ivy-leaved Geranium Galilee, with Antirrhinums as dot plants."

"What is the name of the variety of Antirrhinum?"

"Sutton's Intermediate. As you see, we also use it as a dot plant in two beds, with a groundwork of fibrous-rooted Begonias, Carters' Luminosa."

"The combination in the four Maltese cross-shaped beds is striking."

"Iresine Lindenii is the dot plant, and the groundwork is composed of Mesembryanthemum cordifolium. The four little circular beds are made up entirely of Heliotrope Gloire de Versailles. The large bed of Paul Crampel Geranium in the centre of all is surrounded by two beds of Geranium Mrs. Pollock and Flower of Spring; four semi-circular beds of Coleus Verschaffeldtii, two of Begonia Crimson Gem, and two of Begonia Fairy Queen."

The Scheme of Spring Bedding.

"There must be upwards of thirty beds of varying shapes and sizes?"

"There are thirty-five. As we attach more importance to the spring than the summer bedding, you may like to know the features. Sutton's Blood-red Wallflower fills the large bed of Paul Crampel. The four circular beds are red, white, and blue, Tulip La Candeur and Myosotis Royal Blue. Four beds consist of white Polyanthus; four of Pansies of the giant strain, intermixed with Tulips; four of Wallflower Cloth of Gold; four of Aubrietia purpurea or white Tulips; four with double Arabis and Tulip Yellow Prince (one of the prettiest combinations); and four beds of mixed Polyanthus."

SUMMER BEDDING AT HAVERING PARK.

"Can you give me any idea of the number of plants?"

"Only that there are many thousands."

Proceeding down the sloping lawn, the size of the groups of Rhododendrons attracted my notice."

"These do very well here, and Azaleas and Kalmia latifolia also thrive. One of the Azalea beds was planted forty years ago."

The Sundial Garden.

"You use Liliums for flowering later on amongst the Kalmias?"

"Yes; the variety, L. Pardalinum, is not a delicate one, and only requires to be mulched every year to keep it going. Here we enter the sundial garden, of which Roses are the feature. The beds are filled with Teas, Hybrid Teas, and Hybrid Perpetuals mixed, the Roses festooned being chiefly Dorothy Perkins, Wallflower, Lady Gay, Queen Alexandra, and Blush Rambler. German Iris, with many new varieties, are used for the border. Beyond this little garden is an addition, which was only made five years ago."

"Of which I judge Ericas to be a leading feature."

"There are quite three thousand planted here; the hungry soil suits them. I suppose there are quite thirty varieties. The Heaths give us a quantity of blooms in the summer, and a succession throughout the year."

"How do you treat them?"

"Most of the varieties bear cutting back soon after flowering. But that is all we do to them. Another feature in this addition is the long herbaceous border, with clumps of Michaelmas Daisies, Tree Lupins, Campanulas, English and Spanish Iris, Spiræas in variety, Brooms in variety, Foxgloves, and Agrostemmas. As the old plants of these die, the seedlings come up; while behind are Berberis Darwinii, several varieties of Laburnum, and other shrubs."

The Rockwork in the Ravine.

"Down in the ravine I see there are masses of Roses?"

"Roses on the slopes, and rockwork in the ravine. Some of the Roses were only planted a year ago. The object is—as elsewhere in the gardens—masses of colour. We have nothing stiff or formal, but wherever we can get a bright display we have it. The varieties of Roses which suit the situation and soil for massing are especially Caroline Testout, Fellenberg, Madame Abel Chatenay, Laurette Messimy, Baby Rambler, Liberty, Kaiserin Augusta Victoria, La Tosca, and Soleil d'Or. I should add Tausendschon, which was only planted on a tree stump twelve months ago, and is doing splendidly.

"As to the rockwork," continued Mr. Cox, "it is a very simple business. We did away with old gravel paths and filled with soil and rock, and planted largely Aubrietias—Bridesmaid, Dr. Mules, Fire King, H. Marshall, Moerheimi, Lavender, Prichard's A1, purpurea aurea variegata, with Campanulas amabilis, G. F. Wilson, garganica, persicifolia alba, flore pleno, pulla, pusilla, Rainerii, turbinata, and T. alba. Delphiniums have also been introduced in groups, and so have Poppies, which include all the new shades of colour. Down in the ravine are also Daisies, Polyanthus, Scillas, Grape Hyacinths, Snowdrops, Arabis, Alyssums, Saxifrages, Iris, Sedums, Arenaria, Asperulas—these are by the side of the pool—Calthas, Myosotis, Japanese Iris, and I. siberica, Lysimachia, Gunnera scabra and manicata, with several varieties of Primulas."

"You have done so well in a short time that hereafter you will have a very fine rockery in an absolutely ideal position."

A Celebrated Avenue.

Emerging from the ravine, which includes a walk with Lavender scenting the air, we ascended to the Wellingtonia avenue, under whose shadow a play was acted on June 1st. Chinese Vitis, grown on pillars, Syringas, a noble Beech tree facing a summer-house, and a glorious specimen of Crimson Rambler Rose, contribute to the charms of this portion of the grounds. The Wellingtonias were planted forty-six years ago, and the avenue is more than half a mile in length. The trees are in fine condition, and peeps of clumps of flowering plants and shrubs, specially the old Damask Rose, add to the attractiveness of the stately avenue.

Another surprise is the border, a hundred

Digitized by Google Original from CORNELL UNIVERSITY

yards long, under the walls of the kitchen garden, which is turned to admirable account.

"In spring," said Mr. Cox, "we fill it with red and white Tulips in irregular clumps, and Crocuses and Scillas in front. In summer there are clumps of Antirrhinums Orange King and Crimson-pink, with a band of blue Lobelias. The narrower border opposite contains in spring early-flowering Tulips, and in summer Antirrhinums corresponding to the varieties on the wide border."

"And the beds under the wall near the house in spring?"

"We fill them with May-flowering Tulips, and later scented Geraniums, with a band of Iresires and Mesembryanthemums, follow. Scented Geraniums are grown largely in pots. You may care to mention that the vases standing on the stonework in front of the conservatory are occupied by Ivy-leaved Geraniums in variety, Heliotropes, and the trailing Lobelia."

"Have you any programme of succession for the conservatory?"

"We only have two or three groups of flowers, all of one colour. Malmaison Carnations, Maggie Hodson and Princess of Wales, are just over. Palms are planted out, and hanging baskets of Sprengeri and Nephrolepis are used for decorating. Now, I think, we might look over the houses and the kitchen gardens, taking the old kitchen garden first."

The Value of Crassulas.

"You have a very bright show of Crassulas in one of your houses."

"The variety is coccinea, and we use them largely for grouping in the drawing-room. They are quite easy to grow, and last for weeks in flower, June or July being the best period. They require plenty of sun. The next house is new, and is devoted to Peaches, with Tomatoes in front. The varieties of the latter are Carters' Sunrise and Sutton's Perfection, spring-sown in boxes, and autumn-sown in pots. If they are sown in September, it is essential to keep them in a very dry atmosphere, so that their growths may not be too long by the spring. The feature of a miscellaneous house is Figs in pots. They are a favourite fruit, and we have four varieties —White Marseilles, Negro Largo, Brown Turkey, and Osborne's Prolific."

"When was the Vinery we are entering planted?"

"Four years ago, the only variety being Black Alicante. In the next Vinery are Muscats and Gros Maroc. We get bunches of moderate size, and these we rather prefer. For early forcing, inside borders are greatly to be preferred, but for late varieties outside borders do admirably. But a combination of outside and inside borders is not desirable. Another point in the cultivation of Vines is the question of the depth of the border. It used to be said that the border required to be made six feet down, but I find that three feet is much better. We had another Vinery, but it has just been converted into a Rose house. It is planted with Niphetos, Fortune's Yellow, Climbing Liberty, and Perle des Jardins, the varieties in pots being either Teas, Hybrid Teas, or Hybrid Perpetuals. Here the Chrysanthemums are accommodated in their flowering season."

"You have some of your scented Geraniums in the greenhouse?"

"Yes, as I mentioned, in pots. We generally have them almost alone in the house in flower, because their colour is so pronounced that it virtually kills all others."

Ferns Ancient and Modern.

"The Fernery is so representative that I should like to have the names of a few of the best."

"We have had some of them for thirty or forty years, and we never cut the fronds. Of the Adiantum family, we grow cuneatum, formosum, gracillimum, macrophyllum, Pacottii, and Williamsii. The Nephrolepis section is represented by Amerpohlii, exaltata, Piersonii, Todæaoides, and Whitmannii. Others are Asplenium bulbiferum, Blechnum braziliense, Davallia elegans, Gymnograverna chrysophylla gigantea, and Peruviana argyrophylla, Lycopodium japonicum, Microlepia hirta cristata, Platycerium grande, and alcicorne. We use the Maidenhair Fern for table work, with Gloxinias and Allamandas, and the effect is very pretty."

"What about Tree and Border Carnations?"

"Hermione and Cecilia are favourite Border Carnations; and we grow Malmaisons in preference to Trees. As you see, we have a good show of flowers just now, and in the border outside we get a quantity of bloom later. Also there are long borders, now full of London Pride, which in spring are devoted to May-flowering Tulips."

"It would be interesting, as you use so many May Tulips, to know which varieties you recommend for growing in the vicinity of London."

"Blushing Bride, Bouton d'Or, Fairy Queen, Gesneriana lutea, G. major, Golden Crown, La Merveille, Maiden's Blush, retroflexa, Striped Beauty, Caledonia, elegans and e. alba, fulgens, Inglescombe Pink, Kaufmanniana aurea, La Candeur, macrospila, Parisian Yellow, vitellina, Edison, Sensation, Snow-white, Dream, Bonfire, Bartigon, Beethoven, and Rosalind."

"And Sweet Peas?"

"We have about a dozen varieties, and grow them, as you observe, close to the Peas. The pick are Etta Dyke, King Edward Spencer, Helen Lewis, Clara Curtis, La Marquise, Dorothy Tennant Spencer, Evelyn Hemus, Lady Grisel Hamilton, Captain of the Blues Spencer, and Sutton's Queen."

Fruit and Vegetables.

"How are you off for fruit this year?"

"Rather badly for Apples and hardy fruit. The varieties of Apples we find most useful usually are Allington Pippin, Bismarck, Blenheim Orange, Bramley's Seedling, Braddick's Nonpareil, Charles Ross, Cox's Orange Pippin, Devonshire Quarrenden, James Grieve, King of the Pippins, Lane's Prince Albert, Lord Derby, Lord Burghley, Lord Grosvenor, Newton Wonder, Rival, and Ribston Pippin."

"Are your varieties of Pears numerous?"

"Twelve of the best are Beurre Diel, Beurre Hardy, Brockworth Park, Clapp's Favourite, Doyenne du Comice, Glou Morceau, Marie Louise, Josephine de Malines, Pitmaston Duchess, Williams's Bon Chretien, Vicar of Winkfield, and Catillac. With respect to other fruit, it will suffice to say that we grow a considerable number of Strawberries, of which the varieties are Royal Sovereign, Sir J. Paxton, Dr. Hogg, Bedford Champion, Givon's Late Prolific, and The Latest."

"Finally, as to vegetables?"

"Most of the vegetables are grown in the new garden half a mile away, and I do not think we have anything special, either here or there. Peas and Broad Beans do well, and we grow a quantity, larger or smaller, of most kinds of vegetables, with the exception of Salsify and Scorzonera."

"Have you done much showing, Mr. Cox?"

"No; but when I have shown collections of vegetables, Grapes, or Japanese Chrysanthemums, I have done well. With regard to my gardening career, I started at Osmanton Manor, Derby, proceeding afterwards to Trentham. Then I went for a year or so to a large market nursery, returning for a time to Trentham. My next appointment was at Aldenham, with Mr. Beckett, and I was foreman in those famous gardens for several years. Leaving Aldenham, I went as head gardener to the Hon. A. Holland Hibbert, of Munden House, Watford, and six years ago I came to Havering Park."

ALFRED WILCOX.

THE APPROACH, HAVERING PARK.

NEXT week the gardens at South Down Hall, Polegate, will be described.

LATEST COMERS.

Some New Chrysanthemums.

A FINE sport from the well-known Goacher's Crimson, to which the name Bronze Goacher has been given, was exhibited last week by Messrs. Wm. Wells and Co., Ltd. In colour it is a mixture of orange and bronze. It was awarded a First-class Certificate by the N.C.S.

At the same show Mr. Frank Brazier also gained a First-class Certificate for a new Single Chrysanthemum. The colour is terra-cotta and gold, and it has been named Miss E. Finch.

Emperor is a reflex Decorative Chrysanthemum which will prove very useful. The colour is bronze, with lighter shade on the undersides. Messrs. Lowe and Shawyer, who exhibited it, received the First-class Certificate of the N.C.S., and were commended for Eskimo, a creamy-white Decorative variety.

Phœbe, an exhibition variety of more than usual merit, was recently shown. The blooms are of large size, with broad florets of silvery-pink colour. It was shown by Mr. H. W. Thorp, who also staged a Decorative variety, Roundabout, with florets of a bronzy-gold shade, which looked extremely effective.

A New Nerine.

The number of these charming bulbous plants has been increased by the addition to the list of N. Veitchii, an introduction from South Africa. As shown recently by Messrs. R. Veitch and Son, of Exeter, the plant carried five flowers and two buds on the stem. The flowers are pale pink, with wavy segments. An Award of Merit has been granted to this new species by the Royal Horticultural Society.

John Cox, Head Gardener at Redleaf

Gardeners' Chronicle 1875, n.s. 4

The Head Gardener's cottage at Redleaf

Amongst the practical gardeners of the South of England, Mr. John Cox, whose portrait we now publish, holds a very honourable place, being well known amongst his brethren in the profession as a skilful and successful practical cultivator, especially of vegetables and fruits, as a censor whose services are frequently sought at the metropolitan exhibitions, and as a writer whose teachings are always sound and trustworthy, and such as can be understood by every one who is willing to be taught. We give his autobiography in his own words:—

"I have no record to make of servitude in the great places of the day, my early experiences being confined principally to one place, where I made acquaintance with long days of hard work in plenty. I was born in the village of Buckland, in Berkshire, in November, 1814, my father being principal foreman in the then celebrated gardens of Sir John Throckmorton, one of the great patrons of horticulture of that day. From thence my father went to Lee & Kennedy's nursery, at Hammersmith, and was by them sent to the Ladies Ashburnham, at Wimbledon, where the late Lord Churchill became acquainted with him, and eventually engaged him to go as head gardener to Cornbury Park, in Oxfordshire, at which place he spent the remainder of his life. It is from thence that I date my earliest recollections of gardening, planting, ground. work, the formation of green drives through a roost extensive park, besides miles of carriage roads, all of which work, and much more, was in full and active operation there for many years. I mention this, merely to show that my early life was spent amongst these most active gardening operations, and long before I left school I was indoctrinated by a clever, but stern father, in most of the practical details of the various works in progress, including the measurement of land, and geometrical plan drawing, so that by the time I left school and entered regularly on the practical study of my chosen profession, which was in my sixteenth year, I was proficient in all the practical details of gardening, as then practised. For all that, my father insisted on my going to the bottom of the ladder, and I was therefore put to serve the kitchen — no mean thing either, for the establishment was large and the requirements great. At the same time I was made responsible for the sowing and planting of all the kitchen-garden crops being especially enjoined to keep up a good supply of salading. As there were about five acres of land within the walls, and a fair amount of help, I cannot remember, barring unavoidable atmospherical hindrances, to have ever had any difficulty in keeping the family well supplied. I did this for two years, and have ever since found the benefit of having gone through this training. It is a step which I should strongly advise all young gardeners to take in the beginning of their career, for they will find so many things crowd upon their attention as they advance, that unless previously well grounded in this most important part of a gardener's education, they will find it much more difficult to attain practical proficiency in it in after years.

Towards the end of the two years I found there was gradually falling to my share the management of the wall fruit trees; and when I left serving the kitchen the whole was put into my hands, with occasional help. This to me was a labour of love, for I had always taken delight in assisting, and was early led to the study of the principles by which practice should be guided; and it has continued with me a favourite study through life up to the present time.

During this time my attention was not entirely confined to these departments, as I had very frequently to take a share in whatever was going on, more particularly during the planting season, for planting was carried out on a large scale in this fine park, and the constant removal and replanting of large crowded shrubs was fine practice, which has proved very useful to me in after life.

In these days, when there are so many periodicals and books bearing on gardening, it is comparatively easy for young men to attain, if they will, to a theoretical knowledge of the subject, but in those days we had few helps, and the necessary knowledge came to us

only by dint of hard practical work. About this time Loudon was in full career, publishing his admirable works, and one of my first purchases was his Hortus Britannicus from which I soon found that I needed to know a little of the construction of Latin, and, therefore, I employed my evenings in getting up long lessons, and attended the master of the grammar school at Charlbury twice a week. This was afterwards supplemented by lessons in French. This discipline was with a few interruptions maintained for four years. I have never considered the time so spent as wasted, but would advise all young men who have not attained proficiency in these during the time of their school probation, to follow it up in their leisure time afterwards.

I remained at Cornbury Park five years, during the last two of which, in addition to multifarious other duties, such as the continual overlooking of the houses and pits, I had to devote the half of every day to the pleasure ground, in which position I had to take the lead of nine men in the mowing department. Mowing machines were just then "budding," and were looked upon with much distrust, indeed with a feeling somewhat similar to that which incited the ignorant mobs about that time to break up and burn the threshing machines. Anyway, we were obliged to stick to the scythe then, and on grand occasions, when much company was expected, my men would not scruple to meet me at four in the morning, in order to get a large breadth cut over whilst the dew was on. At this time the keeping of the pleasure ground was such as to be frequently compared to that of White Knights and Blenheim, both celebrated masterpieces of decorative gardening belonging to the Duke of Marlborough. Young men of the present day seem to think that to get into a large range of houses is the most legitimate object of their ambition, but I maintain that unless they have previously, or in combination therewith, passed through a similar probation to the above, they will find they have much to learn when the general man- cement of a large place falls upon their hands or heads.

In 1836 the late Bishop Spencer, who came to Cornbury Parle on a visit, asked Lord Churchill if I would go down to his cottage *ornée* on the edge of the moors in Derbyshire, to help him in his gardening and planting; and his lordship giving me a strong recommendation, my father felt compelled to let me go. I started at once (nearly 150 miles) for the first time from home, and it was four years before I saw it again. One can hardly realise that at that time the journey took two days, and made a very large hole in a £5 note, and that letters were charged 1s. each. The journey may now be done in one day for £1. On arriving everything looked so desolate that I thought I had made a great mistake ; but after a time I became reconciled to the adverse climate, where Green Gages might possibly ripen once in five years; where Keens' Seedling Strawberries were magnificent in August; where Oak trees became tolerably green by the end of June; where common Laurels were either killed outright, or were cut down to the ground every year by frosts which the Rhododendron ponticum and Portugal Laurel bore with impunity— all so very different from the sunny South. The discipline was, however, invaluable. Nothing came forward without the greatest care and watchfulness, and the Bishop gave me every possible encouragement. He gave me the run of his extensive library, procured Paxton's Magazine of Botany, subscribed to the Gardeners' Gazette and also the Gardeners' Chronicle as soon as they came out, and sent me over to Chatsworth with an introduction to Mr. Paxton, from whom, on several occasions, I received marked kindnesses; also to the veteran gardener at Willersby Castle, so noted for the culture of Vines in pots, and with whom I became intimate, and have often gone with him the round of his fires in the early morning before his men came. He supplied me with about fifty fine young Vines in pots, with part of which I planted a large vinery I had put up, and with the other went into pot culture, in which I was fairly successful, as the times were, such culture being then in its infancy, and looked upon as a novelty. I was presented with two guineas for the first bunch of Grapes which had been ripened within 9 or 10 miles of the place. There were plenty within two years after at Buxton, where Mr. Paxton put up one of his ridge-and-furrow houses, which succeeded admirably. In

1841, after the Bishop and Mrs. Spencer had gone to India, I thought it best to leave, and accordingly came South again, bringing with me many a hard-earned lesson of struggles with long-protracted winters of frost and snow, and other adverse influences, always, however, happy and cheerful under it all, so kind and considerate were my employers.

Having a month or two to spare before going to Knight & Perry's, which was my next destination, I shouldered a knapsack and started off on a walking tour through the counties of Warwick, Worcester, Hereford, Monmouth and Gloucester, calling at all the principal noblemen's and gentlemen's seats on the route, and meeting with invariable kindness from the gardeners I thus met; laying up a good store of names of plants, and much useful information, which I have found of great assistance in after-life.

At Knight & Perry's I went through much the same routine as that detailed by Mr. Fish; had the same experience of "Old Joe" with his stealthy tread and sarcastic language; and passed with much advantage through all the principal departments in the houses, until, in October 1842, I was recommended by Lord Churchill as head gardener to the Baroness Wenman, at Thame Park, Oxford, a place with grand capabilities if they had been fully taken advantage of. The noble park added greatly to the attractiveness of extensive and well laid out lawns and pleasure grounds, which latter, by the way, were principally designed by the Duke of Marlborough before alluded to, the groundwork of whose arrangements of flower-beds consisted of large circular beds filled with plants all of one colour, I remember there was one large circular bed which required about 300 large plants, not cuttings, of scarlet Pelargoniums; others were all Heliotropes, made grand beds. During my stay here we made great alterations in the pleasure grounds, reducing the size of some of the beds, and introducing more variety into the furnishing of them, cutting down overgrown trees and shrubs, and planting others of more eligible varieties as they came out; letting in plenty of light, and giving a brighter and more cheerful character to the whole place. In the kitchen garden, which was of fair size for the requirements, and very productive both in fruit and vegetables, there was a good range of houses. The Vines and Peaches were rather worn out, principally through overcropping, I therefore gradually renovated the Peach house with young trees. Of the largest vinery I completely re-made the border, planting young Vines; in the other, I lifted the trees which were younger, but the fruit was small and shanked much and therefore I made a new border, raising it as high as the nature of the situation allowed, replanting the Vines much shallower than before, and trusting by surface dressing to be able to keep the roots nearer the top. The improvement was very marked indeed; even the first year after lifting there was an average crop of good-sized bunches, thoroughly well-coloured, all over the house. The canes in the large house nearly reached the top the first year and at the end of three years the house was well furnished again with good fruitful rods. In the Peach-house hid great success in a novel experiment I made by potting young fruitful Cherry trees from the walls as soon the leaves fell, and introducing them at once to the Peach-house, where I forced them very gradually with plenty of air on; they were very successful, and my account of the same was copied into several papers.

In 1847 the situation at Redleaf became vacant, and my late kind employer wrote to say that I had been recommended to him to fill the place, which I was proud to accept, and in due course left Thame Park, greatly, as I was afterwards told, to her ladyship's regret.

Redleaf has been too often described in various periodicals to need any panegyric from me, I may say, however, that since it came into the hands of its present proprietor, F. C. Hills, Esq., in 1870, many great and substantial additions have been made by the planting of trees, shrubs, and conifers, of which many thousands have been distributed over a long length of shrubbery walks, which pass through rocky dells filled with thousands of hardy Ferns, and miniature lakes with aquatic plants, all of which has greatly added to the charms of Redleaf. Other great and important additions have been

made in every other department, too numerous to be mentioned here, but which have greatly increased the attractions of the place."

Mr. Cox has for some years occupied a seat on the Fruit and Vegetable Committee of the Royal Horticultural Society, where his extensive practical knowledge is often turned to good account.

"COX, OF REDLEAF."—A fine old gardener passed away from us in this parish on August 30, and was buried in the country churchyard of Brading on September 2. A few words in memory of one who was so devoted to horticulture will be welcome to his many friends.

John Cox was born in the village of Buckland, in Berkshire, in November, 1814. His father was principal foreman in the gardens of Sir John Throckmorton. From thence he went to Cornbury Park, in Oxfordshire, at which place he spent the remainder of his life. The son here entered fully into all the details of his business, and besides learning the mysteries of land measurement, geometrical drawing, and such-like things, he became familiar with the management of kitchen gardens, the rotation of crops, &c., and he studied with interest the cultivation of wall fruit trees, in which he afterwards excelled. In 1836 the late Bishop Spencer, who came to Cornbury Park on a visit, took John Cox to his cottage *ornée* on the edge of the Derbyshire moors, and he had to battle there with a very inclement climate for several years. His own words about this matter are:—"On arriving at my destination everything looked so desolate that I thought I had made a great mistake, but after a time I became reconciled to the adverse climate, where Green Gages might possibly ripen once in five years, where Keen's Seedling Strawberries were magnificent in August, where Oak trees became tolerably green by the end of June, where common Laurels were either killed outright or were cut down every year by frosts—all so different from the sunny south." But the discipline was invaluable, and Mr. Cox here made the acquaintance of the late Sir Joseph Paxton, from whom he received many kindnesses. From thence he came southwards, and was engaged by Messrs. Knight and Perry, but the great achievements of his life were at Redleaf, in Kent, where he stayed till the year 1884, and where there are still many memorials of his skill in all that appertains to a garden. Trees and shrubs here by thousands speak of him—so to say—still, and splendid Conifers and fine rock-work have made these grounds the admiration of everybody who has been able to visit them. Perhaps in point of rare and beautiful shrubs, alpine and herbacious plants the gardens at Redleaf, near Penshurst, have few to surpass them. Mr. Cox wrote frequently in different peridicals on the cultivation of fruit. He was a frequent contributor to the pages of the *Gardeners' Chronicle*, the *Journal of Horticulture*, and other gardening papers. As a landscape gardener he had abilities of a very high order. His services were also in request as a judge at the large International and other flower and fruit shows held at South Kensington, the Botanic Gardens, Regent's Park, and the Crystal Palace. He was a Fellow of the Royal Horticultural Society, and for many years he served on the Fruit Committee, and in connection therewith he was one of the Associate Commissioners for the Horticultural Department in the Paris Exhibition in the year 1867.

Mr. Cox's health for several years had not been very robust, but in the summer of 1881 he had a sunstroke, and after this it visibly failed. He came to reside at The Firs, in St. John's parish, near Ryde, and latterly he has been quite incapacitated for all occupation. He leaves behind him a widow, a son, and two daughters. His son is the much respected teacher of drawing at the School of Art in Ryde, which is in connection with South Kensington. Horticulture may perhaps lose votaries who are more widely known than the subject of these few remarks, but there scarcely can be any who has given to it more untiringly the devotion of a life, and who followed out its leadings with more devotion to the end. *H. E., St. John's, Ryde.*

[We are in such thorough sympathy with the spirit and expression of this tribute that we have little to add and nothing to alter in it. Gratitude to one of our oldest contributors on whose knowledge and judgment we could always rely, and respect for a man of high, though unobtrusive character, and great professional ability induce us, however, to point to John Cox as a model worthy of closest imitation by the young race of gardeners. The respectful sympathy of all who knew him will be with the survivors; while those who only knew him by repute will experience a feeling of pride at the record of one who in his allotted career knew his work and did it. A portrait of the late Mr. Cox appeared in our number for September 11, 1875, where may be read a full and very interesting account of his career. ED.]

— 10.—Morning fine but dull, then heavy rain till the evening; lowest temperature at night.
— 11.—A fine day.
— 12.—A fine day, frequently dull, occasionally bright.
— 13.—A very fine warm day.
— 14.—A very fine warm day.
— 15.—Fine morning, afterwards dull and cold; minimum temperature at night.

LONDON: *Atmospheric Pressure.*—During the week ending September 11, the reading of the barometer at the level of the sea decreased from 30.03 inches at the beginning of the week, to 29.95 inches by the afternoon of the 5th, increased to 30.07 inches by 5 P.M. on the 6th, decreased to 29.76 inches by 9 A.M. on the 10th, increased to 30.06 inches by the morning of the 11th, and was 30.01 inches at the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.98 inches, being 0.09 inch lower than last week, and 0.11 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 73°.5 on the 5th; the highest on the 11th was 67°.3. The mean of the seven high day temperatures was 69°.

The lowest temperature in the week was 49°.5 on the 11th; the lowest on the 9th was 59°.5. The mean of the seven low night temperatures 55°.6.

The greatest range of temperature in one day was 17°.8 on the 11th; the smallest was 10° on the 9th. The mean of the seven daily ranges was 13°.3.

The mean daily temperatures were, 64°.1 on the 5th; 63°.3 on the 6th; 61°.2 on the 7th; 60°.6 on the 8th; 63°.5 on the 9th; 59° on the 10th; and 57°.7 on the 11th. These were all above their averages with the exception of the 11th, which was 0°.3 below; by 5°.5, 4°.9, 2°.8, 2°.3, 5°.4, and 1° respectively.

The mean temperature of the week was 61°.3, being 5°.8 lower than last week, and 3°.1 above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 124° on the 6th. The mean of the seven high readings was 114°.1.

ENGLAND: *Temperature.*—During the week ending September 11, the highest temperatures were 76° at Cambridge, 75° at Leeds, and 74°.2 at Nottingham; the highest at Plymouth and Sunderland was 67°, and at Bradford was 67°.8. The general mean was 70°.4.

The lowest temperatures were at Wolverhampton 39°.1, and at Truro and Sheffield 42°; the lowest at Liverpool was 49°.6, at Blackheath, 49°.5, and at Bradford, Sunderland, Preston and Newcastle 48°, The general mean was 45°.7.

The greatest ranges were at Cambridge 33°.3, at Nottingham 30°, and at Wolverhampton 29°.2; the least ranges were at Sunderland 19°, at Bradford 19°.8, and at Newcastle 20°. The general mean was 24°.8.

The mean of the seven high day temperatures was highest at Cambridge 72°.6, at Leeds 70°.4, and at Blackheath 69°; and lowest at Sunderland 62°.7, at Plymouth, 64°.9, and at Wolverhampton, 65°.2. The general mean was 66°.9.

The mean of the seven low night temperatures was highest at Blackheath 55°.6, at Plymouth 52°.8; and at Bradford 52°.5; and was lowest at Wolverhampton 46°.7, at Truro 49°.7, and at Sunderland, 50°.4. The general mean was 51°.5.

The mean daily range was greatest at Cambridge 20°.6, at Leeds 18°.7, and at Wolverhampton 18°.5 and was least at Plymouth 12.°1, at Sunderland 12°.3, and at Blackheath and Bradford 13°.3. The general mean was 15°.4.

The mean temperature was highest at Blackheath 61°.5, at Cambridge 60°.9, and at Leeds 59°.7; and was lowest at Wolverhampton 54°.5, at Sunderland 55°.1, and at Newcastle 57°.1. The general mean was 57°.8.

Rain fell on every day at Nottingham, on five or six days at most places, but on two only at Cambridge. The largest falls were 2.74 inches at Preston, 1.95 inch at Liverpool, and 1.16 inch at Bristol. The smallest falls were 0.42 inch at Nottingham, and 0.45 inch at Cambridge and Leeds. The general mean fall was 0.98 inch.

SCOTLAND: *Temperature.*—During the week ending September 11th, the highest temperature was 70°2. at Greenock; the highest at Aberdeen and Paisley was 63°.3. The general mean was 66°.0.

The lowest temperature in the week was 43°.1 at Aberdeen; the lowest at Leith was 47°. The general mean was 45°4.

The mean temperature was highest at Edinburgh 56°.9; and lowest at Aberdeen 54°.8. The general mean was 55°.8.

Rain.—The largest falls were 3.73 inches at Greenock, and 2.84 inches at Glasgow; and the smallest fall was 0.52 inch at Aberdeen. The general mean was 1.64 inch.

JAMES GLAISHER, F.R.S.

Enquiries.

"*He that questioneth much shall learn much.*"—BACON.

EDIBLE FUNGUS OF NEW ZEALAND.—*T. V.* wishes to know of any book wherein he may find a chemical analysis of the New Zealand edible fungus, and where he could procure a specimen. *T. V.* is not very definite as to the particular fungus he means. Does he mean the Australian Cyttaria, or the so-called Tasmanian "Native Bread" or what?

SUNFLOWER CULTURE IN EGYPT.—A correspondent is desirous of information as to the best method of cultivating this plant in Egypt, in a locality where there is abundant rainfall from November to March, and an average temperature of 60°. For the rest of the year the temperature averages 78° Fahr. and irrigation is easy. Any correspondent with practical experience would oblige with suggestions.

Answers to Correspondents.

AZALIAS: *F. W. B.* It is well known that these plants yield a gum, but we are not aware whether it has been turned to any useful purpose.

BOOKS: *Ignoramus. A Year's Work in Garden ana Greenhouse* (Chatto & Windus).—*R. P. How to Lay-out a Garden*, by E. Kemp, published by Messrs. Bradbury, Agnew, & Co., Bouverie Street, London, E.C., is the work best suited to your requirements. As to the estimating, we do not know of any work dealing with the subject.

FERNS IN OLD MUSHROOM-BED SOIL: *Ignoramus.* The plants will not live long in such material. Get a little loam, peat, and sand; or, failing those, plant in garden-soil manured with leaf-mould and lightened with sand, if that be needed.

GRAPES DECAYING: *F. Orchard.* Your Grapes were almost completely decayed when received. We can only attribute the mischief to the close humid weather. Give more air, and apply fire-heat to make the atmosphere more bracing.

HOW TO LEVEL A LAWN: *X.* The rods are the simplest system of levelling; two rods can be placed on the old ground, and with the third the level can be easily determined at the extreme corner of the new ground. When this has been fixed, a stout pole can be driven into the ground outside the level-peg, and a line, stretched tightly from the old field round this pole, will enable the intermediate pegs to be fixed with sufficient accuracy. It will be better to work it in sections of say 20 feet, commencing at the side next the old ground and working outwards. Remove the turf from No. 1 section, and carry it outside the ground to be levelled. If the material to be used in raising the level be old clinkers, odd rubbish, or subsoil, 9 inches or a foot of the top should be reserved

May 10th.—One of the American imports is of a surprising nature. It consists of ladybirds—a species common in China and Japan. In the year 1902, eight colonies of them were imported and distributed among fruit-growers for test purposes. One colony was settled in an orchard containing 17,000 Peach trees, with a very much larger orchard adjoining, all the trees being infested with the San José scale, an insect which does an enormous amount of damage to fruit trees in America. In the following year a census of the ladybirds was taken—in what manner is not stated—and their numbers were estimated at between thirty and forty thousand. They had been performing in a very praiseworthy way their task of clearing off the San José scale, and the result was considered so satisfactory that great numbers of them are now being imported. Our own ladybirds are very useful in destroying aphides, but I am afraid that their appetites are hardly equal to the amount of food ready for them. Could not we import some desirable aliens?

May 11th.—Metal labels are much more frequently seen in private gardens than they used to be, one reason being that they have been greatly reduced in price, and another that they are practically indestructible, whereas the ordinary wooden label is apt to disappear in the course of a single season. They would probably be still more common were it not for the need of a special ink. This difficulty, however, may be easily overcome, for, if half a teaspoonful of sulphate of copper is dissolved in a penny bottle of ordinary ink, the resulting fluid is indelible if a quill pen is used. For a steel pen, an excellent ink for metal labels may be made by mixing one part of lampblack, two parts of sal ammoniac, two parts diacetate of copper (verdigris), and twenty parts of water. Of course, metal labels are considerably more expensive than wood. Those who prefer the latter may preserve them almost indefinitely by immersing them, first, in a solution of sulphate of iron, and then, after drying them, in a saturated solution of quicklime. When so treated, they will, with ordinary care, last for a long time.

May 12th.—The photograph shows a very beautiful arrangement of trees which would thoroughly satisfy Parsons. "In the middle ground," he says, "the really choice plant offers itself to the eye with the most inviting effect. Its weak points are somewhat hidden, and its charms are enhanced twofold by the distance that here just suffices, not only to lend enchantment to the view, but to give an adequate impression of the plant considered as a whole."

H. C. Davidson.

Famous Gardeners at Home.

No. 236.—Mr. W. H. Cox, at the Gardens, Calcot Park, Reading.

One of the most charming seats within easy access of Reading is Calcot Park, which I visited early in April, thanks to the courtesy of Mr. H. B. Blagrave, the owner. In brilliant weather, with the fine herd of deer grazing near the mansion, on the slopes of the park, Calcot is singularly attractive. The gardens are worthy of the park, but, as Mr. Cox, the head gardener, explained soon after my arrival, utility rather than ornament is the principle persistently kept in view.

"I suppose," said Mr. Cox, "it might be said that we go in for everything all the year round, fruit and vegetables being the principal features."

Accordingly, we started with the fruit, commencing in one of the Vineries, which form a handsome cluster, with a Palm house as centre, in the kitchen garden.

"Here," he continued, "we grow Black Hamburgh, and one Vine of Muscat of Alexandria, from which we get some very good Grapes. Along the shelves we have Strawberries (Royal Sovereign), of which we force about five hundred, and the stage is filled with bedding plants, including, amongst Geraniums, Forbury Nosegay, Flower of Spring, and Vesuvius, other plants being Asters, Clarkias, and Stocks."

"What do you grow in the other Vineries?"

"In the second we have Black Hamburgh and two Vines of Buckland Sweetwater. The borders are outside, and here we have our early Strawberries. The bedding Geranium plants in this house are Mrs. Pollock and Flower of Spring, which we generally get outside about the middle of April."

"I see you have some Abutilons. What is your treatment of them?"

A VIEW IN THE KITCHEN GARDEN AT CALCOT HOUSE, READING.

"They will bear either a cool treatment or a moderately-warm one in winter, but the more they are starved the better colour they get. We pot them up in the autumn, and put them out in the beds in the summer between other plants, the foliage, which should be a mottled green and yellow, being always effective."

"How many Primulas do you go in for?"

"About a hundred in pots for flowering. I do not go in for any special variety, but I have a partiality for the Duchess, whose crimson flower in the centre, with its white edge, is, I think, very pleasing. Close to this Vinery is our newer range of pits, where Melons, Tomatoes and Cucumbers are grown. We often get two crops of Melons in the season, or about a hundred fruits in the year."

Melons and Tomatoes.

"Which is your favourite variety," I asked, as we entered the Melon house.

"We have practically never been without Eastnor Castle (the old variety), which, on account of its flavour, is so popular. I am also trying, this season, Sutton's Ringleader. The Tomatoes have just been potted up for outside work in the summer. The varieties are Princess of Wales, Eclipse, and Sutton's Winter Beauty. I have tried a great many, but could never beat these. The Celery in boxes is ready for pricking off. We grow about twelve hundred heads of Sutton's Solid White and Sutton's Superb Pink. You may like to notice that there is a hot-water pipe underneath the beds, which we find quite sufficient for heating purposes. As you see, we utilise this pit for a number of plants, including Anthuriums, Bilbergias, a quantity of Begonia Rex at the back, and Sutton's Marguerite Carnation. We find the last very useful for cutting, and plant out quantities in mixed borders during the summer."

"How soon do you generally cut your Cucumbers?"

"We cut the first to-day (April 6th); the variety chiefly grown is Sutton's Improved Telegraph, but I am making an experiment with a plant or two of Sutton's Everyday. It has been very highly spoken of, and is understood to be a very free-cropping variety. We shall get some of these Cucumbers about the middle of May. Facing the Cucumbers are about fifty Gloxinias, and the same number of Dracænas, and here, too, we have a few Pandanus Veitchii, also a few Grevilleas."

Grevilleas and Cinerarias.

"Do Grevilleas require any special treatment?"

"Cool treatment is supposed to be the best, but we subject them to any that we find convenient without any ill results."

"You have a very useful flowering house."

"I am glad you think so. The carpenter and myself planned and made it between seven and eight years ago, the chief objects in view being strength and convenience. It is sixty-five feet long by twelve wide, and there is a hot-water pipe up both sides. On the stage are about a hundred Cineraria stellata, which have been in bloom for a couple of months. We find these more useful for house decoration than the big-blooming varieties. About four dozen Spiræa japonica are forced in this house."

The Collection of Zonals.

"Which do you consider the best of your Zonal Pelargoniums?"

"Our best single is Lord Beaconsfield, but Acme is also a very pretty one. Other very good varieties are King of Denmark, Improved Raspail, Wonderful, and Henry Jacoby (doubles). Our collection of Zonals is about five hundred plants. The Crotons embrace the usual shades of colour, and we have about fifty Deutzias, which have flowered very well. The important point with Deutzias is to water them carefully. We stand them out in summer, and take them in during winter as needed."

"Do you give the Begonia metallica any special treatment?"

"No, merely the ordinary greenhouse treatment. The batch of Amaryllis now coming into bloom is from four to five years old. The opposite batch of Malmaisons consists of young plants rooted last season, the varieties being Churchwarden, Princess of Wales, Prime Minister, Mrs. Everard Grimshaw, and Mrs. de Battye. I find that Malmaisons do very well in a mixed house."

The "Cross" Plan in Peach House.

"When was your range of fruit houses built?"

"About thirty-four years ago. The Peach trees have all been renewed since them. A feature in the Peach houses is that the 'cross' plan is in force. In summer I put Tomatoes between the Peach trees in the borders, the space between each being five feet. I find the 'cross' plan most useful, because the borders can thus be made to serve two purposes. The varieties of Peaches are Prince of Wales, Bellegarde, Sea Eagle, and Violet Hative, with one variety of Nectarine—Elruge.

"In the early Vinery," continued Mr. Cox, "where Black Hamburghs only are grown, we have about two hundred pots of Maidenhair Fern, a large batch of Dracæna indivisa, more Crotons, and Tomatoes on the back shelf just coming into flower. The variety is Sutton's Earliest of All, grown in pots. With regard to the last, we have to feed pretty well, using a little guano-water and a little bonemeal for potting."

"And the late Vinery?"

"The varieties are Madresfield Court, Lady Downe's, and Muscat of Alexandria. You will observe that, in addition to the borders inside, we have a border of four feet wide outside. In this Vinery is a batch of fifty Arum Lilies in 12-in. pots, from which we have been cutting since Christmas. I repot and top-dress every other year—a plan that answers. These flowers will last until after Easter, and supply sufficient decoration for the church. On the back wall are more Tomatoes, and below about a hundred and fifty Ivy-leaf Geraniums, the varieties being Souvenir de Charles Turner and Madame Crousse, which I bedded out in the summer."

"You have also a brilliant batch of single Henry Jacoby."

"Yes, we grow about eight hundred of that variety for bedding, and about seven hundred Pelargoniums, which are very useful for groups of plants in the mansion. In the other Peach house much the same varieties are grown, with the addition of Nectarine Victoria. Of the latter, there is an old tree planted at the time the house was built. We grow about two hundred and fifty Marguerites in big pots for bedding."

An Outside Piece of Ground.

As we strolled outside, I asked Mr. Cox whether he preferred outside or inside borders for the Vines.

"I like to have both," he replied; "but, of the two, I prefer the outside border, because it gets all the sun and air. We always top-dress outside borders with eighteen inches of leaves and cover them over with stable manure. In the outside piece of kitchen garden, close to the ranges, I last year made a new Raspberry bed, and the Raspberries (Superlative) are just beginning to break. The little pits here are used for early Cauliflowers and Potatoes, Sutton's Harbinger being the best for early work. I get Potatoes about the end of May. Later on, I fill these pits with Cucumbers, and in the winter with Lettuce. The rest of this ground is used for Rhubarb, Hyacinths to cut from, Currants (Red and Black), Carrots (Sutton's Inimitable), and Strawberries."

"What does the orchard, outside the gates, contain?"

"Apple trees, which were planted twenty-five years ago. They are showing good bloom, and if we do not get late frosts the crops should be excellent, the principal varieties being Blenheim Orange, Lord Suffield, Russet, Scarlet Pearmain, Winter Pearmain, Orange Pippin, King of Pippins, and Ribston. This is the third year of the Currant trees (Raby Castle), which have been cut down twice, and replanted once. We are troubled with birds, but we keep the guns going, and therefore do not require to use netting."

"I notice that you have just begun potting Chrysanthemums."

"We grow about three hundred in thirty to forty varieties, flowering them in 'sixteens.' The best varieties, I think, are Princess Victoria, Mrs. Thompson, Monsieur Remain, Chatsworth, W. H. Lincoln, Niveus, Mrs. Beale, Richard Dean, Jubilee, Eda Prass, President, W. B. Smith, Madame Carnot, and Lady Eve Saunders."

The Inside Kitchen Garden.

"How large is the kitchen garden inside the square?"

"Two acres, and outside the walls three acres. The inside walls are covered by Peaches, Nectarines, Apricots, Pears, and Plums. The Apples were originally planted as espaliers forty years ago, and got into a very poor state. I cut them back two years since, and a good many have made excellent bush trees. In addition, I planted, alternately, new trees of Ribston Pippins (pyramid shape), in the top border, and, in the "cross" walk in the centre, Cox's Orange Pippin. Down one side I planted Plums in bush form, alternating with Currant trees, the Plums being Kirke's, the Currants Raby Castle. On the lower walk there is a row of Victoria Plums on the pyramid system, right along, and these, like the others, were planted at the time I cut back the Apples."

Successful Apricot Culture.

"What about the Pears down both sides of the centre walk?"

"Those pyramids were planted six years ago. I may say that the Pear crop in this district is always very inferior to the Apple crop. There is one wall almost entirely devoted to Apricots, which are fairly successful. Moor Park is not easy to beat, but Shipley's, Hemskirk and Large Early fruit well. The old Pear trees were planted, I suppose, half a century ago, and next year I hope to do away with them, and plant Apples on pyramids. The Pears are chiefly Bergamotte, Glou Morceau, and Beurré Diel."

"You have quite a Gooseberry plantation."

"Yes, but next year I propose to make some alteration, substituting Keepsake and May Duke for Golden Drop, while retaining Whinham's Industry and Lancashire Lad. The bed of Raspberries, here, I think of doing away with in a year or two."

"Is Asparagus a great feature?"

"It runs into thousands of heads, and we cut every day after we begin in the middle of May. Sutton's Reading Giant is the best variety. The Peas, just coming up, are Sutton's Green Gem, and there are also two rows of Sutton's Early Giant and Duchess of York. These are three of the best early Peas, and I grow six more varieties for later use. The Broad Beans are Sutton's Mammoth and Long Pod; the Onions, James's Longkeeping and Sutton's Improved Reading. As to other vegetables, we generally plant out about a thousand Brussels Sprouts, a thousand Broccoli, and a thousand Spring Cabbages, also a number of Carrots, Parsnips, and Shallots."

"When were your large Strawberry beds planted?"

"One three years, another two years ago, both being Royal Sovereign. The border under the wall is President, and this year I hope to get some later varieties of Strawberries. The west and south borders are planted with Potatoes, Ashleaf Kidney—a variety which, for early work, cannot be beaten."

Beyond the walls of the kitchen garden, yet forming almost a part, is another piece of ground, with a summer-house at the end. Here there are both flowers and fruit, a Rose bed, planted a great many years ago, and containing many old varieties, being faced by a number of Apple and Plum trees.

"These Apples," said Mr. Cox, "include Court Pendu Plat (a very late dessert variety, one

of the most dependable, flat, but highly coloured), and some of the other varieties already named. Nut trees cover a patch, and we get good crops of Kentish Cobs and Redskin Filberts; the wall has a south aspect, and Greengages,

WHITE PASSION-FLOWER—CONSTANCE ELLIOTT.

Nectarines, and Peaches thrive on it. On the left-hand side of the centre main walk, connecting this with the centre walk of the kitchen garden inside the walls, are six rows of American Sweet Corn, grown in pyramid shape."

"How long has it been planted?"

"Just recently. I am going to put in eight more. The Corn ripens about August, and keeps on until it is cut down by the frost. Lately, we have filled the border here with herbaceous and other plants."

"What was it before?"

"It was a ribbon border, the whole length of a hundred yards from the summer-house to the Vineries; the varieties planted include Poppies, Irises, Stocks, Asters, and Dahlias. The walk on the right between the Nut trees is planted with Anemones, Primroses, Daffodils, and hardy Ferns, while just beyond is a fine old Mulberry tree, from which we get lots of fruit. The Gooseberry bush, which you see growing out of it, also fruits. The birds must have taken the Gooseberry seed to the Mulberry tree."

The Formal Bedding.

Then, passing up the kitchen garden, and noting the pond containing goldfish, with spring flowers round, we proceeded to the pleasure gardens, which are some distance away. In front of the handsome mansion are tennis and croquet lawns, and on its walls, which are three feet thick, Roses (Devoniensis) and Pyrus Japonica thrive exceedingly.

"As to bedding," resumed Mr. Cox, "there are at present yellow and red Wallflowers, with Limnanthes, in the long beds. These are succeeded in the summer by Geraniums, Fuchsias, Begonias, and Lobelias; the bedding is the same on both sides, both in size and contents. The features of the lawn are a fine evergreen Oak, some stately old Cedars, beds of Euonymus, Lilacs, and the common Snowberry. The water, of which there is about two acres, is just outside in the park."

"The mansion, I imagine, dates back for more than a century."

"It was built in 1755, and is of considerable size, with billiard room, in addition to several reception and some twenty-five bedrooms. There is stabling for about twenty horses. Calcot Park has belonged to Mr. Blagrave's family for several hundred years."

"And you have been in his employment for a considerable time, have you not?"

"Yes, I have been in the gardens over forty years, and I succeeded my father as head gardener ten years ago. Although I have a good foreman, who has been here with me fifteen years (ten as foreman), there is too much to do, with a staff of seven, to allow of time for showing. We are satisfied if we can grow good varieties, the gardening is well done, and we get good results." ALFRED WILCOX.

Letters from a Lady Gardener.

No. 197.—CLIMBERS.

DEAR KATE,—I hope you have plenty of climbers in your garden? There are usually places in all gardens which would be the better for draping or screening with greenery and flowers, and even in a town it is quite refreshing to come upon a house which is not bare.

But don't plant Ivy on your house (except at the back, if there are no windows there), unless you don't mind an influx of earwigs, spiders, and other insects, for the cosy little spaces between the branches of Ivy, well thatched in by thick, shining foliage, make too tempting habitations for these small fry in winter, which become a great nuisance if they can get into the house.

Flowering Creepers.

Besides which, why not have flowering creepers whilst you are about it? Green leaves are all very well if you can't get anything better, but I never can understand the rage there is for Euonymus, Box, Yews, Ivy, and such-like—which are the same all the year round, and one never has a chance of any flowers from them—when there are so many more lovely things ready to produce a mass of blossoms at least once in every twelve months.

Just now my house is wreathed with the starry white blossoms of Clematis montana, from the Himalayas, where it climbs about the Rhododendrons which clothe the mountain slopes; and what a glorious sight they must be there in their season!

Clematises are charming climbers, and you can still plant them (from pots), if you have not plenty. They will drape the walls, climb the arches with the Roses, cover the pergola, or hide and make beautiful the trunk of a dead tree; in fact, you may plant them in many places, even in a garden on the leads, or a balcony, for few plants are more perfect for covering lattice-work. But they do not like too much hot sunshine, and they do best when their stems are protected from this by the foliage of a Rose, when they will throw out the prettiest sprays amongst the Roses, which add greatly to their beauty, so that we plant a Rose and a Clematis at each post of the arches in the garden.

Clematis Culture.

Plenty of good, rich soil they should have, and some of the larger kinds need a sheltered position, for they are hybrids between Japanese and other exotic varieties, whilst others, such as C. montana, C. Jackmanni (in purple or in white), and C. Kermesina (a very beautiful variety, with crimson-velvet blossoms in profusion), are all quite hardy, as well as many other of the smaller-flowered Clematises of the viticella class, which are hardly so well worth growing.

A very fine hybrid is Etoile de Lyon, with crimson flowers five inches across. This was introduced a year or two ago from France, and is already becoming a favourite. Blue Gem is very good in tint, with blooms about four inches across; Fairy Queen is in blush-pink, barred with a deeper shade; Miss Bateman is a very large flower in French white; and Duchess of Edinburgh is a fine white double Clematis.

There are innumerable varieties in lavender, such as Lady Caroline Neville, which is still one of the best in the shade. Grace Darling is the name of a new hybrid with star-shaped red flowers, of which one of the parents was C. coccinea, a Clematis with bell-shaped blooms, which hides its tint on the inner side of its petals, and Grace Darling is therefore a great improvement on it.

C. montana (as well as some of the rest) flowers only on last year's wood, so that it is a terrible mistake to clip off its young shoots every year for the sake of tidiness. I should advise you to ascertain for yourself whether your Clematises bloom on their new growths, or those of last season, before you attempt to prune them, and, whatever you do, don't let old John, with his favourite shears, undertake the job. The large-flowered kinds should be pruned in spring; the rest may be thinned out in the autumn, leaving as much as possible of the strong, young growths untouched.

Other permanent climbers (such as Roses, Honeysuckles, etc.) are best planted in October,

LOPHOSPERMUM SCANDENS.

A charming free-flowering climber, suitable either for the cool greenhouse or outdoor decoration.

but Clematises and Passion-flowers in spring, as they are not perfectly hardy. Passiflora cœrulea is a delightful climber for a sunny, sheltered wall, for it will produce hundreds of its delicately-tinted flowers, in white, with blue stamens in the summer; and in Devonshire these

William Cox

Gardeners' Chronicle 1875, n.s. 4

Mr. Cox, who is known in the horticultural world as the raiser of the well-abused Madresfield Court Grape — a Grape which only needs to be thoroughly known to be better appreciated — has the reputation of being one of our best practical gardeners, and an inspection of the gardens under his charge fully bear out this reputation, not in one, but at all points. He was born, so we learn, in the year 1822, at Ludlow, in Shropshire, his father being then, and for many subsequent years, in business there as a gardener and seedsman.

"At an early age," he writes, "I had to take an active part in the work, and learnt much of the routine of vegetable and hardy fruit culture, in which my father was then considered a proficient. Living within a few miles of the late Thomas Andrew Knight, Esq., with whom he was on terms of intimacy, I had occasionally the pleasure of going with him to see that gentleman's garden, and of hearing Mr. Knight describe the horticultural experiments in which he was then actively engaged, and which were given to the world in the Transactions of the Horticultural Society of London of that time. I may date my aspirations to become a gardener from this early period.

In my nineteenth year I left home, and, after spending a few months in the nurseries at Worcester, was engaged as journeyman by the then gardener at Madresfield, Mr. Norman McKinlay, a good practical gardener of his day. After remaining two years in this capacity I took the foreman's place, which I also held for two years. At the expiration of that time Mr. McKinlay's successor left, after a short stay of only a few weeks, and the situation being offered to me, I accepted it. Since that time I have had the honour of serving four noblemen of the same family, from whom I have invariably received every consideration compatible with my position.

On the accession of the present Earl Beauchamp it was decided to commence extensive alterations in the garden department. The kitchen garden, being very old, badly situated, and unequal to the probable requirements of a large establishment, a favourable site was selected, and the works for a new garden commenced in June, 1866. These were sufficiently advanced to admit of all the fruit houses, as also the walls, being planted early in the following spring. The soil, being a strong retentive loam on a dry sub-soil, fruit trees of all kinds do admirably, and at the present time are probably as near perfection as possible.

During the last eight years the grounds have been entirely remodelled and extended. New flower gardens and extensive plantations of ornamental shrubs, avenues, &c., have been formed, the whole of which it has devolved upon me to design and carry out. This, though a somewhat arduous and prolonged task, has been rendered so much the more pleasant by the confidence reposed in me by my noble employer, to whom I am deeply indebted, not only for the liberal encouragement I have always received, but also for many valuable suggestions in carrying out the works while in progress.

The gardens and grounds here, having received a very favourable notice from the Editors of the Gardeners' Chronicle and others during the last few years, I have only to add that in the construction of the kitchen garden my principal object was to simplify all the arrangements so as to economise labour. With this view the ground enclosed was but of moderate extent, but with high-class cultivation and a constant succession of crops the result has been an ample sup- ply to meet all requirements."

The descriptive notice of Madresfield Court Gardens to which Mr. Cox refers in the passage above quoted, will be found at p. 754 of our volume for 1872. We may quote one sentence as a concluding remark. The writer observes : — "I left Madresfield with the impression that gardening in those of its branches there practised, was carried on in a thoroughly satisfactory manner. There was a general excellence in all departments."

The recently published edition of Paxton's Cottagers Calendar was thoroughly revised and brought up to date by Mr. Cox, who was requested to undertake that work not only on account of his trustworthiness and skill as a gardener, but from the special interest he has taken in the formation and superintendence of Cottage Garden Societies and the like.

—— We regret to record the death of Mr. WILLIAM COX, the late well-known and highly respected gardener at Madresfield Court, where he was successfully engaged for forty-two years, and was head gardener there for thirty-eight years. He has left behind him a monument in the form of the Madresfield Court Grape, which, notwithstanding its tendency to crack, is a splendid variety, and will be cultivated for years to come. The esteem in which Mr. Cox was held in the district in which he was best known was testified in a remarkable manner at the Birmingham Autumn Show last year, where he received quite an ovation. He died on the 8th inst. at the age of sixty-one years.

FAMOUS BRITISH :: GARDENS. ::

HOLE PARK, ROLVENDEN, KENT.

Interview with Mr. C. J. Cradwick.

A FEW weeks back a letter from Mr. C. J. Cradwick appeared in GARDEN LIFE, describing a wonderful new Tomato which he has raised, and to which he has given the name of Cradwick's Abundance. This aroused considerable interest, and offers to purchase the entire stock of seed of this season's saving came from several firms; but Mr. Cradwick declined them, desiring rather to distribute it among readers of this paper, to give them a chance of growing a Tomato of extraordinary productivity. When I visited him at the gardens at Hole Park, Rolvenden, early in November, I learned that nearly three hundred people had applied for and received seed; and, as he still has some to spare, he is willing to send half a dozen to each person writing for it and enclosing 3d. to cover expenses of postage, etc.

Rolvenden lies in the south-east of the county of Kent, not far from the Sussex borders—indeed, in normal times the lights of Hastings are visible to the south-west, while to the east those of Folkestone may be seen. Hole Park, the seat of Col. A. S. Barham, C.M.G., is one of the principal estates in the neighbourhood, comprising some three thousand acres, with a frontage running for miles along the main road. Most of this land is split up into farms, but the park itself contains two hundred and sixty acres, and is well wooded. The house—a fine old Elizabethan mansion—is approached by a drive, a quarter of a mile long, which is continued beyond it for another three-quarters of a mile.

"Three hundred large Oaks have been cut down already," explained Mr. Cradwick, as we started on our walk; "and the contractors who are doing the work for the Government are still engaged in clearing them away. Some of them, as you see, are close to the house, and until they are removed it is not possible to get on with the alterations which are to be carried out."

"What alterations are contemplated?"

"On this, the west side of the house, the Oaks are coming down, and the Laurels and other shrubs will be got rid of, and in their place we are going to have large flower beds, cut in grass. Colonel Barham is keenly interested in the gardens, and when things settle down is intent on enlarging them and making many improvements. Fronting the house, which faces south, a new drive will be made, under the avenue of Elms, and this will open up a splendid view from the terrace."

CLIMBERS ON THE HOUSE.

"You still have a nice show of Begonias in the beds below the terrace."

"They are tubers of Laing's strain, and are the only flowers we used, except for some Hydrangeas which were planted out. The other beds on this lawn were filled with vegetables, and I also had four of Sunflowers for poultry, but the seed was not sown in time for them to do much good, as I did not come here until last April. The fountain in the pool plays from both ends, and the jets meet in the middle. There are a number of Water Lilies, and plenty of goldfish."

"What are the climbers on the house?"

"On the front there are two double Pomegranates, whose scarlet blossoms are a beautiful sight; Magnolia grandiflora, and Wistarias, all of which do well."

"And what is on the east side?" I asked, as we moved towards it.

"The Banksia Rose covers this side, and is a mass of yellow when in bloom."

"Did you have vegetables in these beds, also?"

"Yes; we grew Carrots and Beet here, with a few Lupins to relieve the effect. On this side, too, we are going to make a clearance of trees and shrubs, and have more flowers. When the trees are down a good view will be obtained right to Tenterden, five miles to the north-east. This grand Austrian Pine, over one hundred feet high, and the huge Elms, will remain. In place of the big plantation of Laurels, Aucubas, and other evergreens, we shall have a hedge of Yews—in fact, Yews will be a feature here, for Colonel Barham is very partial to topiary work, and we shall go in for it largely as soon as we can get the trees. We have already grubbed up one long patch of Laurels, and the ground is now being got ready for Phlox, which is another favourite subject, both for cutting and for garden decoration. The lawn near the house has been mown, but those farther on have had to go during the war."

"The Rhododendrons are very healthy-looking, and full of bud," I remarked. "Is the soil specially made up for them?"

"No; it is the natural soil of the district—clay—and was not prepared in any way except by digging. They are all choice hybrids, but the one that is most effective is Pink Pearl—a fine thing. The big clump of Rhododendron ponticum just beyond grew so rampantly that it has had to be severely thinned and cut down. The sheet of water at the end of the walk is called, from its shape, the Egg Pond. It is to be made into a water garden. The shrubs are to be cleared away from the edges, and Irises, Primulas, and other moisture-loving plants will be put there."

Here we turned, and made our way towards the back of the house, passing through the Sundial Garden, which is enclosed by a Yew hedge, and has in the centre a number of small beds, edged with Box, and filled—each with a separate variety—with Polyantha Roses; around these are beds planted with Heliotrope for the summer.

GOOD ROSES.

The Rose garden, at the north of the mansion, was next visited. It is of large size, and probably has at one time been a kitchen garden, but now its walls are covered with climbers, Hybrid Perpetuals and Wichuraianas. All around it, and skirting the principal paths, are Ramblers on pillars and chains, while cut in the grass are innumerable beds, some insignificantly small, but each with its separate colour. Under the walls runs a wide border, filled with herbaceous perennials. I asked Mr. Cradwick what varieties of Roses he finds do best.

"There is no beating Madame Abel Chatenay, Frau Karl Druschki, Mrs. J. Laing, and Hugh Dickson," he said; "these are always reliable. Madame Edouard Herriot is also good, and others that are more than satisfactory are Mrs. Wemyss Quin, Mrs. A. R. Waddell, Gustave Regis, Lady Hillingdon, Dorothy Page Roberts, Lady Barham, Harry Kirk, Madame Ravary, and Pharisäer. Then there is the China Rose Léonie Lamesch, which, as you see, is still flowering well. It is of dwarf growth, with a small flower, but the colour is very striking—a bronzy red with golden centre."

MR. C. J. CRADWICK AND HIS PRESENT STAFF.

On the farther side of the Rose garden, and directly facing the entrance through which we came, is an arbour, and when the clearance of shrubs is made, anyone resting here will be able to look across the valley to Tenterden.

THE KITCHEN GARDEN.

Passing on towards the first and smaller of the kitchen gardens, Mr. Cradwick pointed out the gardener's house, the bothy, and other buildings, built in 1914.

"The bothy has not yet been used," he said, "for the staff was reduced on the outbreak of war."

"How many does it number?" I asked.

"Three men and two boys," was the answer; "not counting one old fellow over seventy, who has worked on the estate for fifty-eight years, and has just given up; and my little son, aged five, who is always ready to help, and dons his little blue apron, and is really useful sometimes. It was formerly seven, but as soon as we can get labour it will be increased to

twelve, as there will be sufficient to keep them all going."

"What is the present extent of the gardens?"

"About five acres of pleasure grounds, and fruit and vegetables account for another two and a half acres. There are two ranges of greenhouses, three in each, and a small stove."

"You have plenty of greens of one sort and another," I observed.

"Yes; we grow more than we want for our own requirements, but we give a lot away to the Red Cross hospital."

THE CABBAGE FAMILY.

"What is the Broccoli in this bed?"

"That is Veitch's Self-protecting. To follow it we have Toogood's Snowdrift, a very nice thing indeed, which comes in about Christmas. Sutton's Satisfaction is another very good variety, and so is Toogood's Reliance; and we finish with Sutton's Late Queen, which I like better than Latest of All—and I have grown both. In Cauliflowers I do not think you could find any better than Autumn Giant and Autumn Mammoth—both splendid stuff. We start with Snowball, and go on with Her Majesty and Sutton's White Queen, which I had not grown before, but which I like very much. The Cabbage we rely on for cutting in March is Harbinger, and we have also a good planting of Best of All. Of Savoys we have Tom Thumb, Drumhead, Best of All, and Toogood's New Year, which is one of the best I know. The Kales are Sprouting, Purple, and Exhibition Curled Dwarf. The Brussels Sprouts are Market Favourite and Dwarf Gem."

"Of course, you grow a good many Potatoes?"

"Yes; for early work we have May Queen and Sir John Llewelyn, and for maincrops, British Queen, King Edward, Up-to-date, and Arran Chief. I have no fault to find with any of them."

CHECKING POTATO DISEASE.

"Have you had much disease?"

"There has been a little, but not much."

"Did you spray to check it?"

"Some rows were sprayed, some were limed, and others left untouched. Those that were limed seemed to turn out best. The lime was sprinkled well under the foliage. I am not altogether in favour of spraying. One thing I do, to prevent the disease from spreading to the tubers, is to lift as soon as the haulm dies down. In my opinion they ripen as well as if they are left in the ground, and even if the skin is a bit tender it soon hardens. It is late in the season that the disease infects the roots, and if you lift before the autumn rains set in you avoid the risk. I also lime the tubers, and the floors and walls, when storing."

"How do you get on with other root crops?"

"Carrots are a splendid success. The varieties are Sutton's Early Gem, and Favourite—this is a very nice Carrot indeed. Beet—Blood Red and Globe—do not do so well; but we get excellent crops of Turnips, which I could not grow at Sherborne, where I came from. Model, Six Weeks, and Golden Ball are the three varieties; and we have had a row of Toogood's World's Best Swede, which I find very good. The soil is too heavy for Parsnips—Tender and True and The Student—and they come a poor shape. We also grow a little Salsafy."

"You have some nice Leeks coming on!"

"The variety is Musselburgh; but for exhibition Prizetaker is hard to beat, though Toogood's Colossal is also excellent."

"And what about Onions?"

"Dobbie's Golden Globe and Ailsa Craig are two of the best; while for general use I know of nothing superior to James's Long-keeping. I have tried most others, but prefer these."

PRODUCTIVE BEANS.

"When did you cease picking Beans—for I see you have some big rows of Runners."

"We were able to cut up to the end of October. For Runners we grow Sutton's Best of All; for dwarf, Canadian Wonder; and for earliest crops, under glass, Negro. We have also grown Climbing Haricot, Green Gem, and Dwarf Gem for drying."

"How did these bear?"

"Two rows of forty feet each of Dwarf Gem gave a bushel and a half of seed, but there were blanks in the rows, as we lost some plants after they came up. Peas do well, but we do not get late crops. We start with Sutton's Dwarf, and sow for succession Early Giant, Fillbasket, Maincrop, Stratagem, Duke of Albany, Alderman Improved, and Latest of All—but this is too late for us."

Then, after taking note of several rows of Celery, which, I was told, were Sutton's Solid White and Pink, and Toogood's Sulham Priory, I inquired concerning the fruit trees.

A PLAGUE OF SQUIRRELS.

"There is a good old Mulberry, which fruits well; and here are several Nut trees, but these are to be cut down, and Apples planted in their place."

"Do they not bear satisfactorily?"

"They bear plenty of nuts, but we are so plagued with squirrels, which take every one, even before it is ripe, that the trees are useless to us."

CRADWICK'S ABUNDANCE TOMATO.

This is the plant which bore twelve trusses and over two hundred fruits, and from which seed has been saved.

"What are the trees on the walls?"

"On the east walls are Plums, though I cannot say what they are like, for we had no fruit on them this year. There are also some black Cherries, which bore plenty of bloom, but the cold winds brought them all down. Apricots do not seem to like an east wall, for they are not very satisfactory. On the north walls are Morello Cherries, and in front of them Apples. Plums on the west wall did better, Coe's Golden Drop and Oullin's Gage cropping as well as any, though it was a poor year at best. On the south wall, inside, Peaches Royal George and Crimson Galande gave splendid crops, and so did Nectarines Early Rivers and Elruge. On the outside wall, facing south, there are Pears, and also twenty varieties on the west wall, but there has been no crop this year. The Apples, Plums, and Damsons in the orchard did poorly, and some bore nothing at all. But there is an old Brown Turkey Fig on the wall that bore hundreds of beautiful fruits. The stems are eight inches in diameter. We netted the tree."

TOMATO CRADWICK'S ABUNDANCE.

And now we entered a pit which had formerly been a vinery, but this year has housed Tomatoes, including the special plant of Cradwick's Abundance. Of course, most of the fruits had been picked, but those left were in various stages of development, and many were full sized and colouring nicely. They were of a good shape, quite round, and with no corrugations. The weight of the crop thus far had amounted to twenty-six and three-quarter pounds.* The picking did not start until August 6th, as, owing to scarcity of labour, the plants were late, and Mr. Cradwick said that if he had had another month he was confident he would have had a few more pounds. There was no artificial heat, and it was discovered, when heavy rains set in later in the season, that the corner where this best plant was growing was very damp.

"What is the parentage of this plant?"

"It is a cross between Sunrise and Bide's Recruit. The fourth truss has been the best, for altogether is has carried forty-eight fruits, and you can judge of their size and shape by those now ripening. It is from the best of this truss that I am saving the seed I am offering to GARDEN LIFE readers, and as I have still some left I can supply half a dozen seeds to anyone who would like them."

"You have, of course, other varieties of Tomatoes?" I inquired, as we made our way towards the greenhouses.

"Oh, yes," was the answer; "I grew several varieties. In this house, which contains Vines, Beans Tender and True were sown in the border, and after these were cleared off Tomatoes were planted out. But they were shaded by the Grapes, and I shall not grow them here a second time. Among the varieties that are in this and other houses are Bide's Recruit, Kondine Red, Sunrise, and Sutton's Best of All, Eclipse, and Earliest. I don't much care for Earliest, as it is not a good shape."

"What are the Grapes?"

"Black Hamburgh is one, and this has done well. Another, Canon Hall, also finished nicely, and so did Muscat of Hamburgh, which is a nice Grape for flavour; but Mrs. Pince, although it is ripening off, shows that it wanted a little heat to finish it properly. We have had no heat in this vinery, owing to the shortage of fuel."

CHRYSANTHEMUMS AND CARNATIONS.

Proceeding, we entered a house bright with Chrysanthemums, mostly Singles and Decoratives.

"In the spring," said Mr. Cradwick, "we shall use this house for Carnations. Among the Chrysanthemums that are favoured here are Ceddie Mason, bright crimson; Sylvia Slade, deep rosy red; Edith Pagram, pink; and Bronze Edith Pagram. These are Singles, and are good doers and easy to grow. Mrs. W. Buckingham is a pretty pink, but I find it is much subject to mildew. For out of doors, Market White is a splendid Decorative; while for indoors Mrs. W. E. Tricker is a deep blush; Source d'Or, golden bronze; A. J. Balfour, pink, would be splendid if it did not mildew so badly. There are a few exhibition varieties, such as Master David, His Majesty, and F. S. Vallis."

In the next house a good collection of Perpetual Carnations was staged, and at the back were Tomatoes Winter Beauty. This house, I was informed, is to be a plant house when the Carnations are transferred in spring, and a

* Writing under date November 27th, Mr. Cradwick says: "I have in all gathered two hundred and fifteen usable Tomatoes. These have weighed twenty-nine and a quarter pounds, with not one bad shape amongst them. Twelve trusses finished; each truss after every successive second leaf. The height of the plant was seven feet nine inches."

good batch of Cinerarias was indicated as destined to be among the occupants.

"The Tomatoes would be all the better if we could get a little heat on; and I am hoping to be able to do so, and then they will go round to Christmas. The Carnations include some of the best. For a white there is nothing finer than Wivelsfield White, while Wivelsfield Wonder is a good white fancy. Bishton Wonder is a heliotrope fancy with a delightful scent, though in that respect there are few to beat the old white Niagara. Baroness de Brienen is a pink that is much liked for indoor decoration, and the family are very fond of the colour; and Triumph is one of the best crimsons. Carola has size, and I have had blooms four inches across, but it splits badly. Mikado, Mary Allwood, and Eastern Maid are very good; and I am greatly pleased with Golden Idol, a new variety of an old gold shade. Champion, Mrs. Kyffin, Mandarin, and Princess Dagmar are others that are liked. Talking of Carnations, I may mention that the Perpetual Border Carnation and Perpetual Pink (Dianthus Allwoodii) are to become a feature here eventually. I have a few already, and believe they are the coming flowers. They are wonderfully prolific, and bloom all the season."

The intermediate house, which was next visited, had a few Cypripedium insigne coming into bloom, and some Cœlogynes. There had been a nice lot of Crotons, but they were thrown out when war started. Some nice pieces of Nephrolepis and Adiantums, and four or five varieties of Fuchsia, saved for stock, were also noticed; and then we passed through to the stove, a small house, where were several pretty Gesneras in bloom, and healthy plants of Begonia semperflorens and Gloire de Lorraine. A small batch of Poinsettias—kept to provide stock later—were beginning to show colour; and there were a few miscellaneous plants likewise. Before leaving, I asked Mr. Cradwick to give me a few details concerning his professional career, and he replied:

"I started in Hollamby's Nurseries at Tunbridge Wells, my native town; and from there went to Lady Sassoon's, at Matfield. My next place was at Lees Court, Faversham, the seat of Earl Sondes; after that Sandhurst, near Tunbridge Wells. From there I went to Middleton Hall, Norfolk; and then for six years I was head gardener at Sherborne House, Sherborne, Dorset. I stayed there until last April, when I took up my present appointment."

W. J. CHITTENDEN.

Next week: Orchid-growing in London. Interview with Mr. F. W. Thurgood, at The Gardens, Rosslyn, Stamford Hill.

MY LITTLE GARDEN IN WAR-TIME.—VI.

To-day, November 7th, is the first work of any sort I have done in my little garden for fully two months, and a cold, biting east wind has been blowing all day, making work more a drudge than a pleasure. Was ever a garden in such a state of chaos? For weeks, practically from the commencement of July, with few exceptions, it has rained almost incessantly; with gales, wind, and hailstorms, and one day of thick fog.

HAVOC OF THE STORM.

Several of my Rose screens and poles are wrecked; the cover of one summer-house lies on the grass-plot; the bulk of my treasured Iris, and plants generally, are torn to ribbons, or have been reduced to pulp. The Roses in particular have been pitiable to behold. Under these conditions it is no wonder that to-day I feel disconsolate and in a despondent mood, and with the poetic pessimist exclaim:

"Hear ye no sound of sobbing in the air?
And with long face and moist eye sigh of the Ah-ness of things, and declare in my heart is grief,
And look upon Nature as passing to the tomb,
Meet subject for depression and tears."

And I really wonder am I the same gardener who sang the praises of this little garden

"With such inordinate optimism in the spring;
For extremes do ever tend to meet."

Usually I can find at least one sheltered spot in this garden, let the wind blow from what quarter it may; but to-day it is not to be, and at last I am driven indoors, and seek solace before a good fire and the peace-pipe.

And yet, is not this the very opportunity I have been waiting for so long? For are not there hundreds of notes waiting to be classified, lists to be tabulated, extracts to be taken from my rough notes made on holidays? After all, the day will not be wasted. The first notes to be tabulated are relative to

THE RAIN GAUGE.

And here is a brief extract from two of the most remarkable months in this rainy year. I wonder if any reader of GARDEN LIFE can produce a more dreadful tabulation of rainfall?

MY LITTLE GARDEN IN WAR TIME.—FIG. V. A CORNER OF THE DRY WALL.
Showing English Iris, Viola cornuta, Saxifraga umbrosa, Santolina incana—all good plants for wet weather. Overhead is an archway of Rose Dorothy Perkins.

During July, from the 1st to the 7th inclusive, were days of fine weather; from the 8th to the 31st there were only six fine days. The total of rainfall for this month was 5.47 inches, against 1.20 inches for this same month in 1917. But when we come to September, I think this will establish a record. There was only one fine day in this month, with a total rainfall of 7.27 inches, against 1.44 inches in the corresponding month of 1917.

During the first seven months of 1918 there were five heavy rainstorms. The most extraordinary was on May 22nd. From 6.45 in the evening to 4.15 of the following morning there was the unusual downfall of 1.19 inches. And when we consider that the weight of rain falling upon each acre of land amounts roughly to one hundred tons for every inch shown by the rain gauge, and add to this wind, hail, and creeping things innumerable, the wonder is that there are any plants left, let alone flowers. One feels inclined to sing Thomson's verse on the "Seasons":

"See, winter comes to rule the varied year,
Sullen and sad, with all his rising train,
Vapours, and clouds, and storms."

Then, again, let us turn to another experience dated for September in my notes—and surely "A gardener's life is not a happy one." Shortly after returning from my last holiday, I wondered what was the cause of all my seedling Columbines gradually vanishing. Then, one by one, the vegetables were going in the same mysterious way, till the Vegetable Marrows growing on the ground revealed the secret. Where or how could a wild rabbit gain entry to my little garden was the puzzling part. Though there are thousands in the woods behind my garden, there is a canal between; but "Bunny" must have travelled a considerable distance, and passed farms and kitchen gardens, before he came to mine. So what with the weather and this depredator, I concluded that luck was against me for this year. The garden will be protected in future with wire netting, though this is the first rabbit that has made its appearance during the ten years I have lived here.

The rabbit's menu is a fairly varied one. Most vegetables seem quite to his liking; but I think of all plants (whether vegetables or flowers) his choice is the Columbine (Aquilegia)—and these were a special hybrid race of Messrs. Barr's. But probably all will come up again in the coming season, for in the Alpine meadows all the flowers, including the Columbines, are cut in the summer to make winter fodder for the cows.

It would take a whole article to tell the tale of bunny's capture, but in the end my neighbour's dog caught sight of him, and there was a speedy Nemesis.

LESSONS FROM EXPERIENCE.

But if these notes of mine are to be of service to the readers of GARDEN LIFE, they must have a practical application; and, therefore, I will try to give the lessons I have learned from this doleful experience. I think it was Bacon who said that

"By pain, men come to greater gains,
And by indignities to dignity;"

and one of the first experiences is the value of single flowering plants over the double flowers. Take the Roses first. The single climbers have, in particular, been grand, while the others have been reduced to a disgustingly pulpy mass. There are many exceptions, of course. For in-

Alexander Cramb

Gardeners' Chronicle 1875, n.s. 3

“I was born in 1810, in the parish of Scone, about four miles from Perth,” writes Mr. Cramb, “and educated at the parish school. I was apprenticed in the gardens of Lord Gray, at Kinfauns Castle, then under the superintendence of Mr. Robertson. The principal ambition among gardeners at that period was not plant cultivation as we now find it, but rather to bring together the greatest number of genera and species. Kinfauns was then famous for its extensive collection of herbaceous and alpine plants, among which I spent every spare minute, preparing a hortus siccus, a much more difficult task then than now. Botanical books were both scarce and dear. We had no Gardeners' Chronicle to consult or reply to questions. The decoration of the flower garden was then in its infancy; Grape and Pine-apple culture was, in the majority of cases, in a sorry condition; had any gardener produced such specimens of either as we now see, the county would have risen en masse and presented him with an annuity.

At the expiration of my apprenticeship I went as journeyman into the gardens of the Earl of Kinnoul, at Dupplin Castle, under Mr. Shilllnglaw, an excellent gardener and British botanist. Here my love of British plants was increased, and it has clung to me through life. Owing to the Castle being burnt to the ground I remained here only ten months, as the hands were reduced to two men. Next I moved on to Edinburgh, and found employment in one of the nurseries, at wages insufficient to pay for food and lodging. Still I do not regret the many hardships I suffered, as I gained considerable knowledge of nursery routine, which I have found very useful.

My next appointment was in the gardens at Tarbert House, now the property of the Duchess of Sutherland, under Mr. Henderson. There was little or nothing to be learned here, so after a term of eighteen months I started for London. One thing I may notice, which is rather unusual in that northern county—the Fig and Apricot ripen thoroughly on the open wall of the kitchen-garden.

My first place in England was in Essex, where I remained a year; and then went as foreman in the garden of Lord Portman, under Mr. Rogers, an excellent Grape and Pine grower. After remaining three years I returned to London, and then to Scotland, owing to domestic matters. Subsequently I found employment in the nursery of the late Mr. Cunningham, at Comely Bank, near Edinburgh, then famous for new plants, and fortunately was placed in the houses, where I secured a knowledge of propagation, in which at this time Mr. Cunningham had few equals. Heaths were struck by thousands by a very simple and unpretentious plan. I may hereafter describe the system, if thought to be useful, [Please do.] Here I remained for eighteen months, and left to lay out a villa garden in the neighbourhood of Edinburgh. The entire space was devoted to pleasure-ground and plant-houses. During the winter months I attended the evening classes at the School of Arts—chemistry, natural philosophy, and architectural drawing—and have ever found the information I gained of essential service. Our lectures were in every sense practical, each fact being proved by direct experiment. For instance, we were told that boiling steam and boiling water are, according to the test of our ordinary thermometers, exactly of the same temperature—212°; but that this is incorrect, as boiling steam is very many degrees in advance, containing what is frequently called latent caloric (insensible or hidden heal), as may be clearly proved by converting the vapour into a fluid by introducing the steam through a tube into a body of cold water. Another experiment I may mention is possibly more beneficial to gardeners, and clearly shows us that we should never trench or dig into the ground frozen earth or snow. In proof of which a piece of ice was placed at the bottom of a glass tube and covered to a considerable depth with hot water. Here it remained for a very long time before being dissolved, as heat descends slowly. But reverse the experiment and the ice quickly disappears.

Dr. Lindley's Theory of Horticulture, which was published at this time, raised horticulture almost to an exact science, providing us with a knowledge of the natural

action of plant life and its requirements, and so demolishing that huge monster—empiricism.

I remained at Comely Bank five years, and after a short space went as gardener to II, G. G. Ludlow, Esq., at Heywood House in Wiltshire. I found the garden in a sad condition, the fruiting Pine plants without a live root, and the foliage from top to bottom covered with white scale. Any remedial measure would have been useless. The young stock was nearly as bad, but easier managed, owing to its small size. It was evident they must undergo a cleansing process, and for this purpose I made a liquid of solt soap and turpentine, and thickened by soot; I had each plant dipped singly in the solution, keeping up a continuous temperature of 150°, which proved effectual, as not a scale was seen afterwards. All the heating material was cleaned out, and the pits whitewashed in case of infection. The Vines were not a whit better; the young growths were not stronger than a good-sized Oat-straw, and they had scarcely any roots, so I had no alternative but removal, remaking the borders, and planting a young stock. The Peach trees on the open wall were sadly out of order; very few fruit had been produced for many years past. And how could they be productive?—the border was of a heavy clay without drainage, so that the yearly produce was strong watery wood, less or more destroyed during winter. During the last week in September I had them carefully removed and planted on a prepared border, and merely fastened to the wall. So soon as the buds began to push in spring, the gross wood was removed or cut back to a couple of eyes to fill up vacancies. This plan had the effect of bringing the trees into a sound and fruitful condition. Every other department, as time would permit, received its full share of attention; and even now I have to thank Mr. Ludlow for his kind and unvarying support.

On leaving Heywood, after a residence of over nine years, I entered the service of Earl Ducie, who had a new kitchen garden in progress. The majority of the fruit houses had been built. The additions since that time consist of three Melon-houses, two Fig-houses, a greenhouse, an Orchid-house, and an intermediate house, principally for Ferns; as well as several ranges of pits. Latterly 100 feet of an Apricot wall has been cased with glass, as a mere protection against spring frosts, which has the effect of securing heavy crops yearly. The Vine borders had been made and planted, but in no instance were the crops satisfactory; I fought on with them for years without the least amendment, the Muscat of Alexandria offering the most resistance. As a last resource I had the Vines lifted, and made a change from calcareous soil to that of the new red sandstone, and ever since they have expressed their gratitude. When planting the fruit trees in the kitchen garden I have invariably grouped every kind by itself, which in several instances is a convenient arrangement, enabling me to protect in the smallest compass against spring frosts, wasps, and birds.

The greater part of our walls are built a foot deep upon a dry foundation, which keeps them warmer by preventing the ascent of moisture by capillary attraction. No Apples are grown in the kitchen garden; the whole of the borders by the walk sides, with the exception of a few Plums, are occupied with dwarf trained Pears worked upon the Pear stock. Here, as elsewhere, every fruit is correctly named, the names being impressed on lead by steel types.

Our collection contains over fifty varieties, and the selection has been made with much care. The entire kitchen garden was, in the first instance, trenched 30 inches deep—a refuge for the roots of both vegetables and trees during the late dry summer. Just on the outside, 3 acres of ground have been set apart as an Apple orchard. This is of a variable texture, the soil of one part is light and brashy, and the other a heavy marly clay, and well drained. On the former the trees are subject to canker, particularly the Ribston Pippin, whereas on the latter it is quite free, and yearly bears heavy crops of excellent quality. We cultivate about seventy kinds, which give an abundant supply so long as

Apples are useful. As a late dessert fruit, none equals Sturmer Pippin, which is juicy and crisp to the last.

In every instance our fruit trees are dwarf, trained, as the blossoms and fruit are afforded more protection, and more particularly on high situations. A few years ago we had an immigration of the American bug, which at one time threatened to do us considerable damage. We have, however, by perseverance and the use of paraffin oil, been able to kill the major part. It is sometimes said that this oil is injurious to the tree, but it is really not so. I suspect this pest came from some of the neighbouring farm orchards.

For more than eleven years I have regularly devoted one evening weekly for the instruction of my young men who chose to attend, taking up such subjects as were likely to benefit them hereafter. With some this was a pleasant task, and with others it proved a continued struggle to fix their attention. In the case of the majority the sight of a book, particularly if requiring the exercise of any mental effort, was about as palatable as a dose of bitter aloes.

The flower garden, arranged purely in the geometric style, is situated on the south side of the Court, bounded by terrace walls, and overlooking the lake. The pleasure-ground is extensive, and planted with choice trees and shrubs, both deciduous and evergreen, which in the course of time will produce a striking feature throughout the place. Tortworth possesses an extensive collection of Coniferae, but no attempt has been made to form a pinetum; the different species have been planted on a variety of soils and situations, to prove which is best adapted to their requirements. Some kinds, indeed the majority, dislike the limestone, while none refuse the red sandstone; the Wellingtonia treats the greater part with indifference."

things of taller growth that would have to be used in a large garden.

Supposing a garden has a long border on one side which is open to the sun, say 4 feet or so in width—here is scope for making a pretty display with annuals. Along the back might be planted Sweet Peas, Convolvulus major, Tropæolum aduncum (Canary-flower), and tall Lupines. A few bunches of pea-sticks should be employed for the climbing annuals to attach themselves to. If these could alternate with Dahlias, Chrysanthemums, Foxgloves, Delphiniums, and the taller growing Michaelmas Daisies, the display would be varied and continuous. Then in front of these might come such good things as Malope grandiflora, crimson, and the new rose-coloured variety, which is very pretty; the double white and double yellow Chrysanthemums, the admirable and useful hardy annuals—Coreopsis Drummondii, yellow; C. grandiflora, yellow and dark; and C. nigra speciosa, dark crimson; Erysimum Peroffskianum, orange; Godetia, The Bride, white and carmine; and G. Whitneyi, white and crimson; double Larkspur, Oxyura chrysanthemoides, Linum grandiflorum rubrum, Schizanthus pinnatus, and Whitlavia gloxinoides. Then the dwarfer varieties already enumerated would come into the front, with such other plants as would be likely to do well among the annuals. What an interesting garden this would make, and it would also be very instructive.

A very small quantity of seeds of some of these annuals suffices for several sowings, and by means of a little expenditure of attention and labour successional sowings might be made during the summer, thus continuing and prolonging the display. Directly any one batch begins to decay, out with it, and make another sowing: growth soon takes place, and annuals are speedy bloomers.

And this leads up to the matter of preparing the soil for sowing. Annuals are very often disappointing, simply because they are sown under conditions deadly hostile to their well-being. A sower goes forth to sow on some hard piece of ground, caked by drying winds, and burnt by the sun. He simply contents himself by stirring the surface soil ever so slightly, sows the seed, covers it very thinly with a coating of earth, and calls it sowing. What is the result? The seeds lie till a shower of rain falls, then they spring up weakly, grow imperfectly, flower sparingly and disappointingly, and the conclusion reached is—I shall not attempt to grow annuals again. How can annuals be expected to behave themselves well under such circumstances? Simple as they are, they are yet messengers charged with the tenderest messages of love and beauty from the bountiful heart of Nature, and they should be properly received and tended by those to whom they are sent.

The soil for annuals should be as carefully prepared for them as for any other garden crop. It should be deeply dug, crumbled to pieces, and then have mingled with it some rich soil to make it kindly in nature, invigorating and holding; and then the seeds carefully and thinly sown, a little of the fine rich soil laid on the top, and the whole gently pressed down, and sprinkled with water if the weather be dry. The seeds cannot fail to grow if there is any power of vitality in them, and the plants are strong and bushy. And while they are making growth, if the weather continue dry, let it not be thought too much trouble to sprinkle the plants occasionally with water, and protect them as far as possible from the ravages of slugs and such-like. All this nurture is a kind of promising investment; in due time it will be repaid with a welcome harvest of flowers.

Then there is the matter of thinning out the plants. This duty is sadly neglected. Very often a large number of plants in a very small space are left to struggle for existence as best they can, and with a disheartening result; but if they were thinned out to a few of the strongest, there would yet remain enough. A few vigorous plants is far preferable to a number of attenuated ones; the stronger will bloom more abundantly, with a superior excellence, and a surer gratification to the cultivator.

Obituary.

We deeply regret to announce the sudden death, on April 27, of Mr. Alexander Cramb, gardener to the Earl of Ducie, Tortworth Court, Gloucestershire. Mr. Cramb, whose portrait and autobiography we had the pleasure to publish in our issue for June 5, 1875, had been gardener to the Earl of Ducie for many years, and was held in high esteem by his noble employer, as well as by a large circle of horticultural acquaintances. It had been arranged, we believe, that he was to retire from the management of the gardens at Tortworth at midsummer next; and his friends, were looking forward to his enjoyment of a well-earned pension, when he suddenly died of heart disease in his sixty-eighth year.

—— On May 1, at Wimbledon, John Russell Reeves, F.R.S., F.L.S., of Woodhayes, Wimbledon, and Huntsland, Sussex, formerly in the H.E.I.C.S. in China, aged 73. Mr. Reeves when in China was the means of introducing several fine plants to this country, some of which, such as Reevsia thyrsoidea and Spiræa Reevsii, bear testimony by their names to the good service he rendered to botany and horticulture. Mr. Reeves was, a few years since, a member of the Council of the Royal Horticultural Society, and was always a zealous patron and promoter of horticulture, while his amiable manners and consistent principles procured him the respect of all with whom he came in contact.

May 3.—Fine and bright till 11 A.M., overcast and dull till evening, then cloudless. Few drops of rain in afternoon. Cold.
— 4.—A fine day, very cloudy at times. Raw cold.
— 5.—A fine bright day, partially cloudy. Cold.
— 6.—A very fine clear day. Cold wind.
— 7.—A very fine pleasant day, but cool.
— 8.—A brilliantly fine day. Warmer.
— 9.—A fine bright day, warm. Overcast at night. Few drops of rain about 8 P.M.

London: *Barometer.*—During the week ending Saturday, May 5, in the vicinity of London the reading of the barometer at the level of the sea increased from 29.83 inches at the beginning of the week to 30.40 inches by the evening of May 1, decreased to 29.85 inches by the afternoon of the 5th, and was 29.86 inches at the end of the week. The mean reading for the week at sea level was 30.10 inches, being 0.23 inch lower than that of the preceding week, and 0.14 inch above the average.

Temperature.—The highest temperatures of the air observed by day varied from 54° on the 5th to 48° on May 1, the mean value for the week being 51½°. The lowest temperatures of the air observed by night ranged from 28¼° on May 4 to 40¼° on April 30; the mean value for the week was 34½°. The mean daily range of temperature in the week was 17°, the greatest range in the day being 25½° on May 5, and the least 11¼°, on April 29.

The mean daily temperatures of the air were as follows:—April 29th, 44°.6; 30th, 44°; May 1, 40°; 2d, 42°; 3d, 39°; 4th, 37°.1; 5th, 39°.7; and the departures in defect of their respective averages were: —4°.5, 5°.4, 9°.8, 8°.1, 11°.4, 13°.7, and 11°.5. The mean temperature of the air for the week was 40°.3, being 9°.2 below the average of observations extending over a period of sixty years.

The highest readings of a thermometer with blackened bulb in vacuo, placed in sun's rays, were 100¾° on April 30, 103° on May 4, and 125° on the 5th; on April 29 the reading did not rise above 59°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 27° on May 3 and 4, and 23° on the 5th; the mean of the seven low readings was 31¼°.

Wind.—The direction of the wind was N.E., and its strength gentle. The weather during the week was generally dull, dry, and very cold for the season, the sky was mostly cloudy.

Rain fell on Sunday, April 29; the amount measured was 0.22 inch.

England: *Temperature.*—The highest temperature of the air was 64° at Portsmouth, at Bradford 50¼° was the highest temperature in the week; the mean value from all stations was 54°. The lowest temperatures of the air were 22½° at Cambridge, and 25° at Eccles; at Plymouth 35½° was the lowest temperature; the mean from all stations was 29¼°. The range of temperature was the least at Liverpool, 18¼°, and the greatest at Cambridge, 33¾°; the mean range of temperature from all stations was 24½°.

The mean of the seven high day temperatures was the highest at Portsmouth, 56¼°, and the lowest at Sheffield, 46½°; the general mean from all stations was 50¼°. The mean of the seven low night temperatures was the lowest at Eccles, 30¾°, and the highest at Plymouth, 38½°; the mean value from all stations was 35°. The mean daily range of temperatures was the greatest at Eccles, 20¼°, and the least at Norwich, 11°; the mean daily range of temperature from all stations was 15¼°.

The mean temperature of the air for the week from all stations was 41°, being 3½° lower than the value for the corresponding week in 1876. The highest occurred at Portsmouth, 45¼°, and the lowest at Wolverhampton and Sheffield, both 38¾°.

Rain.—Scarcely any rain fell during the week. At Blackheath a quarter of an inch fell, but at most other places little or no rain was measured. The average fall from all stations was three-hundredths of an inch only.

The weather during the week was dull, cold, and dry, and the sky cloudy. Snow fell at Bradford, Hull, and Sunderland on May 3, 4, and 5.

Scotland: *Temperature.*—The highest temperatures of the air varied from 55½° at Edinburgh to 50½° at Aberdeen; the mean value from all stations was 54°. The lowest temperatures of the air ranged from 27° at Perth to 33° at Leith; the general mean from all stations was 30¼°. The mean range of temperature from all stations was 23¾°.

The mean temperature of the air for the week from all stations was 40¾°, being 5¼° lower than the value for the corresponding week in 1876. The highest was 42½°, at Greenock, and the lowest 39½°, at Aberdeen.

Rain.—The amounts of rain measured at Edinburgh, Aberdeen, and Leith were 0.04 inch, 0.08 inch, and 0.06 inch respectively; at Dundee, Greenock, Paisley, and Perth no rain fell; the average fall from all stations was 0.03 inch.

Dublin.—The highest temperature of the air was 56½, the lowest 28°, the range 28½°, the mean 44½°, and the fall of rain 0.08 inch.

JAMES GLAISHER.

Law Notes.

A Salesman's Dispute.—*Thomas* v. *Carrey.*—This was an action brought by one salesman in Covent Garden against another salesman to recover the sum of £6, under the following circumstances. The plaintiff—or whom Mr. R. Bartlett, solicitor, of Bedford Street, appeared—stated that on the 12th of January last he sold the defendant ten crates of Broccoli, at 9*s.* 6*d.* a crate, and that they were delivered according to order, but only two crates were accepted and the rest returned to the plaintiff, who refused to receive them, and on application being made for payment the defendant refused to pay; hence the present action. The plaintiff corroborated his solicitor's opening, but, in cross-examination by Mr. Lawrence, the defendant's solicitor, admitted having received £47, £52, £28, and other sums subsequently, and not alluding to the present claim.

The solicitor for the defence urged that his client was in no way liable, as the goods were not what he bought. Those he saw were quite fresh, but those received were not fit for human food, being completely rotten. E. Carrey, the defendant, said the plaintiff introduced some Broccoli to him which were very good. Two crates were sent at once, but when the eight arrived, he could not sell them. The price agreed upon was 9*s.* 6*d.* per crate, and the next day he sold two crates to a costermonger for 2*s.* 9*d.* each, as they even were not fit for sale in the market at 12*s.* 6*d.*, which was the market price on the day.

In cross-examination by Mr. Bartlett, the defendant said it was not an unusual thing to buy goods in the market upon the representation of a fellow-salesman, but in the present instance he considered he had been imposed upon, and thought he was justified in

as Executrix Dative quâ Next of Kin of Alexander Scott Craik formerly of Idol-lane London afterwards of Glen Allan House who died at Glen Allan House 5 May 1877.

a mystery. Self-sown Shirley Poppies are more abundant, many of them already of considerable size. There will be no need to sow seeds of these or many other hardy annuals this autumn. I notice, too, quite a number of young plants of perennials, such as Del-

MR. J. W. C. GRAY.

phiniums. Here and there, pods had been left to ripen, and some of the seed must have fallen before it was gathered. To the dry weather the seedlings probably owe their escape from slugs. For outdoor Tomatoes it has been a wonderful year. In one part of my garden manure was used which must have contained some seeds, for young Tomatoes sprang up in all directions and grew like weeds. Beyond some thinning and stopping, they have received no attention, many of them sprawling about on the ground, yet they have borne and ripened an excellent crop. If we could rely on such summers as we have just had, glass would be quite unnecessary for Tomatoes—they could be grown as easily as Turnips or any other vegetable. There cannot be much doubt that plants grown entirely out of doors—from seed to fruit—must be hardier than others raised under glass in heat, and by selection we may yet hope to get a race which can be trusted to produce a fair crop outside in an ordinary English season. That, however, is more than we can say at present.

September 20th.—My Lettuces have been tumbling over in a most exasperating way. On examination, each plant is found to have been severed, or almost severed, just at the surface of the ground, and the result of scraping away a little soil brings to light a "leather-jacket," the grub of the crane-fly or daddy-longlegs. These insects do an immense amount of damage, and are most difficult to get rid of. The application of soot or lime cannot be said to be really effectual, and trapping them with pieces of Turnip or Potato is laborious in any case, and, for any but a very small area, impracticable. Fowls will devour the insects, but cannot be turned loose among Lettuces. Nothing remains but to destroy the grubs as soon as they have disclosed their position by destroying the plants—hardly a satisfactory remedy.

September 21st.—The illustration shows admirably the effect to be aimed at in constructing a rock garden. The rocks look as if they had been laid bare, or brought to their present position, by the agency of water. Even in a small rockery this idea should be kept in view. The thing to avoid is a mere jumble of stones.

H. C. DAVIDSON.

Famous Gardeners at Home.

No. 246.—MR. J. W. C. GRAY, AT THE GARDENS, CONDOVER HALL.

AMONG the numerous beautiful seats in the fair county of Shropshire, Condover Hall, the residence of Mr. E. B. Fielden, takes a foremost place. Within five miles of Shrewsbury, it has for a background the hills of Church Stretton, and it also stands in a commanding position. The fine Elizabethan mansion is approached from the main road by a short carriage drive, and it is at once apparent that English Yews are a feature of the pleasure grounds. As Mr. Gray, the head gardener, pointed out, on my arrival on a bright afternoon towards the close of July, there are eight Yews on each side of the drive.

"But of these," he continued, "I will say more presently. Among the trees on the lawns on either side of the carriage drive are rather fine specimens of Cedrus atlantica, Cedrus deodara, Cupressus Lawsoniana, and C. retinospora; also a very fine one of Wellingtonia gigantea."

A Favourite Sweet Pea.

After I had spent a little time in looking at the trees, and at a fine clump of Yews close to the Hall, we strolled into a small garden at the side, where Sweet Peas in clumps of one variety were flourishing.

"Your soil appears to suit Sweet Peas," I said.

"Yes, they do remarkably well in it. As you see, I grow them in round rings, having each colour by themselves; the advantage is that they are handy to get at. The varieties are all good, but Salopian is one of the best. Others, if you would like a dozen, are Countess Spencer, Sadie Burpee, Gorgeous, Dorothy Tennant, Duke of Westminster, Mars, Coccinea, Venus, Black Knight, Blanche Burpee, and Lottie Hutchings."

"Have you any special varieties in the bed of Dahlias beyond?"

"No. We only grow Dahlias for church decoration, Roses being grown behind."

"I notice that you have a hedge of Lavender facing the Sweet Peas, and that is a capital specimen of Crimson Rambler on the wall."

"Fortunately, this year it is free from blight, which sometimes gives us a good deal of trouble."

The Terraces.

Then we proceeded to the terraces, and here the Yews were a blaze of gold.

"How many are there on the terraces?" I inquired, as I admired the effect.

"Twenty-two. We do not clip them until the middle of September, because they look so beautiful."

"Will they bear shifting?"

"Oh, yes, and do well afterwards. As you perceive, they differ in size, but we cut them all round. The cutting is done by hand."

"I never saw Yews present a more charming picture."

"There are more in other parts of the grounds."

"The scarlet of the Henry Jacoby Geraniums in the terra-cotta vases show up well amid the green. How many vases do you fill?"

"Twenty, in different sizes. We always place them on the pillars of the stonework on the first terrace, immediately in front of the Hall. Mixed with the Geraniums are Lobelias, and a few Eulalias. There is a bit of carpet-bedding at the south entrance to the terrace, with one of the Succulent plants, Echeveria, as a feature."

"What does the very striking piece of stonework near represent?"

"A hermit clinging to a flag. The face is cut out of solid stone, and the hands are considered particularly good. It has been here ever since the mansion was built, some three hundred years since."

"The bedding on the west side of the terraces is rather elaborate."

"It was designed many years ago. Here, again, English Yews are greatly in evidence, Hollies (Silver Queen) and Junipers being also used. In each case the two triangles form a square, and inside are Cotoneasters. The Box hedges, with a cone in each corner, are a part of the design."

"There are two splendid Golden Yews here."

CONDOVER HALL—THE FRONT DRIVE.

"They are two of the best. Golden Yews are also on one side of the beds, in pairs, while behind these are numerous trees, including a notable specimen of the evergreen Oak."

Features of the Bedding.

"And the bedding itself?"

"There are five beds between each square, two corresponding. In the centre beds are Souvenir de Charles Turner Geranium, Ivy-leaved Geranium Golden Harry, large-flowering single Begonias, and blue Lobelias. Some of the side beds contain Cannas in the centre, quartered with Flower of Spring and Henry Jacoby Geraniums, edged with Alyssum compacta. I can get the Alyssums from seed, but I find that cuttings do better, and they are very free-flowering and graceful, as well as sweet-smelling. Of the remaining side beds, one consists of Crystal Palace Gem Geranium, and the other of Henry Jacoby, and these are edged with two rows of Box hedges."

"You have Irish Yews, I see, on either side of a large piece of bedding on the lawn."

"There are twelve, which have been cut into shape, with three vases on either side, the latter containing Rosa polyantha multiflora, with Golden Feather and blue Lobelias. As to the beds, there are two of Crystal Palace Gem Geranium, edged with Box, one containing only Henry Jacoby Geranium; and two diamond-shaped beds, with Lobelia cardinalis, small-flowering Begonias, Golden Harry Geraniums, and blue Lobelia, edged by a double row of Box."

"The Beech trees make a good background for the flower beds."

"Speaking of trees, you might add that here there are also more specimens of Oaks, a fine specimen of Retinospora tetragena aurea, two large Elms, some Horse Chestnuts, and several more Golden and Irish Yews."

A Rare Magnolia.

"You have not included the Magnolia?"

"No, but that is well worth a note. It is a rare tree, and the variety is Hypolmen glauca. It is a foliage rather than a flowering tree, and the flowers, which are white, do not expand much. The Tulip-tree beyond is Liriodendron tulipifera. There is also a very fine specimen of Ailanthus glandulosus (Tree of Heaven)."

"You have Golden Yews behind the Rose beds, and in the background two fine deodara Cedars."

"I think there are fifteen there, and alongside them a number of vases containing Chinese Roses."

"Perhaps you could tell me now how many Golden Yews you have in the pleasure grounds."

"About eighty. I believe this is the finest collection in the country. You will observe that beyond the Rose beds there is a Yew hedge of great height and width, which is kept closely clipped."

The Rose Beds.

"Do you go in largely for Roses?"

"There are four beds, and in each of the big ones there are about sixty bushes. The system adopted is a mixture of sorts in each bed. The varieties, which are rather numerous, include Her Majesty, Mrs. John Laing, Grand Mogul, Merveille de Lyon, Ulrich Brunner, John Hopper, Margaret Dickson, La France, White Niphetos, Madame Morel, and Robert Duncan."

"In the spring," continued Mr. Gray, "I took up a large bed of Rhododendrons and planted Roses instead. There are six arches of pillar Roses, three in each bed, the varieties in the beds being Hybrid Teas, and including Bardou Job, Francisca Kruger, Madame Lambard, The Bride, Madame Falcot, Catherine Mermet, Princess of Wales, Safrano, Papa Gontier, Maman Cochet, Marie van Houtte, and Homere, with L'Ideal. The centre bed is filled chiefly with Lobelia cardinalis and Nicotiana Sanderæ, edged by Golden Feather, and in the outside borders are annuals, mixed with Pentstemons and Scabiosas."

Some of the Bedding at Condover Hall.

The Kitchen Garden.

From the pleasure grounds we went to the kitchen garden, which is about three acres in extent. There is a herbaceous border right along on both sides, with a few Chrysanthemums of the early-flowering varieties at the end. Here, too, are more Sweet Peas.

"These," said Mr. Gray, "flower in August, and are grown in two clumps of one variety, for decoration, others being grown as a hedge, for cutting. The best of these varieties are Modesty, America, Miss Willmott, the Hon. Mrs. Kenyon, Mrs. Walter Wright, the Hon. F. Bouverie, King Edward VII., Scarlet Gem, and Lady Grisel Hamilton. We also grow, for autumn flowering, Salopian and Black Knight. The Michaelmas Daisies, facing the Sweet Peas, are also grown in clumps."

Specialities in the Herbaceous Border.

"Have you anything special in the herbaceous borders?"

"I can mention some of the varieties that do best. They include Achillea (The Pearl), Gypsophila paniculata, Hemerocallis fulva, Lilium candidum, Valeriana of varied colours, Lychnis viscaria and L. chalcedonica, Thalictrum aquilegifolium, Statice latifolia, Tritomas, Eryngium alpinum, Chelone glabra, Geum coccinea, Montbretias, a number of Pæonies, Phloxes in variety, and a large collection of Hollyhocks."

"How long has the border been made?"

"Four years, with fruit trees planted as espaliers behind, and, at the end, tall red Nasturtiums are trained to poles, with Pampas Grass in the centre, and Lavender in the beds. We think of having a Hollyhock walk right along the middle of the garden. Hollyhocks do exceptionally well here."

"And Nuts, I should think."

"We shall have a very good crop this year in the Nut walk, including Filberts, Kentish Cobs, and the small early kinds. Pears are grown on bushes, which were covered with flower, but the frost intervened and did great mischief."

Pears and Plums.

"What are your principal varieties of Pears?"

"Jargonelle, Clapp's Favourite, Williams's Bon Chrétien, Louise Bonne of Jersey, Souvenir du Congres, Marie Louise d'Uccle, Pitmaston Duchess, Beurré Diel, Doyenné du Comice, Marie Louise, Winter Nelis, Easter Beurré, Bergamotte Esperen, Le Lectier, Marie Benoist, Oliver de Serres, Catillac, Verulam, and Uvedale's St. Germain."

"Your Plums appear to be doing well."

"Yes. Some of them are old trees, which I cut back two years ago, and which have now formed some good fruiting wood. I like nothing better than to see a well-trained fruit tree on a wall. The crop promises to be fairly good. We only grow five varieties—Jefferson, Greengage, Victoria, Goliath, and The Czar."

Apples and Bush Fruit.

"I should like the names of some of your Apples grown as espaliers."

"The principal are Stirling Castle, Newton Wonder, Lord Grosvenor, Bramley's Seedling, Mere de Ménage, Dumelow's Seedling, Cox's Orange Pippin, Alfriston, Bismarck, King of the Pippins, Worcester Pearmain, Allington Pippin, Gascoyne's Scarlet, Peasgood's Nonsuch, Adams' Pearmain, Devonshire Quarrenden, Court Pendu Plat, and Blenheim Orange."

"Do you net all your bush fruit?"

"Yes, and I have all of it planted together, as it is much easier to protect. I think it is a better plan than planting on sides of the walks. The Black Currants are Ogden's Black, Carter's Black Champion, and Lee's Prolific; the Red, Long Bunched, Comet, Raby Castle, and Red Dutch. We also grow White Dutch. The four principal varieties of Strawberries grown are Royal Sovereign, President, The Viscountess, and James Veitch."

Herbs and Vegetables.

Passing a corner of the kitchen garden which is reserved as a nursery, where Oaks, Box, and Privet, among other things, are grown, we paused for a minute at a large bed devoted to herbs. Here are grown Mint, Thyme, Bush Basil, Tarragon, Rue, Sage, Marjoram, Balm, Fennel, Sorrel, Chives, Chervil, Camomile, and Borage. Vegetables are a great feature in the kitchen garden, and receive special attention. I asked as to the Potatoes preferred.

"Royal Ashleaf for early work, and two of the best of the others are Sharpe's Express and Sutton's Abundance. Seakale is dug up for

forcing, and we bring it on inside. Of the climbing Beans, I find Carter's Champion the best, and of Cauliflowers I grow Early London, Veitch's Autumn Giant, and Johnson's Market."

"What about Broccoli?"

"I have several varieties, including Veitch's Self-Protecting, Sutton's Winter Mammoth, Covent Garden, Sutton's Late White, Eclipse, Leamington, and Late Purple Self-Protecting. The Peas, of which Autocrat is the best, include, also, Earliest of All, Veitch's Exonian, and Sharp's Monarch."

"Your Celery looks remarkably well."

"The two varieties are Wright's White and Red. Of Lettuces, we grow Webb's Wonderful, and All the Year Round; of Leeks, Musselburgh; of Brussels Sprouts, King of the Market, and Covent Garden Select; of Parsnips, Elcombe's Improved; of Carrots, St. Valerie, Long Red, and New Scarlet Intermediate; of Beetroot, Dell's Improved and Cheltenham Green Top; and, of Onions, Brown Globe, James' Keeping, Up-to-Date, Bedfordshire Champion and Banbury Improved."

The Fruit Range.

Before inspecting the houses, Mr. Gray called my attention to six rows of annuals opposite the Vineries, one consisting of Scabious, a second of Jacobæas (a very pretty annual, quite easy to grow, and lasting well when cut), Pentstemons, Aster sinensis (mauve), Alyssum compacta, and Antirrhinum Golden Queen.

"Do you go in largely for Violets?" I enquired.

"Yes, we have a considerable number, and grow Marie Louise, Princess of Wales, Mr. J. J. Astor, Wellsiana, Swanley White, Lady Hume Campbell, Kaiser Wilhelm, and California. The long-flowering Mignonette proves to be one of the best sorts, which has very fine heads of bloom, and is very strong-scented."

"In the early Vinery you have some fine bunches of Foster's Seedling."

"The other varieties are Black Hamburgh and Madresfield Court. In the middle Vinery we have Muscat of Alexandria, and, in the late house, Lady Downe's Seedling, Black Alicante, and Lady Hutt."

"What is the width of the range?"

"Twenty feet. It was put up five years ago. The Peaches grown are Grosse Mignonne, Royal George, Sea Eagle, Dr. Hogg, Exquisite, Alexandra, Early Beatrice, Crimson Galande, and Early Rivers. The Nectarines are Lord Napier, Elruge, Spencer, and Dryden; but, owing to the late frost, Peaches are very scarce outside, though these and Nectarines inside look remarkably well, and are bearing a good crop."

Tomatoes and Melons.

"What do you grow in the other houses?"

"Well, first, as you see, Tomatoes in pots; the varieties are Ham Green Favourite, Challenger, and Frogmore Selected. In front of the Tomatoes are Poinsettias, and Coleus thyrsoides, and on the stage are Salvia patens. The Cucumbers are Rollison's Telegraph and Blair's Prolific. I have only one variety of Melons—Hero of Lockinge—and on the stage there is a batch of Gesnera splendens, with Gloxinias and Begonias, all seedlings. The small house is devoted to Ferns in variety, Grevillea robusta, and Begonia Gloire de Lorraine."

"You might name some of the plants now in bloom in the flowering house."

"There are Hydrangeas Hortensis and Japonica, Sutton's Fairy Queen Begonias, Canterbury Bells, Francoa ramosa, Streptocarpus, Celosias, and Geraniums in variety, one of the best of the latter being Leopard."

"Which Orchids do you find thrive most in your stove?"

"We have a very fine batch of Calanthe Veitchii, and other Orchids grown are Dendrobium nobile, Cattleyas (mixed), Cœlogyne cristata, Zygopetalum, Lælias, and Cypripediums. In this house, among other plants, are Gardenias, Crotons, Acalypha musaica, Isolepis gracilis, Pandanus Veitchii, and Dracænas (His Majesty), Gardenia florida, and others. A feature of the Palm house are two fine pots of Adiantum, and here we grow Plumbago rosea, a very beautiful scarlet flower, which ought to be more cultivated in pots."

The Frames.

"Then, there are the frames facing the houses."

"The chief contents of these are Chrysanthemums, of which we have about two hundred, and Bouvardias. Of the former, a dozen good varieties are Mrs. E. L. Fox, Madame G. Debrie, Niveus, Australia, Millicent Richardson, Vicar of Leatherhead, Mafeking Hero, Mrs. H. Emmerton, Viviand Morel, Simplicity, Soleil d'Octobre, and Mrs. J. McCallum. The Bouvardias, which we dig up and pot for the winter, include President Garfield, Alfred Neuner, and President Cleveland. A few Malmaisons, of which Princess of Wales is the best, are also grown."

"Finally," I enquired, "how long have you been at Condover, Mr. Gray?"

"Five years in September. Previously I was in Scotland, at Dunnikier House, Kirkcaldy, where I had the management of the glass department for five years; and I was two years at Trentham Hall, Staffordshire, four years at Penrhyn Castle, Bangor, N. Wales, and four years at Wicken Park, Northamptonshire."

ALFRED WILCOX.

Letters from a Lady Gardener.

No. 216.—FRUIT AS FOOD—PEARS FOR NINE MONTHS.

DEAR KATE,—We live and learn (or should do so), and the latest dictum of science on the subject of the necessity to eat plenty of fruit, if we would be healthy, confirms me in the opinion which I have before expressed to you, I think, that we don't get half enough fruit to eat, and that everyone

A PROMISING PEAR TREE.

(especially women) ought to see to it that their tables are properly supplied with both ripe, raw fruit for breakfast, and stewed or cooked fruit later in the day.

Certainly, this is not so difficult as it used to be, for we have Bananas, Dates, and Oranges from many countries brought to our doors very cheaply in these days of rapid transit, and these are all valuable as food; but where we sometimes fail is, I think, in the provision, each one in her own garden, of an abundance of the small fruits during the summer time, and of Pears and Apples for the autumn.

Strawberries and Raspberries, which have been picked before they are quite ripe, packed in baskets, and sent many miles by train, are not nearly so valuable for food as fresh fruit gathered with the sunshine on it, for they quickly deteriorate, unfortunately, and actually become unwholesome in the first stages of decay. Therefore, we women, for whom fruit-growing is specially suited (witness the thousands of American women who "run" fruit farms on their own account, with success), should be up and doing, learning, first of all, in our own gardens, however small, to really understand the culture of various good fruit, for our families and our tables.

The Food Value of Fruit.

One of the facts which have lately come to light is this: that the pure sugar in ripe fruit is capable of producing more muscular power than even fat meat, which is generally supposed to be most important and necessary for the hard worker. Figs, Bananas, Grapes, and Pineapples contain a large percentage of this glucose (as it is called), besides various valuable salts and acids, whilst the Strawberry, Raspberry, Gooseberry, and other small fruits, as well as Oranges, Lemons, Currants, etc., are most useful purifiers of the system, which have this peculiarity, that none of the noxious germs which infest the digestive organs can survive in fruit juice, as an American doctor, who has made many curious experiments in this direction, has abundantly proved. That fashionable complaint, appendicitis, is, it is said, unknown amongst tropical people, who live largely on fruits—no doubt, because the bacillus which causes this complaint is thus destroyed.

Some years ago, when I had a large garden splendidly stocked with Apple and Pear trees, I noticed some poor little children in a neighbouring lane eating hard and unripe Blackberries from the hedge. Their faces were much disfigured with sores about the mouth, and it struck me that they needed good fruit to cleanse their blood, so I asked them to fetch a basket from their cottage, after which I took them into my garden, and told them to pick up enough ripe Apples to fill it. This they did, with joy, as you may think, and, after repeating the dose for a few weeks, their little faces healed up completely, and they looked far more healthy and happy.

Ripe Apples and Pears are excellent for breakfast, and those who eat plenty of them will soon find out their good qualities; but hard, unripe fruit, or over-ripe, bruised, and rotten specimens are all most objectionable. Plums, too, are amongst the most highly nourishing of food, but they should be perfectly whole, ripe, and, if possible, just gathered from the tree, whilst the mashy mess which is sold for Plums on costers' barrows is too often poisonous with the bacilli of decomposition, and is likely to cause illness.

We Britishers, as the Americans call us, have

The Gardens of the Earl of Lytton, at Knebworth House, Hertfordshire.

INTERVIEW WITH

MR. A. E. CRESSWELL.

AMONGST the historic homes of England, Knebworth House occupies a high place, both on account of its magnificence and its associations, while the extensive gardens which form its surroundings are of great beauty and interest. Visiting the gardens for the first time on a pleasant October afternoon, when I was conducted over them by Mr. A. E. Cresswell, who has been head gardener since the Earl of Lytton came into residence, I was struck by the grandeur of the Tudor mansion, and yet even more impressed by the remarkable manner in which its dignity is enhanced by its harmonious setting. Ivy and Wistaria are the only climbers on the house, which, in fact, does not need decoration, and we turned our attention at once to the Italian gardens. In grounds so large as those of Knebworth, the principal features alone can be referred to. One of these is, of course, the bedding, and I asked Mr. Cresswell to tell me the details of the scheme which is worked out with such fine effect.

Bedding on the Terraces.

"You see that we use Begonias largely," he rejoined. "Each bed contains two hundred and fifty plants, which are mostly three or four years old. They are mixed colours. The clay soil suits them well. We start them in the pits, get them into the ground in the first week in June, and they flower from the end of June right on to the frost. Then there are eight beds of the Worthiana Begonias, which we treated in the same manner as the others."

"I notice that you have several beds of Heliotropes, and that Geraniums occupy a good deal of space."

"We are going to increase the Heliotropes. The variety is Lord Roberts, and it is very satisfactory. With regard to Geraniums, there are single beds of Galilee, Charles Turner, Thomas E. Hanbury, and H. Cannell, all of them edged by Lucy Lemoine, with the broad-leaved silver Euonymus in the centre. There are also on what we call the lower terrace a few beds of Pentstemons of different colours; and four beds of Nicotiana affinis, combined with Oak-leaved Geraniums, and a groundwork of silver-leaved Madame Sallery. We go in for as many fragrant flowers as we can grow."

"How are all these beds filled for spring?"

"The whole of those on the lower terrace will consist of Myosotis compacta and English Iris. We shall use quite six thousand of the Forget-me-nots. The beds on the upper terrace will be entirely composed of dark red Wallflowers—Vulcan."

"Some notice ought to be given of the specimen trees in the vicinity of the Italian gardens."

"There are two nice pieces of Cedrus deodara, a fine specimen of Wellingtonia gigantea, and on the upper terrace four singularly good Irish Yews. As to other points, the basins with the fountains in the centre have Calla æthiopica. We are planting the new wall at the end with a representative collection of Alpines and rock plants. In the Fernery all the best British hardy varieties may be found, and the long border near the Fernery, which is now filled with Phlox, will next year consist exclusively of Canterbury Bells and white Foxgloves."

The Dutch and Horatius Gardens.

Proceeding quickly through the quaint Dutch garden, with wonderful English Yews trained as sugar-loaves, twenty-five feet high—which are clipped every October—and observing more fine Cedars, and a beautiful Pine, we paused a little longer in the new garden.

"Here," said Mr. Cresswell, "are more clipped Yews, as well as Portugal Laurels (umbrella-shaped), and clipped Hollies. The centres of the four corner beds are Rhododendrons, with Azalea mollis outside. They are old, but very good. The summer-flowering plants are chiefly Phlox in variety, but not named, and Roses of the Tea section. The maze close by is all composed of English Yews, flanked by a row of specimen Irish Yews."

MR. A. E. CRESSWELL.

"What is the name of the garden with the statues which we are now approaching?"

"The Horatius garden, because it contains statues of Horatius and others. Contiguous to this is the old Rose garden, with beds of separate varieties, such as Camille de Rohan, La France, General Jacqueminot, Moss Rose, and White Polyantha. Here is the memorial, erected in 1886, to Mrs. Bulwer-Lytton, wife of the grandfather of the present peer. Facing the old Rose garden are the tennis courts and bowling green. But most of the Roses are in the new Rose garden."

Roses and Violas.

Making our way thither, my attention was attracted to a number of Yews, which are now trained as standards, looking remarkably well, and with the advantage that it is possible to plant under them.

"When was the new Rose garden made?" I enquired, as we entered a charming enclosure with grass centres six feet wide, and brick paths.

"About twelve months ago. There are twelve separate beds, the red and pink varieties alternating."

"I should like to know the names."

"Duke of Teck, Countess de Cayla, Hugh Dickson, Madame Abel Chatenay, Mrs. Reynolds Hole, Madame Lambard, Duke of Edinburgh, Betty, Dean Hole, General Jacqueminot, Papa Gontier, Leonie Lamesch, and Marlborough. For protection for the Roses are Yews all round, and on the poles dividing the garden from the new frame ground are Climbing Liberty and Lady Waterlow Roses, while on the wall Moor Park Apricots yield good crops."

"What do you use for groundwork in the Rose beds?"

"Violas only—a separate colour in each square. The varieties are J. B. Riding, W. Niel, Beauty of Chipping Norton, Sunset, Blue King, Victoria, White Gem, and Duchess of Fife. Beyond the four pyramid Bays in pots at the corner is a Lavender border, which extends to the herbaceous border. The latter has Carnations Raby Castle in front, and in the border itself are Phlox in variety, Pæonies (herbaceous and tree), Spiræas, Delphiniums in variety, Lychnis, Chrysanthemum King Edward VII., Galega officinalis, double Pyrethrums, Potentillas, Anemones (japonica and St. Brigid), Hemerocallis, and a few Liliums. On the west wall behind are dessert cordon Cherries, which were planted twelve months ago. The varieties are Governor Wood, Early Rivers, Bigarreau Napoleon, May Duke, Black Heart, Black Tartarian, and Adam's Crown. Lady Lytton likes a background of fruit for the flowers where it can be arranged."

The Wilderness Garden.

"To the right," continued Mr. Cresswell, "is the wilderness garden of between seven and eight acres, where things are allowed to grow as they please. For example, there are great beds of double Deutzias, Rosa rugosa, Spiræas, herbaceous Fuchsias, Rhododendrons, Lilacs of different sorts, Prunus Pissardi, Cerastiums, and Penzance Brier Roses. There are also numerous flowering trees. We cut quantities of the bloom for decorating."

"The park must be immense," I said, as we got a peep of it from this point.

"It is not quite two thousand acres in extent. The lakes cover six acres at least. I have charge of the park as well as of the gardens. Now we come to the new frame ground, which was made last year. The Violets are Marie Louise and Princess of Wales. We force about a thousand Royal Sovereign Strawberries, the only variety we grow, either in or out. Cauliflowers and Lettuces are also grown in frames. Adjoining this we grow our Sweet Peas, which we use very largely for table decoration."

Digitized by Google Original from CORNELL UNIVERSITY

How Sweet Peas are Grown.

"How do you start them?"

"In pots, early in February, five Peas in a 'sixty' pot. They are kept close to the glass. In April, when the weather is open enough, we plant out in rows, and place each pot, about eighteen inches apart, in the rows, which are eight feet apart. The ground is thoroughly well trenched, and we use plenty of manure."

"Do you keep the varieties separate?"

"Yes, we do not mix them up. Here are some of the best varieties:—Etta Dyke (syn. White Spencer), Norah Unwin (white), Black Knight (dark), Evelyn Hemus (cream and pink edge), Frank Dolby (the best lavender), Helen Lewis (orange, the finest flower of any), Helen Pierce (mottled blue), Henry Eckford (salmon), King Edward Spencer (scarlet), Lady Grisel Hamilton (lavender), Mrs. Hardcastle Sykes (black), Countess Spencer (finest pink), Queen Alexandra (good scarlet), Mrs. Walter Wright (mauve), and St. George (mauve). These, I think, are the pick."

"When did you begin to gather flowers?"

"Early in July. They were about twelve feet high during last season. As to table decoration, the time the flowers last depends a good deal upon the weather, but they are usually fresh for four or five days."

Favourite Vegetables.

"Now, I conclude, we have the kitchen garden to explore, and the glass."

"There are two kitchen gardens. We might look into the new one first. As you see, it has hedges round. There are about six acres here, chiefly devoted to fruit and vegetables, but we also grow a few Chrysanthemums for cut flowers. There are large plantations of Apples and Pears, and one of good size of Raspberries. Pears, Asparagus, Potatoes, Celery banked up, and Onions do well in this garden."

"You seem to have an especially fine crop of Onions."

"They are chiefly Ailsa Craig, but we also grow Rowsham Park."

"What Peas do you start with?"

"Little Marvel. In a dry season this variety fills well. The other early variety is Daisy. A few Peas are raised under glass, but we begin to pick outside the last week in May, and go on until the middle of October. The Scarlet Runner Beans are Scarlet Emperor and Red Giant, and we have several dwarf varieties."

"What sort of fruit crops did you have generally this year?" I asked, as we reached the old walled-in kitchen garden.

"Those of bush fruit were very satisfactory, and we had a fine crop of Plums on the walls. The varieties of the latter are Coe's Golden Drop, Washington, Jefferson, Greengage, and Black Monarch. The Peaches on the walls also yielded an excellent crop."

"You grow Pears in various shapes?"

"Cordons and fan-shaped. The crops of both Pears and Apples have been good."

"Are all your Apples pyramids?"

"Yes. Perhaps you would like the names of the exhibition varieties, as we show Apples a good deal. They include Emperor Alexander, Peasgood's Nonsuch, Bismarck, Grenadier, King of Tompkins County, Lane's Prince Albert, Sandringham, Lord Derby, Hitchin Pippin, Queen, Allington Pippin, Cox's Orange Pippin, Baumann's Red Reinette, Gascoigne's Seedling, Blenheim Orange, Ribston Pippin, Mere de Menage, Washington, and Stirling Castle. Allen's Everlasting is the latest of all Apples, which also has the merit of keeping sound until June."

"Do you go in for much pruning?"

"We prune in summer—the first week in August, and in autumn as soon as the leaves are off the trees, but I do not believe in too hard pruning."

"Do your Peach cases date far back?"

"They are quite forty years old, and have very little heat. One variety is Walburton Admirable, which is a bigger Peach and of better colour than Late Admirable. We bring our Chrysanthemums into these houses, and into the Vineries. These are for cut flowers. Our principle is to grow a good many of one variety, rather than a great many varieties. The next range of houses is only twenty years old, and has recently been done up."

"You might mention some of the plants."

"Begonias (Gloire de Lorraine and Turnford Hall), a few Gardenias, a few Orchids (including Vanda cœrulea, now in flower, Cœlogyne cristata Chatsworth variety, Cypripedium insigne, Aerides crispum, and Dendrobium nobile), and a quantity of double white Primulas, our own strain. We propagate this year after year, growing about a hundred, which we use for cutting for small vases."

Collections of Carnations.

"You have a nice show of Carnations."

"We have lately started a collection of Winter-flowering and Malmaisons. The varieties of the former are Britannia, T. W. Lawson, Enchantress, Mrs. H. Burnett, Cardinal, Mrs. W. J. Brookes, Harlowarden, Winter Cheer, Leopold de Rothschild, Countess of Lytton, Fair Maid, and The Mikado, the favourite of all. We have also a number of Border Carnations, of which Raby Castle is the favourite."

"Do you use Primula obconica for cutting?"

"Yes, and it is very useful to us; and also Primula kewensis. Another useful pot plant is Eupatorium alba, which is one of the flowers we use to decorate the church. After the plants have flowered, I cut them down, let them break, plant out in the open garden, and lift and pot them up again in September. Here is a house in which we have had two crops of Melons, and are now getting a good crop of Tomatoes."

"What varieties of Melons do you grow?"

"Carter's Hardy Frame, a new variety, which has done very well; and Blenheim Orange and Royal Sovereign. Of Tomatoes, we use Sunrise, saving a great deal of seed, from which we get better fruit than by any other means. We also grow, as you notice, a house full of Sutton's Currant Tomatoes; they are used for salad, or may be eaten raw. Now there remain the Vineries."

"How long does your Grape season last?"

"Usually until March. In the late house, the varieties are Lady Downe's Seedling, Alicante, and Gros Colmar; in the mid-season house, Muscat, Madresfield Court, and one Vine of Melton Constable, a Grape resembling Gros Colmar, but of better flavour. In the early Vinery there are Black Hamburgh and Foster's Seedling."

"Then there are the Chrysanthemums and Zonal Pelargoniums."

The Finest Chrysanthemums.

"Of Zonal Pelargoniums we only grow the double varieties of pinks and whites, for cutting. Chrysanthemums are a great feature. We show them, and have flowers until February. There are considerably over a hundred varieties of Japanese, a dozen of the best being F. S Vallis, A. T. Miller, Mildred Ware, Mrs. W. Knox, Soleil d'Octobre (a big batch), Mrs. J. C. Neville, J. R. Upton, Lady Conyers, Walter Jinks, Sappho, Mrs. F. W. Vallis, and Valerie Greenham. All the Pockett family are also included. Of Incurves, we have about twenty varieties. The best half-dozen are Mrs. J. J. Bryce, Duchess of Fife, C. H. Curtis, Buttercup, Lucien Giles, Mrs. Judson, and Embleme Poitevine."

"You were very successful, I think, with Chrysanthemums at the Hitchin show."

"We had the best blooms in the show at Hitchin in 1908. Since I have been showing at Knebworth, I have taken prizes for Chrysanthemums and Sweet Peas, and collections of fruit and vegetables at Hitchin, Luton, King's Walden, Sandy, Stevenage, Knebworth, and Baldock."

KNEBWORTH HOUSE, THE RESIDENCE OF THE EARL OF LYTTON.

Mr. Cresswell's Career.

"Perhaps you will give me a few particulars of your career, Mr. Cresswell?"

"I first started showing at The Elms, Wanstead, and have been pretty successful ever since. As to my career, I started in market gardens at Thornton Heath, now all bricks and mortar; at fifteen years of age I went into a nursery at South Norwood, where I remained for three and a half years. Then for five years I was single-handed at gardens in Thornton Heath, proceeding next to Essex Hall, Walthamstow. At the end of eighteen months I was appointed head gardener at Leigh-on-Sea, and from there I went as head gardener at The Elms, Wanstead. That appointment I kept for four years, and I was then for a time at Fellside, Wanstead, which was afterwards sold. For some considerable time, I was also secretary of the Forest Gate and Stratford Amateur Chrysanthemum Society, which I think I may say I was instrumental in making a very satisfactory organisation. We had several hundred members, and our monthly display averaged a hundred exhibits. Moreover, we handed over every year to the West Ham and East London Hospital a nice little cheque. In November, 1907, the Countess of Lytton offered me the position of head gardener at Knebworth, which I accepted, and came here on June 24th, 1908. From November to June I was employed by

Digitized by Google Original from CORNELL UNIVERSITY

the Leyton Urban District Council, under the superintendent of their open spaces. This year I was elected at the top of the poll for the Executive Council of the British Gardeners' Association, of which I had only been a member since May, 1908 You will like to add that Lord Lytton, who, like Lady Lytton, takes a keen interest in the gardens, opens them to the public once a year, and, judging by the attendance in August this year, the privilege is very much appreciated." ALFRED WILCOX.

The interview for next week is with a well-known amateur gardener, viz., The Rev. Arthur Bridge, Rector of Worth.

Fruit Under Glass.

WORK IN THE VINERY.

VINES require severe pruning every year to keep the branches within the space allotted them. Indeed, so close are the season's growths cut back to the main rod, that they lose the dignity of branches altogether, and are termed spurs. When it is remembered that all the prominent buds upon the brown canes produced this year would, if permitted to develop, each become a long shoot equal to the parent, the wisdom of hard pruning is apparent.

Rule for Pruning.

Provided the spurs are set at proper distances apart upon the rods, the Vinery should be amply furnished with fruit and foliage in due course, if one strong bud only be left upon the current season's wood. The rule to adopt in pruning is to cut back all sidegrowths to one, or, at most, two prominent basal buds. If the latter method is favoured, the grower has a chance of selecting the strongest or best-placed of the two resultant shoots, but this advantage is gained at the expense of a somewhat longer spur.

To facilitate pruning operations, the Vines should be unfastened from the roof-wires, and slung upon cords at a convenient height. With a sharp, strong knife, each shoot should be cleanly severed in one slightly slanting cut. Steady the spur with a firm grip of the left hand, and begin the cut at a point just opposite to the position of the bud to be retained, and a little in front of the nodal swelling. With a well-controlled, unhesitant sweep, the knife should take a slanting direction, and come out immediately in front of the point of the bud—not too near so as to imperil its life, but as close as possible without touching it. Of course, if a lack of confidence, due to inexperience, is felt, it is well to keep at a perfectly safe distance from the bud, but if a long length of the internode is left, it ultimately dies back to the bud, thus producing an ugly, dead "snag."

Treatment of Young Vines.

The leaders of young Vines that have not become properly furnished with spurs are often left at too great a length. It doubtless seems a great shame to reduce a fine cane, eight or ten feet long, to about a third of its length, but, in the interest of the Vine, it should be pruned thus hard. In the case of young Vines planted this autumn, cut the canes right back to a bud, about level with the top of the low wall beneath the front ventilators. Although such procedure may look like wholesale slaughter, it is the only practical way of building up Vines on the right lines.

Regulate the Spurs.

Another point to be considered in the shaping of young Vines is the regulation of the spurs. The side-growths will often be produced too thickly, in which case a sufficient number of them should be cut out, either with the pruning knife or a small saw, afterwards smoothly paring the wound. Spurs should emanate first from one side of the rod, and then the other, as far as possible, and there should be a space of at least eighteen inches between each spur upon a given side of the rod. That is to say, allow not fewer than nine inches from one spur to the next, but take care that the latter stands upon the opposite side to the first. This distance is suitable for Black Hamburgh and kindred varieties; but Gros Colmar, Gros Maroc, Black Alicante, and the stronger-growing kinds are the better if from twenty to twenty-four inches are given between spurs on the same side.

After pruning, a little styptic should be applied to the cuts. This preparation soon sets hard, and stops any tendency to bleeding when the Vines are started.

KNEBWORTH FROM THE PLEASURE GROUNDS.

Cleaning the Rods.

The washing of the rods must next be taken in hand, and this work is the more important if mealy bug is unfortunately in evidence. Where this persistent pest has established a hold, all loose bark should be removed, so that the wash may penetrate to the cracks and fissures.

In giving this advice, we hope the amateur grower will discriminate between merely rubbing off the easily detached outer bark, and the barbarous peeling which is sometimes practised. It is never necessary to scrape below the firm, brown, second layer that constitutes the real covering of the wood, which cannot be torn away without misapplied effort. A blunt knife may be used with advantage round the spurs, to enable the operator to get a better hold of the loose, hollowed-up outside layer, but particular care must be taken that the eyes are not injured, and that no cutting takes place.

A strong insecticide, such as Gishurst compound solution, should afterwards be thoroughly well rubbed into every part of the wood and spurs with a soft brush. A large paint-brush is an excellent implement for the work. Two or three dressings of hot solution should be applied, at a temperature of about 110 degrees Fahrenheit.

Work Before Growth Starts.

The Vines may then be slung up loosely, with their top extremities dipping slightly downwards, and until the time comes for starting them into growth, keep the house very cool, with abundance of ventilation.

All prunings should be taken away and burned as soon as possible, also any loose soil from the surface of the border.

Thoroughly wash down all parts of the house, glass, doors, trellis, etc., with hot water and soft soap, using new scrubbing-brushes in order to clear out odd corners, where stubby bristles would not penetrate. Syringe off the soapy grime with clear water before it dries on. The walls should be limewashed.

The pruning of Vines should, in no case, be delayed after the middle of January, or the rising sap may drip from the cuts—an unfortunate result, which causes serious weakness.

J. E. S.

Two Fruit Tree Pests.

THE lackey moth often causes considerable damage to fruit and other trees by the onslaught it makes upon the leaves. It gets its name from the bright colouring of its body, which is bluish-grey, with black spots and blue and scarlet or orange stripes evenly marked upon each side. It grows to about an inch and a half long, and is then covered with long, soft hairs.

The eggs are deposited in close, spiral masses encircling the smaller twigs, during the latter part of the summer and early autumn. At about the beginning of May, the eggs hatch out, producing small caterpillars, black and hairy. These at once commence to spin a web over themselves, enlarging it as occasion requires. In this web or nest they live in companies ranging from fifty to two hundred, and thence they go to seek their food, returning for shelter in dull or wet weather, and at night They are full-grown by the middle of the summer, and they then separate, to spin for themselves cocoons, on leaves, under roofs of sheds, in hedges, or anywhere near their food. From the cocoon a moth emerges later, and proceeds to lay her eggs.

One of the best remedies for reducing the numbers of this insect is to seek for the rings of eggs during the winter, burning or otherwise destroying them when found. Another method is to cut off the webs made by the caterpillars in the early part of the summer, and plunge them in an insecticide, or burn them. For this, a dull or wet day should be chosen, as all the caterpillars are then more likely to be inside. Spraying with Paris green, or an emulsion, as previously described, is also very effective.

The garden chafer, or Rose beetle, does not—as its name might imply—confine its destructive attentions to the Rose, but attacks at times the Apple, Pear, Plum, and other trees, feeding on the leaf, and even the blossoms and young fruit. It is about half an inch in length, bright glossy green in colour, and usually appears towards the end of May, or early in June. In the autumn, the grubs or maggots—which are of a yellowish-white colour—descend into the ground, feeding on the roots of grass and certain vegetables, and doing considerable damage to lawns, etc. While in the ground, they turn into chrysalids, from which the beetles emerge in the spring, to fly about and devour anything suitable. The best method to capture them is to shake the trees in the early morning, or late in the evening, laying sheets or other receptacles beneath the trees to receive them as they fall. Soot applied to the ground is stated to be useful in preventing the pests depositing their eggs. Birds are keen hunters of the Rose beetle, and should be encouraged. RHEA.

Digitized by Google Original from CORNELL UNIVERSITY

same condition to treat it in the same The rapidity with which these insects and spread is so great that unless they checked at the fountain-head, they will soon the garden.

Annuals.

August 25th.—That annuals are generally far too thickly can hardly be disputed. in my own garden, some groups of Poppies which have not been thinned nearly enough. Massing does not mean packing. Every plant should be allowed sufficient space to develop, and to show its individual features. This is impossible, if they all make a simultaneous bolt for the air or go under. Some time ago I measured Shirley Poppy, and found that the plant was over three and a half feet through. from seed sown last autumn, it was than the generality of spring-sown plants, if it had been transplanted, which always some reduction in size. It will be seen a dozen plants grown thus will cover a considerable area—an area often crowded with or eight times their number. Not only is a loss of effect when they are crowded together, but also they are so weak that they cannot withstand the slightest pressure of wind rain. Whereas my solitary Poppies were unscathed, my insufficiently-thinned groups were beaten to the ground by the heavy downfall of rain at the end of June, and though they were piled like sheaves of Corn and supported, they lost much of their beauty. Almost everyone knows these charming annuals, but I find that many people do not sow the seed until spring. Sowing in spring, and also in early summer, is all right for a succession, but to obtain really large plants and fine flowers it should be done about the present time. The seed should be sprinkled very thinly, and the seedlings should be thinned as they grow, never allowing them to do more than just touch one another. As accidents may cause some gaps during the winter, they may remain so until they recommence growth in spring, when they should be thinned out to a foot and a half from centre to centre, and eventually to three feet. Advantage should be taken of each thinning to hoe the ground round the plants, and if, at the same time, some artificial fertiliser is sprinkled about them, it will greatly improve them. Those who have been in the habit of growing their Shirley Poppies only in dense masses have no idea of the magnificent plants they make when treated as recommended.

August 25th.—I mentioned last week the importance of providing in a garden a cool retreat for summer. The illustration shows another and more elaborate style—a delightful summer-house, delightfully situated, with a fine view of its surroundings. H. C. DAVIDSON.

Gardening for Ladies.

INTERVIEW WITH MISS MAY CROOKE, F.R.H.S., AT MANOR FARM, BREDON'S NORTON.

IT is quite true that every woman is not fitted to enter the gardening profession. Just as the successful nurse possesses the nursing instinct, so the successful lady gardener has a natural love and aptitude for the work. But, however large or small the number of girls may be who fulfil this condition, there is no doubt that the lady gardener has come to stay. In making provision for her requirements, Miss May Crooke is supplying a need which is likely to increase rather than to diminish. A visit to the scene of her operations at Bredon's Norton in July, when the country was looking its best, justifies the assertion that the School of Gardening which she has founded promises to be an extremely useful and popular undertaking.

ON THE TERRACE, NORTON PARK.

THE MANOR FARM.

The Situation.

The place has been happily chosen. Situated within a mile and a half of two stations on the Midland main line, between Birmingham and Bristol, it has all the advantages of delightful surroundings, and convenient proximity to important centres. The district is not only beautiful, but it is remarkably healthy. Protected from east winds by the Bredon Hills, which are a constant source of admiration, with the Malvern and Cleeve Hills in view, it is only a short distance from Tewkesbury and its glorious Abbey; and, as Miss Crooke informed me, soon after my arrival at the picturesque and spacious Elizabethan manor house, which is the headquarters of the school, the soil, being loam with a gravel bottom, is particularly well adapted for the cultivation of fruit and vegetables.

"In fact," said Miss Crooke, as we chatted in one of the pleasant rooms in the Manor House, "this is the very heart of the choicest portion of the long stretch of Worcestershire which is famous for fruit-growing. The land is very early, and the garden lies on the north-west slope of the Bredon Hills. It is quite an ideal spot."

"Perhaps, before we go any further, you will tell me how it was you decided to start here?"

The Origin of the Scheme.

"When I left Studley Castle, where, as you know, I was instructor in horticulture at Lady Warwick's College, having previously filled the same position at the hostel in Reading, I intended to go on with the work in conjunction with Miss Bradley, who had taken a house in the village of Bredon's Norton; and Miss Zula

Woodhull, of Norton Park, kindly offered me the garden attached to the park for the purpose."

"Did any members of the staff come with you?"

"Yes, two. One acts as assistant-instructress, and the other as housekeeper. Three of the former Studley and Reading students have taken up their residence in cottages in the village, and Miss La Motte is coming in the autumn to take up dairy work."

"All the work, I conclude, is in conjunction with the Mercia Settlement, yours being, in effect, the horticultural branch?"

THE VINERIES AT MANOR FARM.

The Club House.

"That is so. Miss Bradley and I have worked together for years, and she is always willing to give me the benefit of her wide experience. The Settlement, as you can see for yourself, has already made a promising start, and is likely to develop largely. It is intended to convert this Manor House into a Club house. That is to say, one part of it will be for my students, and the other for a ladies' club, so that all the ladies who live in the cottages can take their meals at the Club, which will have suitable accommodation. We hope that it will eventually be affiliated to the leading women's clubs in London, and that the members of the latter will come to Bredon's Norton for rest and change."

Three Years' Training.

"In that case, will they be afforded an opportunity of obtaining an insight into the work?"

"If they like, they will be afforded the opportunity of judging whether gardening, or dairying, or poultry-keeping would attract them as an occupation. With regard to this School of Gardening, I am endeavouring to carry it out on different lines to the gardening colleges."

"In what respects?"

"Why, it always seems to me that at the gardening colleges practical work is neglected for the sake of the theoretical, very much to the detriment of the pupil. I am also advocating three years' training, instead of two, because I feel that at the end of two years a girl only begins to feel her feet."

"Do you undertake to prepare students for the examination of the Royal Horticultural Society?"

"Certainly, if they wish to be prepared. Moreover, with the consent of Miss Beale, the Principal of Cheltenham College, I have arranged that any of the students here can go to the College to take any class they wish, providing that it does not unduly interfere with the practical work."

"Are the trains convenient?"

"Very, and it only takes a quarter of an hour to get to Cheltenham. Another advantage of being so near Cheltenham is that Mr. Cypher has kindly told me that if the students have time they can always go through his nursery, and see what is being done there at the different seasons."

The Theoretical Work.

"Of course, a portion of time is devoted to theoretical work?"

"I give lectures regularly on fruit-growing, vegetable-growing, and plant cultivation. My experience in lecturing has been rather considerable. In addition to the lectures which I gave at Studley, I have given them at Clifton, Altrincham, Sheffield, and other places. I always try to lecture at the time the practical work is going on. Thus, at the present moment the practical work here is in the vegetable cultivation, and I am lecturing on vegetables. The object-lesson is therefore ready to hand. In the winter I give the fruit lectures, when the practical work of pruning is proceeding; and in the spring, when seed-sowing is in hand, I lecture on general knowledge, and gardening of all sorts."

"What about flowers?"

"Lectures on flowers come in at various times—on wet days, for example, when no practical work can be done."

The Practical Work.

"With regard to practical work, are the students expected to dig?"

"I do not approve of women doing any very heavy physical work. The great point is that they should utilise their brains. It is essential that they should thoroughly understand how the digging and other rough work is done, and be able to show the man, who is paid fourpence or sixpence an hour, the way to do it."

"They do all the work under glass," continued Miss Crooke, "and do not in the least mind the heat."

A French Garden.

"What are the chief crops in the glasshouses in summer?"

"Cucumbers, Tomatoes, Melons, and Vines. In the winter there are Adiantums in quantity, Arums, Geraniums, and bedding plants generally. I am thinking of starting a house for Lilies of the Valley, in order to keep up a succession of flowers throughout the winter. I also propose to go in for a French garden, on the lines of that of Mr. John Idiens, at Evesham, who has been so successful in producing early salads for the market."

"How much land do you mean to devote to that purpose?"

"I contemplate starting with a quarter of an acre, on which I hope to be able, by using the French cloches, to pull Radishes at Christmas, cut Lettuce in January, and pull Carrots in February or March. The object aimed at will be, in short, the production of five crops a year."

"I suppose you already grow bedding plants of many varieties?"

THE CUCUMBER HOUSE AT MANOR FARM.

"Yes, and also herbaceous plants of various kinds. The garden, as it stands, is a first-rate one for teaching. There is a walled-in kitchen garden of about an acre, and a hundred feet of glass. We turn what we have to the best possible use, but there is plenty of land to enlarge the garden as enlargement becomes necessary. I do not, however, desire any great rush of pupils."

"You would rather that they came gradually?"

"I do not wish to receive the casual young lady who takes up gardening as a passing amusement. The School is intended for those who are really interested in the work, and who either take it up for the pleasure of doing it, or intend to earn a living—girls who deliberately choose it as a pursuit."

"Do you care to say anything about the domestic side?"

"I attach great importance to the domestic side, which in the big schools, I think, is often not at all adequately considered. I have tried to make the home life as good as possible. The fee for resident students is £60 a year, which includes everything, except the small item for the classes at Cheltenham College, and for that amount I provide a study bedroom for each. At the Colleges, similar fees do not cover the cubicle. But I object to the cubicle altogether as unsuitable for women. It is most important, I think, both for the student and for the institution, that the former should have her own room. She needs one place where she can be absolutely alone."

Marketing the Produce.

As we proceeded to inspect the garden, Miss Crooke observed,

"I took the garden as I found it, and this year only got in the running crops. But, for the future, I shall grow only what I require to grow, and my hands are entirely free as to cultivation."

"Is there plenty of scope for the sale of crops?"

"Ample. I do not contemplate the slightest difficulty in marketing whatever we grow. So long as the standard is maintained, we shall always be able to command a sale for our products."

"You have a nice little potting shed."

"Here, also, the students keep their tools. Each one has her own set."

"Do you grow many varieties of Cucumber in the range?"

"Only one—Rochford's Market. I supply the Park with Cucumbers, and a shop at Cheltenham takes all the rest. The Tomatoes are Holmes' Supreme, which I find a very good market variety. We have been picking since the first week in May, and have made satisfactory prices."

"What Grapes do you grow in your Vineries?"

"Muscat of Alexandria and Black Hamburgh."

"And in the plant-house and frames?"

"There is a little batch of Cyclamen, and we have a few cool Orchids. Winter Carnations and about a thousand Chrysanthemums are grown. The Violets are Marie Louise and Princess of Wales. The outside is divided into four principal plots. One consists of roots, such as Beets, Leeks, Carrots, and Parsnips."

The Vegetable Crops.

"I notice that in another you have Potatoes?"

"Yes, first and second-early sorts, between which we grow Brussels Sprouts. Of Potatoes, I have tried Duke of York and Royal Kidney, and I shall probably change them. The former has been disappointing. Our third plot is limited to Celery, except that I have cropped all the trenches."

"Do you grow many varieties?"

"No, only Sutton's Prize and Standard Bearer. In the trenches I have had Peas (Eclipse), Beans (Ne Plus Ultra), Lettuces, Spinach, and Radishes. Of course, the object is to make the most of the ground."

"How is your fourth plot laid out?"

"With a general crop of Cauliflowers (Early London), which do remarkably well and are already being cut, Tomatoes, and Peas (Autocrat)."

"Then, you have a fine lot of Sweet Peas?"

"We began to pick flowers in the middle of June, and sent them to our flower market, which is chiefly Birmingham. I prefer the clump system, and we try to get the stems as long as possible. The three varieties are Gorgeous (red), Countess of Cadogan (blue), and white Blanche Burpee."

"What fruit do you grow on the walls?"

"Peaches and Apricots. Apples and Pears (bush, standard, and horizontally-trained) are grown right round the plots, and we have a little orchard of a quarter of an acre where we get some good fruit."

"Have you anything special in the pretty herbaceous border?"

"The Delphiniums are just over. The Papavers are rather fine, and we have had a brave show of Columbines."

The Pleasure Ground.

From the kitchen garden we made our way to the small pleasure ground, taken out of the private garden at the Park, which is richly dowered with shrubs and Conifers. There are seats along the pathway, and it is altogether a charming retreat. The same may be said of the flower garden near Hermes Lodge, an ancient cottage which is being transformed into a modern house. Here, when the Manor House becomes a Club house, Miss Crooke will take up her abode, and I think that she will be envied. As an illustration of what can be done with the soil, I may mention that close to Hermes Lodge are several beds bright with many blooms. They have taken the place of a Potato patch, and the soil is evidently appreciated by the Carnations, the Stocks, and the Asters, which now reign, instead of the one indispensable vegetable. There can be no doubt as to the varied character of the School at Bredon's Norton, and its progress will be watched with attention by all who are interested in gardening as an avocation for women.

ALFRED WILCOX.

Letters from a Lady Gardener.

No. 212.—IN PRAISE OF THE OPEN AIR AND CLEANLINESS.

DEAR KATE,—When I go into the drawing-rooms and greenhouses of my friends, I often see signs of anæmia, both in the plants and their owners, and this I usually attribute to the want of fresh air. My own theory of the way to be healthy is to live in the garden, not in the house; and certainly this is a wonderful cure for many ills. On my terrace, facing south, there is a revolving shelter, and this cosy nook is much more used than the house, except at night and for meals.

Those who habitually live in pure air never catch a cold, and, instead of being pale and anæmic, they become rosy and strong; in the same way, our plants need plenty of fresh air, few of them failing to benefit by it during the summer months.

More Air.

When I suggest to my friends, sometimes, that they should sit in the open air, they often reply: "Oh! we open the windows instead!" Now, open windows are, of course, necessary to life; but if you compare the window plants with those in the borders—and we are much the same—you will see at once that there is a great difference in robustness, the strong, dark green growths made in the open air being far better than the long, weakly stems of the poor plants which are reaching towards the sunshine and air in a window. Especially towards the end of the summer our plants need the tonic of a time in the open air, and if you have not yet given your room-plants such a help, you should do so at once, before frosts set in, when they will be in a far better state to stand the winter than if they have been kept indoors and coddled up throughout the year.

PRUNING IN THE GARDENS AT MANOR FARM.

Of course, there are exceptions to this rule. Delicate Ferns and hothouse plants (such as Gloxinias) always need more moisture in the atmosphere than they can obtain out of doors in Britain, but greenhouse and room-plants generally improve wonderfully if placed in the open air in summer, and properly tended there. A border of fine ashes is a useful place for this purpose. If the pots are merely placed on the ground, they will probably be blown over and broken, but if sunk to the rim in a coal ash bed, they will need less watering, and be safe from falls. Each plant should have plenty of room, and must not touch any of its neigh-

FAMOUS BRITISH GARDENS.

KIDBROOKE PARK, FOREST ROW.

Interview with Miss May Crooke

AMONG women who have taken up gardening as a profession Miss May Crooke can be considered a pioneer, for she has been actively engaged in it for over twenty-three years. She was one of the first members of the teaching staff when the Lady Warwick Hostel was instituted at Reading, subsequently assisting in its removal to Studley Castle. Later she became principal of Bredon's Norton School of Gardening; and a few years ago founded a school for women gardeners at Ivybridge, South Devon, which she relinquished owing to a breakdown in health. In 1916 she was appointed head gardener at Kidbrooke Park, Forest Row, the Sussex seat of Sir James Horlick, and it was here I saw her at the end of November.

"The place is now only in the making," she explained, as we waited awhile in her office for a shower to give over; "for before Sir James Horlick bought it the house had been used as a hospital for a time, while the gardens had been allowed to go almost wild, and the glass was sadly out of repair. However, I have been given a free hand, with instructions to remodel the gardens, and bring them up to the highest possible state of excellence. I want to make a success of the place professionally, and leave it at its best, not only because I love the work, but for the sake of woman generally, and to show that, given the opportunity, she really can do good gardening."

"Is the work here done solely by women?"

"No; there are, besides four women, five men and four boys. When the gardens are fully made we shall want a staff of eighteen."

"The men, I presume, do the heavy work?"

"Generally; but Miss Carlyon, my outdoor forewoman, can do anything, even to digging and trenching, and she prefers to do most things herself."

"And do the men and women work together satisfactorily?"

"Oh, quite! I find men respect you if they see you know your work; and as for the boys, they are obedient and easy to manage, especially if they are kept apart. I give them lectures on gardening, which they seem to appreciate, and they are eager to learn, and try to get on."

WHERE SOME WOMEN FAIL.

"What do you think of the prospects of women gardeners?"

"A great deal depends on the woman. It is against women gardeners that so many of them are unsuited for the work, both temperamentally and physically. Some of them lack physique; some lack brains. Often they do not start normally healthy; and they come to gardening thinking it is light work. But gardening is not 'all beer and skittles.' If a girl is healthy when she starts she should be able to do any work that comes along. We have to remember that the owner judges by results; and if he finds the paths not kept properly, or the hedges untidy, or the fruit trees neglected, or anything else going wrong, he naturally concludes that the woman is not up to her work, and replaces her by a man."

THE QUESTION OF TRAINING.

"Do you think the training they undergo is sufficient?"

"Many women unfortunately make the mistake of thinking that gardening can be learned in a few weeks, and that a superior education will enable them to grasp things quickly that others need a long period of training to acquire. They imagine that a six-weeks' course will equip them sufficiently. Well, it may be sufficient to learn, say, the cultivation of Tomatoes or Mushrooms, but that is all. Everything must be learned by experience, and this entails time and hard work. You cannot train a healthy girl too hard. After all, the average male gardener begins at fourteen or fifteen, and goes through all the drudgery, acquiring knowledge as he gets on, and passing through the stages of improver and journeyman before he becomes a foreman, while he seldom becomes a head gardener before he is thirty. But, as I say, many a woman has taken a short course, and gone out into the world as a gardener, only to be found wanting. Then, perhaps, after a few weeks in one place she leaves for another, the gardener giving her a good reference to get rid of her. There the same trouble is repeated, until people begin to think that women gardeners are no good."

"But is not this type of woman gardener amenable to teaching?"

"Too frequently she is not. She will not study the plants under her charge. Even potting and watering require care and thought, and often she will not try to grasp that fact. I have known cases where valuable fruit trees under glass have been spoilt for a season at least through the lack of skill of a woman who claimed to understand their management. But given a normally strong girl, who is willing to learn, and not imbued with the idea that she can grasp every detail in a short time, I know of no reason why she should not be able to hold her own with men gardeners, while there is certainly no healthier life. All gardening is study, and is never completed. I have been a practical gardener for twenty-three years, and am learning something fresh every day."

"Your present staff of girls does not come in the category you have just referred to?"

"Oh, no; those I have now are all my own pupils. Some had been with me before, and all are thoroughly in earnest. Both they and the boys are what I may call very promising material, taking much interest in the work."

By this time the weather had cleared up, and we started to go through the houses.

NEW GREENHOUSES.

"I have been greatly handicapped by the difficulty of getting the houses built," said Miss Crooke. "As I told you, when I came here the houses were in a bad state, and it was decided to rebuild most of them, and to increase the area of glass. But the builders were unable to get on with the job, owing to the war, and I could not grow a lot of stuff that was wanted. For the first six or nine months the work was altogether stopped. Then, when they came to erect the new houses, they first had to take down some of the old ones. One was a plant house, with a stock of Geraniums and Heliotropes worth fifty or sixty pounds—all of which had to go."

"The houses are not yet finished?"

"Not yet. When they are completed there will be two Peach houses, two Vineries, one Fig house, three Carnation houses, two plant houses, a stove, three forcing houses, and four cool Orchid houses, all connected by wide, glass-covered corridors. The Orchid houses have not been commenced."

"What is the reason for having corridors like these?"

DECORATIVE CORRIDORS.

"They serve instead of a conservatory, and, as you will see, they are kept filled with flowers."

These corridors are of a uniform width of about twelve feet, and are twenty feet or so high, with a paved path along the middle, and staging on each side. In the main corridor the eye was at once attracted by a beautiful display of Single Chrysanthemums, tastefully arranged. Further on, one could see fine examples of Decoratives and large-flowering Japanese. But Singles predominated, these being favourites with Lady Horlick, who has quantities of cut flowers sent to London when she is in town.

The first house we entered is intended to be a forcing house when completed, but at present it is used to winter bedding stuff. There is a fine lot of the bronzy-leaved Coleus Verschaffeltii, and a still finer collection of Helio-

tropes, concerning which Miss Crooke remarked:

"These include most of the best varieties in cultivation, such as The Speaker, Rosine, Angus, Mdlle. M. André, and La Favorita—all from the King's Acre Nurseries."

The next house—also a forcing house—contains Perpetual Carnations, and batches of Roman Hyacinths and Paper-white Narcissi for Christmas blooming; and in the third house Cyclamens are the principal subject at present.

Then we went into another plant house, whose most attractive features were a big lot of a pretty pink variety of Primula stellata named Miss Irene, and Coleus thyrsoideus. These are all intended for decorating the corridors, and for this purpose large quantities of one colour are preferred.

GOOD PERPETUAL CARNATIONS.

The bulk of the Perpetual Carnations were seen in the adjoining house, a large and lofty structure. One variety, Malcolm, was pointed out for special praise.

"There is nothing to beat this," said Miss Crooke, "for freedom in flowering, for lasting when cut, or for decoration. The colour, salmon-cerise, is very bright under artificial light, and it has a strong calyx, and also a nice fragrance. This was one I had from the Misses Price and Fyfe, who, I believe, raised it; but most of the others I have obtained from Mr. Allwood. His Bishton Wonder is a lovely thing, of a shade I find it difficult to describe, though perhaps lilac with a deep pink shading comes near it. It has a delicious scent, and is a good grower. Mikado is another that is greatly liked here, and so is May Day; while I cannot say too much in favour of Mary Allwood."

Across the corridor we came to a range of three smaller houses, the first containing more Carnations; the next—not quite finished, but intended also for Carnations—at present filled with miscellaneous plants to go out in the spring; and the third, a cool house, now occupied with Malmaison Carnations.

Retracing our steps, and passing again through banks of Chrysanthemums in the corridors, we entered the Vineries, each of which is eighteen feet wide, twenty feet long, and twenty feet high, with an admirable system of ventilation.

"Of course, you started these Vineries?" I said.

"Yes; not only these, but I started everything else in the houses. I made the borders and planted the Vines. This house is the Muscat house. I did not know so much about Vines then as I do now, or I would not have got Foster's Seedling."

"What is your objection to it?"

"I consider it is too poor in flavour, and if you are going to the trouble of growing Vines you might as well grow the best. True, Foster's is easy to grow, and very prolific; but if you want a good white Grape have Muscat of Alexandria—there is none better for flavour. I am doing away with Foster's Seedling next year."

DWARF FIGS IN POTS.

In the second Vinery is Foster's Seedling again, also Black Hamburgh, and many canes in pots on the back wall—these will be planted out now as opportunity permits. Then, coming out into another corridor, the first thing noticed was a number of Fig trees in tubs.

"These were obtained last spring," explained Miss Crooke, "and are still in the pots they came in. We could not repot them then, so for the present they are plunged in soil in these big tubs, and they have made splendid roots above the pots. They have fruited well, and I hope we shall get two crops next season."

"They look extremely healthy," I remarked, "and some of the second crop is nearly full size now. What are the varieties?"

"There are three—Brown Turkey, Negro Largo, and Violette Sepor."

"And when were the Peaches planted?" I inquired, as, crossing the corridor, we entered the early Peach house.

"Not until last May. Of course, we had no fruit the first season, but the trees have made good growth, and I think you will agree that the wood is well ripened, and that they look very promising. The varieties are Dymond and Nectarine Pine Apple."

"Obviously, you had to make up the borders here, as the houses are new. Did you do the pruning yourself?"

"Yes; I rather fancy myself on fruit pruning. When I was in the Midlands I used to go out to different gardens superintending pruning—also of Roses and other trees—and made a fair income. There is room for a good fruit grower, and you must have one in a large garden, for it is useless to have a girl who cannot be left, as she may spoil the trees."

"Are you training any of your girls to the toes last season?"

"Yes; by arrangement with my employer I have two pupils, who live with me, and are under my entire charge. They will receive a thorough training in all branches."

This completed our inspection of the new houses, and we now made our way towards the kitchen gardens, where a couple of the old houses still remain. Whether they will come down is not yet decided; but at present they are filled with plants that will be wanted for bedding next summer. Among these are quantities of Heliotropes, standard Ivy-leaf Geraniums, two thousand Paul Crampel Geraniums, and a similar number of King of Denmark. Alongside this house is a glass cover, without sides, sheltering Peaches in pots, which will be taken in after February.

"The varieties," said Miss Crooke, "are some of the best; in fact, everything throughout is of the best and from the best nurseries. If you want a good garden you must have good plants. Peregrine is one that is especially good, and so is Nectarine Milton. Early Rivers and Pitmaston Orange are two other very fine Nectarines. In the old Peach case are four varieties that were here when I came. Elruge is one of them, and I think it is a splendid maincrop. These old trees were root-pruned and cleaned of scale, and have since borne well."

THE KITCHEN GARDEN.

"You have a large area under vegetables. What is the extent of the kitchen garden?"

"The old kitchen garden within the walls is two acres, and there is another acre outside. It is a splendid soil for vegetables. All the walls are planted with up-to-date varieties of Peaches, Plums, Pears, and Cherries; and outside in the open we are at the present time planting espalier Apples, late varieties. We have just planted Gooseberries and Red Currants on one north wall, and on another Morello Cherries."

"Who is in charge of this garden?"

"One of my pupils is forewoman. We grow large quantities of vegetables, and have two thousand greens for winter. We also go in largely for intensive culture. This is a subject that I have specialised in; indeed, I was one of the first to practise French gardening in England, and had the second garden in England on that principle. When I was at Reading and Studley I used to exhibit vegetables at the Temple Show."

"Did you grow any extra quantities of Potatoes last season?"

"All told we had three acres of them. For the early we had Sharpe's Express; and for maincrops Arran Chief, King Edward, and Golden Wonder. Concerning Golden Wonder, I must say it is the best Potato I have ever had, and I agree with what Mr. Cuthbertson said at the Mansion House, 'it is food for the gods.'"

A GOOD LATE-FLOWERING ROSE.

"You have still plenty of Roses in bloom," I observed, looking at the borders on each side of the principal path in the kitchen garden.

IN THE GARDENS AT KIDBROOKE PARK—A BACKGROUND OF ROSE HOLLYHOCKS.

"Yes; though it is close on December we could cut a good few blooms. There are six hundred plants in these two borders, all General McArthur. I wish you could have come earlier in the season, to see the herbaceous borders when they were in their glory. They are three hundred and seventy-three feet long and eighteen feet wide, and I planted them to work out a gradation of pink colour, with groupings of Hollyhocks at the back. That was for summer. In autumn yellows predominate. One of the loveliest things I had this year was Helianthus sparsifolius, which was a blaze of colour, a wonderful, rich yellow, as though it had caught its glow from the sun. It wants protecting with bracken in winter, but it is well worth the trouble. Another plant that gave wonderful results was Dianthus Allwoodii, the new perpetual Pink. I put in some plants last year, and they were in bloom all the season."

At right angles to these borders, down another side of the garden, runs a border of similar length, and twelve feet wide, planted solely with Michaelmas Daisies of all species and varieties, dwarf and tall. The flowers were all over, but, labour being scarce, the stems still bore witness to the fine effect produced by this massing of one subject.

But this does not exhaust the list of herba-

ceous borders, for the principal one is outside the kitchen garden, backed by its wall, and so placed that it will be fully visible from the dining-room of the mansion when an old Yew hedge is removed, as it is to be shortly. This hedge, which has been kept in good order, is on the top of a gently sloping bank, where Miss Crooke hopes to have another herbaceous border.

"When completed," she remarked, "the features of these gardens will be the herbaceous borders, the houses, and the fruit, of which we are now planting a lot. Plenty of flowers are wanted for cutting for the house and for London. Later on, too, we shall do much bedding. Last summer, in one of the long beds on the lawn we had Paul Crampel Geraniums edged with Ageratum; another had standard Fuchsias, dot plants of Maize, blue Salvias, Marguerites, and an edging of Cerastium tomentosum; and a third had standard Heliotropes, with a groundwork of pegged-down Heliotropes, a two-foot border of pink Ivy-leaf Geraniums, and an edging of Cineraria maritima. They made three very effective beds. The four beds with the old sundial between them have only two varieties of Rose, Lady Ashdown and Lady Hillingdon."

WALLFLOWERS FOR SPRING.

"You will have a good show of Wallflowers for spring in these beds on the west lawn."

"Each of those beds has three hundred and sixty Wallflowers Sutton's Fire King, and a yellow Tulip. Rabbits give a lot of trouble, and I have wired all round the south lawn to keep them out. A few days ago I found they had got to these beds, so I put tarred string round them, and since then the pests have not come back."

"The lawns have not been neglected?"

"Not those round the house. The farther lawn on this side was ploughed and sown with barley last season, but that will revert to grass next year. Then beyond that is a big field where we grew a lot of Potatoes, and that is going to be made into a lawn as well. When it is finished it will open up a long view through the park. I have made a big lawn for croquet and tennis."

PLANS FOR THE FUTURE.

"What other alterations and improvements do you contemplate making?"

"I am anxious to make a water garden, for there is fine scope for it on the banks of the stream that flows through the park. Then I shall take up more Orchids when the houses are finished, and I can get more labour. At present they are mostly Cypripediums."

"Do your women gardeners work the same hours as the men?"

"Oh. yes! In summer they start at seven in the morning and finish at half-past five, with an hour for lunch. Sunday duty is taken once every three weeks, a forewoman and a boy coming down, and often they are here all day."

"Do you think you will be able to get a sufficiency of male labour?"

"There will, I think, be plenty of men, but when gardens get in working order again wages will certainly have to be on a more generous scale than they used to be. They have never been what they should. I am paying thirty-five shillings a week for male labour now. One other thing I should like to say before you go: I have had much kindness from other head gardeners, and have always found them ready with help and advice. There is absolutely no trace of professional jealousy, either locally or among the gardeners I meet at the Royal Horticultural Society's shows in London."

W. J. CHITTENDEN.

Next week: A Successful Grower and Exhibitor of Vegetables. Interview with Mr. H. E. Wallis, Drayton Manor gardens, Sherfield-on-Loddon.

Letters from a Lady Gardener.

RASPBERRIES AND NERINES.

DEAR KATE,—I think we do not grow nearly enough Raspberries, although they are amongst the most wholesome and delicious of fruits; and as for Raspberry jam, there is never too much of it. This is the time to start Raspberry canes, and you might well put in some, even if you can only grow a few; whilst those who can should spare a good piece of ground, in a moist position, if possible, for all the Rubi love plenty of water.

Do not be deterred by the old idea that you must put in posts and wires to support the canes. This is a quite unnecessary expense, and really the plants bring a better crop without any stakes, if you bend the canes over towards the next stool, and tie them together in arches. Everyone who has tried this plan agrees that it distributes the sap more evenly, so that instead of bearing fruit only on the upper sprays, those sprays which are produced all along the bent cane are fruitful. One sees the same thing in dealing with climbing Roses. If you want flowers all along the stem, you must not allow it to grow upright, but arch it over.

RASPBERRIES EARLY AND LATE.

We grow yellow Antwerp Raspberries as well as the fine red Superlatives, and the first-named has this advantage—that the birds do not touch them, so that they need not be netted. They are also extremely floriferous, and of very fine flavour, though not so large as the red varieties. We also have Raspberries of the red kind in October and November, and this year they have been quite plentiful during the late autumn. For this late crop we cut the canes down to within six inches of the soil in February. This makes them throw up a number of short canes in the spring, which produce their fruit very late, when they are scarce and valuable. Baumforth's Seedling and Fastolf are useful for autumn crops. They are both red, and of good size and flavour.

PREPARING THE SOIL.

The soil should be deeply dug and in good condition, but it is not advisable to bury a quantity of animal manure in it, which tends to breed insects and to cause sourness. Raspberries depend greatly on their surface roots, which are only a few inches below the soil, and top-dressing is the best way to feed them. But dig in all the humus (decaying vegetable matter) and burnt garden rubbish you can get, and in the spring you can add a good sprinkling of lime, which is useful both to destroy grubs and to fertilise the soil.

Get young canes, each with a good mat of rootlets, which must be spread horizontally about six inches under the surface all round the cane, not dropped into a hole. They will extend in a year or two to six feet from the stem, so that you must give them plenty of room—six feet every way is none too much. If the roots are dry from travelling, dip them into a bucket of mud and water before planting, and tread them in firmly.

In February these canes should be cut down nearly to the ground, which will make the plants throw up new growths.

THE FIRST YEAR'S WORK.

The object of your cultivation during the first year must be to strengthen these young growths, so that they may produce strong canes the following season. They cannot do this until they have broad surface roots, and for this reason it is necessary to sacrifice the original canes after they are planted. But the young canes which will appear in July yearly after the first season are only to be thinned out (if too numerous) to six of the strongest, which will bear fruit the following year. Directly the crop is over the old canes (*i.e.*, those which have fruited) should be cut down to the ground, so as to give all the sap to the young growths. They should not be tied in arches until their leaves are off in winter. All weeds must be kept down while small, but the Raspberry bed must never be dug with a spade, only hoed as often as you can. The least injury to the surface roots from a cut or bruise will result in the starting of a sucker, which will proceed to throw out its own circle of roots, and so starve the mother plant. Too often one sees a forest of suckers between the plants, the result of the ignorant use of a spade between them; and there is then nothing to be done but to make a fresh plantation at once.

In the spring, just as the plants start into growth, give them a top-dressing of old hotbed stuff, leaf-mould, burnt rubbish, or a mixture of fresh soil, soot, lime, and poultry manure. Their roots will then grow strongly, and about the middle of June they will enjoy a covering of cut grass, straw, or leaves, to keep them moist and cool during the time when their fruit is swelling. This should be laid down after hoeing the surface, and during a wet time; in a drought you should drench the soil between the rows with water before top-dressing it.

HOW TO GROW NERINES.

In the scarcity of fuel, many plants which are almost hardy have come into their own. But Nerines, which are amongst the most beautiful of autumn flowers, are seldom seen in good bloom, for they need special cultivation, although they are so nearly hardy that they do not require fire heat under glass. Being Amaryllids from South Africa, they should be kept absolutely dry, in the full sunshine, close under the glass roof, from the middle of May until the end of August, when one soaking of tepid water should be given, but no more until the soil is very dry again. Before long the points of the flower stem, crimson-brown in colour, will appear, and from that time they must have plenty of water. The leaves do not start till the blooms are over, but the exquisite flowers look their best when arranged with Maidenhair Ferns as greenery. Every shade of carmine, pink, and red is found amongst them, and some (such as N. corusca major) seem to sparkle with silver.

After flowering, the plants must still be kept fairly moist throughout the winter, for this is their growing season; and even when the tips of the leaves begin to turn yellow in the spring they must not be hurried, but kept slightly damp until the foliage has ripened off completely. Then comes their baking time, when we have to do our best to make them imagine that they are under an African sun during the rainless time of the veld. Without this dry heat the blooms will not start, and it must not be omitted.

SMALL POTS BEST.

Nerines do best in small pots, well drained, with a mixture of good loam and charcoal dust. They should not be potted every season, as they blossom best when very tight in their pots, and seldom flower the first year after repotting. They are, I believe, grown in the open air at Kew, close to the warm south wall of a greenhouse, in the same way as the Belladonna Lilies (Amaryllis Belladonna) and the Fairy Lilies (Pancratium illyricum and P. maritimum), which flourish in such a position. But in cold districts Nerines are safer in pots, and their dainty flowers are so valuable in the conservatory in autumn that it seems a pity to expose them to the winds and storm of our climate. Everyone who has a cold greenhouse should grow them.—Your friend, I. L. R.

A New Year's Resolution: To introduce GARDEN LIFE to all your gardening friends, to induce them to become readers. Our thanks in advance, and theirs when they see the paper.

ORCHIDS FOR AMATEURS.

Interview with Mr. A. W. Cross, at The Gardens, Achnacone, Colchester.

THE gardens of Mr. A. G. Mumford, at Achnacone, near Colchester, to which, by the courtesy of the owner, I paid a visit in April, have many features of interest. These will not be neglected, but the head gardener at Achnacone, Mr. Cross, has so successfully devoted his attention to Orchids which may be grown by amateurs, that I asked him to give me the benefit of his experiences and views on that subject in particular.

We spent a considerable time in exploring the pleasure grounds, which, situated on high ground, surround the residence, and are approached on both sides by a drive through an avenue of Elms, beautified by numerous varieties of flowering and foliage shrubs. In April, the naturalised Daffodils were just coming on, and later clumps of Lilies are a feature. Passing on to the lawn—where Abies in variety (feathered to the ground), Wellingtonia gigantea, Araucarias, with other specimen trees, notable in many cases for the charming growth of Ivy underneath, claimed attention—I noticed the vigorous appearance of a large bed of Rhododendrons.

"The variety," said Mr. Cross, "is Cunningham's White, but several of the beds are mixed. They were only planted three years ago, and I attribute their thriving condition partly to the fact that in planting them we made a hole three feet deep, and three feet square, and filled it up with good peat. Also, each year we have given them a mulching of cow manure and peat."

The Destruction of Daisies.

"How do you treat the lawn itself, to get it into such perfect condition, with Daisies banished?"

"We always dress with well-rotted, sifted manure in the early spring, taking care to well brush it in with a good, stiff broom. A Daisy killer is used twice a year in spring and autumn. The two beds of Cupressus Lawsoniana and Aucubas, now filled in with Wallflowers (Blood-red in front, and Cloth of Gold behind), edged by Myosotis, will presently contain Geraniums (Vesuvius), and Marguerites, edged with Lobelias, the colour combination being red, white, and blue. Just here I am trying Roses in the shade. Last year I planted and flowered them. The varieties are Alberic Barbier and Dorothy Perkins in combination in one place, and Alberic Barbier and Crimson Rambler in another. We have to make our Rose soil. The natural soil is dug three feet deep, and a quantity of rotten manure put in the bottom."

Roses in Pairs.

Noticing, further on, a pretty rustic bridge and some tastefully arranged rockwork, we approached the spacious tennis and croquet lawn. Along half its length are Roses in pairs, not chained, but linked together by a coil of wire.

"I should be glad to know how you mate the Roses?"

"The first couple consists of white Dorothy Perkins and Wedding Bells. The others are Lady Gay and Claire Jacquier, Crimson Rambler and Electra, Hiawatha and Madame Berard, Dorothy Perkins and Electra, Dorothy Perkins and Thalia, Minnehaha and The Garland, Crimson Rambler and Aglaia, Dorothy Perkins and Aimee Vibert, and Jersey Beauty and Lady Gay. The trees were planted two years ago, in holes three feet deep, and the Fir poles are about nine feet high. The hedge on one side of the Rose-Companionships is composed of Apples (Ribston Pippin and Cox's Orange), and Pears, Marie Louise and Calebasse."

The Pergola and Rose Garden.

"You have more Roses on the wall?"

"Yes; Marechal Niel, W. A. Richardson, and Climbing Devoniensis. In the beds in front we have Maman Cochet, White Maman Cochet, Frau Karl Druschki, Dean Hole, Mrs. Grant, and A. K. Williams, as half standards; while the dwarfs, of which there are half, include Augustine Guinoisseau, Viscountess Folkestone, Lady Roberts, Madame Lambard, Madame Abel Chatenay, and Marie van Houtte. The Rose pergola, on the other side of the lawn, is from ten to fifteen years old, and the varieties are Dorothy Perkins, Dundee Rambler, Alberic Barbier, and Reve d'Or. The Rose garden proper, with standards in the centre, and four round beds of bushes, all edged with Box, contains some of the varieties already named, as well as Hugh Dickson, Abel Carriere, Boadicea, Mrs. John Laing, Bessie Brown, Killarney, Mrs. Edward Mawley, Fisher Holmes, Margaret Dickson, Mrs. Sharman Crawford, Miss B. Cant, and Ben Cant."

MR. A. W. CROSS.

"The last two names suggest that the soil has something to do with the fine growth and flourishing appearance of your Roses."

"Yes, the natural soil at Braiswick is just what Roses like. It also suits Hollies, as you can judge from the handsome specimens of the golden variety, which we have just clipped into shape near the house."

"Are there any special creepers on the house?"

"The Wistaria sinensis, nearly covering the west side, is notable. We get flower sprays three feet long."

Eupatoriums and Dielytras.

"Do you always manage to keep the conservatory as bright as it is to-day?"

"Sometimes it is brighter. Much, of course, depends upon the season. The permanent features include the Geraniums on the wall, which flower profusely. Then there are the Plumbago, Bougainvillea, and Streptosolen. Tree Ferns are also planted in beds. The rest of the contents vary. Just now there are pots of Eupatorium Fraserii, which, by the way, is quite a plant for an amateur to grow. It is easily struck from cuttings, is useful for decoration, and lasts nearly six weeks in flower. The same remark applies to Dielytra spectabilis, also in flower. The vital point with Dielytras is to let them get dry in their pots."

"What is the variety of the handsome Fuchsia dotted about the building?"

"Scarcity. I can strongly recommend it. I grow from cuttings in the autumn, and the next year the plants run up five feet high. If flowers are wanted at a given date, they should be pinched six weeks before the time. Cinerarias of the stellata type, a few Cattleyas Trianæ, Coleus thyrsoideus, Azaleas mollis and indica, Deutzias, Clivias, and several fine plants of Asparagus Sprengeri, which we use as pyramids for decoration, make up the rest."

The Cultivation of Hydrangeas.

Pursuing our way outside, Mr. Cross pointed out the only piece of formal bedding, the combinations in spring being Wallflowers, Arabis, Tulips, and Myosotis; in summer, Geraniums (Mrs. Patrick Campbell, Mrs. Pollock, and Flower of Spring), Heliotropes, blue Lobelias, and Golden Feather Pyrethrum. Under the windows of the billiard-room are a couple of beds with Golden Gem Calceolarias, edged by Purple Bedder Violas, to be succeeded by Mrs. Patrick Campbell Geraniums. The glasshouses being all in the pleasure grounds, we next entered them, beginning with the Vineries.

"In spite of the aspect being west, the Grapes do well," said Mr. Cross, "and I do not think that the question of aspect need trouble anyone. We make up the wide inside border every year, using bonemeal, mortar rubble, and cow manure, but not giving too much. The Vines in both houses are Gros Colmar, Black Hamburgh, Foster's Seedling, and Muscat. Here we have some of our Hydrangeas, which flower the whole of the summer and into November. They are very easy to grow. I start from cuttings in the spring, which is better than the autumn, and feed with cow manure. Hydrangea Hortensis is, in fact, one of the easiest and least expensive plants to grow."

"When was the range put up?"

"Twenty years ago. The Peach houses contain several varieties, and both Peaches and Fig trees grow good crops. I give the Peaches plenty of lime, mortar-rubble, and cow-manure, relying on these rather than on fertilisers. Perhaps, as the plant houses include the Orchids, you would like first to glance round the kitchen garden."

Fruit and Vegetables.

"And its environs," I rejoined, as we walked through a garden devoted entirely to annuals and herbaceous plants, all grown for cutting, with Currants trained on the walls, and an orchard planted with healthy standard fruit trees."

"Yes, the environs are very useful, and enable us to reserve the kitchen garden entirely for wall and bush fruit, and vegetables."

"You appear to have a representative collection of each?"

"Peaches, Nectarines, Pears, Plums, Cherries, Raspberries, and Gooseberries are largely grown. We get rid of the Black Currant mite by the simple expedient of destroying infested trees. Waterloo, Royal Sovereign, and Givon's Late Prolific are our Strawberries, and we only keep the runners until the third year. Rhubarb is protected with wooden or earthenware boxes, and, later on, with litter from the stable; and we cut from the latter end of October until the Gooseberry season begins."

"I should like to have a few particulars about the principal vegetables."

"There is a great call for Artichokes, of which we have a large plantation. I have just started cutting Asparagus, which will last until Peas are ready. The Asparagus beds are salted every year, and, after cutting, a dressing of some kind of fertiliser is applied. We start Peas with Sutton's Pioneer, and go on to Early Giant, Gradus, Exhibition, Centenary, Autocrat, and Gladstone. Last year, for the first time, I grew Midlothian Early Potato, and I can strongly recommend it. For the main crop, Factor and Up-to-Date are the best. The Seakale beds were planted two years ago, three in a clump, and I did not cut any until the second year. I cover over with pots, and use litter and leaves for gentle warmth, beginning to cut in the middle of January. All the varieties of Onions are autumn sown. Last year I had bulbs of Ailsa Craig weighing two pounds each. It is a mistake to sow too early. Most of our Tomatoes, Carters' Sunrise and Sutton's Perfection, are grown in 'The Bath.'"

Orchids for Amateurs.

Having inspected that remarkable structure, which was built by a previous owner of Achnacone, we returned to the plant houses. Here the Orchids in flower, or coming into flower, were Cœlogyne cristata, Odontoglossum Crispum, Oncidium tigrinum and varicosum (with flower-spikes three feet long), Cypripediums insigne and barbatum, Lælia purpurata, Calanthes Veitchii, and a number of Dendrobiums (nobile).

"These," observed Mr. Cross, "are some of the most useful kinds, all of easy cultivation, and there is no reason why any intelligent professional gardener, or amateur, with ordinary means at his disposal, need hestitate to grow Orchids of this class. The culture of them is really not more formidable than that of Chrysanthemums. I should like you to understand that here we do not attempt to go in for the more expensive varieties, and that I merely practise what I preach."

Imported Plants.

"To begin with, then, you do not consider that it is necessary to build special houses in order to cultivate Orchids?"

"By no means. Of course, houses are necessary, but anyone who wishes to go in for Orchid culture need not be deterred by considerations of aspect. If, on the other hand, it is a question of building, say, three houses for Orchids, I would not advise that all three should be built together, because they need bottom ventilation more than they do air at the top. A great many persons are deterred from growing Orchids because of the expense, but that is almost imaginary. Owing to the immense consignments from foreign countries, a couple of pounds will suffice to purchase a few nice varieties, which are easy to cultivate. Beginners obtaining newly-imported plants should, however, ascertain the country from which they came, and the elevation in which they were found growing, because Orchids from very high elevations require much less warmth than those from the lowlands. This is notably the case with Odontoglossums."

The Importance of Shading.

"Perhaps you will now say a few words on the treatment of imported plants on arrival?"

"They should all be unpacked as soon as possible, but some varieties need a different treatment from others. For instance, most of the Odontoglossums reach England devoid of their leaves, and it is rather trying to this class of plant that it has to come from its home in the high mountains through tropical countries. The consequence is that plants often arrive in a rather shrivelled condition, but with proper care they soon revive. In order to revive them, and this applies to plants from all parts of the world, they should be placed in a moderately dry, hot atmosphere, and given little or no water for a few days. My own practice with Odontoglossums is to suspend them head downwards, and syringe them twice daily until the foliage has assumed the natural colour. While this is being done, they should, of course, be shaded. Some of the Cattleyas, Lælias, and Cœlogynes require to be set on a gravel or other bench, and as soon as they revive they can be repotted or re-basketed."

Cypripedium Insigne.

"But," continued Mr. Cross, "I would advise amateurs to purchase established plants, because, so far as my own experience goes, I have found them much more satisfactory in the long run. A great many can be bought at 3s. 6d. a plant. With regard to species that may be described as strictly amateurs' Orchids, one of the most easy to cultivate is certainly Cypripedium insigne, with its various varieties. They are for the most part cool-house Orchids, although some need a stronger heat than others. Several, such as Cypripedium Argus, Hoveril, and barbatum, are well worth growing as foliage plants alone. With a few exceptions, Cypripediums do well potted in equal parts of a mixture of rough fibre, peat, loam, and sphagnum moss, and some broken crocks mixed with them. The drainage should be free, and it is advisable to half fill the pots with the pieces of broken crocks. The plants need not be raised above the pots, but as the roots grow very vigorously, ample provision should be made for their development. After repotting, they want very careful watering, just enough to keep the moss alive. Orchids of this class also need shading from very strong sunshine, especially if they have variegated foliage. The best time to repot them is about a fortnight after they pass out of flower. The great recommendation of this section is that you can gather flowers nearly all the year round, and that they remain in good condition for several weeks. I have had several Cypripedium insigne in flower for two months, but I do not recommend that period, because it weakens the constitution of the plants."

"Perhaps you could mention some other varieties of Cypripediums which will flourish with similar treatment?"

"C. Leeanum, C. Charlesworthii, and C. villosum will do in a temperature of about forty to fifty degrees, but C. barbatum requires a little higher temperature. Referring to another section, Calanthes, especially Veitchii, are very useful to grow, but they need a little care in management, and a different compost. The compost I use is one half good fibrous loam, one-fourth good leaf-soil, and one-fourth sphagnum moss, chopped fine, with a sprinkling of coarse, sharp sand, a little dried cow manure, and a few broken potsherds, well mixed together. The mixture should be placed in a 6-in. pot, about a quarter full of crocks for drainage, and the base of the bulb should be just about an inch below the rim of the pot. After the bulbs have been repotted, they should be kept somewhat on the dry side, syringed once or twice a day for a few days, placed in rather a warm corner of the house, and then, when the plants are in full growth, they should receive a little weak cow manure-water. As the bulbs approach maturity, the leaves begin to turn a little yellow, and the water supply must be reduced. Calanthe Victoria Regina is not so free-flowering as Vetchii, but I think that Calanthes, for people who can command a good heat, respond satis-

ACHNACONE, COLCHESTER.

factorily to the extra attention bestowed on them. Perhaps, with regard to Cattleyas, you would rather I named two or three varieties that will do well in cooler houses. C. Trianæ and C. Mossiæ thrive in a mixture of peat and sphagnum moss, and will grow well in pots or pans. These are both winter-flowering varieties, and, although they are not the best for cutting, they supply lovely tints that are hardly to be found in any other class of Orchids. I think they are decidedly the two best Cattleyas for amateurs, but C. labiata is a very nice flower to grow, and C. Mendelli is also very attractive."

Cœlogyne Cristata.

"What about Cœlogyne cristata?"

"That is certainly one of the most suitable for amateurs, as it is also one of the most popular Orchids grown. It does well in pans or teak-wood baskets, and will grow in a mixture of sphagnum moss and peat, with a good sprinkling of sharp sand. The flowering time is from the middle of January to the end of February, and the best time to re-pan or re-basket is as soon after flowering as possible. C. cristata must be well supplied with water whilst it is growing, and a humid atmosphere must be retained. When the growth is finished, it requires a period of rest, but it must not be dried off too severely. Then there is the large and popular family of Dendrobiums."

The Amateur's Dendrobium.

"Which of its varieties do you recommend for amateurs?"

"D. nobile is quite an amateur's Orchid, and one that almost always gives a very good account of itself. It is very regular in flower, anyone having a plant or two can soon get a good stock, and it only needs a period of rest after it has made its growth, to get it well ripened. Re-potting should be only done once in three years. Dendrobium speciosum is another variety that may be cultivated by amateurs."

The Most Popular Cool Orchid.

"Do you recommend any of the Oncidiums?"

"I think Oncidiums have been rather neglected as a class, and that for lightness and beauty they will compare favourably with any. But there are only two or three that are particularly suitable for amateurs. I mean O. macranthum (whose flower-spikes are usually very fine), O. varicosum, and O. concolor. These will grow in a mixture of sphagnum and peat, and should be slightly raised above the rims of the pots. But the most popular family of all amongst cool-house Orchids is Odontoglossum Crispum and its numerous varieties. The treatment which I have mentioned for other varieties will suit them perfectly well. O. Crispum itself takes the palm, but O. gloriosum and O. grande are also good varieties. Few plants are more beautiful at flowering time, or have a more distinct appearance. Here I may mention, for the benefit of amateurs, that it is important to tie up all the flower-spikes, a precaution which should be adopted in the case of every variety of Orchid."

The Beauty of Lælia-Cattleyas.

"Do these exhaust the varieties which you consider may readily and inexpensively be grown by amateurs?"

"I should like to add the Lælia family, especially Lælia purpurata, because of its great beauty. It requires a good deal of attention, but it is not difficult to grow, so long as the atmosphere in which it is placed is not close and stuffy. It must have plenty of air, and the treatment generally should be the same as that I have recommended for Cattleyas."

THE LODGE, ACHNACONE.

Hints on Fern Cultivation.

"I notice that in your houses you have also a singularly attractive collection of Ferns."

"We use a great many for table work. With a proper selection of varieties, and a little extra care bestowed upon their treatment, there should be no difficulty in keeping Ferns in a healthy condition. They do not require to have their roots always standing in stagnant water. I myself only give my Ferns a good soaking of water when, after testing the pots with my knuckles, they give a clear ring. Another mistake in the spring is to stand Ferns in a window or some other place where a burst of sunshine may at any time succeed sharp-cutting winds on the young fronds, and cripple the plants for the remainder of the season. It is also quite a blunder to place Ferns outside when there is a heavy downpour of rain. It is far better to use a water-pot with the rose on, taking care also to use tepid water. For nourishment when the Ferns are in an active state of growth, I use weak soot-water, which gives a nice dark green to the foliage, and helps to build up a robust constitution. Yet another word of caution—people who are constantly picking fronds from their Ferns must not expect to have good plants. It is wiser to keep one or two plants for the purpose of cutting. The best varieties for house work are Pteris Wimsettii, P. major, P. tremula, Cyrtomium falcatum, Asplenium bulbiferum, Nephrolepis Piersonii, and Adiantum cuneatum."

Stocks and Single Chrysanthemums.

"Do you make a speciality of any other plants?"

"We grow a fair number of Malmaison and winter-flowering Carnations, force a few Rhododendrons, and make rather a feature of Stocks in pots. The variety is Sutton's Winter White. They are potted in ordinary soil, with a little loam, leaf and sand. As soon as they begin to show flower, I feed them with a little cow manure. The plants you see are in 'forty-eight' pots, and if bigger specimens are wanted, they should be put in 'twenty-fours.' They last six weeks in flower, and furnish a mass of bloom. Then we grow a quantity of Chrysanthemums, including some new varieties of Japanese and Incurves, the latter including Buttercup, Clara Wells, Calypso, T. H. Hambledon, Eileen, Mrs. J. Wynn, Gem, and Mrs. Cora Stoop. I also find Single Chrysanthemums very useful, because they lend themselves to decorative purposes."

"Where did you begin your gardening career, Mr. Cross?"

"At Park House, Reigate, and afterwards I went to Mainbridge Hall Romsey. I was then at The Grove, Exening, going next to Merton House, Exening, as head gardener, and before I came here I was at Blacklands Hall, Cavendish, Suffolk, for nearly five years. Since I came here as head gardener, two and a half years ago, I have done a good deal of showing, and have taken a number of first prizes for groups of foliage plants, fruit and Sweet Peas. I have lectured in Colchester and Ipswich on Carnations, Ferns, and Orchids."

ALFRED WILCOX.

NEXT week's interview is with Mr. S. Stewart, at The Gardens, Connington Castle, Huntingdonshire.

Perpetual-Flowering Carnations.

VII.—HYBRIDISING.

NO work connected with the cultivation of flowers has more charm than hybridising. To be successful, the grower should have an object in view in regard to the varieties he intends to cross. To go haphazard from one flower to another, with the idea that perhaps something may come good, is a waste of material and time.

The Fertilising Organs.

I may explain that fertilisation is the fusion of the male and female organs, which are readily observed in the flower of a well-developed Carnation. The female organs, or pistils, are two or more hornlike bodies protruding from the centre of the flower. They are furnished with the stigmas at the apex, and are attached to the ovary or seed vessel, which is at the base of the flower. The stamens or male organs differ from the pistils in that they are more minute, and are found generally amongst the petals of the bloom. Their tips are furnished with the anthers containing the pollen. Having decided on the flower you intend shall be the seed bearer, the operation of emasculation must then take place. With a small pair of tweezers, carefully remove the anthers, which must be done before the pollen becomes ready. The reason for this is that you should have a perfectly clear cross.

The next item of importance is that the

William J. Cross

Gardeners' Chronicle 1877, n.s. 8

In the pretty little village of Whitechurch, on the banks of the Thames near Reading, the subject of our present memoir was born, September 10, 1832. His father, a poor but honest tradesman, strove hard to bring up a large family respectably, and to give them all the best education the neighbourhood, afforded. "My own, however," writes Mr. Cross, "was poor indeed; for in the National School, to which I was sent, there was no grammar, geography, history—in short, nothing taught but the common rules of arithmetic, reading and writing. Our only two books were the New Testament and the five books of Moses, excepting a "Dialogue" between William Walker and Thomas Brown on the subject of getting a boy christened—the one asking the favour of the other to stand godfather. A better school was looked out for me, but one morning, when on my way to read this silly story in my fourteenth year, I met a man looking for boys to hold up little forest-trees for the planters. I went, and, having spent a season at that work, my master and father made arrangements for me to go into the gardens of S. W. Gardiner, Esq., Coomb Lodge, in the same parish. A premium was paid, and my wages were to start at 2s. per week. The gardener, Mr. J. Piggott, was what is known as a good old-fashioned gardener, and the gardens, although small, were under his management productive. Good Pines, Melons, Cucumbers, excellent Grapes, and plenty of forced and common vegetables, formed the usual supply to the house. He used hot dung properly prepared with good effect, and, I believe, sent away all his young men ignorant of thrips and mealy-bug. My scanty income was in due time raised to 4s. per week, and, having the apprentice's privilege—that of killing the rats of the place at 1d. each—I began to lay out plans for myself. My fancy for gardening soon grew into an intense love for it, and my duties by night and day gave me the greatest pleasure. A sharp frosty night compelled one or the other to remain on duty nearly or quite all night, but my lodging a mile from the gardens made this duty hard and wearying, so that it can hardly be wondered at, that on one cold November night I found myself floundering about in an open tank in the centre of the gardens, containing several feet deep of water, having walked in asleep on my way to the Pine-house fire.

"My first spark of garden literature, in the shape of McIntosh's *Practical Gardener* I bought with my rat-tail pence. A description in the *Floricultural Cabinet* of some wonderful Fuchsia or other plant, and an occasional peep into the *Gardeners' Chronicle*, increased my strong desire to progress. I owe a deep debt of gratitude to Mrs. Piggott, a very ladylike person, and sister to Mr. T. Webster the artist; her many kindnesses and advice to me at a time when my troubles ran high, will ever be remembered and appreciated by me.

“Having spent one season weeding and several in the stokehole and houses, and in serving the kitchen and kitchen gardening, I was considered a fit subject for a London nursery. Accordingly in the spring of 1851 I was placed in the Pine-apple Nursery under that best of all propagators, the good old Mr. Fancourt— a man hardly to be equalled in the art of increasing hard-wooded plants. One day I asked him to what did he consider his great success mostly due? He replied, "close observation.' 'Observation,' he continued, ‘will enable a man to propagate and grow any plant living.' Although his work lay principally under bell-glasses, yet for the principles of plant-growing there is no man to whom I owe so much as to him. My wages at that time being but 8s. per week I could not do much in what I so much desired—self-improvement. My handwriting being considered suitable for seed-packets I was ordered, with four or five others, to write each evening till 8 o'clock, but no extra pay was allowed for it. Being already a member of a Mechanics’ Institute, I begged off on certain evenings weekly to attend it, and this was readily granted. From one department to another I went with a small increase of wages, till I was made foreman of the soft-wooded propagating department, including choice hardy shrubs and Tea Roses, with the assistance of one little boy, and pay 15s. per week. My staff soon increased to six or eight men. This position enabled me to satisfy myself as to the value of large pots for soft-wooded specimen plants applied in

the early stages of growth—what is known as the one-shift system — which I am convinced is the true principle for the production of handsome plants. My evenings now were my own, and were devoted to education — practical geometry and music forming part. I attended all the lectures possible on a variety of subjects. Before leaving London I must have heard some hundreds by clever men, but, I regret to say, not one did I hear, or hear of, on botany or any branch of it. My lessons on geometry were taken in a class; then at my lodgings, when all the inmates of the house had gone to bed, I worked out the problems, and copied them, with definitions, into a large book, and carefully lettered and described all through the course, in the hope my book would be a useful one some day. This work generally brought me into the small hours of the morning. I may mention that the tens of thousands of plants I had to produce were obtained principally by means of well-prepared hot-beds, which for speed, and for securing health and strength, I think cannot be equalled by any other kind of heat. In search of further information I decided to leave London for the country, and was engaged to serve Mr. Scott at Leigh Paik, Havant, Hants, in the houses, leaving one guinea a-week, with the promise of a rapid advance, to accept I4s. This engagement did not turn out a happy one, for in a month or two I was discharged at a moment's notice — to leave the place the same night—for stopping a few Calceolarias, some of which were being stopped daily as they grew long enough. This sudden change drove me to lodge at a dirty public-house till it could be settled what my next step was to be. But for the kindness of Mr. Arthur Henderson my gardening career might have been sadly interrupted, and perhaps, as is the case with many young men, cut short. I think head gardeners have a duty to perform, and a responsibility in the management of young men, which should be seriously felt. I do not believe in the degeneracy of the rising generation of gardeners, but I think there is evidence enough to prove that even better results will be obtained by them when the present head gardeners have passed away. Suppose only one young man in ten is promising; is he not sufficient to carry away one's best practice, and add that to the practice of the other good men? What are the best head gardeners of the present day but the finished foremen of a few years back, who needed all the assistance and encouragement their masters could give them? Every one of such will remember with pleasure the man who gave him valuable instruction and encouragement as contrasted with those who practised a tyrannical authority discharging men by the dozen on the simplest fault, or with no fault at all, regardless of consequences.

“It was soon settled for me to go to Kinmel Park, North Wales, as foreman to the late Mr. Mountford, gr. to H. R. Hughes, Esq., where I remained two years. Soon after arriving there I found, to my great sorrow, my bock of practical geometry was missing, never to be recovered. I hoped a letter to my last place would recover it, but it did not. At this place I grew a dozen tree Mignonettes 4 feet 6 inches high, with heads as much through; the leaves had almost the substance of Cabbage leaves all up the stem. Some plants were very graceful, and bore flower-spikes 13 inches in length. I had some little difficulty to convince Mr. Mountford that they were from an ordinary packet of seed. Mr. Barron had some men at Kinmel Park lifting large trees, and his simple method of lifting a heavy ball with the tree perfectly upright was I thought worth remembering.

"During my stay here I began to form my little library, and learnt the art of entertaining myself in the long winter evenings. My duties at other seasons were hard, as often, while the Vines required so much attention, we worked from 4 in the morning till 9 at night. In fact the work went with but one change-—from work to sleep, and from sleep to work. In the spring of 1858 I left Kinmel for London, to seek a situation as head gardener, and the following summer was sent by Mr. Arthur Henderson to manage a small garden for Mr. Nicholl, Cowley Grove, near Uxbridge, Middlesex. This gentleman was an ardent lover of his garden, and I spent two very pleasant years with him. While there I wished to try an experiment with some plants of free growth, to test the principle of raising the temperature about mid-day to the highest degree possible by sun-heat. Accordingly I

selected some young Fuchsias struck the previous autumn, and by this time in 6-inch pots. I shifted them into 16 or 18-inch pots, using rough rich soil and free drainage, and placed them on a bed of warm tan some time in March. Ventilation was given as usual in the morning when the temperature rose high enough, but at about half-past 12 o'clock I shut all up as tight as possible, and syringed away pot after pot of warm water all over plants, pots, glass, walls, and all surfaces till the house in the full blaze of the sun rose to 120º or more, and was charged with all the vapour possible, I locked it up to make sure no one could open the door by any chance. At about 6 o'clock I gave an inch of top air to every sash, and during the evening increased it so that the temperature would stand through the night at about 60º. This treatment was followed up for two or three months, when the plants were taken out for conservatory decoration. Their growth was remarkable for thickness of wood and leaves. The leafstalks on the main stem were much shortened by the wood burying them in; they broke at every joint, these being extremely short, and branched again and again till without stopping a shoot they became a thick pyramid, and during the summer and autumn flowered abundantly at every point. When carried out of the conservatory to let in Chrysanthemums they measured from 6 to 14 feet high according to habit. I was much pleased with the result. "

In the year 1860 I went again to Messrs. A. Henderson & Co.'s nursery to wait a better situation, and in the autumn of the same year was engaged as head gardener to A. J. R. Stewart, Esq., Ards, Co. Donegal, Ireland. Here I had a good staff of excellent men and a good garden, and was much pleased with the wildness and natural beauty of the place. Five or six vineries were still holding their crops, but not one bunch of Grapes was fit for table. The roots of the Vines ran outside. The next season, having all ready for a good start, I loaded the borders with 18 or 20 inches of stable dung, which was well attended during the season, and the inside properly cared for as to ventilation, &c. The result was five houses of good black Grapes and one of Muscats. The next season the bunches came much larger, without disturbing a root. This garden was remarkable; for a very fine collection of Pears planted by Mr. McLachlan, a good gardener, once at Ards. The climate of the North of Ireland seems most suitable to a clean healthy growth and large well-finished fruit.

“In 1862 I left Ards for London once more, and was destined the same autumn to come to Melchet, being engaged by the late Lord and present Louisa Lady Ashburton. Besides the management of the garden much more important duties fell to me about the new mansion, which was begun the following spring by H. Glutton, Esq., architect. Under him I carried out extensive ground-works during several years, such as the terraces, carriage road, &c. Having a love for trees, and a dislike to destroy any, Lady Louisa ordered me to transplant. Now the recollection of Mr. Barron and his excellent plan became of use to me. I was allowed to purchase one of his machines, and transplanted many trees weighing from 1 to 6 tons without a single death; they are all, in fact, at this time more vigorous than ever. I found some little difficulty in removing smaller trees and shrubs of from 10 to 15 cwt.; and consequently for this purpose I had a truck made which when attached to the ball, the young tree is lifted by the horse pulling down the shaft, causing the tree to swing up on to the bed of the truck in a perpendicular, position. When drawn to its destination, the operation of lifting is reversed with much ease and speed, the tree being readily planted without the slightest risk. About this time the valuable and interesting collection of plants was began to be formed, and many soon grew into size. Among the plants I have raised may be mentioned Actiniopteris radiata from spores, for which the Royal Horticultural Society awarded me the Silver Flora Medal; hybrid Cypripedium Ashburtonae and Crossionum, also Harrisianum, but in this last Mr. Dominy was before me. Good Grape and other fruit growing was not lost sight of.

"In 1869 I left Melchet and was engaged as gardener to the Rev. S. Phillpotts, Porthgwidden, Cornwall, a gentleman possessing much horticultural knowledge, and a

profound lover of his garden, in which there is a great deal of glass, a nice collection of plants, and good fruits. Here I applied my usual remedy to exhausted Vines, namely, a heavy coat of stable dung and due attention to the inside of the house, with excellent effect. On the walls are two Pear trees remarkable for their large size—Glou Morceau and Beurre Rance. The estate is exceedingly pretty, and situated on the banks of Falmouth harbour. I remained at this place very comfortably for two years, when arrangements were made for me to return to Melchet to my former post. Here I found most of the garden buildings swept away and new ones erected, besides a new kitchen garden formed. During my absence the big Lily and Phalaenopsis had been awarded each the Lindley Medal when exhibited at South Kensington.

"Through the kindness of lady Louisa I have exhibited plants and fruits successfully. The last time I exhibited plants I won at Southampton the cup I prize more than all I ever was awarded, inasmuch as we carried off the laurels, beating a large collection brought from Leigh Park, the only place (I must own it) I ever owed a grudge to."

Cut flowers shown in bunches are always a feature at York, tender exotics and hardy outdoor kinds being alike forthcoming in quantity and in faultless condition. With twelve bunches of stove and greenhouse sorts Mr. McIndoe was easily 1st, showing a grand lot, consisting of Orchids of various kinds, Ixoras, Anthuriums, Dipladenias, Stephanotis, and the singular Callistemon rigidus; 2d, Mr. Black, gr. to the Misses Pease, Darlington.

Six varieties.—With these also Mr. McIndoe had 1st, and Mr. Black 2d.

Twelve bunches hardy flowers. — Here again Mr. McIndoe had 1st with a fine collection; 2d, Mr. Craig, gr. to T. Hutchinson, Esq.

FRUIT

was present in large quantities, with less of an inferior character than is often to be seen where much is brought together at this time of the year. In the class for three bunches of black Hamburgh Grapes there were some nine competitors, several of whom ran a close race—Muscats, as might be supposed, taking the time of year into account, were deficient in colour. The collections of fruit shown in the different classes were with few exceptions in good condition. For eight dishes Mr. Miles, gr. to Lord Carington, Wycombe Abbey, took 1st, with an even collection consisting of Black Hamburgh and Forster's Seedling Grapes, a good Queen Pine, Elruge Nectarines, Hale's Early Peaches, Negro Largo Figs, Hero of Lockinge Melon, and Black Circassian Cherries; 2d, Mr. McIndoe, whose best dishes were Black Hamburgh Grapes, a Queen Pine, Bellegarde Peaches and Pitmaston Orange Nectarines; 3d, Mr. Westcott, gr. to the Duke of Cleveland, Raby. Six dishes.—1st, Mr. McIndoe, with a good collection, the best examples being Black Hamburgh and Foster's Seedling Grapes, Best of All Melon, and a Queen Pine. Mr. Dawes, gr. to the Hon. Mrs. Meynell-Ingram, Temple-Newsome, was a close 2d, having, amongst others, Muscat of Alexandria and Madresfield Court Grapes, the latter very large in berry: Royal George Peaches, and Lord Napier Nectarines. 3d, Mr. Westcott. In the class for four dishes of fruit Mr. Clayton, gr. to J. Fielden, Esq., Grimston Park, took the lead, with Black Hamburgh Grapes, Abec Peaches, Elruge Nectarines, and a Melon—all in excellent condition; 2d, Mr. Leadbetter, gr. to A. Wilson, Esq., Hull. Three bunches of Black Hamburgh Grapes.—Mr. Allsop, gr. to Lord Hotham, Dalton Hall, Hull, was 1st, with medium-sized bunches, even in berry, quite black, and covered with thick bloom; 2d, Mr. Wallis, gr. to Sir H. Meysey-Thompson, Kirkby Hall, York, showing nicely finished bunches; 3d, Mr. H. Gill. Three bunches of Muscats.—1st, Mr. Sleightholme, gr. to T. W. Dymond, Esq., Barnsley. Three bunches any other varieties of white Grapes.—With these Mr. Allsop was easily 1st, staging Buckland Sweetwater in beautiful condition; Mr. Miles, who was 2d, had the same variety.

Six Peaches.—1st, Mr. Dawes; 2d, Mr. Black. Six Nectarines.—1st, Mr. Muller, gr. to W. H. Long, Esq., Trowbridge, with an excellent dish of Elruge; 2d, Mr. Sunley.

Scarlet-flesh Melon.—1st, Mr. Hare, gr. to R. H. C. Neville, Esq., Grantham; Mr. Clayton, 2d. Green-flesh Melon.—1st, Mr. McIndoe; 2d, Mr. Short, gr. to A. Pease, Esq., Darlington. Dish of Figs.—1st, Mr. McIndoe, with good Brown Turkey; 2d, Mr. Short.

Messrs. Harkness & Sons, Bedale, exhibited a good collection of show and fancy Pansies, for which they received a Certificate of Merit.

Mr. House had a First-class Certificate for a new hybrid perpetual Rose named Miss House. It is delicate flesh in colour, very full, and promising in appearance.

Obituary.

MR. JAMES WELSH, of Messrs. James Dickson & Son, nurserymen, Edinburgh, died somewhat unexpectedly at Erickstane, near Moffat, on the 18th inst., whither he had gone to recruit his health. The third son of the late Mr. James Welsh, of Earlshaugh, the deceased came of an old agricultural family, several members of which were among the best known sheep farmers of the Western Border country. Mr. Welsh, however, after a liberal education at the Moffat Academy, chose a mercantile career, and as a partner in the well-known firm of nurserymen and seedsmen with which he has for many years been identified, found scope there for his admirable business habits and ability. He was well known to many farmers and foresters, horticulturists and landed proprietors, in every county in Scotland; and his death, in the prime of his powers, will be regretted by a wide circle of friends, who greatly appreciated his many business and social virtues.

MR. J. W. CROSS.

It is with much regret that we record the untimely death of Mr. J. W. Cross (of the firm of Cross & Steer, nurserymen, seedsmen, and florists, at Ford and at Salisbury), which took place under painful circumstances on Monday last. When driving into Salisbury, accompanied by two of his children, the deceased was suddenly taken with a fit, fell from the trap on to the road and expired. The painful occurrence has cast a gloom over the residents of Salisbury and surrounding districts, by whom the late Mr. Cross was well known and respected, and great sympathy is felt on all sides for his widow and young family. Those of our readers to whom the deceased was personally known will read this notice of his death with sorrow, as they will recognise in it the loss of a well-trained, courteous, and unassuming gardener of high ability. The deceased was for many years gardener to Louise Lady Ashburton, at Melchet Court, Romsey, where, as is well known to readers of the *Gardeners' Chronicle*, he established a good collection of Orchids, some of which found their way to Stevens' Rooms, and thence to the now famous collection at Burford Lodge. Cypripedium Ashburtonæ and C. Crossianum were, as the names imply, raised by the late Mr. Cross while in the service of Lady Ashburton for the second time as head gardener. Though plant-culture was our lamented friend's forte, he was also a good fruit grower, and good all-round gardener. When he left Melchet Court the second time it was to embark in business as a nurseryman, &c., at Ford, a couple of miles from Salisbury, where, at 8, The Canal, he carried on the seed and cut flower business, taking Mr. Steer into partnership a few years since. It will be remembered that within the last few years The Governor and Louise Ashburton Carnations were brought into commerce by the deceased, who, through straightforward business-like habits and practical industry had at the time of his death succeeded in establishing a good sound business connection.

June 18.—Very fine.
— 19.—Fine, dull, rain in morning.
— 20.—Fine and bright at times, strong wind, rain in evening.
— 21.—Fine day, strong wind.
— 22.—Fine day, strong wind.
— 23.—Fine day and night.
— 24.—Very fine day, overcast at night.

LONDON: *Atmospheric Pressure.* — During the week ending June 20, the reading of the barometer at the level of the sea decreased from 30.15 inches at the beginning of the week to 30.05 inches by 5 P.M. on the 14th, increased to 30.11 inches by 9 A.M., and decreased to 30.04 inches by 5 P.M. on the 15th, decreased to 29.84 inches by 9 A.M. on the 17, increased to 30 inches by 9 A.M. on the 18th, decreased to 29.53 inches by 1 P.M. on the 20th, and was 29.56 inches by the end of the week.

The mean reading of the barometer for the week was 29.91 inches, being 0.25 inch lower than last week, and 0.05 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 84°, on the 14th; on the 17th the highest temperature was 64°. The mean of the seven high day temperatures was 71°.9.

The lowest temperature was 43°.2, on the 18th; on the 20th the lowest temperature was 56°. The mean of the seven low night temperatures was 50°.9.

The greatest range of temperature in one day was 33°.6, on the 14th; on the 20th the smallest was 12°. The mean of the seven daily ranges was 21°.

The mean temperatures were—on the 14th, 65°.1; on the 15th, 58°.5; on the 16th, 55°.2; on the 17th, 54°.9; on the 18th, 58°.3; on the 19th, 60°.1, and on the 20th, 58°.6; of these the 14th and 19th were above their averages by 6°.2 and 0°.4; the rest were below by 0°.5, 3°.9, 4°.4, 1°.2, and 1°.3 respectively.

The mean temperature of the week was 58°.7, being 1°.7 higher than last week, and 0°.7 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 152°, on the 14th. The mean of the seven readings was 122°.2.

Rain.—Rain fell on three days, to the amount of 0.27 inch.

ENGLAND: *Temperature.*—During the week ending June 20, the highest temperatures were 84°, at Blackheath, 82° at Cambridge, 79° at Truro; the highest at Liverpool and Newcastle was 65°, at Hull and Sunderland 68°. The general mean was 73°.7.

The lowest temperatures were 37° at Cambridge, 40° at Hull, 43°.2 at Blackheath; the lowest at Preston and Newcastle was 50°, at Liverpool 49°.7. The general mean was 45°.7.

The greatest ranges were 45°, at Cambridge, 40°.8 at Blackheath, 34° at Truro; the smallest ranges were 15°, at Newcastle, 15°.3 at Liverpool, 22° at Sunderland and Preston. The general mean was 28°.

The mean of the seven high day temperatures was highest at Blackheath, 71°.9, at Cambridge 69°.4, at Plymouth 68°.2; and was lowest at Liverpool, 61°.3, at Sunderland 61°.7, at Bolton 62°.5. The general mean was 65°.9.

The mean of the seven low night temperatures was highest at Plymouth, 53°.5, at Preston 52°.9, at Brighton 52°.7; and was lowest at Hull, 47°, at Cambridge 48°.6, at Wolverhampton 49°.6. The general mean was 51°.

The mean daily range was greatest at Blackheath, 21°, at Cambridge 20°.8, at Wolverhampton 16°.6; and was least at Liverpool, 10°, at Newcastle 11°, at Sunderland 12°. The general mean was 14°.9.

The mean temperature was highest at Plymouth, 59°.1, at Blackheath 58°.7, at Brighton 58°.2; and was lowest at Hull, 53°.2, at Sunderland 53°.9, and at Bolton 54°.3. The general mean was 56°.5.

Rain.—The largest falls were 1.30 inch at Bolton, 0.53 inch at Preston, 0.38 inch at Plymouth; the smallest falls were 0.08 inch at Hull, 0.10 inch at Newcastle, 0.11 inch at Nottingham The general mean was 0.31 inch.

SCOTLAND: *Temperature.*—During the week ending June 20, the highest temperature was 71°, at Perth; at Aberdeen the highest was 64°.7. The general mean was 67°.2.

The lowest temperature in the week was 40°, at Glasgow and Leith; the lowest temperature was 48°.5. The general mean was 45°.2.

The mean temperature was highest at Perth, 55°.9; and lowest at Greenock, 54°.2. The general mean was 55°.2.

Rain.—The largest fall was 0.87 inch, at Greenock; the smallest fall was 0.09 inch, at Edinburh. The general mean fall was 0.40 inch.

JAMES GLAISHER F.R.S.

PLANTING IN CENTRAL ASIA. — Here (Kitale) was one of the plantations mentioned by General Korolkoff, which the Russians place in the mountains to keep the soil from washing down. The surplus trees raised for this purpose are given to the natives, who readily undertake their culture. The year I was in Samarkand they had distributed 1,000,000, and in the following spring expected thus to give from 2,000,000 to 3,000,000 of saplings. Of the various trees and shrubs cultivated by the Russians the General mentioned to me a variety of Poplar (P. alba pyramidalis, also called P. Bolleana), almost unknown in Europe, but common in Central Asia, where it attains, in from fifteen to twenty years, proportions fit for building, and is sold from 10*s.* to 16*s.* the tree. Elm is used for making *arbas*, as also sometimes is Almond wood, but not often that of the wild Nut. They have introduced also several kinds of Conifers, among them Thuia orientalis, which does not grow so large as in Europe, though it attains to 70 feet. To these may be added the white and black Mulberry (M. alba and nigra), especially the former for silk culture, and many attain only moderate perfection as cultivated by the Sarts, and Raspberries, which I understood the natives do not cultivate at all. More than 12,000 fruit trees were grafted the year of my visit, and were to be given to the natives. "*Russian Central Asia,*" *by Henry Lansdell, D.D.*

Personal Estate £224.

31 August. Administration of the Personal Estate of James Crossdale late of 9 Manchester-road-East Little Hulton in the County of **Lancaster** Auctioneer who died

ORCHID NOTES AND GLEANINGS.

CYPRIPEDIUM × HAYNALDO-BELLATULUM (HAYNALDIANUM ♀; BELLATULUM).

A VERY singular, new, and pretty hybrid, possessing the desirable feature of being distinct from any other. The scape bears but one flower, though it is almost certain to bear more when thoroughly matured and strong. The flower-stem is covered with soft purple hairs; the bract, which is two-thirds of the length of the ovary, is green, spotted with purple; the ovary greenish, white with purplish down on the prominent ridges. The upper sepal, which is 2¼ inches long, and 2 inches broad, is yellowish-green over the basal two-thirds of its area, the upper and marginal third being pure white; the whole surface, with the exception of a narrow white margin, bearing irregularly dotted purple lines. The petals, which have a peculiar wave or twist in them, suggestive of the influence of C. Haynaldianum, are 1 inch broad and 3 inches long, distinctly decurved, creamy-white, with a striking purple reticulation in spots and lines over their whole surface. The lower sepal is half the size of the upper one, greenish-white, with purple-dotted lines. The lip, which has a peculiar lateral compression, has the side-lobes folded one over the other, both being closely shielded by the large staminode, which is yellow, with a few purplish lines towards the base. The colour of the lip is very pale yellow, the face being delicately tinged and dotted with rose. The leaf resembles that of C. Haynaldianum, but bears an obscure dark green reticulation. It flowered for the first time with Walter C. Clark, Esq., Orleans House, Sefton Park, Liverpool, who kindly furnished the material to enable the writer to describe it. *James O'Brien.*

MADRESFIELD COURT GARDENS.

IT is interesting to find that, under the control of the present Earl Beauchamp and his gardener, Mr. Crump (whose portrait is given herewith), this fine old place, near Great Malvern, has not only continued to worthily occupy its old position amongst British gardens, but it has greatly advanced. Lord Beauchamp is a great lover of flowers, and for that reason has had large masses of many descriptions of hardy things planted in all sorts of places, hence in all directions there crop up big climbing, bulbous, and ordinary perennials, beneath trees, amidst long grass, in semi-woodlands—indeed, wherever it is possible to find space, with some show of adaptability or fitness. There are, too, the usual mixed hardy borders, also gardens solely of Roses and of annuals, beautiful flowering or foliage shrubs and trees in all directions, a considerable range of rockwork, not the least prominent feature on which is constituted by Cyclamens in their season; whilst on grass there is a broad serpentine rivulet of Colchicums in variety, the large C. maximum being very prominent. In all directions hardy bulbs have been planted, and the grounds in the spring may be said to be full of Daffodils of all descriptions, Squills, and other bulbs. A very quaint feature of the large flower-gardens fronting the mansion is its coloration, which consists exclusively of orange, yellow, and lemon shades. These allied hues are furnished by all descriptions of plants that have adaptability for the purpose. Such a flower garden is so widely dissimilar to what is commonly seen in similar positions, that it is difficult to criticise it, yet there is, in spite of the oddity, a softness, and harmony in the whole that renders it far from unpleasing. Of course, it would entail immense labour were it resolved to vary the colours to buff, brown, blue, red, white, &c., from year to year. There seems, however, to be no such intention, and Mr. Crump is still on the look-out for yellow-flowered plants that will suit Earl Beauchamp's tastes, although as it is, he seems to have almost everything yellow, or of allied shades. In a new garden where mixed colours rule, there was a small mass of the most perfect single-flowered bedding Begonia I have ever seen. It is there known as the French Worthiana, and though of the same height, it is much stiffer or erect in habit than is the common Worthiana, and the flowers are of double the size, of a rich orange-scarlet, and borne boldly in great profusion. Every one who uses Begonias for bedding should have this beautiful one. They would not then plant the ungainly, large-flowered ones again.

Conifers are very abundant here, especially in the neighbourhood of the fine rockery, which is one of Pulham's best productions. This is well furnished, and the garishness so characteristic of new rockwork has entirely disappeared. The entire construction now looks quite natural. There are intersecting the grounds two very fine avenues of Conifers, each some quarter of a mile in length. The trees composing these are now in the very prime of life. One is of Abies nobilis glauca, the trees averaging 50 feet in height, and perfectly furnished throughout; the habit is somewhat stiff,

MR. W. CRUMP
(The Gardener at Madresfield Court.)
See p. 51.)

but the colour of the foliage, here almost blue, gives to the trees a very marked aspect. Each tree has lately received a top-dressing in the shape of a couple of cartloads of marl, which they seem to like greatly, previous dressings having done great good. At one end of this avenue there runs at right angles another of a more elegant Conifer, Cedrus atlantica glauca. Some of these trees have the true blue or glaucous tint of the variety richly displayed, others less so, but the avenue is one of great beauty, and commands warm admiration. At its extremity, towards the kitchen gardens is a yet rather new semi-rock garden, which is fast becoming furnished, and will soon become of exceeding interest. Here plants are fully exposed to sunlight, and many thrive that would hardly do so in the comparative shade of the rockery previously mentioned.

Hardy Fruit is at Madresfield a very prominent feature. It is evident that the reputation the gardens enjoyed in the days of Mr. Cox has not suffered in any way in the hands of his successor. Fruit-trees are not only found in remarkable abundance, but are wonderfully well done, and generally carried capital crops. The walls within and without the gardens are well clothed, and all ordinary trees are in perfect condition. Pears are specially good, and such varieties as Pitmaston Duchess, Doyenné du Comice (see fig. 16, p. 51), Beurré Boussoch, Beurré Clairgeau, Beurré Superfin, Beurré Diel, Williams' Bon Chrétien, Josephine de Malines, here regarded as the best late Pear, and keeping well till February, were, with many others, finely cropped, having noble fruits. A long series of cordon Pears, planted on either side of the central garden-walk, have had three shoots or branches run off laterally on either side, and these are trained along wires strained tightly overhead, so that the path becomes literally a Pear-bower some 400 feet long. Between each of these side cordons there is a large pyramid or bush-tree. From this walk very fine crops are obtained. Some old espalier Apple-trees merit notice, notably several Ribston Pippins. These are about 4½ feet in height, are in superb health, and were carrying wonderfully fine fruits. There is an espalier of Lord Derby, 4½ feet high, with four horizontal branches on either side, and the entire tree is 42 feet long (see fig. 18, p. 53). This was carrying a grand crop of superb fruits, and indicates in a marked way the value of espalier training in Apple culture. These are, however, only the few out of many. Cox's Orange Pippin was giving a splendid crop on double oblique cordons. These have been six years planted, each stem is about 9 feet long. There are some 30 feet run of these cordons, planted 2½ feet apart. The fruits were remarkably fine, quite perfect samples. These trees were originally budded on to seedling stocks obtained from pips of the cider fruits. Also similarly worked and fruiting well were Claygate Pearmain, Sturmer Pippin, Tyler's Kernel, and others. Apples, Pears, and Plums, are in great plenty in outer gardens and orchards, and there is in one place a large trial orchard, the trees being all of bush form, and planted rather close. Here varieties are tested for fitness for general estate as well as for home culture.

THE ESTATE NURSERY.

A remarkable feature is the fruit nursery. Lord Beauchamp, with thoughtfulness and regard for his tenants' interests, has had raised under the gardener's care yearly about 2000 trees; that is, at least, the number annually worked, chiefly by budding. The nursery, which is changed from one area to another every two or three years, vegetables alternating, has at the present moment several thousands of trees in it, all first-class stuff. The maiden growths on Apples, Pears, Plums, and Cherries would do credit to any nursery in the kingdom, as would also the appearance of the entire stock. Good trees are sent out to tenants yearly, on application, and under such conditions no farm or garden need be otherwise than well stocked. All the best varieties found suitable for the locality are grown. Mr. Crump raises his own stocks; and all seedlings when lifted after the first year for planting up in lines for budding later, have the long tap-root carefully preserved, not cut off or shortened, but bent horizontally, and in the process of planting always towards the front. The result is, he states, that this tap throws out numerous fibres, and these during the season form such mats of roots, that the trees when lifted from behind literally stand alone. That is very much more than can be said of fruit-trees generally when young.

Cordon Currants and Gooseberries are a very interesting feature in the kitchen-gardens; Gooseberries are trained as treble cordons on a single wire trellis, and as quadruple cordons on a double wire trellis. This latter is of the greater interest, as being the more novel. The bushes are planted 18 inches apart in one row; each bush has four stems. These are trained up in pairs on either side, so that, reaching a height of about 6 feet, they are at the top 20 inches apart, each side slanting outwards. Originally each stem was tied up to sticks. There are but three wires on either side, and the top ones are nearly 7 feet high, to carry the nets which

FIG. 16.—A FAN-TRAINED TREE OF DOYENNÉ DU COMICE PEAR, MADRESFIELD COURT.

(SEE P. 50.)

FIG. 17.—AN ARCADE OF PEARS MADRESFIELD COURT

(SEE P. 50.)

enclose all the quarter. This double cordon of Gooseberries includes dessert varieties only. The adjoining one that is single, is composed of the Lancashire show varieties. Next come wire trellis-trained Raspberries, one row being double-wired as for the Gooseberries. This latter row gives far more fruit from the same space than is given by single-wired trellises. Red and White Currants are trained as cordons by wire also. The former, planted 2½ feet apart, each have three stems, completely furnished with spurs, to the full height of 6 feet. The stems slant somewhat obliquely. The produce in fruit is enormous, and it is wonderfully fine and clean. Birds do not seem to trouble either whites or reds so grown.

There are, of course, large numbers of houses devoted to plant and fruit-culture, but these have for me little of interest compared with what is found outside in hardy fruit-culture at Madresfield Court. *September*, 1898.

WILLIAM CRUMP,

the highly esteemed gardener at Madresfield Court, was born at Pontesbury, Salop, in the year 1843. He must have been born a gardener (not bred), for not one of his friends or relations were ever engaged in matters horticultural. From earliest childhood he spent nearly all his time in his parents' small garden amongst the flowers, planting one day, and taking up the next "to see if they grew." One of his earliest experiences was the raising of a healthy sapling Oak from an Acorn, but owing to being planted too near an important window, it proved his first disappointment. After overcoming the objections of his friends, young Crump was duly apprenticed, and went through all the necessary probationship, until the year 1865, when he took charge of the glass department at Powis Castle, Welshpool, under the late Mr. G. Browo, a good all-round Scotch gardener of the old school. Carpet-bedding then became fashionable, and in his thirst for practical knowledge Crump took an unusual step, viz., an Irishman's rise, involving a reduction of wages, but which proved a very wise step. He took the general foreman's place, under the late Mr. Wildsmith, at Heckfield Place, Hants—a place from which have proceeded so many gardeners now holding leading positions. After staying there three years, he became head gardener to F. Harris, Esq., The Grange, Lamberhurst, Kent, a new place, which did not reach the anticipations formed of it. After four years' service there, he went to Blenheim Palace, Woodstock—a place that required much tact to sustain. Much exhibiting was done at the Royal Horticultural Society, South Kensington (then in its greatest prosperity), Crystal Palace, Royal Botanic, Manchester, Oxford, and other shews; Silver Cups and Medals being awarded, including the blue riband at the International Potato Show, Crystal Palace, and, what was most appreciated of all, Messrs. Webber's packing prize, twice in succession. Blenheim Orange Melon, which still holds its own, was raised, exhibited, and received First-class Certificate, R.H.S., during the seven years of his tenure of office as head gardener. In the year 1883 he removed to Madresfield Court gardens, in succession to the late Mr. W. Cox. The place is noted for its excellent soil for fruit growing, which always had a special attraction for Mr. Crump. Large numbers of trees are produced annually for tenants, and distributed gratuitously. There is also an interesting experimental plot, where some 250 varieties of Apples, 80 of Pears, and 50 of Plums are on trial. One of the Victorian Medals of Honour was awarded to Mr. Crump in 1897. Mr. Crump has done excellent service in working up an efficient auxiliary of the Gardeners' Royal Benevolent Institution at Worcester, and has been the means of adding many annual subscribers, and £300 in cash in three years. Oh, that gardeners in other counties would do likewise!—it only requires the will.

GLOXINIAS.

HAVING been unusually successful in the cultivation of these beautiful plants, it may prove of use to some of our readers if I describe my methods of cultivation. It is at this season that the foundation of a good summer display is laid. Some years ago the Gloxinia was con-

those which are included in the first division, of which some thirty-eight species are described and figured. The plates are mostly coloured lithographs, and are exceedingly good, the insects being shown of their natural size on their food plants, as well as magnified, often with dissections, some of the plates showing simply in outline the last joint of the body of the female, in which are certain important characters that distinguish one species from another. The descriptions are very full, but decidedly technical, and for the most part would not be understood by those who were not accustomed to entomological phraseology. However, it would be almost impossible to have given the descriptions in popular language. The difference between the sexes before alluded to in these insects is very extraordinary, the adult females in most cases are immovable, inanimate-looking creatures, very unlike other insects in every outward appearance, while the males are active two-winged little flies which anyone would at once recognise as insects; in some species the males are very common, in others they are very seldom met with, and in some they are unknown. The most interesting part of this work to horticulturists is no doubt the chapter on "Methods of Prevention and Remedies." The author goes very fully into the subject, but does not suggest anything but what is well known in the way of insecticides. Fumigating with hydrocyanic acid gas for the wholesale destruction of scale is strongly recommended, but it can only be used with specially-constructed fumigation chambers or some other form of air-tight covering over the plants. Kerosine emulsion of a strength suited to the plant operated on is mentioned as one of the best insecticides. This volume will be consulted by those who are to some extent interested in entomology as well as horticulture with much pleasure and profit, and to all entomologists who wish to study this group of insects it is almost indispensable. We look forward to the next volume with some impatience.

WORKERS AMONGST THE FLOWERS.

WILLIAM CRUMP, V.M.H.

THE subject of our illustration is a gardener who thoroughly loves his profession, and who by his perseverance and indomitable energy has raised himself to the front rank of horticulturists.

Mr. Crump was born in Shropshire in the year 1843. Throughout his school days it appears he spent most of his playtime hours amongst flowers and vegetables. After receiving a fairly good education for that period in the National school, various occupations were offered and strongly advised, but none was liked so well as gardening. For a considerable time every possible obstacle was placed in his way, but his parents ultimately gave way, and after a course of probation Mr. Crump was duly apprenticed in a moderately well managed garden. His first responsible charge was that of foreman of the glass department at Powis Castle, Welshpool, under the late Mr. G. Brown, a famous Scotch gardener of the old school. There was a good home nursery there at that time, also some splendid specimens and collections of choice coniferæ. The cultivation of Pine-apples was then a feature, and so were the terraces of herbaceous flowers. Mr. Crump then took an apparently downward step by accepting the appointment of general foreman under the late Mr. Wildsmith at Heckfield Place, Hants, a noted place from which so many good gardeners have proceeded and now hold good appointments. After staying here three years or so, he became head gardener to Mr. F. Harris, Lamberhurst, Kent, and from there went to Blenheim Palace, Woodstock.

In due course Mr. Crump exhibited successfully at the Royal Horticultural Society, South Kensington, Crystal Palace, Royal Botanic, Manchester, Oxford, and other shows, silver cups and gold medals being awarded, including the blue riband at the International Potato show, Crystal Palace, and what was the most appreciated of all awards was Messrs. Webber's £10 10s. prize for the best packed three boxes of fruit delivered by the railway companies at South Kensington intact, in the way of ordinary parcels, consigned and signed for as customary. This was twice competed for in succession, a first prize won each time against such competitors as Mr. Coleman of Eastnor, and other first-class fruit growers and fruit packers.

MR. W. CRUMP, V.M.H.

Blenheim Orange Melon, which still holds its own as one of the best scarlet flesh Melons, was raised by Mr. Crump, and exhibited successfully in open competition with upwards of thirty others, and obtained a first-class certificate of the Royal Horticultural Society the same year. In the year 1883 Mr. Crump removed to Madresfield Court, a place noted for its excellent soil for fruit growing. Large numbers of hardy fruit trees are worked up annually for tenants and distributed gratuitously. Many experiments in grafting and double grafting with a view to the fusing of new blood and the improvement of existing choice varieties have been made in the hope that the subtle influences of stock and scion would produce something worthy of the experiments.

Partial success at times rewarded Mr. Crump's efforts, but further trials proved disappointing, and were abandoned. There is an interesting experimental plot, where some 250 varieties of Apples, eighty of Pears, and fifty of Plums, all bush trees, are on trial; and when any new variety is found to suit the locality a stock is worked up. There are also a good many seedlings and local varieties added to the above Apples, a large number being annually discarded. Visitors to Madresfield Court gardens will have observed the encouragement given by their owner, and the additional improvements carried out from time to time with the object of making the gardens thoroughly interesting, especially in the naturalising of hardy shrubs and flowers. Mr. Crump has also been partly instrumental in working up for the county an auxiliary of the Gardeners' Royal Benevolent Institution, and through the generosity of his master, Earl Beauchamp, allowing the gardens to be open to the public once a year several hundred pounds have been added to that excellent institution. One of the Victoria Medals of Honour was awarded to Mr. Crump in 1897.

CONTINENTAL NOTES.

THE following novelties appear in *Gartenflora*, February 1, 1902:—

New Pelargoniums.—A coloured plate illustrates five very fine forms raised by Max Bürger Halberstadt, one of which, Die Braut (The Bride), is an exceedingly fine pure white semi-double form, with large, frilly petals and a compact, handsome truss. The others, though very fine, are on more familiar lines of scarlet and rose-pink, more or less flamed with scarlet.

A Cultural Report of the Union for the Encouragement of Horticulture (Verein zur Beförderung des Gartenbanes) in Berlin gives an impartial report regarding numerous flowering plants and vegetables tested in their gardens, giving full descriptions—in many cases correcting those of the raisers—and opinions as to success or failure (a practical step worthy of adoption on this side). Amongst these is mentioned

Petunia hybr. grand. comp. fl.-pl. rosea perfecta (!!!), which is highly recommended with the remark that the name is longer than the plant is high. It is, at any rate, a charming example of nomenclature.

Comet Asters.—Ernst Benary, Erfurt, describes and illustrates some novelties of this strain, amongst them Kaiserin Friedrich, a dwarf grower, with very large flowers like reflexed Chrysanthemums as much as 6 inches in diameter, pure white; and

Darwin Asters (Lady Asters), light blue, pure white, innumerable narrow petals curving outwards, forming neat, almost hemispherical flowers of a huge double Daisy type.

Antirrhinum majus grandiflorum Queen Victoria.—A very bold, broad-tipped, pure white form; very long stalks to individual flowers, hence suitable for cutting.

Celosia spicata (argentea linearis).—This appears to be a truly handsome novelty introduced from the East Indies. It is an annual, forming tall, upright, pyramidal plants about 2½ feet high, bearing a great number of awnlike spikes of bloom, rosy red, which turn to a silvery white, the spikes thus becoming beautifully parti-coloured; suitable for pots or the open.

Phlox Drummondii cuspidata fol. albo-marginatis (Benary).—A beautiful variety with long, crisped, and caudate petals, sometimes fimbriate,

tion) is worthy of a place in every collection. It is of French origin, having been introduced by Pernet-Ducher in 1895. The buds are long, and the flowers, carmine in colour, with a shading of salmon. They are produced most freely and during a long period. It is suitable either for exhibition or for decorative purposes, and, being a vigorous grower, can be recommended for town gardens. For the Hybrid Teas, as

MR. W. CRUMP, V.M.H.

well as for the Teas, clay is not necessary. Indeed, they grow better in rather a gritty soil, provided only that it is made quite firm, and not allowed to get dry.

Hints on Strawberry Culture.

September 13th.—The Editor of the Royal Horticultural Society's journal gives some valuable hints about Strawberry culture. He points out that in most beds there are some barren plants, and, as these naturally produce the earliest and finest runners, these are apt to be chosen for new rows, the inevitable result being that they yield no fruit. He also emphasises the importance of change of stock. "Soils," he proceeds, "play a very important part in Strawberry culture, and, if light and sandy, it is almost useless to attempt growing such fine-flavoured varieties as British Queen, Dr. Hogg and others of that type, as they require a strong, loamy soil to do them justice. Such a soil will practically grow any variety; but on a light, sandy soil the choice of varieties that can be relied upon is limited. At the head of such we should, without hesitation, place Countess, an old first-rate-flavoured variety, nearly lost to cultivation a few years ago. Dumbarton Castle is a small-growing, free-bearing variety of good flavour; and, as a late variety, Givon's Late Prolific is excellent in every respect. Filbert Pine, Vicomtesse Hericart de Thury, and Eleanor are all reliable on light soils, and on heavier soils, except Countess, which does not ripen well at the points of the fruit, on heavier soils." As all these varieties, with the possible exception of Countess, belong to the late section, Noble might with advantage be substituted for one of them. I believe that Laxton's Reward also fruits well on a light soil, and it is said to be equal in flavour to British Queen. This season I have had an object-lesson in the disadvantage of planting too closely. The runners were put in two years ago, one foot apart in the rows, and it was intended to remove every alternate one after the first crop had been gathered. As the result of unfavourable weather, however, so little growth was made that it did not seem necessary to carry out this intention, and the plants were all allowed to remain. Then came the wet spring and summer of the present year; foliage was produced so thickly that it covered the bed, and under it lay great quantities of fruit on the sodden straw, only a small proportion of it able to colour and ripen, the rest moulding away. Again, gathering was very difficult. It was impossible to avoid treading on a good deal of the fruit spread out between the rows, and hidden between the rows. It may seem a waste of space to plant thinly, but in the long run it is a distinct gain. For, when fruit cannot be gathered in good condition, it is merely a drain on the plants.

H. C. DAVIDSON.

Famous Gardeners at Home.

No. 269.—MR. WILLIAM CRUMP, V.M.H., AT MADRESFIELD COURT, MALVERN.

THE gardens at Madresfield Court, which, by the courtesy of Earl Beauchamp, I visited in July, are exceptionally interesting for various reasons. The Court itself is a famous historic seat, or moated mansion, with a setting in all respects worthy of the noble mansion, and in recent years, since the present Earl succeeded, the natural beauties have been augmented by the introduction of several attractive features. Moreover, the head gardener, Mr. William Crump, is not only an all-round man of recognised ability, but one of the finest fruit-growers in the kingdom, and the possessor of the coveted Victorian Medal of Honour, which was awarded to him in 1897. Withal he remains as unassuming as he was when, nearly a quarter of a century ago, he entered upon his present responsible duties. While quite willing to tell me all about the gardens, he was very much disinclined to talk about himself. Mr. Crump's house is situated in the kitchen garden, and from there we started on our walk round.

Features of the Kitchen Garden.

In the kitchen garden a grand bed of Royal Sovereign and Bedford Champion Strawberries first met my eye, some extraordinarily fine fruit growing on prepared plants less than a year old. Some single fruit of the latter turned the scale at three ounces each.

MADRESFIELD COURT, MALVERN.

We then passed under an avenue of the new Loganberry, ten feet high, covered with canes that length, bristling with fully-developed fruit on all the lateral growth. On the margins of the walks were cordons of Gooseberries, Currants (white and red), Apples and Pears, grown on the single, double, treble, and four-branch system, and beautifully trained and fruited. The soil is a strong clay loam, deeply cultivated and enriched, and is able to produce heavy and constant crops in succession of succulent vegetables. There were rows of highly-developed William the First and Gradus Peas, with strong, healthy rows, in succession, of Glory of Devon and Autocrat.

Runner and Dwarf Beans, Onions, Carrots, Beet and other roots, all in the rudest health of skilful cultivation, and early Potatoes and Cauliflower, with an abundant supply in successional order of salading, were much in evidence.

The extent within the walls is about four acres, but there are other outside quarters for common vegetables. The walls are covered with healthy and well-trained specimens of Apricots, Peaches, Nectarines, choice late Pears, Plums and Cherries.

The "Peacock Garden" is so called from some topiary-work where that bird figures. It is close to the kitchen garden, but, none the less, is a surprise, and I found, as we proceeded, that surprises are quite the feature of Madresfield. Somewhat of a Dutch pattern, the peacock garden contains fan-shaped beds of Box edging, planted with Polyantha and other Roses, alternating with beds of Border Carnations. I asked for the names of some of the varieties of these.

"The Roses," replied Mr. Crump, "include Perle d'Or, Anna Maria de Montravel, Souvenir de la Malmaison, and Hermosa, an improvement on the old pink. There are also a number of Monthly Roses, which keep in flower until January. I have decorated a table with

Rose buds on Christmas day. The beds of Carnations are Trojan, Raby Castle, Mrs. Leigh, Lady Audrey Campbell, Old Clove, Sundridge Park, and several others."

The Wild Garden.

"How large is the peacock garden?" I asked, as we made our way towards the wild garden.

"About fifty yards by twenty. Of Yew hedging, which helps so much to afford shelter, we have miles in the gardens. One of the characteristics of the wild garden, which we are now entering, is that there is no repetition. You see a clump of a particular plant, and all the other clumps are different. In fact, this principle is maintained throughout, and thus the interest is always kept from flagging. We hope before long to have a fresh flower for every day of the year."

"Your Michaelmas Daisies are very conspicuous?"

"Yes, the irregular beds of varying sizes in the grass, of Asters, and the large number of tall-growing plants, all naturalised, are, perhaps, the most attractive part of the gardens. The golden Yews here are exceptionally good."

"You have plants all along this path?"

"Yes, the idea is to step over a different kind of plant as you proceed. The varieties which love moisture and partial shade have been chosen. They are chiefly, but not all, short-growing, and there is a collection of water plants. On each side is a border of Ferns, and the banks are likewise planted with Ferns, and with Lilium giganteum."

"You might indicate some of the plants which do best here?"

"They include the newer Senecios, some of the Gunneras, Saxifraga peltata, Callas, Primulas capitata and japonica (the former one of the most beautiful), Giant Meadowsweet, some of the hardy Kingcups, Lythrum, and Lychnis. But the list would be too long for you if I exhausted it."

The next surprise was a lovely Lemon-scented Thyme walk, and then we reached the picturesque rocks. Here huge boulders of massive rock shelter numberless specimens of telling plants, around which were striking specimens of Bamboos, a Heath garden being just beyond.

"Which of the Bamboos thrive best on the rocks?"

THE ROCK GARDEN AT MADRESFIELD COURT.

"But so are many other things. Please tell me the names of some of the most striking now in flower?"

"Anchusas (red, white and blue), Rudbeckia Newmanni, Megasea cordifolium, Valeriana coccineum, Delphiniums (including the King of Delphiniums), Verbascum olympicum, Pæonies in variety, Papaver orientalis, Artemisias, Scotch Thistles, and others, all selected in order to supply bold groups of colour, in successional order."

"The contents of the wild garden must be considerable?"

"This part of the gardens should be seen in the bulb season, when millions of bulbs are set out in the boldest manner, and naturalised. Masses of Crocus (autumn and spring varieties), Daffodils, Tulips, Fritillarias, Colchicums, Anemones, etc., produce a grand effect, as will be seen in the pictures which Messrs. R. Smith and Co., of Worcester, are kindly lending you. The wild garden covers from four to five acres, including the little stream running through it, the rustic bridges, and the stepping-stone path, which has recently been added. Flamingoes and other water birds of gay plumage are quite at home here."

"Nigra, flavescens, mitis, viridi-glaucescens, metake and palmata. The specimen of Gum Cistus is considered exceptionally good."

Conifers and the Rose Garden.

"The rockwork, of course, is artificial?"

"Entirely, but it was exceedingly well done by Messrs. Pulham. From the summit you get an excellent bird's-eye view of the wild garden, and also of some of the most choice Conifers. The cream of these are Abies grandis, over a hundred feet high, beautifully furnished from top to bottom; two very fine specimens of A. orientalis, A. Douglassi, Picea pinsapo, and P. casiocarpa, Thuja Lobbii, and Juniperis chinensis fœmina variegata. I think you will agree with me as to the extreme loveliness of the Rose garden which we are entering. It is called Lady Susan's garden, and the beds are in scrolls of choice varieties of garden Roses. With respect to colour, we work from pink to red, one variety only being planted in each bed."

"How many beds are there altogether?"

"About thirty, the principal varieties being Papa Gontier, Grand Duc de Luxemburg, Madame Yvonne Cranier, La Tosca, Madame Pernet Ducher, Liberty, Bessie Brown, Madame Lambard, Souvenir de Catherine Guillot, Madame Barkley, and Gruss an Teplitz."

"Have you any idea of the circumference of the English Oak close to Lady Susan's garden?"

"It is sixteen feet in circumference at four feet from the ground. Here you might mention the grand clump of Japanese Maples, and the avenue of Picea nobilis glauca, nearly half a mile long, all of one colour."

"The effect certainly is very fine."

"Then there is the flowering shrub border, right and left of us, where dozens of the recently-introduced varieties have recently been planted. The herbaceous garden itself, with its tiled path, contains an up-to-date collection planted in bold masses, one clump consisting of one variety, and there is no repetition. In flower just now are Tree Lupins, Heuchera rosea and H. sanguinea, Campanula rhomboides and macrantha, Erigerons, Delphiniums, Scabiosa caucasica, Betonica grandiflora, and Pentstemons George Holmes. But we had better go into the annual garden, which is also known as Lady Mary's garden. This, too, is planted in bold, irregular blocks of colour. The varieties now in flower include Antirrhinums, Alonsoa Warscewiczi, Petunias, Stocks, Marigolds, Dianthus, Verbenas, Salpiglossis, Godetias, Mignonette, Asters, Cosmos, Helichrysums, Salvias, Love-in-a-Mist, Pentstemons, and Larkspurs."

Having spent a little time in these gardens, we proceeded through the Lavender walk and the Eglantine walk, to the maze.

"This," said Mr. Crump, "was planted by the present Earl in 1895 on his succession to the peerage, the feature from the horticultural point of view being the English Yew hedges, and the Penzance Sweet Briers. It is a very tricky maze, and people experience considerable difficulty in getting in and out of it."

The Moat Garden.

"I suppose the Court itself dates back a long way?"

"To a very remote period, indeed. As you see, it is an old moated mansion, and the moat garden is quite a distinctive feature. The paths are paved with very old flagstones, with small Alpine plants growing in the chinks or crevices between, while the beds are of Roses, Lavender, and Rosemary, bulbs being planted amongst them for spring flowering."

"What are the climbers on the Court?"

"Vines, Figs, and Pomegranates, with flowering plants of a half-hardy nature. In warm corners there are real blue Hydrangeas, Madonna Lilies, Clematis, etc. The sunk garden on the opposite side of the moat, the terraced walls of which are covered with climbing Roses and Clematis mixed, contains numerous vases filled with bright-coloured Geraniums, Verbenas, and Marguerites. There is a design in Yew hedges, with beds of Begonias, Heliotropes, Verbenas, Calceolarias, Abutilons, and Lobelias."

"And more huge masses of Lavender, Rosemary, and other sweet-smelling aromatic plants form the boundary on the top of a ha-ha or sunk fence, dividing, though a quite hidden fence, the garden from the park."

"They are, we consider, in keeping with the situation. In fact, everything round the Court is intended to harmonise with the surroundings of an ancient baronial mansion. The next feature is the bowling green, with statuary of the Cæsars let into niches cut in the massive Yew hedges. The bowling green avenue is planted with blue and white flowers, with Cedar trees on each side."

"Here is another surprise," I observed, as we came suddenly through a great Cedar avenue to another Rose garden.

"This is the old Rose garden, fan-shaped, and planted with one variety in a bed, of Hybrid Perpetuals, such as Alfred Colomb, General Jacqueminot, Mrs. J. Laing, Gustave Piganeau, Captain Hayward, La France, Frau Karl Druschki, and Cheshunt Hybrid."

"The pergola of semi-circular pattern is as beautiful as the garden itself."

"Yes, it is very much admired, consisting entirely of bleached Limes; it is about a hundred yards long. Close by is the Lily and Iris garden, with irregular beds planted in the grass, which a little earlier, as you may imagine, presented a glorious sight, especially when the Tulips (Gesneriana) were in flower. The best of the germanica section of Irises are here massed together with Madonna and other Lilies, planted so as to prolong the flowering period."

Flowering Shrubs.

"The border of flowering shrubs on the right is very effective, chiefly planted in bold, irregular groups, of large size."

"It was planted in great masses to harmonise, the more notable varieties being Spiræa ariæfolia, argentea, Van Houtteii and prunifolia, Lilacs in variety, Philadelphus grandiflorus, Ribes floribunda, Forsythia suspensa, Sea Buckthorn, Deutzias, Berberis in variety, Weigelas, Guelder Roses, and Viburnum plicatum. These, again, have large masses planted in the front, of Tritoma uvaria, Rudbeckias, and Lychnis. The next surprise is the spring garden."

"Yes, that was quite unexpected, and seems to contain a wealth of flowers."

"Annuals follow the spring bulbs, those now in flower including Gladioli The Bride, the Blushing Bride, Colvillei, Colvillei alba, Alstrœmerias, Triteleias, hardy Orchids, Ranunculus, Montbretias (Davidsonii and Prometheus), Ixias, Tuberoses, Codonopsis ovata (which flowers in June and July), and Eremurus, including a seedling self-sown, which takes seven years to flower."

"How high is the remarkable hedge of climbing Roses here?"

"More than ten feet, I think."

"The number of blooms must be enormous. Not less interesting is your great bed of Lilium candidum, coming into flower in the grass, under the partial shade of the Oak tree."

"We have grown Liliums there for three years, and they improve each year. Some of the plants have three or four stems, and the foliage remains good as long as the flowering season lasts. The soil is quite poor, but the Liliums, which like neither the full sun nor the entire shade, seem to revel in this position."

The Glasshouses.

Then, through pergolas of Clematis and Sweet Briers, we passed into the famous kitchen garden, where the hardy fruit trees form an object-lesson to non-pruning fanatics. But first of all we inspected the glasshouses.

"What are the features of the stove?" I enquired.

"It contains Gardenias, Eucharis, Pancratiums, Stephanotis, and Gloxinias, on the roof being a number of plants of the charming Ipomæa cœrulea trained on strings. Later on this will be taken down, and placed on balloon and ordinary trelliswork for house decoration."

"Then there are the greenhouse and the propagating houses?"

"The contents of the first include a collection of Fuchsias, Pelargoniums, Hydrangeas, Rehmannia angulare, and other like plants, for furnishing purposes. The propagating houses are full of winter and spring plants in various stages of preparation, the most conspicuous being batches of Begonias Gloire de Lorraine and others, Bouvardias, Poinsettias, Coleus thyrsoideus, Moschosmas, and Euphorbias."

"Was your Carnation house built specially for Tree Carnations?"

"It was, and we grow all the best varieties, such as Britannia, Robert Craig, Harlowarden, Enchantress, White Lawson, Mrs. Burnett, Nelson Fisher, and Flamingo. They are now in their permanent pots."

"And, judging by the appearance of the foliage, may be depended upon to give grand and sufficient blooms all through the winter."

In some low frames were large batches of healthy young Cyclamen, Cineraria, Primulas, Celosia, Campanulas, and other plants for winter supplies, while a large frame contained fruiting plants of French Beans, which Mr. Crump informed me were planted out after Potatoes.

"In a north house," he continued, "the huge specimens of Camellias, loosely trained to the back wall, produced, earlier in the season, big crops of flowers. This is an extremely useful house for retarding plants, or for shade-loving plants. Now we come to the fruit houses."

The Indoor Fruit.

"What is the variety grown in the Cucumber house?"

"Telegraph Improved. The house of young Melons next to it has just been replanted, following the ripening of the first crop. We call the adjoining house the Strawberry house, but, as you see, Strawberry forcing being over, it is utilised for Melon growing."

"I have never seen a finer house of Melons, every plant being apparently in the best of health, and free from insect."

"The system is to plant back and front in weekly small batches. There is a constant daily demand for Melons here, and we keep up the supply accordingly. The favourite varieties are Blenheim Orange and Penhryn Hero."

"Madresfield Court are, of course, the chief black Grapes you grow?"

"Not only the chief, but, we think, the best, and they have to be supplied for the longest possible season. In one of the two small Vineries, Black Hamburgh is grown for very early forcing, and in the other Madresfield Court. In the long range of Vineries, five in number, two are devoted entirely to Madresfield Court, one to Muscat of Alexandria, one to Lady Downe's, and the other to mixed varieties, such as Mrs. Pince, Appley Towers, Black Morocco, and Mrs. Pearson."

"Of how many houses does the Peach range consist?"

"Three. In the early house Alexander was ripe at the end of April; in the next we grow other Peaches and Nectarine Lord Napier; and in the later house Stirling Castle and Grosse Mignonne, with Rivers' Orange Nectarine, are grown."

"Your crop in the second house is very fine, and the foliage in the other strikes me as remarkable for its cleanness."

"The last range comprises Tomato, Melon and Fig houses, the Fig house being full of Brown Turkey fruit of good quality. Of Tomatoes, Carter's Sunrise is a great favourite, and for later work Winter Beauty."

"The most noteworthy features of the kitchen garden are your two Pear pergolas."

"Originally, only one pergola was planted with Pears, and the second was carried out by training lateral branches overhead from the pyramidal trees then in existence, and growing alongside the path. The pergolas run at right angles, and cross each other in the middle, the whole length and breadth of the garden. Not only is the effect considerably enhanced, but the Pears enjoy extensive growth. As to varieties, the best are Doyenné du Comice, Beurré Superfin, Louise Bonne of Jersey, Marie Louise, Pitmaston Duchess, Beurré Diel, and Beurré Hardy. The six best Plums are Rivers' Early Prolific, Kirke's Victoria, Cox's Emperor, Czar, and Belle de Louvaine."

A Generous Landlord.

"What about Apples?"

"With regard to Apples, there are rows of double-branched diagonal cordons of Cox's Orange Pippin and other choice dessert varieties, as well as cordons of choice Pears. But Apples are a very great feature here. In the adjoining nursery of about four acres, fruit trees are raised in quantity, and distributed gratuitously to Lord Beauchamp's farm and cottage tenantry, in standard and bush form."

"Do you mean annually?"

Fruit Trials.

"About two thousand trees per annum are dealt with in this manner, and, though Apples predominate, Pears, Plums, Cherries, Apricots, and Currant and Gooseberry bushes are also distributed. A trial ground has been set apart to test the varieties suitable to the district before propagation, and there are no fewer than two hundred and fifty varieties of Apples, eighty varieties of Pears, and sixty of Plums on trial at the present time. Any tree that fails to realise three marks in nine years is at once discarded and replaced by a new one."

"The tenants, I suppose, appreciate Lord Beauchamp's generosity?"

"Unfortunately, it is not fully reciprocated by them, so far as careful cultivation goes. Otherwise, as the operation has been in force some twenty-five years, very much fruit and more successful orchards would be found. Still, there are exceptions, and there now exist on the estates several very valuable orchards."

"Which do you consider the best-paying Apples?"

"Worcester Pearmain, Cox's Orange Pippin, Allington Pippin, May Queen, Peasgood's Nonsuch, Pott's Seedling, and Gascoyne's Scarlet Seedling. As to wall fruit, the south walls are devoted to Peaches, Nectarines, and Apricots, the east to Plums and cordon Pears, and the west to late varieties of Pears which require assistance to ripen."

"Then, there are Strawberries."

"Large quantities of Royal Sovereign, Leader, President, Givon's Late Prolific, Latest of All, and Oxonian are grown. Of the newer kinds, Laxton's new Progress stands out as far away the best, owing to its good constitution. Gooseberries and Red and White Currants are grown on V-shaped cordons; each tree has four branches, or cordons, trained to iron wire and sticks vertically."

Mr. Crump's Career.

"Before you commenced your quarter of a century's experience at Madresfield Court, Mr. Crump, you must have enjoyed the best possible training."

'I cannot remember the time when I did not spend most of my hours in the garden. After the necessary apprenticeship, and considerable probationership, I took charge, in 1865, of the glass department at Powis Castle, Welshpool, and afterwards was foreman at Heckfield Place, Hampshire, then considered the best garden in Great Britain. My first position as head gardener was at Lamberhurst Grange, Kent, and at the expiration of four years I went in the same capacity to Blenheim Palace, where much exhibiting was done. I succeeded in winning a large number of prizes at the leading shows, including silver cups and medals; but I do not think I appreciated anything so much as the packing prize, given by Messrs. Webber, awarded to me twice in succession. During my seven years' tenure of office at Blenheim I raised the Blenheim Orange Melon. From Blenheim I came to Madresfield in 1883."

"You do not show here?"

"No, my time is fully occupied in fruit growing, lecturing on fruit and vegetable growing for Worcester County Council, in acting as judge at horticultural shows, including champion Grape class at Shrewsbury, and, above all, in doing my utmost to reach and maintain a high state of perfection in the gardens. In this object I have a constant help and encouragement from my employer, one of Nature's true noblemen, who, as well as Lady Beauchamp, leads and takes the keenest interest in all attempts to enrich and beautify the place."

ALFRED WILCOX.

VOL. LII.—No. 2 894. SATURDAY, APRIL 17, 1909.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Observation.

It is a remarkable thing, considering the two wonderful gifts we possess of seeing and hearing, that so little practical use is made of them by the majority of human beings, as compared, that is, with the use which might be made. We may obtain a pretty good proof of this if we are the happy owners of a garden which is frequently visited by friends, ladies and gentlemen. Except in such cases where the visitors are specially invited as recognised flower lovers and students, the majority will simply ramble about, conversing on extraneous social or political matters, some of the young ladies will ejaculate "How pretty," in the intervals of their gossip about "him," and the fashions; and in short, the innumerable wonders of Nature, which teem in every garden worthy the name, will be entirely ignored and unobserved. Probably if asked on their departure, in a casual tone, whether they had seen everything in the garden, the reply would be a cheery, "Oh, yes! it's very nice indeed," although, if cross-examined, it would transpire that they had really seen nothing at all in the sense of seeing and appreciating properly. The power of observation is, in point of fact, rare, and its possession involves a freemasonry of incalculable social value when natural study is the incentive. Every true gardener knows what a delight it is to anticipate and receive a visitor of the keenly observant kind, who can fully appreciate the merits of what he sees, and be very probably in a position to impart some fresh knowledge in the desired direction. There is no superficiality here, no "How pretty" and "How nice" distributed broadcast, but a close study of points pro and con, and an eventual verdict which, if favourable, constitutes in itself a reward for much previous study and trouble. In point of fact the measure of cultural success in horticulture is determined entirely, given of course fair facilities, by observation of results and intelligent adoption of the lessons they teach. Every failure has its underlying reason, and hence, like the successes, constitutes a stepping stone to further knowledge, if only the grower is determined to get at the bottom of it, and does not merely accept it as a misfortune, and let it go at that. Observation, however, should be accompanied by notes and records, and not merely committed to memory, since it is often by comparison of such records with other and subsequent ones that the true meaning of the phenomena observed becomes apparent, and something tangible is then elicited. The man who makes no notes may, by virtue of a retentive memory, acquire a great deal of useful knowledge in the course of his existence, but he is little likely to be a contributor to that mass of knowledge which forms the literature of horticulture, and through which man learns from man, and as a note-maker adds his quota to that accumulation of ascertained facts, by virtue of which each generation becomes wiser than its predecessor. That great factor in horticultural progress, the Horticultural Press, is the practical outcome of powers of keen observation, coupled with careful recording, and we have only to contrast that Press of to-day with that of less than a century ago, to see what an immense advance has been made, and is always being made in the acquisition of invaluable practical knowledge. In the old days, say of Gerard, to go back still farther, the general ignorance permitted the authoritative promulgation of the most ridiculous myths and fables, and although in the outside Press of to-day we still, from time to time, find examples of horticultural and botanical marvels of equally grotesque character put forward with all verisimilitude, knowledge is now so widespread that it is rare, indeed, that anyone is taken in by them. Superficial observation is no good at all, it is the man who is always about and closely examining the plants he cultivates who hits upon the "reason why," both of success and failure, and by experiment based upon such discoveries eventually enriches not merely himself, but his fellows, with additional items of knowledge. This close research begins in the laboratory of the botanist, who pokes and pries with his microscope into the abstruse mysteries of the fundamental cell formation, and it ends with the selective cultivator, who, by close study of the plant as a whole and its peculiarities, adds so much to our floral and agricultural wealth, as exemplified in our up-to-date exhibitions.

MR. WILLIAM CRUMP, V.M.H.

Mr. William Crump, V.M.H.—Few men are more widely known in horticultural circles than Mr. William Crump, head gardener to Earl Beauchamp, at Madresfield Court, whose portrait we present in this issue. His first charge was at Lamberhurst, and from thence he went to Blenheim Palace, where he became particularly successful as a fruit grower, twice winning the packing prize of £10, offered

by Mr. J. Webber, of Covent Garden, for the best three boxes of fruit sent by ordinary railway carriage, and delivered at South Kensington by the conveying company. From the Royal Horticultural Society and the Royal Botanic Society, Mr. Crump won gold medals for fruit while at Blenheim, and secured the blue riband of the old International Potato Society at the Crystal Palace. At Blenheim he raised the fine Blenheim Orange melon, and obtained a first class certificate for it at South Kensington, as well as first prize against thirty-one other entries. Rather more than a quarter of a century ago Mr. Crump took charge of the Madresfield Court Gardens, after the death of Mr. W. Cox, and ever since then his name has been intimately associated with the Madresfield estate as well as the gardens. The latter have been largely extended and greatly improved under his care, the massing of hardy flowering trees and shrubs, the bold grouping of herbaceous plants, and the naturalisation of bulbs in grass being a few of the innovations that have made Madresfield famous. But, as Mr. Crump is a famous fruit grower, it was only natural that he should develop hardy fruit culture at Madresfield, and this, with the generous support of his enthusiastic employer, he has done in a remarkable way. He has an experimental orchard, where all likely varieties of hardy fruits are tested, and all those that prove their worth are propagated extensively and distributed from the home nursery to the farmers, cottagers, and others on the various estates belonging to Earl Beauchamp. Mr. Crump has distributed in this way over 40,000 trees, thereby adding largely to the letting value of the property and the well-being of tenants. Mr. Crump is an old member of the Royal Horticultural Society's Fruit and Vegetable Committee, and he was one of the original recipients of the Victoria Medal of Honour in Horticulture.

Water Gardening will receive special attention in our issue of the 24th inst., and, with a view to afford our readers the fullest possible information on the work that must be done in the water garden during the next few weeks, the contents will include articles on formal and informal water gardens, water lilies, planting water margins, hardy aquatics other than nymphæas, and spiræas in the bog garden. The issue will be freely illustrated.

Fruits of Foreign Growth were less plentiful in British markets in March last than they were in the corresponding month of 1908, the aggregate decrease in value amounting to the substantial sum of £47,845. The increases and decreases were equal in number, and the more important of the former were those of nuts and oranges. As in the case of the first two months of the year, there was a big drop in the imports of apples, the aggregate having been 201,716 cwt., of the value of £129,888, as compared with 357,484 cwt., of the value of £208,401, in the corresponding month of last year. Apricots and peaches were, on the other hand, imported in larger quantities, the total imports amounting to 230 cwt., of the value of £1,547, or an increase in quantity of 168 cwt., and in value of £1,390. Of bananas the imports were 449,625 bunches, of the value of £127,959, or a decrease in number of 80,482 bunches, and in value of £13,180. Grapes were received in lessened quantities, the aggregate having been 3,213 cwt., of the value of £15,052, against 5,584 cwt., of the value of £24,138. The imports of pears were larger than they have been for several years, the total having been 2,898 cwt., of the value of £11,730, or an increase in quantity of 1,064 cwt., and in value of £6,785. The imports of plums aggregated 595 cwt., of the value of £2,831, as compared with 198 cwt., of the value of £429. Strawberries, of which a few were imported in the corresponding month of last year, have no place in the March returns. Of unenumerated fruits, the imports were 8,724 cwt., of the value of £12,674, the figures representing an increase both in quantity and in value of nearly 100 per cent. The value of the fruit imports for the month was £818,403, bringing the total value for the first quarter of the year up to £2,380,615.

Orchids at the Temple Show.—An important notice has been issued by the Royal Horticultural Society concerning the orchid classes at the forthcoming Temple Show. It appears that attention has been drawn to the possibility of misunderstanding arising from the use of the word, "unrestricted" in Classes 1, A. and B. It cannot, therefore, be too clearly and fully understood that the word is governed by Rule 4, which gives 200 square feet as the maximum. In other words, Classes 1, A. and B., are unrestricted in size only so long as they do not exceed the 200 square feet permitted by the rule.

A New Primula—P. Forresti.—We understand that at the meeting of the Royal Horticultural Society on April 20, Messrs. Bees', Lim., of Liverpool, will show a new Chinese primula. The newcomer owes its name—P. Forresti—to the fact that it was secured by Messrs. Bees' intrepid collector, Mr. George Forrest. Our readers will remember that on one of Mr. Forrest's collecting expeditions, he was hunted among the mountains by a band of insurrectionary Lamas, who murdered the French missionaries with whom he had been staying. Mr. Forrest escaped, but was eight days barefooted among the mountains, and during this period he touched no food. Primula Forresti is a native of limestone cliffs among the Yunnan Alps, at an altitude of 9,000-11,000 feet. It has been kept unprotected during the past winter at Sealand, near Chester, and has proved quite hardy. The leaves are strong and of a dark shining green. The flower spikes are from 10-12 inches high, carrying loose spreading heads of from 10-15 blooms. The individual plants vary in colour from light yellow to a fine rich orange. Perhaps the most notable feature, however, is the fragrance, which is quite unlike that of any other primula. It is not confined to the flowers, but is also present in the leaves, and is deliciously suggestive of ripe fruit. The whole effect of the plant is sturdy and vigorous, very different from the delicate beauty of the firm's previous introduction, the graceful P. malacoides.

Imports of Foreign Vegetables last month were much smaller than in March, 1908, the most noteworthy decrease being in potatoes. Of these tubers the imports were 85,017 cwt., of the value of £35,648, against 606,727 cwt., of the value of £129,625. The imports of onions amounted to 450,495 bushels, of the value of £110,165, these figures representing a decrease in quantity of 108,830 bushels, and an increase in value of £46,246. The imports of tomatoes dropped from 86,928 cwt., of the value of £69,722, in March, 1908, to 66,249 cwt., of the value of £51,712 last month. Unenumerated fruits, on the other hand, show an increase in value of £21,970, the total having been £59,700.

The Easter Holidays, although marred by the break in the weather, which occurred on Monday, were held under favourable climatic conditions, and there was a large exodus from London and the principal provincial towns to the country and the seaside during the week previous. Residents in London and its suburbs who remained at home, were careful to take full advantage of the opportunity they had for visiting the public parks and gardens within the Metropolitan area or not far distant from London. Enormous numbers visited such popular resorts as Epping Forest, Hampstead Heath, Hampton Court, and the Royal Gardens, Kew. According to the official return, there were 41,000 visitors to Kew on Easter Monday, against 56,000 last year. To the heavy rains which fell from noon onwards may be attributed the decrease, for the visitors came in such large numbers in the forenoon as to suggest a record attendance for Easter Monday. The daffodils on the Cumberland mound are now producing a glorious display of colour, and in other parts of the gardens these flowers are making such rapid progress as to suggest that the later varieties in other parts of the gardens will be equally attractive within the next few days.

The Journal of the Kew Guild for 1908 has just reached us, and, though it is dated for Christmas, and comes with the daffodils, it is not less interesting because belated. The frontispiece is an excellent portrait of Mr. George Massee, F.L.S., V.M.H., and is followed by a biographical sketch of this famous cryptogamist. The annual report and accounts show that the Guild's balance on current account almost doubled itself during the year, and consists of £20 9s. 2d. in cash. In addition, there are invested funds to the total of £320, yielding a trifle less than £10 10s. per annum. Old Kewites will read with interest of the doings of the "Kew Mutual," and the results of the courses of lectures, and will think of the days of the years that are gone. "The Kew Training" is an article that should make present Kewites think hard. We fear that an objection by students to be regarded as such, and an endeavour to belittle the educational advantages of a sojourn at Kew, on the part of Kewites of recent years, is answerable for some measure of reduction in appointments from Kew. Mr. F. J. Cole's plea for an Institute of Gardeners is particularly good, and the idea will appeal to many who desire to see the profession placed on a higher level. The "Notes from Old Kewites" are numerous and entertaining, but there is a lack of descriptive accounts of travels this year.

The Lasting Qualities of Dahlia Flowers.—A Fellow of the Royal Horticultural Society, writing from Wiesbaden, draws attention to a point of considerable interest in connection with dahlias. He found that some varieties would, on being cut for decorative purposes, last much longer than others kept under the same conditions. Herr Emil Becker, also of Wiesbaden, states that he finds those varieties with narrower foliage possess more lasting qualities than those with broad flat leaves. He considers that plants which have been heavily manured with stable manure are less lasting than those which have been grown without its aid, and finds that if the foliage be removed immediately after the flowers have been cut, they last much better in water than they do in the ordinary way. The matter is one well worthy the attention of growers and raisers of these brilliant decorative flowers, and observations upon the subject would be welcomed.

MR. WILLIAM CRUMP, V.M.H.

IN the *Gard. Chron.*, April 19, 1919, p. 192, we made the announcement that Mr. William Crump was relinquishing his care of the gardens at Madresfield Court, Malvern, after a period of about 40 years' service in that famous establishment. His retirement has now taken effect and readers will be interested in the following account of the career of this distinguished horticulturist. He was born in Shropshire on June 27, 1843, and, as a youth, exhibited a strong inclination for gardening. After receiving the usual education of the village lad, at the local National School, he determined to make gardening his career, but his parents put every possible obstacle in his way, and endeavoured to persuade him to adopt some other occupation. Various posts were offered him, but he was so determined to adopt gardening as his profession that finally his parents consented, and, after a course of probation, he was duly apprenticed in a garden. His first responsible charge was that of foreman of the glass department at Powis Castle, Welshpool, under the late Mr. G. Brown, a famous Scotch gardener of the old school. Powis Castle gardens included a good home nursery at that time, also splendid specimens of trees and shrubs and collections of choice and rare Conifers. The cultivation of the Pineapple was a feature of the place, which also included fine wall trees of Peaches and Nectarines and terraces of hardy, herbaceous flowers. After four years' service, he accepted the office of general foreman at Heckfield Place, Hampshire, under the late Mr. Wildsmith. It was for the experience to be gained from a place where so many famous gardeners had received their early training, rather than for the wages, which were lower than those he had received previously, that Mr. Crump accepted this appointment. After staying there for three years, where fruit and flowers were specialities and so grandly cultivated, he obtained a position as gardener to Mr. F. Harris, Lamberhurst, Kent. The place did not realise his expectations and, after four years, he was appointed to Blenheim Palace gardens, an office demanding much ability and general all-round knowledge. At this time Mr. Crump commenced exhibiting extensively and was successful at the R.H.S. shows at South Kensington, at the Crystal Palace, Royal Botanic Gardens, Manchester, and at other provincial shows. He won several silver cups and gold medals, including the Blue Ribband at the International Potato Exhibition at the Crystal Palace. Most appreciated of all was Messrs. Webbers' packing prize of ten guineas, awarded for the three best packed boxes of fruit, delivered by the railway company at South Kensington intact. This prize was twice competed for against such exhibitors as the late Mr. Coleman, of Eastnor, Mr. Austin of Witley Court and others, and Mr. Crump won the first prize each time. Blenheim Orange, which still holds its own as a scarlet-fleshed Melon, was raised and successfully exhibited in open competition with about thirty others and obtained the R.H.S. First-Class Certificate the same year. After seven years' service at Blenheim Palace, Mr. Crump was appointed to Madresfield Court, where, as stated above, he was gardener for nearly forty years. At Madresfield large numbers of hardy fruit trees are raised annually for both cottage and farm tenantry, and distributed gratuitously. Mr. Crump made many experiments in grafting and double grafting, with a view to the improvement in flavour of choice varieties of fruits. Partial success, at times, seemed hopeful, but further trials proved disappointing, and were abandoned. At Madresfield there is an interesting experimental plot where about 250 varieties of Apples, 80 varieties of Pears and 40 varieties of Plums—all bush trees—are on trial. In addition, there are numbers of seedlings and local varieties of these fruits.

There are many flourishing young orchards on the estate, the result of a scheme introduced some twelve or fifteen years ago, whereby the landowners' and tenants' interests are identical and mutual. A tenant requiring a new orchard makes application for trees, and if the site and soil are considered suitable for fruit growing, the landlord undertakes to find the trees (which are always of the very best and home raised), the stakes, fencing and a skilled man to plant them. He also undertakes the pruning, spraying and other attention for five years, gratis to the tenant. The latter undertakes to find a labourer to assist with planting, and one barrowfull of soil for mulching each tree. At the expiration of five years, the tenant pays an annual rent of 6d. per tree so long as it is in good health. The landlord continues the pruning and the tenant takes all the fruit. The property value is, thereby, very much enhanced, as recently proved.

Mr. Crump was among the first sixty horticulturists selected to receive the Victoria Medal of Honour of Horticulture. He is one of the examiners for the park employees, cottage gardens and allotments, and school teachers' examinations of the Royal Horticultural Society. For twenty-one years he has officiated as a churchwarden of Madresfield Church, has served as a manager of the local schools for seventeen years, and has been secretary for thirty-five years, and corresponding manager for twelve years, of the Madresfield Horticultural Society. He has acted as judge at many important exhibitions, including Shrewsbury. Mr. Crump has received many gifts from friends and neighbours on the occasion of his retirement, including one from the Countess Beauchamp and younger members of the family at Madresfield Court.

Mr. Crump is succeeded by Mr. W. H. Lambert, who was his foreman some 14 years ago and who has since been with Earl Grey at Hawick.

Our best wishes go with Mr. Crump, and we feel sure that, after a record of so many years useful service, he will not fail to find happiness in his retirement and well-earned rest.

MR. WILLIAM CRUMP, V.M.H.

SOCIETIES.

ROYAL HORTICULTURAL.

JULY 15.—There was a capital exhibition at Westminster on this date, and during the afternoon there was a large attendance, many of the visitors coming from considerable distances to see the National Carnation and Picotee Society's display.

In addition to Carnations, hardy flowers, stove plants and Orchids were prominent features, but the outstanding display was a group of vegetables from Aldenham House, Elstree. Delphiniums and Sweet Peas provided the greater number of novelties.

Floral Committee.

Present.—Messrs. H. B. May (in the chair), E. A. Bowles, George Paul, J. W. Barr, H. Cowley, John Dickson, C. Dixon, John Green, John Heal, Andrew Ireland, E. H. Jenkins, H. J. Jones, J. F. McLeod, W. P. Thomson, Charles Pearson, Thos. Stevenson, Wm. Cuthbertson, S. Morris, C. R. Fielder, Arthur Turner, G. Reuthe, E. F. Hazelton, W. Howe, J. Jennings, and Jas. Hudson.

AWARDS OF MERIT.

Delphinium Sir Douglas Haig.—A remarkable variety, with large, semi-double flowers carried in dense spikes of extraordinary size. The colour is deep purplish blue.

Delphinium Millicent Blackmore. — This beautiful variety has semi-double flowers of large size, of a clear, bright mauve blue shade that is very pleasing. The deep brown centre adds to the attractiveness of the flowers that are of regular form and each nearly 3 inches in diameter.

Both the foregoing were shown by Messrs. BLACKMORE AND LANGDON.

Delphinium F. W. Smith.—A most attractive variety with rounded, semi-double flowers of large size, long-stalked and daintily set on tall spikes. The colour is bright rich blue, with white centre. Shown by G. FERGUSSON, Esq. (gr. Mr. F. W. Smith), Weybridge.

Delphinium Joan.—A single variety of large size and good form. The colour is soft medium blue with brown centre. Shown by Mr. W. WELLS, Jun.

Sweet Pea Gladys.—A charming variety that bears some resemblance to R. F. Felton, but is of soft lavender blue or light mauve colour and more refined in form than the older variety.

Sweet Pea Doris.—A very attractive Sweet Pea of very waved form and good size. The colour is a very bright shade of cerise pink.

These two varieties were shown by Messrs. E. W. KING AND CO., Coggeshall.

Sweet Pea Mascott's Scarlet. — A handsome Sweet Pea of fine size and good form and bearing four blooms on every spike shown. The colour is very dense and of a rather deeper shade than one usually understands by scarlet.

Sweet Pea Annie Ireland (see Fig. 22).—A dainty variety with white wings and a blush standard which has a flushed edging of bright pink. The flowers are of exceptionally good form and size.

These two Sweet Peas were shown by Messrs. IRELAND AND HITCHCOCK, Mark's Tey.

Rose Sea Foam.—This Rose is a seedling from Rosa bracteata. It bears its double, full blooms in bracteate clusters on stout growths furnished with deep green, neat, shining foliage. The flowers are slightly scented and the petals curve prettily at the margins. Shown by Messrs. WM. PAUL AND SON.

GROUPS.

J. OSBORNE, Esq., Walton-on-Thames (gr. Mr. G. Cook), exhibited fine flowers of Nymphaea chromatella, N. Marliacea albida, N. M. carnea; and fruiting sprays of Eleagnus longipes; these fruits are said to be useful for preserving. The elongated, ground group contributed by the Alder River Nursery, contained very freely-flowered branches of Plagianthus Lyallii, and fine specimens of Lilium regale, L. pardalinum, Hypericum patalum Henryi, and Coriaria japonica (Silver Banksian Medal).

Stove plants were again well shown by Mr. L. R. RUSSELL (Silver Flora Medal).—Messrs. H. B. MAY AND SONS arranged standard Fuchsias over Ferns, Verbenas, Hydrangeas and Heliotropes (Silver Banksian Medal).—Messrs. BLACKMORE AND LANGDON are as expert in Gloxinia culture as in Begonias, and they showed a dozen fine specimens representing a good strain.

Messrs. B. R. CANT AND SONS showed a handsome group of cut Roses and displayed the varieties Mrs. Alfred Tate, Iona Herdman, Lyon Rose, Lady Hillingdon, Cupid, Emily Gray and Christine in fine form (Silver Flora Medal). The Director of the Royal Gardens, Kew, sent flowering branches of the pink Kew Rambler Rose (see *Gard. Chron.*, July 27, 1918, Fig. 12), obtained by crossing Hiawatha with Rosa Soulieana.

Paul's Scarlet Climber Rose was well shown by Messrs. WM. PAUL AND SON, who also displayed the single, light yellow Mermaid in excellent condition, as well as their new Seafoam (Silver Banksian Medal). The Rev. J. H. PEMBERTON showed Roses in variety, including Havering Rambler (pink) and many other varieties of his own raising (Silver Banksian Medal).

Some wonderfully well grown spikes of Delphiniums were shown in big vases by Messrs. BLACKMORE AND LANGDON; the spikes of Sir Douglas Haig, Statuaire Rude, Sergeant

CRUMBIE Robert of 10 Front-street Shotton Colliery county **Durham** died 5 October 1933 Probate **Durham** 13 November to Susan Greener (wife of Thomas Greener) and Charles Cornforth Gott colliery clerk. Effects £409 1s. 2d.

CRUMP Ada Jane of 19 Litchfield-gardens Willesden Green **Middlesex** (wife of Laurence William Crump) died 24 January 1933 at University College Hospital St. Pancras Middlesex Administration **London** 2 May to the said Laurence William Crump organ builder. Effects £461 3s. 3d.

CRUMP Albert John of 22 Grosvenor-court-mansions Marble Arch **Middlesex** died 5 November 1933 at 42 Talbot-road Hornsey Middlesex Probate **London** 21 December to Gladys Mary Crump widow and Frederick Cecil Ellerton bank official. Effects £4421 13s. 6d.

CRUMP Alfred Edgar of 926 Marguerite-street Portland Multomah Oregan **U.S.A.** died 10 December 1932 at Portland Sanatorium Portland Administration **London** 10 April to Isabel Crump widow. Effects £274 5s.

CRUMP Ann of 81 Hughenden-road High Wycombe **Buckinghamshire** widow died 9 February 1933 Probate **Oxford** 7 March to Eliza Annie Croxford (wife of James Leonard Croxford). Effects £250 3s. 5d.

CRUMP Annie Sophia of 18 Yew-street Fartown **Huddersfield** spinster died 26 January 1933 at Royal Infirmary Huddersfield Probate **London** 6 April to James Drake secretary. Effects £570 12s. 11d.

CRUMP Charles William of Grasmere Coronation-road Rodborough **Gloucestershire** died 9 April 1933 Probate **London** 12 May to Annie Crump widow. Effects £1083 11s. 8d.

CRUMP Elizabeth of Hagley Gate Cottage Lugwardine **Herefordshire** spinster died 15 April 1933 Probate **Oxford** 4 October to National Provincial Bank Limited. Effects £2428 4s. 11d.

CRUMP Emma Maria of 68 Hawstead-road Catford Lewisham **Kent** widow died 25 July 1933 Administration **London** 16 September to Lilian Kate Crump spinster. Effects £272 3s. 3d.

CRUMP George Arthur of 124 High-road Leyton **Essex** died 29 January 1933 Probate **London** 10 March to Amelia Osborne Overett (wife of John Overett). Effects £329 5s. 11d.

CRUMP George William of 122 Underhill-road East Dulwich **Surrey** died 18 March 1933 Probate **London** 26 April to Susannah Crump widow. Effects £327.

CRUMP George William of 57 Windsor-avenue Hillingdon **Middlesex** died 22 April 1933 Probate **London** 1 June to Donald Fulton civil servant and Francis Rowley commercial traveller. Effects £493 12s. 11d.

CRUMP Herbert of 26 Archway-road Highgate **Middlesex** died 7 January 1933 at Royal Northern Hospital Holloway-road Middlesex Probate **London** 8 March to Alice Lucretia Mary Crump widow. Effects £3804 2s. 9d.

CRUMP Herbert John of 27 Cambridge-street **Aylesbury** died 2 March 1933 at The Royal Buckingham Hospital Aylesbury Probate **Oxford** 13 April to Frances West Crump widow. Effects £1050 8s. 5d.

CRUMP James of 68 Hawstead-road Catford Lewisham **Kent** died 19 January 1933 at Lewisham Hospital High-street Lewisham Administration **London** 12 October to Lilian Kate Crump spinster. Effects £251.

CRUMP John of Dunval House near Bridgnorth **Shropshire** died 31 January 1933 Probate **Shrewsbury** 7 June to Vincent Corbet Cook architect and George Edward Smith insurance manager. Effects £19862 2s. 11d.

CRUMP Joseph of Hazelton Hall-road Leckhampton **Gloucestershire** died 25 May 1933 Probate **Gloucester** 22 June to Sarah Hannah Crump widow and Percy Charles Lloyd solicitor. Effects £1139 11s. 3d. Resworn £1262 16s. 3d.

CRUMP Nellie Rachel of 79 Forburg-road Stoke Newington **Middlesex** spinster died 11 March 1933 Administration **London** 25 April to Frederick Arthur Crump accountant. Effects £169 11s. 7d.

CRUMP Percy George of Porters Arms Duke-street High Wycombe **Buckinghamshire** died 15 March 1933 Administration **Oxford** 21 April to Charles William Crump licensed victualler. Effects £642 12s. 11d.

CRUMP Thomas otherwise Charles of The Bungalow Bradley **Cheshire** died 12 December 1932 Probate **London** 26 January to Thomas Lievesley and James Chesters farmers. Effects £771 18s. 4d.

CRUMP William of Oakridge Richmond-road Malvern Link **Worcestershire** died 30 December 1932 Probate **London** 15 February to Charles Foster Crump gardener and John Bernard Watson Lambert solicitor. Effects £5271 6s. 2d. Resworn £5171 6s. 2d.

CRUMPLER Charles Robert of Lytchett Matravers **Dorsetshire** died 5 January 1918 Probate **Blandford** 10 January to Ellis Crumpler gardener. Effects £160 10s. Former Grant D.R. **Blandford** 21 October 1918.

As the berries actually affected, nothing one to save them. It is therefore best away at once all that lie beyond the and withering portions of the stalk, to divert all the sap into those which in sound.

bbage-fly.

16th.—A friend has tried to grow kinds of Cabbages in part of his and has failed. They looked all right e weeks after they were planted, and after the other began to droop. When e pulled up, the stems were found to ed with holes made by little white hich swarmed in them. They were the the Cabbage-fly (Anthomyia brassicæ). cts are, unfortunately, common enough, ve never seen so many of them. They y turn into small, grey flies, not unlike es, but not quite so large. A strong ion of lime-water is often recom- but I doubt its being effectual where k is as bad as it was in this case. e best thing to do is to take up the and burn them, so as to destroy the A dressing of lime may then be applied ground, but for some time to come it not be used for any of the Cabbage

17th.—I have learned here the dis- e of what gardeners call a "hungry In bygone ages all the ground around es must have been the bed of a very ver, which first brought down gravel n laid a thick deposit of mud on top. thus formed, though it contains little s of such an extremely porous nature rain runs through it as through a sieve. e heavy downfall at the end of June was a day or two, and with it, of course, vast quantity of the soluble plant-foods in the upper layers. That is why the "hungry"; it has to be fed so often.

18th.—Those who are fortunate to possess extensive grounds are able to arrange many delightfully cool retreats, such as the one shown in the illustration, for the hot weather of summer, but even in a small garden this important point should not be neglected, even if no more is done than to plant a shade-tree.

H. C. DAVIDSON.

Famous Gardeners at Home.

No. 243.—MR. F. CUBBERLEY, AT THE GARDENS, FAIRLAWN, TONBRIDGE.

EVEN in the "garden of England" there are few seats equal in beauty of surroundings to Fairlawn Park, the residence of Mr. W. M. Cazalet, between four and five miles from Tonbridge. A striking feature of the gardens, in which Mr. Cazalet takes a great interest, is that they are in three tiers, rising one above the other. On the last of these the gardener's lodge is situated, and here I found Mr. Cubberley, on the occasion of my visit towards the end of June. At his suggestion we started with the new Rosery, made about four years ago, of which Rambler varieties are the feature.

A Great Show of Foxgloves.

Here, too, is a striking herbaceous border, with a Yew hedge in front, and, behind, a Nut plantation. My attention was arrested at the entrance by a wonderful display of Foxgloves.

"How long have they been in flower?" I inquired.

"For three weeks, and they will last in flower for four weeks longer, if we get showery weather. They are Sutton's seedlings, and this is the second year."

"Do they want much attention?"

"We allow the seed to drop on the ground, put the hoe through, and then keep what we want. For the rest, they go on just as they like, but the ground is always kept damp."

"What is the height of the spikes?"

"Some of them are quite six feet high, and, as you see, they go right along the border, which is two hundred feet long, the colours being white, dark pink, and light pink."

"Do you grow many varieties of Ramblers?"

"No, only Dorothy Perkins and Crimson Rambler. The Roses along the borders, both standard and dwarf varieties, are Hybrid Perpetuals, and those nearer the north wall are Hybrid Teas, which do better where it is cooler. On the wall itself, Morella Cherries flourish."

"And underneath that wall you have a fine show of London Pride. How long has it been in flower?"

"Between five and six weeks, and it will last some time longer. London Pride should always be under a north wall, where it can obtain plenty of moisture."

The American Walk.

"Perhaps the great feature of our gardens," continued Mr. Cubberley, "is the beautiful walks. The one we are now entering is the American Walk, in which the Rhododendrons and Azaleas are conspicuous. The Rhododendrons grow bigger every year; they are nearly all hybrids, largely of the Himalayan tribe. A few of the best varieties are Lady Eleanor Cathcart, John Waterer, and Dolly Varden. The stems of some are as big as a man's body, and the height of many from twenty to thirty feet. I have had Rhododendrons in flower ever since Christmas, and I showed twenty-four varieties in London in April."

"Azaleas appear to do almost equally well."

"Both the Ghent and indica varieties like this soil, the former being especially good. With the Kalmias just coming out, and the Magnolias in bloom, the variety of colours presents a very pleasing appearance in the American Walk, which is over two hundred yards long."

THE HAUNTED WALK AT FAIRLAWN PARK.

We next strolled into the Wilderness, which is another delightful part of the gardens, con-

taining some of the finest Yews in the country. The Beeches are also a great feature. Leading out of the Wilderness are many beautiful walks, from which fine views of the surrounding country may be obtained. One of the most notable is called the Haunted Walk, which, with its clipped hedge and overhanging trees, forms a most lovely retreat. The splendid mansion, which is covered with creepers, including variegated Ivies, Viriginian Creeper, and Crimson Ramblers, has adjacent to it no fewer than three lawns, on one of which are three trees, planted by three of the younger members of the family. The square lawn in front of the mansion has shrubs on both sides, and a little Rosery, containing Teas and Hybrid Teas, with arches of Dorothy Perkins and Crimson Rambler. Here, too, is a fine specimen of Philadelphus grandiflora in flower, under some noble Turkey Oaks, close to which are remarkable specimens of Rhododendron Thompsonii, from fifteen to twenty feet wide.

The Bedding Combinations.

"With regard to bedding," said Mr. Cubberley, "the beds have just been replanted, but they have been in flower all the spring, with Violas as a great feature."

"They are still looking extremely well."

"We grow about twenty varieties, it being a principle to mass our flowers with Violas, and to let Geraniums come up through them. The best varieties of the former are R. P. Ripling, The Mearns (mauve, with white borders), Kitty Bell, Skylark, Blue King, Devonshire Cream, General Baden Powell (yellow), and Woodcock (yellow)."

"I should like to have some of the leading combinations in the beds."

"There are four beds of Violas (The Mearns) and Flower of Spring Geraniums; four of Verbena Miss Willmott, coming through variegated Grass, edged with Lobelias; four of Viola Kitty Bell, with Geranium Crystal Palace Gem coming through, edged with Princess Beatrice Begonias; four with Ageratums (a new variety from Carter's), carpeted with pink Antirrhinums and Cineraria maritima; two of Mr. Cannell Geraniums, coming up through dark Heliotropes, edged with Princess Beatrice Begonias. Other beds consist of J. P. Ripling Violas, and Flower of Spring Geraniums coming through them; Devonshire Cream Violas and Tricolour Geraniums (Mrs. Cox); Kitty Bell Violas and Weltoniensis Begonias, with a deep edging of Alyssum maritima; Geranium Souvenir de Charles Turner in centre, with a deep edging of Alyssum and Coleus Verschaffeldtii; two Rose beds carpeted with yellow Antirrhinum, intermixed with Lobelia cardinalis, and edged with Ivy-leaved Geranium (Souvenir de Charles Turner), and two carpet beds of Alternanthera."

Violas and Wallflowers.

"You must plant an enormous number of Violas."

"This year, beside the old ones, I put out about five thousand. I get a number of new varieties each year. For instance, next year I shall start five or six. By the way, The Mearns Viola may be specially recommended; it is purple, with a yellow centre, and deep white edge."

"Then your Wallflowers are a great feature?"

"Yes, we have a very large number during the season; in fact, they come next to Violas. The best variety, I think, is Eastern Queen, and others very good are Belvoir Yellow, Blood-red, Ruby Gem, Vulcan, and Primrose Dame."

"You have a nice quantity of Schizanthus in the conservatory."

"We have recently done away with Palms in the conservatory, and substituted flowers. In the rockwork, which was done by Messrs. Pulham, Begonia Rex, Asparagus Sprengerii, Tradescantias, and Osmunda Ferns are ornamental, and there are goldfish in the water. I have shown Asparagus Sprengerii at the local shows in baskets, nine feet long. The tubs which stand on the terrace are filled with Souvenir de Charles Turner and Madame Crousse Geraniums."

Behind a Laurel hedge is another long herbaceous border, and here, also, there is a Peach case two hundred and fifty feet long.

"Is any heat used for the Peaches?" I asked.

"None at all, and they grow splendidly without. The Nectarines are Rivers' Early and Rivers' Orange; the Peaches are Waterloo, Hale's Early, Stirling Castle, Dymond, Royal George, and Golden Eagle."

Favourite Sweet Peas.

"Which are your favourite Sweet Peas?"

"We use pink as much as possible for table decoration, intermixing it with Gypsophila elegans. The first batch includes [illegible] and Miss Willmott, which are two [illegible] Of the new varieties, we have the [illegible] Kenyon, Coccinea, Navy Blue, [illegible] Hamilton, Dorothy Eckford, Prince [illegible] Duke of Westminster, Black [illegible] Salopian King."

The Tunnel Walk.

"The main feature of your kitchen [illegible] of course, your Apple walk?"

"We call it the Tunnel Walk, [illegible] mainly of Apples. The walk was [illegible] twenty years ago, and extends the [illegible] of the garden, about a hundred [illegible] crops, as you can judge for yo[illegible] heavy. There are over fifty [illegible] side."

"Which varieties do best in the [illegible]

"Lord Derby, Stirling Castle, [illegible] Pippin, Peasgood's Nonsuch, [illegible] Beauty of Kent, Nanny, Lane's [illegible] Bismarck, Grenadier, New Hawthorden, Sudeley, Prince Arthur, Cox's [illegible] Warner's King. They look their [illegible] tember. We have also a nice lot [illegible] bushes."

Pears and Strawberries.

"What about Pears?"

"They also do very well. Pears is one of our surest. Our system [illegible] them as standards, and then pull [illegible] down again, training them right [illegible] sides of the garden. Other good [illegible] Marie Louise, Beurré Clairgeau, [illegible] of Jersey, and Beurré Diel. All [illegible] netted, even Pears, the birds [illegible] plague. Brown Turkey Figs do [illegible] wall outside."

"How many varieties of Strawberries [illegible] grow?"

"Only a few—Royal Sovereign, [illegible] and Latest of All. The latter come [illegible] later, but it will only do planted [illegible] ordinary way, with rough frames [illegible] is of no use for pots. We use [illegible] exclusively for that purpose."

"You seem to grow a large number [illegible]

"We grow about a dozen varieties [illegible] main crop I prefer Gradus, and [illegible] Ne Plus Ultra is the best. The [illegible] Potato is Sir John Llewellyn; [illegible] I like Ninetyfold, and Up-to-Date [illegible] But I grow quite a dozen varieties [illegible]

Carnations in the Vine Border.

"In the old Vine border," [illegible] Cubberley, "I am growing the best [illegible] Border Carnations. That is to say [illegible] away with Vines, except Muscats [illegible] buy Grapes anywhere. The Peach [illegible] three divisions, contains much the [illegible] ties as those in the case; and the [illegible] devoted to Figs in pots. In addition [illegible] Turkey, we grow White Marseilles [illegible] Sepor, both of which are good [illegible]

"Have you any preference in Malmaisons?"

"I think Princess of Wales and [illegible] much the best. Of winter-flowering [illegible] there are none better than Mrs. [illegible] and Enchantress."

"I see you grow Melons in one [illegible]

"Most of them are seedlings [illegible] also grow Gunton Park and Blenheim, but if we get a good seedling [illegible] Crotons, Calanthes, and Dracaenas [illegible] here, and we force Lilacs, Azaleas [illegible] drons—Pink Pearl and Cunningham [illegible] The only Orchids we go in for [illegible] and we are going to make another [illegible] ally for these."

"How many Chrysanthemums [illegible]

"About two hundred large [illegible] hundred bush and singles. We [illegible] five hundred Princess Victoria, [illegible] Everyone has them in November [illegible] is to flower them as late as we [illegible] often have blooms in February."

The Head Gardener and his Staff at Fairlawn Park.

The Fruit Plantation.

With a glance at the fine fruit room, which will hold a thousand bushels, we proceeded to the fruit plantation, beyond which is a huge orchard, containing Apples and Plums, the varieties including Kentish Fillbasket, Irish Peach, Blenheim Orange, Yorkshire Beauty, and Wealthy. Of the last there is an exceptionally good crop. Before we returned to the gardener's lodge, we had a look at the two grand specimens of Catalpa bignonioides, in front of the mansion, which is approached through a fine avenue of Limes.

The Gardener's Garden.

"You have a pretty garden in front of your house," I remarked to Mr. Cubberley.

"In the border is Statice Suworowi coming up through white Violas; in the Rose beds are Spanish Irises in variety, the edging being yellow Violas; and the bed facing the Roses consists of Blue King and Kitty Bell Violas."

"Do you show much?"

"As a rule, only locally—at Sevenoaks and Tunbridge Wells. If I show away, it is at the exhibitions of the Royal Horticultural Society. I have been awarded their silver medal several times. On the August Bank Holiday a flower show is held in these grounds, under the auspices of the Shipborne and Plaxton Society, which was started four years ago, and is one of the most prosperous."

"How long have you been at Fairlawn?"

"Five years. I was previously head gardener for five years at Leyswood, and prior to that I was for five years foreman at The Dell, Egham, and for three years foreman at Culford Hall, Bury St. Edmunds." ALFRED WILCOX.

Letters from a Lady Gardener.

No. 211.—BOG TUBS AND CHRYSANTHEMUMS.

DEAR KATE,—One of the advantages of being a gardener is this—that one really enjoys a wet day after a long dry time. Drought is so trying to the plants, and they look so sad for want of water, that it is delightful to feel, when the rain at last comes down, that their wants are being fully supplied. For an amount of watering will do half the good which the rain does, and even mulching their pots after a soaking (though much better than watering continually) is only a makeshift when compared to the value of a good day's rain.

Cannas for Tubs.

The plants in bog tubs have been the most fortunate this summer, which has been inordinately dry here, and I shall extend this plan

SOME FINE NEW CANNAS.

next season, as it is so useful in a light, warm and such as ours, with terraces lying to the southern sunshine. Cannas, which are often short of water in the borders (for they are exceedingly thirsty plants), do much better in a tub or half-cask (well charred out, if it has contained paraffin), as it is then easy to keep them thoroughly moist, even in a drought. The modern Cannas—dwarf and sturdy, with fine heads of bloom—are most effective plants, and, as they can be grown very easily, they should be in every garden; but they are not always a success, because they need so much nourishment and water, and do not always get enough of these. A common mistake in their cultivation is to dry them off too much in winter; they take months to recover, if they ever get over it, and as it is quite easy to have them in bloom from May till after Christmas if not dried off, it is a pity to try them in this way. We only rest our Cannas (in pots) for about six weeks from the beginning of the year, by keeping them in the cool Vinery just free from frost, when they need very occasional watering to prevent them from drooping. Then the roots are pulled to pieces, and the finest of them are selected for potting up with rich soil, and starting in heat; but we always have a quantity of second-sized roots left. These we plant rather thickly in a box of rich soil, and start them in warmth, too; they make excellent plants for a bog tub in May, where they look very handsome when in blossom.

A good plan for these tubs on a terrace is to cover the tub with wire netting, and this, with such creepers as Tropæolums, Canary Creeper, Convolvulus major (Morning Glories), making a narrow border round the tub with rich soil for these seeds. This year we have grown some very pretty turquoise-blue Peas in this way; their proper name is Lathyrus sativus azureus, and they are quite dwarf in growth, so that they just cover a tub nicely, if trained on the wires. One advantage of this kind of gardening is that it can be carried out in a city, on the leads, or in a balcony, as well as in the garden, if the surrounding climbers are sown in boxes, covering these with wire netting, too, to prevent the cats troubling them.

Scarlet Lobelias (fulgens, etc.) are just now very handsome in bog tubs; others contain the lovely fluffy blooms of Spiræas in rich pink (S. venusta and S. palmata). Azalea mollis, too, rejoices in a bog tub, and grows into a fine shrub. Japanese Irises (Kæmpferi) do far better here than in the borders, and the graceful North American flowering Fern, Osmunda gracilis, is quite at home in them, as well as our own native Osmunda regalis. Of course, you can lower your bog tubs into the soil if you prefer it, or let them stand half out of it surrounded by rockwork, which last plan looks very well at the edge of a carriage drive or a lawn, especially if you cover the rockery with Alpines.

The Chrysanthemums.

August is, perhaps, the most important month in the year with regard to the culture of Chrysanthemums, although they need attention and care throughout the year, if the result is to be good. The early-flowering kinds, both double and single, are already in bud, and these have been slightly disbudded, leaving from three to five blossoms on each spray, for the small side buds below those at the top are of little use, and only detract from the appearance of the spray and the size of the flowers. The mid-

SINGLE CHRYSANTHEMUM—MISS F. K. CHARLTON.

season large-flowered Chrysanthemums have to be more severely dealt with, if exhibition blooms are wanted, and it is impossible to remember, I find, whether their first-crown buds or their second-crown buds ought to be retained in the case of all varieties, unless one has the help of a good list of the plants, with this information added to the date in the spring at which the plants were pinched back. As a general rule, the second-crown bud is the best to secure, but I advise you to get a list from the horticulturist from whom you obtained the plants, as the best Chrysanthemum growers usually supply these particulars of the plants they send out.

For large blossoms, you should only leave from three to five buds on the plant, according to the number of its shoots and its vigour, and it is necessary to begin feeding these selected flowers as soon as they are secured. But here one has to exercise caution, for I doubt whether more plants do not die from over-feeding than from starvation, and many amateurs, not knowing the danger of using strong chemical manures too often, kill their plants with kindness.

"Feeding" the Plants.

The first meal we give to the plants, after the buds have formed, is a slight top-dressing of fine, rich compost of loam, old manure, and fertiliser mixed together, taking care not to fill the pots too full, as there should be at least half an inch of space for watering. The amount of artificial fertiliser for each pot should not exceed a teaspoonful, and the plants will not need more stimulants for a week or two after top-dressing. Then soot-water, alternated with clean water, may be given, but it must be in a fine, clear state, not thick or muddy; in fact, if you find the top soil in the pots looking

The Garden, 1877

OBITUARY.

We have to record with regret the death of Mr. David Cunningham, an event which took place at Moorpark, Hertfordshire, on the 17th inst., at the comparatively early age of fifty-seven. As a gardener he always held responsible situations, the duties of which he discharged with credit to himself and satisfaction to his employers.

be worked by a valve, and only used when the ground thermometer indicated its necessity.

It may be asked, How about the bottom pipes in case of accidents? Now I do not see the use of burying so much money for the sake of gratifying a feeling of security against evils that may never came. Nor do I think it at all necessary or profitable to attempt to heat vineries except in the case of small houses for especial early purposes, and even then the advantage is only one of time. This has been my experience of bottom-heat—not that I have ever made it a point to select houses for Vines where I had bottom heat at command, but the force of circumstances has compelled me to have recourse thereto in order to fill up gaps which might otherwise occur while a process of renovation was being carried out. *W. Hinds.*

(*To be continued.*)

THE CHAMPION GRAPE GROWERS.

WE are glad to be able to lay before our readers the portraits of the two Vine growers whose successes at the International Fruit Show at Edinburgh last year, were so noteworthy. This year at Dundee, as will be seen in another column, they have well maintained their repute, for which reasons some account of their respective careers may be of unusual interest.

JOHN R. CURROR.

Mr. Curror served his apprenticeship in Fife, and then became gardener in a small place in East Lothian, from which he removed to his present situation, where he has been four years. He has two vineries, where the Vines were planted six years ago—the soil a strong yellow loam mixed with the dark sharp soil of the neighbourhood where they grow, with a large allowance of ground bones and some rotten dung. The early house produces splendid crops of Black Hamburghs and other early sorts; the late house grand examples of Black Alicante, Mrs. Pince, Lady Downe's, and, as all the world now knows, splendid bunches of Raisin d'Calabre. The Vine of this Grape that produced the largest and probably most handsome bunch of Grapes that was ever seen, produced last year besides it over 20 lb. of Grapes, showing that the monster had not swallowed all its neighbours, as is common in such cases. Mr. Curror makes no sacrifice of crop for the mere fame of producing great bunches, which makes his success the more creditable.

In his greenhouse are a number of very finely grown Heaths, as well as other greenhouse plants. His Orchid-house is filled with very healthy, well managed plants of that most interesting race. His cold and warm Fern-houses are also filled with well-grown Todeas, Dicksonias, Davallias, Adiantums, &c.

The whole place is in excellent order, and though not more than an acre in extent it well repays a visit at all times. Mr. Curror seems a gardener by intuition, and his skill is only equalled by his modesty; in fact he seems quite embarrassed when reference is made to his triumph as a Grape grower.

JAMES DICKSON.

I commenced my gardening career in 1853 (says Mr. Dickson), at the age of fourteen, under Mr. John Maclean, gr. to the late Wm. Forbes Mackenzie, Esq., of Portmore, Peeblesshire, under whom I served for three years, and during the greater part of that time I had charge of the houses. Mr. Maclean was famed as a first-class grower of Camellias; indeed, I have never seen a finer and more healthy collection of that favourite plant anywhere.

When leaving Portmore I engaged as an under gardener with Mr. James Baird, gr. to the late Captain Patterson, of Cunnoquhie, Monimail, Fifeshire, in which garden I had the privilege of assisting to renew the vineries, the Vines of which, Mr. Baird told me some time after, had turned out remarkably well. Few growers excel Mr. Baird as a grower of Pines and Grapes.

While at Cunnoquhie I was requested by Mr. John Pender, late gr. to David Anderson, Esq., of Moredun, Liberton, near Edinburgh, to come to him as a journeyman. Accordingly I engaged with him, and I had charge of a very extensive range of forcing-houses. I had good opportunities afforded me while there of improving myself.

After four and a half years' service at Moredun I came to Arkleton, my present situation, in the latter end of 1862. It is 5 miles north of Langholm, in the centre of Ewesdale, and surrounded by the finest hill scenery in the South of Scotland. It has for centuries been the property of the Elliots, an old and celebrated border family. The present proprietor, Wm. Scott Elliot, resides in Edinburgh. It is the residence of my present employer, John Jardine, Esq., of Thorlieshope, and has been the residence of his ancestors for upwards of a century. He is a retired country gentleman, who not only takes great pleasure in his own garden, but also patronises liberally the horticultural societies in the locality, and awards handsome prizes to the cottagers in the district for the best kept gardens and window plants—an example well worthy of imitation.

The house was erected in 1860, and occupies the site of the old Peel Tower of the Elliots of Ewesdale, and combines all the architectural features of the Border keep with the elegancies and conveniences of the modern mansion.

The gardens were planned in 1862 by the late Mr. Little, of the firm of Messrs. Little & Ballantyne, of Carlisle, and were laid out by me in 1863 and 1864. The ground occupied by the garden had evidently at one time been a watercourse, so that I had in a great measure to make the soil, but a deep stratum of gravel underlies it which makes an excellent drainage—a circumstance not without its advantages in a locality where the rainfall is so heavy.

The vineries consist of two houses (Shaw's patent), each 30 feet long, planted with the following Vines:—Black Hamburgh, Mill Hill Hamburgh, Golden Hamburgh, Duke of Buccleuch, White Frontignan, Black Frontignan, Black Prince, Alicante, Lady Downe's, Mrs. Pince's Muscat, Madresfield Court, Tyninghame Muscat, Archerfield Muscat, Gros Colman, and Syrian.

The Peach-houses are 180 feet long, in two divisions, each 90 feet long, with a drum trellis running along the front, and occupied both back and front with well-grown, healthy-looking and fruitful trees, principally Peaches and Nectarines, with the exception of a few Cherry and Plum trees.

Each of the Vine borders is 14½ feet wide inside and the same outside. In making the border I took out what soil there was, and gravel to the required depth, and in the bottom of the border I laid as a foundation a foot of stones, over the stones a slight covering of lime-rubbish, over this turf with the grassy side down, and then filled up the borders with the following compound:—The turf of a fine fibry loam taken from an old sheep pasture; to every twelve cartloads of this turf were added two cartloads of old lime-rubbish, one cartload of horse-droppings, one cartload of charcoal, and 5 cwt. of inch bones. The turf was fresh from the field, mixed with the other ingredients; and with this compound the borders were filled up to the required depth, 3½ feet deep inside, the same depth immediately in front of the houses, and 2½ feet next the walk.

In common with others similarly situated I was on the look-out for young Vines, so I heard from my old master (the late Mr. Pender) that Messrs. James Dickson & Sons, nurserymen, Edinburgh, had a superior stock. I therefore took train for Edinburgh, inspected them, and satisfied myself that they were really first-rate. I then ordered the number required, including one Syrian in the list. The number of bunches, with the weight this Syrian has carried, is seen by what follows:—

In the year 1865—3 bunches, 6½ to 8 lb. each
,, 1866—4 bunches, 6 to 8½ lb. ,,
,, 1867—3 bunches, 7, 8, and 9 lb. ,,
,, 1868—2 bunches, 8 and 8¾ lb. ,,
,, 1869—1 bunch, 16½ lb.
,, 1870—1 bunch, 19 lb. 5 oz.
,, 1871—1 bunch, 18 lb. 7 oz.
,, 1872—1 bunch, 19 lb. 6 oz.
,, 1873—1 bunch, 16 lb. 10 oz.
,, 1874—1 bunch, 12¾ lb.
,, 1875—2 bunches, 8 lb. 12 oz., and 12 lb. 10 oz.

The Vine that carried the bunch last year which weighed, when cut, 26 lb. 8 oz., is a young Vine grown from an eye taken from the above. The second year it was planted a bunch was cut from it that weighed 14 lb.; the third year, one of 16 lb. 6 oz. Another that I have of the same, growing on the back wall of one of the vineries, has carried some very big bunches, with which I have taken prizes at local shows. All the other Vines, with the exception of a few that I have added recently, were cropped the second year, each carrying seven or eight bunches.

I last year cut from a young Vine of Mrs. Pince's Muscat two bunches, each 5½ lb., one 6 lb., one 6½ lb., and one 8 lb. weight. From a young Vine of Alicante four bunches, which weighed 3 lb., 5 lb., 9 lb. 6 oz., and 10 lb. respectively, and Black Hamburgh bunches that weighed 6 lb., 7 lb., and 8 lb.

In the year 1869, at the Edinburgh International Show, I got 1st prize with a bunch weighing 16½ lb.; in 1870, at the Royal Caledonian Society's Show, with a bunch weighing 19 lb. 5 oz.; at the same place in 1871, 1st prize, with a bunch weighing 18 lb. 7 oz.; at the Glasgow International Show in 1872, I got 1st prize for the heaviest white, with a bunch 19 lb. 6 oz., and 1st for heaviest black, with a bunch of Hamburghs, 6¾ lb. In 1873, at the Manchester International, I was 1st for the heaviest white, with a bunch 16 lb. 6 oz.; and 2d for the heaviest black with a bunch of Black Prince, weighing 5 lb. 13 oz.; and in the same year, at the Royal Caledonian Horticultural Society's show in Edinburgh, I received the 1st prize for white, with a bunch weighing 16 lb. 10 oz. At the same Society's show in 1874 the 1st prize for white was awarded to me for a bunch weighing 12¾ lb.; and the 1st for black, for a bunch of Alicante weighing 8 lb.

In addition to the places named, I have been very successful as an exhibitor at local shows, where for fruits, flowers, and vegetables, I have taken over 400 prizes during the last twelve years. The bunches of Grapes shown for weight at the local shows have been of various weights—from 5 lb. to 16 lb.

Fruit trees thrive very well here; very few standards are grown, but the walls are covered with a very good selection of Pears, Apples, Plums, and Cherries, most of which bear annually fine crops of fruit. The following is a list of Pears that fruit remarkably well here:—Easter Bergamotte, Beurré d'Amanlis, Beurré Diel, Chaumontel, Crawford, Dunmore, Nélis d'Hiver, Green Chisel, Hessel, Jargonelle, Marie Louise, and Swan's Egg.

JOSEPH DALE.

It is with great regret that we have to record the death, on Tuesday last, of Mr. Joseph Dale, so long and so honourably known as gardener to the Hon. Society of the Middle Temple. He left his residence, Pompon Villa, Church Road, Leyton, Essex, intending, as usual, to proceed to his charge in the city, and was apparently in very good health; but on reaching Leyton Station he had to wait for a train, and was sitting and talking to a neighbour, when he suddenly fell over on to his friend's lap, and expired of heart disease, without a moan. Mr. Dale was born on the 29th of June, 1815, and was therefore in his sixty-fourth year—singularly enough, the same age as his old colleague, "Sam Broome," who died in January, 1870. A gardener from his youth, and wonderfully fond of his calling, Mr. Dale was appointed gardener to the Hon. Society of the Middle Temple in 1843, previous to which he was, we believe, employed in a nursery famous in those days, and familiarly known as "Groom's of Walworth." From first to last, during the thirty-five years he had charge of the Temple Gardens, he gained and held the esteem and affection of a very wide circle of friends. Soon after entering upon his charge—a more onerous post then than from encroachments and other causes it has been of late years—town gardening became his hobby, and it was his discovery in the Temple Gardens of the adaptability of the Chrysanthemum for culture in towns that induced him to pay so much attention to the cultivation of that flower, and some years ago to publish a small book on the same subject. So far back as 1857, at a Special Parliament of the Bench of the Middle Temple "it was ordered that a testimonial be presented to the gardener, Joseph Dale, as a token of the great satisfaction which his very successful show of Chrysanthemums has given to the Bench;" and it was only in February last when he was presented with a handsome timepiece and a purse of fifty guineas "by friends who esteem his worth and appreciate his labours in the cultivation of the Chrysanthemum."

Mr. Dale always took a lively interest in the improvement, by planting with trees and shrubs, of the squares and churchyards of London, and many a handsome "Plane" bears witness to his labour of love. It was a custom of his at one time to freely distribute plants and cuttings to the charity children connected with the churches in the neighbourhood of the Temple, and in this way induced them to tend and ultimately to exhibit the plants at shows held in the parish school-rooms. For many years past he has acted as judge at most of the leading Chrysanthemum shows in the kingdom; and, full of enthusiasm for his profession and all belonging to it, and of a most kindly and sociable disposition, he was, take him all in all, a fine specimen of the old-fashioned English gardener, and one of the most worthy of men.

His funeral will take place in the churchyard of the old parish church of Leyton, to-day, at 12 o'clock.

Home Correspondence.

Liriodendron tulipifera.—It is strange that we see so few of this tree about conserved grounds in any place. Seeing that it is such a very hardy tree, and most ornamental with its peculiar cut leaves and fine scented Lily-like flowers, one would think that it would be found oftener than it is in mostly all such places. That it will assume large dimensions in this country is amply verified from what we have seen in places here and there, notably one at The Hirsel, Coldstream, the Earl of Home's seat. Here is a very remarkable specimen, some 20 feet or more in circumference and apparently quite 200 years old. It stands in the middle of the kitchen garden, and forms a very beautiful object in summer. It is not high—not more than 30 feet or so, but to all appearance it has been much higher. The wood is valuable, close grained, and highly prized for carved work. I am inclined to think that it is (where it is planted) placed in a too hemmed-in situation, surrounded by trees, and consequently gets too little sun. It should be planted always on a south aspect, and on a dry bottom. *Chevalier.*

The Maréchal Niel Rose on the Borders.—I had intended sooner to have offered what I think is the real explanation of the statement, which I have not the least doubt is quite true, of the Maréchal Niel Rose flowering at high elevations in the southern counties of Scotland. It is, what was said to me years ago, "There are two Maréchals Niel." I had been wondering at a Rose from one of the best of the great Rose nurseries, which grew enormously, and had flowers with the deep form and large smooth petal of the Maréchal—like moderate-sized coffee-cups in fact; but the colouring approached to that of Gloire de Dijon, and was no more than that, the bright pure yellow of dead or frosted gold, which is the colour the Maréchal is supposed to be. I have since seen a Rose standing the winter in a situation not very different from those described, which was called Maréchal Niel, and which I was at first inclined to think was simply Gloire de Dijon, but I observed that it had not the perpetual habit at all, and seemed only to flower in summer, giving a fair succession of flower then, and that it attained to the tree-like growth of the Maréchal. The probability seems to be that one strain of Maréchal Niel—in fact a sort of sport at some time or other—has developed something of the colouring of what Reynolds Hole calls its hardier congener, Gloire de Dijon, and apparently something of the hardiness along with it. The facts are not without interest for botanists, as they certainly are of some importance to gardeners. I regret that the fine plant I mentioned before had not been planted out on a fruit-wall. Not being the yellow Rose wanted, it was not planted in the conservatory, and eventually died in a pot. The Roses mentioned as flowering in Roxburghshire at a considerable height near the sea were no doubt yellower than Gloire de Dijon. The foliage of the Maréchal is very distinctive. *J. M., December* 30.

The Weather at Kelso has been very severe and below zero on two nights since the 10th ult., and it has always been below 20° every night since till Wednesday, Christmas Day. I understand this winter to be more severe than that of 1860-61 in this part. The snow I anticipate to have been a great protection to many things, and in fact to everything that has more or less come within its fall. Roses especially, with perhaps the exception of standards, will have had a secure protection with the snow. It is to be hoped the storm will make its exit with less suddenness than it did its entry, and from all appearance it will do so. *H. K.*

The Pitcher-Plants of Borneo.—I have been pleased by your not relying on the correctness of a report of some paper on a lecturette given by me. It is rather alarming to read in the papers what one is made to say. I gave some general remarks on Borneo and Kini-Bala, stating that my knowledge was derived chiefly from Spenser St. John's *Life in the Forests of the Far East*, vol. i. (1862). Then I spoke of the Nepenthes, showing specimens, and explained their habitats at various altitudes from 9000—10,000 feet as far down as N. Veitchii and Rafflesiana. That was all, and I did not expect to see anything about it in the *Gardeners' Chronicle. H. G. Rchb. f.*

The Prizes for Market Gardens.—I am informed by a member of the Council that the *Gardeners' Chronicle* has twice, in commenting on the small entry of market gardens and garden farms, blamed the Council of the Royal Agricultural Society for this result, on account of the entries having been closed so soon, and also for making the offer of prizes so little known. It may be, of course, a matter of opinion whether the entries were closed too soon; but as regards making the prizes known, I wish to inform you that, in addition to issuing extensive advertisements, I sent forms of entry by post to over six hundred market gardeners in the district for which the prizes were offered. *H. M. Jenkins, Secretary.*

Salvia splendens.—Mr. Ravenhill condemns the planting-out system of growing this plant, and comes to the conclusion that the plants grown here must be similar to his own in grossness of growth and paucity of bloom. To ensure success by the planting-out method, the plants should be propagated in the latter end of April or the beginning of May, and planted out about the middle of July in poor soil, in a sunny position; give the plants a good watering, to settle the soil about the roots, and no more through the season, unless they show signs of flagging. About the end of August a sharp spade should be run round the roots to prepare the plants for removal into pots, which should be done a fortnight or three weeks after the operation. After potting, stand them in a cool house, shading them should the weather be sunny, and dew them over with the syringe three or four times daily till established, watering when necessary with tepid water only. By practising the above method the plants will at lifting time be studded with flowering shoots that will only require a little extra warmth to bring them out perfectly. There is nothing new in planting this Salvia out in summer, but it is new to me to hear of it producing black foliage, as it appears to have done with Mr. Ravenhill. I have seen and grown this plant successfully by planting out, and also in pots, and have seen many grown by the latter method that did not yield much return for the labour spent on them, being both shabby in foliage and thinly bloomed. *J. Roberts, Gunnersbury Park Gardens.*

The Rogiera gratissima.—This fine old plant is worthy of the high encomium you pass on it at p. 759. Is has often surprised me it is not more generally grown. Doubtless one reason for this is that the umbelliferous-like cluster of bloom, more like a Laurustinus than any other well-known plant, soon tumbles to pieces when cut. This very much lessens its value for bouquet and vase work, but is no valid reason against its cultivation as specimen plants in tubs or pots, or planted out as is the fine specimen you describe. The Rogiera also flowers freely running up loosely against a pillar, or grown against a wall. It would be interesting, as well as useful, to know the temperature of the cool-house in which the Rogiera did so well at York, as the plant has generally been grown in the stove or intermediate-house rather than the conservatory. Cuttings root readily, and strong shoots show terminal flowers almost as soon as rooted. The fragrance is remarkably delicate and almost unique among flowers, as is also the soft pink colour. *D. T. Fish.*

A Reading-Room in the Gardens.—With the permission of my employer we have a reading-room in the gardens, which I must say is not only a pleasure, but a great benefit to all who are employed in the gardens. My idea is that where young men are employed in gardens, no such place ought to be without something approaching a reading-room, because, as I have said before, it is not only a pleasure to pass away the dull evenings of the long winter months in reading such valuable papers and periodicals as we have now offered to us at trifling cost, but it is also a great benefit to know something of the doings of the outer world; young men will go away from home to get such news as can be obtained, but often to their own detriment, not only of mind, but pocket. The cost of a reading-room, with the help of one's employer, is but trifling. Mine has arranged with me in this way: that all illustrated papers and periodicals that he subscribes to (which are numerous) are sent into the reading-room at the end of the week of their publication, and then we subscribe together for our own gardeners' periodicals and local daily paper, which costs twopence per week each person; by that arrangement we have all we desire to pass away a pleasant hour. Many large gardens that have no reading-room might have one in like manner. I know there are many gardens that have a valuable library and reading-room, but they are few and far between compared with the great number of large gardens we have in the United Kingdom. *H. S., Ringwood Garden.*

Winter Dressing of Peaches and Vines.—Is the winter dressing of Peaches and Vines with a mixture made to the consistency of paint beneficial or otherwise? The practice of first washing the main branches of Peaches and Vines with a solution of soft-soap or other powerful insecticide, and afterwards painting them with a mixture of cow-dung, sulphur, soot, clay, or other similar ingredients, is carried out by a great many gardeners of the present day, and most of them agree as to the necessity of the washing, inasmuch as if a strong solution be used, and well rubbed in with a stiff brush, it cannot fail to penetrate any crevices which may exist in the bark, thereby destroying red-spider, scale, or any other insect life which may exist therein; and what is more, it will cleanse the bark of any dust or dirt which may have been deposited since the time the syringing was discontinued, and which must have a beneficial effect, inasmuch as the bark, like the epidermis or skin of animals, is furnished with cortical pores or breathing organs, the uninterrupted action of which must have a beneficial effect upon the health of the plant. But this after painting I cannot understand. Surely it is not done because it is likely to prove more destructive to animal life. This cannot be, inasmuch as it will not penetrate so readily the small crevices which may exist in the bark, but on the other hand it is more likely to partially cover over the entrance of these crevices, thereby forming capital breeding places for red-spider during the ensuing spring; and what is worse, this paint must have a tendency to stop the cortical pores, and thereby to a certain extent impair the health of the plant. Rather than paint, I would recommend a second washing as being the more likely way to effectually destroy insect life. I think indoor fruit trees with clean healthy shining bark are a credit to any gardener; but this painting, if not an absurdity, is most certainly very unsightly. Perhaps some of our pomological friends will kindly give their opinion upon this subject. *J. Hughes, Chadwick, Temple Balsall, Birmingham.*

Extraordinary Flowering of a European Orchid.—We have now in the greenhouse a Spiranthes autumnalis just beginning to flower. It has flowered several times with us at the normal times. This plant was imported from Southern Europe last winter. *H. G. Rchb. f., Hamburgh.*

The Culford Vine Sport.—Those who have seen, handled, and tasted this sport may be well content to rest the fact of its reality on your able leader of last year, especially as you took the trouble to test it on the spot instead of doubting it from a distance, and I should not further trouble you on this subject but for the following two sentences in Mr. Thomson's letter: "Trebbiano has this much in common with Golden Champion, that if it is subject to an irrational mode of treatment its skin gives way, and it gets spotted and rots. This may have been the experience *some of the advocates of the sport had of Golden Champion, and they concluded rather hastily that as the bunch on the Trebbiano rotted also it must be Golden Champion.*" I have ventured to put these words in italics, and would crave your permission to add that Mr. Thomson ought to be the last man to indulge in a style of criticism so unfair and unjust as to be unusual in the pages of the *Gardeners' Chronicle*. There is the less excuse for this in full view of the unfortunate history and career of the Golden Champion Grape. It has caused sufficient trouble and annoyance to gardeners already without their being indirectly told, as in these sentences, that if it spots or rots these mishaps follow from irrational treatment. Then the Trebbiano does both at times under the most skilful treatment, but it has this advantage at least over the Golden Champion — that it spots after it is ripe; whereas the Golden Champion rots either before or abreast of maturity. Besides, the Trebbiano more frequently merely discolours than either spots or rots, and the writer has seen the examples of splendid bunches in this state in different gardens within a few weeks, where the treatment had been anything but irrational, and the Grapes were still fit for table. And thus any one reading the above extract would be led to the conclusion that the Culford sport had but one bunch—that that bunch rotted or spotted like the Golden Champion, and that, therefore—that is, on the spotting or rotting alone—the advocates of the sport rather hastily concluded that the sport was Golden Champion. Now no one knows better than Mr. Thomson how completely at variance such a statement and inference are with the facts of the case as recorded in the *Gardeners' Chronicle:* and as one of those concerned, not in advocating the sport as Mr. Thomson puts it—for there would be no motive nor room for anything like advocacy in such a case—but in recording and carefully testing an interesting natural phenomenon, I enter an earnest protest against such statements as advanced by Mr. Thomson. No little or unknown man would be permitted to make them in your paper, and neither should he whom most of us have long looked up to and loved as one of the leading gardeners in Scotland. The word "advocate" is twice used in the last paragraph, and if such terms are allowed in regard to the honest testimony of what competent witnesses saw and felt assured of at Culford, there cannot be a doubt that many cases of unusual development of growth will remain unrecorded, to the serious loss alike of horticultural science and practice. However painful, it seems almost necessary to add, that the knowledge of Grapes is really not wholly confined to the north of the Tweed, and that among the Culford witnesses to the fact that the sport of the Trebbiano Grape was indistinguishable in size, colour, flavour, form, and general character, from the Golden Champion, were men who know Grapes as well as Mr. Thomson, though they may perhaps neither grow them so well nor in such large quantities. As to the point that eyes from a shoot from the spur that bore the bunch of the Golden Champion the previous year, now show Grapes which are amazingly like, if not identical with Trebbiano—I have seen and tasted them. I agree with you that this is just what might have been expected, though the same spur, or at least one very near to it, if not the same, produced last year Golden Champion again; and such "facts are chiels that winna ding," and cannot be successfully disputed by such criticisms as those that have been brought against the chronicler of the facts anent the Culford sport. *D. T. Fish.*

The Best Season for Planting.—In the several articles I have already written on transplanting evergreens I thought I had given abundant reasons and stated sufficient facts to bear me out that spring is much the best time for the work. The old saying your correspondent, Mr. A. O. Walker, again quotes, of—"Plant a tree in the autumn and command it to grow, plant in the spring and entreat it to live," applies very well to deciduous subjects, but with evergreens the case is different, and the adage might well be reversed, as will be proved but too conclusively should we get a much longer continuance of the present weather, which will not only try those removed in the autumn, but will severely tax the enduring powers of old-established plants as well. I remember the sad havoc the winter of 1860-61 made among shrubs, and my experience always has been that those whose vitality is at the lowest ebb through being checked in removal are the first to succumb to the inclemency of the weather. I have during the last twenty years planted largely at both seasons, and have always met with by far the greatest success in the spring, especially among a certain class of evergreens, such as Hollies, Arbutus, Berberis, and Conifers, but all these should be taken just before growth commences, when, if handled carefully, they start away almost as if nothing had happened. In all vegetable life the greatest root-action takes place with the advent of young leaves, and plants bear removal best when they have few old ones to support, which is the case with evergreens in spring, as then they cast a considerable portion of their foliage to make room for the new. April, then, to them is something like autumn to deciduous trees, and points to that season as the proper one for transplanting. Few have any idea of the great evaporation there is going on from every pore of the leaves of evergreens during a dry day in the autumn, and with most of the feeders severed or disturbed that supply them it is simply impossible that the rapid drain can be kept up, and the plants in consequence go on from bad to worse till winter with its scathing winds is upon them and finishes them up. Your correspondent gives the rainfall for September and October, and shows that it is greater than that in April and May, and therefore tries to prove that it is against me and in favour of spring transplanting, but he apparently forgets that in the first-named months the earth, when rain comes, is generally parched by the summer heat, and then takes a long time before it becomes thoroughly wetted, whereas in spring it is soaked by what we get during the winter. Again in the autumn the ground is fast losing its heat, while every day in April and after it is rapidly gaining more warmth, besides which the atmospherical conditions are then so much more favourable, as that month is proverbial for sunshine and showers. *J. S.*

THE LATE JOSEPH DALE.

Plant Shading.—There are few subjects of greater importance to all concerned in gardening operations than this, and I am very pleased to see it again brought before the public, and trust it may be thoroughly discussed. I have read Dr. Wallace's remarks on the Bamboo shading, which seems to answer so well. I have no doubt as to its durability, but suppose there would not be a breadth of light of uninterrupted volume—I mean there would be lines of light and shade, from the fact of the Bamboo being opaque, which would to some extent diminish the light during the day; still, I have no doubt for many purposes the thing will answer well, but I do not think the Colchester plan is at all to compare with the plan we adopt here, as fully explained in former articles in this paper. I believe all outside shading is wrong. Rollers and their accompaniments are a nuisance which can be done without, and I do not hesitate to say that they will never be made use of again by any professional man after trying inside shading for a season; no outside shading can compare with it, and I am more than ever satisfied that inside shading has a most salutary effect on the atmosphere of the houses by retaining or economising the heat and humidity—two factors of the highest importance in the problem of developing and sustaining plant life, and which can only be produced efficiently and fully by shading inside. Tiffany is the best material I have yet found for this purpose; it is cheap, easily fixed by any handy man, is self-acting and suitable, it admits sufficient light to make solid and firm growth, and any amount of air can be given. A sweet and pure atmosphere may be continually kept without draught or current. We have no scorch, no weak growth, hardly any insects, such as thrips or red-spider, and an abundance of flower. I am alluding principally to Orchids so far. I attribute this satisfactory result to the favourable conditions in which the plants are placed during their growing season. While this method of shading will prove a boon to gardeners it will also be acceptable to amateurs, who will have their houses and plants safe from scorching, &c. Let air be given, and the floors be damped down in the morning; there will be little more to do during the day. We have this year used the shading more extensively than ever, and have grown greenhouse plants, both hard and soft-wooded kinds, most satisfactorily. Even such kinds as Calceolarias, Balsams, Begonias, &c., developed admirably, and kept strong and stocky and flowered abundantly. These are the results of our experience, without exaggeration. I trust this method will be thoroughly tested during the coming season. I have no fear of the results. *William Payne, The Gardens, Belmont, Taunton.*

The Oak at Boscobel.—I read the article by "H. E." on the above subject in your issue of December 14, which appears somewhat inconsistent, inasmuch as the combined evidence with which he begins certainly favours the idea of the original tree having disappeared; and yet the opinion, grounded on mere family tradition, which he afterwards produces, that the present tree is the identical Royal Oak, is made to override all. It certainly, however, is a very mysterious subject, and one which will most likely continue a matter of controversy for generations yet to come. I will not, therefore, attempt to offer an opinion of my own on this disputed point, but what I am writing for is to answer a question proposed by "H. E.," as to "what evidence there exists of the usual size of Oaks of 200 years old." To this, as no else has replied, I think I can give an answer which will be much to the point. There is now existing an Oak at the parsonage of Burton Overy in Leicestershire, which is known to have been raised from an acorn of the Royal Oak, in the year 1660, and under the following circumstances: During the inter-regnum, the then rector, the Rev. Theophilus Biddulph, being a staunch loyalist, was ejected, and one Thompson intruded; but at the Restoration in 1660 Biddulph was reinstated (as recorded in the parish register). In gratitude for this, and from feelings of loyalty, he then sowed an acorn of the Royal Oak, from which the tree in question was raised, and of which I had the following description

The Garden, 1879

OBITUARY.

JOSEPH DALE, for many years gardener at the Middle Temple, died suddenly on the 31st ult., aged 65. Mr. Dale, like the late Mr. Samnel Pro ›me, was a most successful grower of Chrysanthemums, and was the author of a little book on their culture.

DALE Henry.

Personal Estate under £1,000.

9 October. The Will of Henry Dale late of Preston near North Shields and of North Shields both in the County of **Northumberland** Gentleman who died 30 June 1879 at Preston was proved at **Newcastle-upon-Tyne** by Eleanor Dale of Preston Widow the Relict the sole Executrix.

DALE James.

Personal Estate under £100.

23 September. The Will of James Dale late of St. Agnes in the County of **Cornwall** Stamp's Grate Maker who died 7 March 1879 at St. Agnes was proved at **Bodmin** by Jane Dale of St. Agnes Widow the Relict the sole Executrix.

DALE John.

Personal Estate under £50.

11 August. Administration of the Personal Estate of John Dale late of St. Stephen's near St. Austell in the County of **Cornwall** Mine Agent who died 10 March 1863 at the City of London was granted at **Bodmin** to Mary Dale of Breage in the said County Widow the Relict.

DALE Joseph.

Personal Estate under £100.

22 January. The Will of Joseph Dale formerly of the Middle Temple in the City of London but late of Pompon Villa Vicarage-road Leyton in the County of **Essex** Gardener to the Honourable Society of the Middle Temple who died 31 December 1878 at the Leyton Station of the Great Eastern Railway was proved at the **Principal Registry** by Maria Dale of Pompon Villa Widow the Relict the sole Executrix.

DALE Martha.

Personal Estate under £200.

23 July. Administration of the Personal Estate of Martha Dale late of Nantwich in the County of **Chester** Widow who died 22 May 1879 at Nantwich was granted at **Chester** to William Dale of Nantwich Tailor and Draper the Son and one of the Next of Kin.

DALE Mary.

Personal Estate under £600.

24 November. The Will of Mary Dale late of 236 Wandsworth-road in the County of **Surrey** Widow who died 7 February 1879 at 236 Wandsworth-road was proved at the **Principal Registry** by Thomas Cranch of 1 and 3 Lansdowne-road Stockwell in the said County Butcher the Brother one of the Executors.

DALE Thomas.

Personal Estate under £100.

5 December. The Will of Thomas Dale late of the Brighton-road Redhill in the Borough of Reigate in the County of **Surrey** Dustman who died 21 July 1879 at the Brighton-road was proved at the **Principal Registry** by Lavinia Ann Dale of the Brighton-road Widow the Relict one of the Executors.

DALE William.

Personal Estate under £100.

23 January. The Will of William Dale late of 4 Precentors-court in the City of **York** Labourer who died 29 September 1877 at 4 Precentors-court was proved at **York** by Ann Dale of 4 Precentors-court Widow the Relict the sole Executrix.

DALE William.

Personal Estate under £200.

27 August. The Will of William Dale late of Slater's-court in the City of **York** Tobacconist who died 27 July 1879 at Slater's-court was proved at **York** by Jane Dale of Slater's-court Widow the Relict and the Reverend George Henry Hewison of York Clerk the Executors.

as they shelter behind the leaves, not infrequently in cosy little nooks, caused, as in the Red Currant, by their depredations. I see that one authority recommends sprinkling the foliage with red pepper. Though an aphis is not capable of sneezing, I daresay it might like red pepper even less than tobacco. I wonder whether anybody has ever tried burning pepper.

MR. DANCY, AND THE FRUIT PERGOLA AT HOLBROOK.

I don't suppose the fumes would injure plants, and judging by their effects on human beings they ought to offer a strong inducement to insects to quit. The Rose Tortrix is another insect which starts work early—as soon as there are any leaves on the plants to attack. It sews them together, and hides inside, eating as much of them as it may require, and unless it is destroyed, turns its attention to the young buds and completely spoils them.

Seed Germination.

April 2nd.—It is a pity that seedsmen do not give in their catalogues some indication of the germinating powers of the seeds whch they offer. A word or two in each case would be quite sufficient, and would often save much trouble. For instance, it is not uncommon to sow half-a-dozen or more different kinds of seed in the same box. Too late the fact may be discovered that, while some germinate in a few days, others are very slow to do so, and as seeds and seedlings require very different treatment, one or other runs the risk of being spoilt. Even if that difficulty is overcome, there still remains the fact that the whole box must be kept and watered until the latest comers appear. This might be obviated by a brief intimation in the catalogue of the average time required for germination. The following note on the subject occurs in a book issued by Messrs. Sutton: "Portulaca is almost explosive in its energy, less than two hours being necessary to render the germs visible. All the Brassicas, and other seeds such as Peas, Beans, Asters, Stocks, and Sweet Peas, can be successfully germinated in from two to four days. Beet, Celery, Dianthus, Marigold, Seakale, Sweet William and Wallflower need a longer period. Parsley is proverbially slow under natural conditions, and can seldom be started artificially in less than twenty days." What is wanted is this information for all plants of which seed is offered, and it should be under their respective headings.

April 3rd.—Although the ordinary greenhouse Primulas are very beautiful, their compact habit of growth often renders it difficult to arrange them effectively. In this respect the newer Star Primulas have a distinct advantage. Their taller branching habit shows off the flowers admirably, and as pot plants, whether in the conservatory or in a room, they are charming. They are easily raised from seed, and if a good strain is obtained, they can be relied on to come true to name when any special colour is wanted.

H. C. DAVIDSON.

The Gardens at Holbrook Park, Horsham, Sussex.

INTERVIEW WITH MR. THOMAS DANCY.

ALTHOUGH the number of beautiful gardens in the vicinity of Horsham is exceptionally large, Holbrook, the seat of Mr. H. Alan Scott, holds its own, and possesses several special features of interest. Visiting the gardens at the end of January, by the courtesy of the owner, I was struck by the tranquillity of the scene. Holbrook Park is not more than three miles distant from the busy Sussex centre, but it is in the heart of delightful country, under the shadow of a pleasant range of hills. The gardens are not large—about ten acres, but they are so arranged that they give the appearance of greater extent, and the surrounding park, of nearly a hundred acres, with its magnificent Oaks and Beeches, seems almost an extension of the pleasure grounds. The mansion is a fine stone building, erected some twenty years ago, on the site of the original house, which dated back several centuries. On the north side there are plenty of flourishing creepers—Ivies and Vitis in variety, Clematis montana, Bignonia radicans, Romneya Coulteri, and Aristolochia sipho.

HOLBROOK, SUSSEX.

"As to the bedding on this side," said Mr. Dancy, the head gardener, whose interest in the details of his work at once impressed me, "Wallflowers (golden and dark red), with an edging of Erysimum and Muscari Heavenly Blue, are used for spring. The marble sundial in the centre of these beds came from Italy a few years ago."

"And the summer bedding?"

"The great feature is the display of Begonias Benjamin Farrant, of which we use about a thousand. They do splendidly, but the soil is made for them."

The Cultivation of Bedding Begonias.

"What is your system of cultivation?"

"We start them in a cold frame, on a bed of ashes, with a layering of half-decayed leaves where the Violets have been growing. The dry bulbs are placed on the leaves, and just covered over with leaf-soil. When the time for bedding-out arrives, the first week in June, we take them off the ashes, and plant them out. Most of them are then in flower, and continue in bloom until the frost cuts them down. Then, probably

in November, we take them up with a little soil, and put them into the early Peach house until they are ready for packing in boxes. Here they are kept as dry as possible until we start them in April. The cultivation is quite easy. Begonias do not like heat, and they need plenty of moisture in the soil. For edging the scarlet Begonias, we use Alyssum Little Gem."

"Then you have other varieties than Farrant?"

"Yes, the two corner beds are filled with seedlings, crimson and white, edged with blue Lobelias; and the beds on the south side consist of yellow Begonias, edged with Geraniums Dandy. This last bed, and the corner ones, contain specimen plants of Brugmansia Knightii (from four to five feet high), and the large bed is dotted with standard Fuchsias—Rose of Castile."

Sub-tropical Combinations.

"How do you fill the two big beds to the left of the principal lawn in front of the mansion?"

"The centre of the beds is occupied by sub-tropical plants, including Eucalyptus, Humea elegans, Abutilons, Thompsonii and Savitzii, Ricinus in variety, Eulalias variegata, gracillima, and zebrina, and Acacias lophantha and dealbata. With these are introduced clumps of Montbretias, Gladiolus in variety, and about a dozen clumps of Commelina tuberosa (Spiderwort), with clumps of distinct varieties of Antirrhinums, Verbenas, Geraniums, and Nemesias (tall and dwarf)."

"Are the beds at the bottom of the croquet lawn, and on the west side, chiefly sub-tropical?"

"Yes, with the difference that they include Nicotianas affinis and sylvestris, also Brugmansia Knightii. Behind the beds are belts of shrubs, chiefly Rhododendrons—ponticum, and hybrids which were planted many years ago."

"Is there peat in the soil?"

"No, but there is plenty of iron in it, and Rhododendrons appreciate iron. The soil is strong loam at the top, and clay at the bottom."

"What is the building with a clock on the face, and Ivy growing up to the clock?"

"The stables. On that side of the mansion, in addition to Ivies, there are Ampelopsis Veitchii, Pomegranates, Clematis Duchess of Albany, and yellow Banksian Roses. Facing the house, here, are shrubs, notably Rhododendrons, and a clump of Bamboo metake only planted five years ago."

Strolling as far as the sunk fence, which separates the park from the gardens, and is filled up with Roses Dorothy Perkins, I was able to form an excellent idea of the brilliant appearance of the scarlet Begonias, as seen from this point. Between the lake and the sunk fence is a rough garden, with white and yellow Broom, Berberis Thunbergii, and hardy Heaths. Over the lake is a rustic bridge, with Virginian Creeper running over it. Returning to the lawns, and passing a bed devoted to single Dahlias in variety, we proceeded along the terrace walk. Here on each side are four specimens of Cupressus Lawsoniana, planted about eight years ago, while beyond are two old-fashioned vases, filled in summer with Geraniums Madame Crousse, and a fine bed of Azalea mollis. Ascending the terrace steps, I noticed in front of the balconies four beds of mixed Ericas, interspersed with China Roses, and then we inspected the "panel" of Roses, otherwise a sunk Rose garden, formed in the angle of the mansion.

An Ornamental Bridge at Holbrook.

Delphiniums and Roses at Holbrook.

"The variety used here," said Mr. Dancy, "east and west of the vases in the centre (which, like the others, are filled in summer with Madame Crousse Geraniums), is Caroline Testout; while north and south are Fellenburg and Frau Karl Druschki. The corner beds are mixed, the varieties being Madame Hoste, Maman Cochet (white and pink), and Antoine Rivoire."

"Have you any groundwork?"

"For groundwork we use Violas White Queen and Dove, edging the round beds with Saxifraga leptophylla, and others with Saxifraga umbrosa (London Pride). All round the terrace walks in summer we have tubs filled with Agapanthus umbellata, and Sweet Peas, chosen for colour, alternating."

Sweet Peas in Tubs.

"How do you treat the Sweet Peas in the tubs?"

"We get a paraffin tub cut in two, clean out thoroughly by burning, make about six holes in the bottom for drainage, and fill with good loam and well-rotted manure, and a little fowl manure, rammed in tightly. The seed is sown singly in pots, inside, during February or early in March; the plants are afterwards hardened off carefully, and then we place five in each tub. These tubs are left out in the kitchen garden until the plants come into flower, when we remove them to the terrace, where they make a fine show. We give them manure-water constantly, with good results."

"What are the principal varieties?"

"Frank Dolby, Etta Dyke, A. J. Cook, Miss Drayson, The Marquis, Helen Lewis, Mrs. H. Sykes, Constance Oliver, Malcolm, Prince of Asturias, Paradise, and Sutton's Scarlet."

Arums in the Lake.

"And the pergola on the right of the Rose panel?"

"The Roses on the pergola, which was built seven years ago, are Electra, Crimson Rambler, Queen Alexandra, and Leuchstern, with a few

Vitis to give colour in the autumn. The bedding underneath is chiefly Acanthus mollis latifolius, with clumps of Funkias. The Rhododendron ponticum at the end of the pergola is about forty yards round, an amazing specimen. The boughs have laid in, and struck root. There are more Rhododendrons on the left, and a large bed of Azalea mollis."

"Also the Lily pond?"

"In the Lily pond are a quantity of white Lilies and Nymphæa rosea, and in more water close by are clumps of Arums. We select two big plants, and bind them together with ordinary wire netting, with good soil, and throw them into the pond. Sometimes they have to be removed, but they yield quantities of flower. Last year there were eleven blooms on one clump. They last several years, and are not killed by ice covering them. Round the edge of the water are Gunnera glabra, and clumps of Japanese Iris, Spiræa aruncus, and Bamboos. At the far end we plant Bamboos for shelter, manuring them occasionally. Behind the Bamboos, and beyond the rustic bridge over the water, is a big bed of Montbretias, which flourish exceedingly. Now we come to the Rose garden proper, which contains about twenty varieties of the best kinds. In the centre you see there is a little Rose bower, with Crimson Rambler and Aimee Vibert (red and white)."

"Then, there is the fountain?"

"With rockwork round it and Rose beds in the centre. There are twelve beds round the fountain, every other bed containing Gruss an Teplitz, which alternates with Madame Abel Carriere. On the left of the summer-house is the herbaceous border, about fifty yards long, containing chiefly Asters, Phlox, Eremurus, and Acanthus, backed by Crimson Ramblers, which give a blaze of colour on the fence in the season."

An Apple Pergola.

"You have also, leading out of the Rose garden, a fruit pergola?"

"Yes, it was planted seven years ago, is about eighty yards long, consists chiefly of Apples, and runs through an old orchard, with a bulb garden on the right."

"What are the varieties of Apples?"

"Chiefly Cox's Orange Pippin, Mere de Menage, Stirling Castle, Golden Spire, Emperor Alexander, Gascoigne's Scarlet, Keswick Codlin, Egremont Russet, New Hawthornden, Warner's King—in all, about twenty varieties. Some of the old Apples in the orchard, which were planted probably sixty or seventy years ago, are Ribston Pippin, Bess Pool (a splendid keeper), and The Denne Pearmain (a fine dessert Apple with a Ribston flavour, which keeps good up till March). In addition to the twenty varieties of Narcissus in the grass under the old trees, we use a number of the best varieties of Cannas."

A Blue and Pink Walk.

"In the Rose garden itself, I notice you are making a number of fresh beds, with wide grass walks round them."

"Yes, and in the centre there are Penzance Briers, and eight poles of Dorothy Perkins. Round the Briers are a number of choice varieties, including Bessie Brown, Mrs. E. Mawley, Mrs. John Laing, Reynolds Hole, The Bride, Killarney, La France, and Mrs. Sharman Crawford. We use a good many more Roses outside the Rose garden. Thus, between the Yew hedge and garden walk, where we now are, is a wide border planted with Delphiniums and Roses. We call it the Delphinium border."

"Blue, then, is the predominating colour?"

"Blue and pink, the Roses being all pink varieties. The Delphiniums are seedlings raised here, and grow to a height of eight feet. We grow others to cut, but these remain for ornament, and during the season are quite a picture."

"Do you grow many varieties in the herbaceous borders on each side of the Yew hedge?"

"Yes, a considerable number. One of the features of these borders is the quantity of Incarvillea Delavayi, whose deep rose flowers and beautiful leaves are very attractive. It may interest you to know the treatment. The seed is sown in boxes as soon as it is ripe, and we prick the plants out in the boxes until the following spring. The plants are then put out in a little nursery bed, and transferred here as they are wanted. Incarvilleas like good rich soil, with a covering of leaf-mould in the winter. If they do not get this protection, the frost kills them. They flower in June and July, and are extremely useful for cutting. Before we go into the houses, I think you ought to see our New Zealand garden, which is quite a feature."

The New Zealand Garden.

Accordingly, we proceeded along a shady walk to this unique addition to ordinary pleasure grounds. The garden includes a large lake, and many clumps of trees are planted by the waterside. The New Zealand varieties came direct from that country in the spring of last year, and I asked Mr. Dancy to tell me the names of some of the most valuable.

"There is a shrub called Sophora tetraptera, which grows from six to ten feet high. It is deciduous, and requires a deep, sandy loam. For position, it should have a south wall and a very sheltered border, with protection in winter. The flowers are large, deep red in colour, exactly like a parrot's beak. We have kept some of these in pots, in case those planted out should die. Then there is Blagianthus betulinus, a fine, vigorous tree, like Birch in character, but more graceful Leptospermum Chapmanii is a strong, pretty, dwarf-growing bush, with rosy-pink flowers, requiring protection in winter. Muehlenbeckia alpina is the New Zealand Ivy, which grows best in a sunny rockery, in sandy loam or peat. It also requires protection in winter. A valuable hardy, evergreen, ornamental-foliaged shrub, growing from three to ten feet high, is Griselinia. This shrub has egg-shaped leaves, dark green in colour. It needs rich loam, and a sheltered position, in a shady bower. Then there is the Celery-leaf Pine, which is best grown in a large pot or tub."

"What is its botanical name?"

"Phyllocladus trichomanoides. It is not hardy here, and therefore requires to be taken indoors during winter. The same applies to Pseudopanax Ferox (or Lance Wood). Both require loam, peat, and sand. We have altogether about thirty kinds of New Zealand plants, shrubs, and trees, but I cannot say much about the others until I have grown them for another year."

How to Fertilise.

In the fruit houses we started with the Peaches, flowers being conspicuous in the early division.

"Do you get a long run of Peaches?" I enquired.

"We begin to pick on May 20th, and keep on until the end of October. Two years ago I picked for a week later, finishing up with Sea Eagle outside. You may like to know that I fertilise with a rabbit's tail on a stick, just lightly brushing it over the trees. I use it afterwards for early Muscat Grapes."

"When were the trees planted in your early Vinery?"

"The Muscats fifty years ago. Last year I cut from this tree thirty-one bunches, averaging two to two and a half pounds each. The Black Hamburgh is also about fifty-six years old, and still gives fine crops. I lifted them from outside four or five years ago, and they have improved since. In the late Vinery the varieties include Golden Queen, a splendid doer and a fine cropper. In this Vinery are the Chrysanthemums in their first pots."

"How many do you grow?"

"Between four and five hundred, in fifty varieties. For exhibition purposes, I recommend, of yellows, Algernon Davis, F. S. Vallis, Mrs. W. Knox, and Duchess of Sutherland. The best whites are Mrs. A. T. Miller and Mrs. Norman Davis."

The Treatment of Lachenalias.

"You have a fine large flowering house?"

"We call it the 'Conservatory.' As to its present contents, you see that there are Lachenalias Nelsonii in flower. Our treatment is to bake the bulbs in the sun before they are potted up. For soil we use leaf-mould, loam, bonemeal, and sand, with a dusting of clay. It is a vital point to dry them off gradually, so that the bulbs may be ripened. Arums are also in flower."

"Yes, and I should like to know the size of the flowers."

They are eight inches across the span. We put one bulb in one pot, obtaining one flower at a time, and getting four or five flowers off one plant. I always stand Arums out, when

THE GARDENER'S COTTAGE AT HOLBROOK.

they have done flowering, under a north wall. The first week in September I dig round with a grafter. A fortnight later I take up and pot the plants in 'twelves,' with three parts loam, one part decayed horse manure, a good dusting of soot, bonemeal, and a little artificial manure. When they have been potted firmly, and placed under the north wall, I syringe twice a day until the frost comes. Then I cover them in a cold frame until there is room for them in a house—about November."

"Is there any special feature in the Palm house?"

"There are one or two fine specimens of Phœnix, Kentias, and Lantanas; and baskets of Asparagus Sprengeri, plumosus, p. nanus, and deflexus variegatus. On the roof are Bougainvillea glabra, Clerodendron Balfouri, and Allamanda Hendersonii. The house also contains Crotons and Dracænas in variety."

"You go in for Tree Carnations, too?"

"Yes, this season we cut nearly three hundred flowers out of a house with a hundred and fifty young plants. The varieties include Enchantress, Britannia, Flamingo, Mrs. T. W. Lawson, Scarlet Prince, Royalty, Lady Bountiful, Flora Hill, and Mrs. Brooks. But now I think we must finish up with the kitchen garden."

Arches of Scarlet Runners.

"Do you grow many flowers in it?"

"Pentstemons are rather a feature. They like good, rich soil. Then we have two rows of Cactus Dahlias, growing about a hundred plants, while right round the kitchen garden we have arches of Scarlet Runner Beans about ten feet high, one plant on each side of the path. The arches were made for ornamentation, but each plant averages a yield of from twenty to thirty pounds during the season. This means that forty pounds of Beans are picked off each archway. We generally dig in holes in the winter for the Beans, having previously, at the end of April, planted them in pots. This secures them from exposure to frost. The Loganberry is also grown, partly for ornament and partly because it is useful. The trees made growths of twenty feet in one season, and we had fruit from the tip to the toe."

"What about other fruit?"

"Both Red Currants and Gooseberries are grown on wire trellis They do not take up half as much room as on bushes, and are much easier to pick. There are Peaches on the south, west, and east walls. The Pears on the walls include a very old variety known as Althorp Crassane, a very good stewing variety. We also grow about a hundred Pears on cordons. Amongst the varieties which do well on this clay soil are Williams's Bon Chretien, Clapp's Favourite, Doyenne Boussoch, Doyenne du Comice, Durondeau, Beurre Diel, Beurre Sterckman, Beurre Superfin, Louise Bonne of Jersey, Winter Nelis, and Pitmaston Duchess."

Celery and Peas.

"Do you go in largely for Celery?"

"We grow about a thousand heads, and have exhibited Celery four feet long, two feet clear being bleached. As to ordinary Celery, we dig out trenches six feet apart, and leave them open till spring, when the manure is dug in. We always grow Peas between the Celery, and when the Peas come off, we can earth the Celery. The next year the Peas take the place of the Celery, and after two years we shift them elsewhere."

"Which do you consider the best early Pea?"

"The best early varieties include May Queen, Little Marvel, Duke of Albany, and Early Giant. We grow Gladstone and Autocrat for the main crop. About ten quarts are sown, and we begin picking in June, going on till November."

"Your Broad Beans are coming on well."

"Yes; the variety is Norfolk Giant. They are sheltered by a high wall, and grown on a south aspect. The spring Cabbages, as you can tell, have not been injured by the frost. I find that Flower of Spring cannot be beaten. Instead of adopting the old-fashioned method of two feet apart, I grow Cabbages eighteen inches apart—an economy of space."

"I believe you show a good deal, Mr. Dancy?"

"I have taken over two hundred prizes since I came here. Last year I won twenty-eight firsts, most of them for fruit, flowers, and vegetables."

"When did you come here?"

"Ten years ago last September. I have been head gardener twenty years. I began showing in 1893, and took a number of prizes for Chrysanthemums, winning, in 1896, the challenge cup with a keen competition of thirteen, some of the competitors growing a thousand plants. In the same year I won two first-class certificates, and the N.C.S. Jubilee medal. Since then I have exhibited a good deal, and put up four times for the cup, taking first, second, third, and fourth. During the last six years I have won—at Horsham—four cups, three for fruit and flowers for a table, and one for Chrysanthemums; also four gold medals, one silver gilt, one silver, and one bronze, for vegetables."

Alfred Wilcox.

Letters from a Lady Gardener.

No. 349.—FLOWERS FOR SUMMER AND AUTUMN.

Dear Kate,—Last week we counted up some of our hardy flowers in the winter and in the early spring garden, but we cannot do that for the summer quarter of the year, within the limits of a paper. For, with the returning warmth, most of our flowers open their blossoms—annuals, biennials, and perennials, each and all in gorgeous profusion. Roses, Carnations, Irises, blue Delphiniums, Lilies, and Violas, are a few of the principal herbaceous groups in summer, but the great bouquets of the flowering shrubs—Rhododendrons, Lilacs, Hawthorns in pink and in white—and the flowering trees, the orchards, and the hedgerows, all contribute their quota to the pageant of early summer. Later on, we have the semi-tropical bedding-out plants (Geraniums, Heliotrope, Lobelia, etc.), to reinforce the brightness of the garden, with many fine, half-hardy bulbous plants, of which the Gladioli (which should be planted at once, if the late wintry weather has deferred the work) are amongst the grandest, especially where the rich tints of the Kelwayi group are selected.

Rose, Madame Falcot.

Our forebears of several centuries since had but a comparatively small range of choice in flowers, until the magnificent shrubs, climbers, Lilies, Pæonies, Chrysanthemums, and Irises of Japan became available through the power of steam; but the fashionable craze for semi-tropical bedding-out plants ousted many grand old herbaceous flowers throughout the first half of the nineteenth century. Now we employ both hardy and half-hardy flowers, in endless variety, to fill our borders.

Plant These Now.

There are several groups of these last plants which should be put in during the next month, before the more delicate semi-tropical flowers (Cannas, Heliotropes, Begonias, Pelargoniums, etc.) can be safely risked in the open air. Of these half-hardy plants may be mentioned Pentstemons (of the newer large-flowered varieties, which are amongst the loveliest of blossoms), blue Salvia patens (indispensable for its pure and rare tint), Dahlias (both dwarf and the taller Cactus varieties, now to be brought on in slight warmth for early flowering), early-flowering Chrysanthemums (in endless shades of rich colouring, both double and single), and Pyrethrums (crimson and pink Marguerites), with many another native of foreign lands which are on the border-line between the temperate and the tropical zones, and must, therefore, have special consideration.

At this season, too, we must make provision for our gardens in the autumn (for planting cannot be safely carried out after June arrives, except from pots), and forethought is needed if the mass of summer colouring is not to be followed by a want of brightness in the garden during the autumnal months. Dahlias, early Chrysanthemums, Michaelmas Daisies, and Salvias, both the red (Bruanti), and the blue (patens, aforesaid), will do much towards providing autumn flowers, but they may be reinforced by late-sown annuals (Salpiglossis, Asters, Zinnias, etc.) with great advantage. To secure plenty of these bright blossoms (which are half-hardy), without fire heat, is quite practicable, if you sow the seed in the border towards the end of April, and cover it with a sheet of glass (raised on stones three inches above it) until it has germinated, when the glass can be gradually raised, and the seedlings may be pricked out into rather shallow boxes of rich soil, from which they are placed in the borders in May or June, and will be found very useful to plant between the spring bulbs which will then be ripening their foliage, in a rather untidy way, needing the fresh growth of annuals to take their place.

Another valuable addition to our gardens during the last three months of the year may be found in encouraging the Roses to bloom at that time, and a plentiful supply of these favourite

ssential facts, and then put any questions as oncisely as possible.

March 21st.—Not very far away there is an venue of large Limes, three deep, and on lmost every tree there are masses of Mistletoe. was not previously aware that it grew on imes, but I find that Dr. Masters includes

Mr. R. Davidson.

them among its favourite trees, the others being the Apple, Poplar, Hawthorn, Maple and Mountain Ash. It is singular that, contrary to the popular idea, the Mistletoe seldom grows on the Oak. "Dr. Bull, in a paper in the 'Journal of Botany,' only mentions seven authentic instances of the growth of Mistletoe on the Oak in this country." So far as I know, in spite of the large demand for it at Christmas, it is not cultivated in England, probably because of its ness of growth.

H. C. Davidson.

(To be continued.)

FAMOUS GARDENERS AT HOME.

No. 78.—Mr. R. Davidson, at the Gardens, Culford Hall, Suffolk.

The great feature of interest at Culford Hall, from the horticultural standpoint, is the garden within the walls; and on the occasion of my visit the other day I first had an opportunity of inspecting this portion of the pleasure grounds surrounding the well-known seat of Lord Cadogan in Suffolk. I also was able to stroll through a portion of the noble park, some two hundred and fifty acres in extent, ornamented by a lake (spanned by an artistic new bridge), which winds beautifully from east to west, and is nearly a mile in length. The park contains several stately Oak trees, one of which is over three hundred years old, and also many fine specimens of Beech, Chestnut, Thorn, and Limes.

Mr. Davidson, the head gardener, who has been at Culford about eight years, was previously foreman at Lambton Castle, Durham, for between three and four years, and prior to his appointment to his present post in East Anglia gained all his experience in the North of England and Scotland. The picturesque cottage in which he resides is in the centre of a long range of vineries, running east and west, and commands a full view of the flower garden. I say flower garden, but the eleven acres within the walls are a remarkable and unique combination of flower and kitchen gardens, with Yew and Hornbeam hedges on an imposing scale, while the arches that form the crosspaths through the hedges add to the dignity. The hedges at once attracted my attention, and I asked Mr. Davidson how long ago they were planted.

"The garden," he rejoined, "was planned by Mr. Peter Grieve, who was head gardener here to the late Mr. Benyon for over thirty years. Lord Cadogan, who purchased the estate about fourteen years ago, has not altered the arrangement."

"Can you tell me the length of the Yew hedges?"

"About one thousand eight hundred and thirty yards. The height is from five to nine feet, and they are about four feet wide."

"Their condition after so many years is wonderful."

"Yes, that is the general opinion. Of course, they have to be carefully trimmed every year."

"When do you begin clipping?"

"The end of July. It takes nearly three months to do the Yew hedges properly. But they want no other attention, save that in the spring we sometimes go over them in order to see if any stray shoots are showing, in which case they are clipped out, the great object being to preserve the trim and straight appearance they now have."

"What is the length of your very beautiful Hornbeam hedge?"

"About two hundred and fifty yards. It is about eight feet high, and three feet six inches wide. There are also, as you see, some fences of common Privet. These are about one hundred and eighty yards in length, four feet high, and two feet wide."

"I notice that you have a Rose and Clematis garden?"

"Yes, that was recently made. Formerly, the space given to it was only partly planted with Roses and Clematis, the other part being summer bedding plants, including varieties of the East Lothian and Intermediate Stock."

"You have, I presume, a large number of Roses growing out of doors for several months?"

"Hybrid Teas flower from early in June until Christmas. In fact, I was able last Christmas to furnish the rooms of the Hall with Hybrid Tea and Noisette Roses all grown out of doors. This was partly due to the unusually favourable weather."

"Are there any special varieties that you care to name?"

"All the leading varieties are included in the collection, notably Caroline Testout, Belle Siebrecht, Viscountess Folkestone, La France, Grosherzog Ernst Ludwig (a German variety, but a very fine Rose), and Antoine Rivoire."

"And the Clematis?"

"The varieties include some of the new hybrids, such as Fairy Queen, Mrs. Hope, Duchess of Edinburgh, and Duchess of York."

"What about your spring bedding?"

"It includes the very best flowering bulbs, Tulips, Jonquils, Narcissus, Crocuses, and variegated Kale, which are very ornamental, and last well."

"I notice that you have a large quantity of Wallflowers?"

"About eight thousand in the borders and beds. The three principal varieties are Fairy Queen, Easter Queen, and Purple Queen. We have also the old-fashioned Blood Red, and the Golden Tom Thumb varieties. These five suffice to produce a fine blending of flowers. The old Blood Red Wallflower is in considerable request, it being quite the most sweet-scented of the Wallflowers."

"When do you sow the Wallflower seeds?"

"During the first week in June, in a north border, shaded by a high wall. Seedlings are pricked out about five inches apart, as soon as they are fit, into a portion of the kitchen garden, in a soil which is not by any means enriched with manure. Afterwards, a good deal of water is given to settle the soil about the roots of the plants. They receive little further attention, beyond keeping them free from weeds, until they are transplanted into their positions."

The Gardener's Cottage and Vineries at Culford Hall Gardens.

"As to other spring-flowering plants, numerous varieties of Violas and Pansies are grown from seed, and for this purpose they cannot be surpassed."

"At what period do you have a great show of spring flowers?"

"From the middle of April until the end of June, when they are pulled away in order to make room for summer flowers. The higher portion of the garden, within the squares of hedges, is generally devoted to Strawberry culture and Carnations; and sometimes to vegetables that do not grow above the level of the Yew hedges."

"With regard to fruit and vegetables, I conclude that they are produced entirely for consumption."

"Yes, everything is grown for consumption or decoration, either here or at Chelsea House. During the time Lord and Lady Cadogan were in Ireland we sent supplies of flowers and fruit and vegetables to Dublin."

"Do you grow anything exceptional in vegetables?"

"Asparagus is very largely grown, being a favourite vegetable. There are only two varieties, Conover's Colossal and Argenteuil. The Globe Artichoke is also a favourite."

"Your wall fruit is a considerable feature. Beginning with Pears, you might, please, tell me the order in which the varieties ripen?"

"Beurré Giffard, Jargonelle, Souvenir du Congress, Triomphe de Vienne, Williams' Bon Chrétien, Fondante d'Automne, Beurré d'Amanlis, Thompson's, Durandeau, Marie Louise, Pitmaston Duchess, Doyenne du Comice (the Pear *par excellence*), Beurré Diel, Winter Nelis, Zephirin Gregoire, Josephine de Malines, Olivier de Serres (one of the best—if not the best—of all winter Pears), Beurré Rance, Bergamotte Esperen, and President Barabe."

"Which variety of Plums do you start with?"

"Rivers' Early Prolific. Then we go on to Rivers' Czar, Oullin's Golden Gage, Denniston's Superb, Belgian Purple, Transparent Gagé, Kirke's Blue, Victoria, Jefferson, Greengage, Bryanston Gage, Pond's Seedling, Reine Claude de Bavay, and Coe's Golden Drop. Of Cherries, we grow Early Rivers, Belle d'Orleans, Frogmore Bigarreau, May Duke, Reine Hortense, Elton Heart, Royal Duke, Waterloo Heart, Bigarreau Napoleon, Late Duke, and Black Tartarian. Morello Cherries are also extensively grown."

"Your Apricot trees are a sheet of blossom?"

"Yes, I hope to have a good crop. The varieties are Early Nonpareil, Frogmore, Grosse Peche, Kaisha, Oullin's Early, and Moor Park."

"What are the principal dessert Apples?"

"I must limit the list of their names. Among the best are Juneating (American Red), Irish Peach, Devonshire Quarrenden, Lady Sudeley, James Grieve, Wealthy, St. Edmund's, Cox's Orange, Scarlet Nonpareil, Fearn's Pippin, and Allen's Everlasting. Among Apples for cooking purposes, some of the most noteworthy are Duchess of Oldenburgh, Lord Suffield, Cellini, Stirling Castle, Peasgood's Nonsuch, Blenheim Orange, Bismarck, Mere de Menage, King of Tomkins County, Beauty of Kent, Lane's Prince Albert, Bramley's Seedling, and Sandringham."

"Do you go in for many varieties of Gooseberries and Currants?"

"Both of these, and also of Raspberries; only the best and newest varieties are grown. The Logan Berry is also grown."

"We have not mentioned Strawberries?"

"About an acre of ground in the kitchen garden is allotted to Strawberries, and we have all the leading varieties. About five thousand plants are also grown in pots every year for early forcing. Filberts and Blackberries are grown extensively, and a few Peaches and Nectarines on the walls."

"What is the extent of the lawn round the front of the Hall?"

"About fourteen acres. It contains some fine specimens of Conifers and Cedars; also of Wellingtonia gigantea, Picea pinsapo, Cupressus Nutkænsis, and some very handsome examples of the Retinospora family. Among the decorative and ornamental varieties are two fine Tulip trees, varieties of Philadelphus, Syringa, Prunus Pissardi, and the Japanese variety of the Plane tree, flowering Cherries, Almonds, and Peaches, Magnolias and Catalpas, Deutzias, the Jew's Mallow, and a nice collection of the Bamboo family."

"Is there anything of special consequence in the lake?"

"No, but in the water basins, the garden close to the Palm house, and elsewhere, are a number of Water Lilies which do extremely well. The varieties are Alba (the common white), Alba rosea, Caroliniana, Flava, Laydekeri, Liliacea, L. purpurata, and L. rosea, M. liacea Albidii, M. chromatella, M. rosea, M. rubra, M. pygmæa melveda, and M. tuberosa."

"The numerous houses, I gather, are chiefly devoted to the cultivation of fruit?"

"Yes, especially Grapes, Peaches, and Nectarines. We wish to ensure a continuous supply throughout the year, and can always, at any rate, carry on from the second week in March until the middle of the following January."

"How many vineries are there?"

"Nine, the principal varieties grown being Muscat of Alexandria, Black Hamburgh, Madresfield Court, Black Alicante, and Gros Colman: the first two are preferred."

DOUBLE BEGONIA—MRS. RICHMOND.

"What are the principal varieties of Peaches?"

"The best of all early Peaches is the Amsden, which we pick in June. The other varieties are Waterloo, Early Alexander, Violette Hative, Condor, Hale's Early, Early Grosse Mignonne, Royal George, Stirling Castle, Dymond, Crimson Galande, Barrington, Lady Palmerston, and Belle de Doué. The two best in existence, I think, are Royal George and Stirling Castle. The Nectarines include Cardinal, Early Rivers, Lord Napier, Dryden, Elruge, Humboldt, Rivers' Orange (very free, and one of the best), Pine Apple, Spencer, Newton, Stanwick, and Victoria."

"You have also a large number of Figs in the houses?"

"They have always been a feature, and I have introduced one or two varieties. We grow St. John's (white), Marseilles, Violette Sepor, Brown Turkey, White Ischia, Bourjasotte Grise, Negro Largo, and Castle Kennedy."

"A few words about your treatment of Figs would be useful."

"They are early planted out, the depth of the house border being sixteen inches, and the width about twenty-four feet. The staple is composed of good, turfy loam, and about a quarter of the whole consists of charcoal. Other ingredients are crushed bones, bonemeal, dried cow manure, a little charred refuse, some mortar rubbish, and, most essential, lime. The early house is heated underneath the border of four rows by means of 4½-in. hot-water pipes, the border material being rested upon strong, specially-made iron gratings."

"Lastly, perhaps you would mention some of the flowers in the houses, in addition to the lovely Cœlogyne in flower?"

"The large batch of Calanthe just out of flower made also a fine show of Orchids. We go in extensively for Carnations (including the Malmaisons and the Tree varieties), winter-flowering Begonias, Cyclamens, Calceolarias, French Pelargoniums, and many other well-known flowers. Our batch of Nerines is particularly striking. The Nerine Fothergillii major is the best and largest collection I know of in any private establishment. There are about ninety pots, varying in size from eight to twelve inches, the pots, according to their size, containing from fifteen to sixty bulbs in a pot. A more charming plant, when it is in flower during the latter part of September, October, and November, cannot be imagined."

ALFRED WILCOX.

LETTERS FROM A LADY GARDENER.

34.—A COOL GREENHOUSE.

DEAR KATE,—So you have started a cool greenhouse. I don't quite understand whether you intend to get a small hot-water stove for it in the autumn? If not, you can still cultivate a quantity of flowers so long as you manage to keep the frost out, by means of covering the top with mats at night in severe weather, and putting a good lamp (well trimmed, to keep alight all night) on the floor in winter, as you say it is a small one. So few people understand that there are plenty of fine flowers hardy enough to grow in such a place, and they keep their greenhouses bare and wretched looking because they have not any hot-water pipes in it; or else they buy a lot of delicate plants, which are sure to look miserable in the winter, and will probably die then.

I will tell you, with pleasure, what plants to cultivate, on the plan of just keeping the frost out, and in another letter I can add the more delicate plants, if you prefer to have hot-water pipes. A great many bulbs can be grown to perfection in a cool greenhouse. For instance, Tulips, Hyacinths, Daffodils, and Scillas will do much better without fire-heat, although they will not bloom quite so early; then the deliciously-scented Freesias I wrote about on January 17th will now be in bloom in a cool greenhouse, and are much more easily managed without forcing.

The lovely starry flowers of the Ixia, the Sparaxis, and a host of pretty Irids from South Africa also prefer no heat, and only need the slight protection of glass in winter; even Amaryllis hippeastrum, with its great scarlet Lilies, can be grown in the same way, if kept fairly dry in winter. Then, for a handsome background to these bulbs, you can have early-flowering hybrid Rhododendrons, in pots or tubs, of the more dwarf varieties, such as R. Nobleanum coccineum, with brilliant scarlet flowers, opening in February; R. ocholeucum, in pale yellow, spotted with maroon; or R. Blanche superbe, in pure white, and others. Azalea mollis is perfectly hardy, and will do well without heat, so that these lovely things will keep your greenhouse gay in spring.

You can also have two or three Myrtles, for their foliage, as well as that of the Rhododendrons, is always decorative, and their flowers are lovely; some of the hardier Palms, too,

not until one has yielded to the temptation to buy plants that the defect shows itself. I bought a number of last year's novelties, and out of them all there is not one that holds its flowers erect. Unless this is altered, Cactus Dahlias, beautiful as they are, will certainly go out of favour, as many other plants have done before them.

June 7th.—The Cranesbill, or Wild Geranium, is now in the hedgerows, and those who are interested in the subject may study its remarkable method of dispersing its seeds. The seeds, each in its own capsule, are fitted into a little groove at the base of the beak-like appendage to the fruit (from which the plant gets its name, Crane's-bill), and each is connected with the extremity of this appendage by a tiny rod. These rods, as the drying process proceeds, are in a state of great tension, and at length they give way, throwing the seeds a considerable distance. The method, it will be seen, differs widely from the more common one by which the edges of the capsule come together and forcibly press the seeds out.

June 8th.—In every garden of any size a summer-house is almost an essential, and one constructed of rustic woodwork with a thatched roof is more in harmony with its surroundings than any other. It needs creepers, of course, and for a time may look rather bare, but when they grow it will become a charming retreat from the heat of the sun at midday. Earwigs? Oh, yes, you will find a few, no doubt, if you look for them, but in a garden where will you not? And, after all, they are not centipedes—the tropical kind, I mean. H. C. DAVIDSON.

The Gardens of Mr. J. Gurney Fowler, at Glebelands, South Woodford.

INTERVIEW WITH MR. J. DAVIS.

NATURALLY, one expects to find in the glasshouses of the chairman of the Orchid Committee of the Royal Horticultural Society, Mr. Gurney Fowler, a splendid collection of Orchids. But, while this expectation was not disappointed on the occasion of my visit to Glebelands a short time ago, I was hardly prepared for the numerous other features of interest inside the walls (which enclose eight acres) at South Woodford, one of the most representative gardens in the country.

The Rose Quarters.

And, first of all, Mr. Davis, the head gardener, who has occupied his present position just twenty-one years, and has a staff of half a score under him, showed me the collection of Roses, extending over half an acre.

"Roses, then," I said, "are a great feature?"

"We grow all the best, and have about three thousand," rejoined Mr. Davis, "chiefly Hybrid Teas and Hybrid Perpetuals. The Roses are massed according to colour, four beds, for instance, having four varieties of colour. They are well protected from the north-east wind by Irish Yews, and we are able to cut pretty well from June until Christmas. Elsewhere there are garden Roses which we peg down, but, with regard to these, we only take out all the old wood in March. There is one large bed consisting entirely of Tea varieties, which we prune the first week in April."

"Do you show Roses?"

"We used to do so, but now all the trees are grown to provide flowers for decorating the house and giving away to the hospitals."

"You have some fine old trees on the lawn?"

"Yes, the Copper Beech and the Cedars close to the house present a beautiful contrast, and among other good specimens are a Pyrus spectabilis floribunda and a Tulip-tree."

General Bedding and Herbaceous Borders.

"What does the bedding chiefly consist of?"

"For spring bedding, Wallflowers and Silenes, with bulbs intermixed, are largely used; for summer, in the same beds, there is a row of Gladioli in the centre, filled up with bronze or Vesuvius Geraniums. There is a bed of Delphiniums of the best varieties on a north-east aspect, and they flower all through the summer."

"Then, you have a bed of Eremurus opposite the Delphiniums?"

"They include the best varieties, such as E. himalaicus, E. robustus, and E. Wareii. Close to these are the standard Roses, the varieties including Dorothy Perkins and other climbers, and, speaking of Roses, there is a bed of Crimson Ramblers pegged down, with Wallflowers and Lilies underneath."

"What are the principal varieties in your very extensive herbaceous border?"

"In that border and elsewhere, we have some of the newest and best species, such as Anchusas (Dropmore variety), Campanula Fergusonii, Corydalis thalictrifolia, Gypsophila paniculata, Incarvillea grandiflora, Lathyrus latifolius (the White Pearl), and Senecio argenteus. The collection also embraces Acanthus, Asclepias, Asters in variety, Centranthus, Chelone (crimson variety), Eryngiums, Funkias, Inulas, Orobus, Physalis, Polygonums, Solidagos, Spiræas, Thalictrums, Tradescantias, Tritomas in variety, Tussilagos, and Verbascums."

"There are herbaceous plants underneath the wall, with the Wistaria sinensis and Magnolia?"

"A considerable number, and beyond is a ribbon border with a row of Phlox at the back. In addition to the Wistaria, which flowers exceedingly well, Roses and Clematis intertwined are grown on the wall."

The Orchid Houses.

"Are the whole of the Orchid houses in the kitchen garden which we are now entering?"

"Yes, and the first is the Cattleya house. Here is a specimen of Cœlia Bella, one of the finest in the country; few people grow it well. It is a Chysis hybrid."

"It would be interesting if you would mention the names of some of the most choice of your hybrid Cattleyas."

"Brasso Lælia King Edward VII. is just throwing up two sheaths. Lælia-Cattleya Woodfordiense was raised here; also C. Fowlerii. The Lælia-Cattleyas include Bletchleyensis (Fowler's var.), Canhamiana alba, Dominiana Langleyensis, Ilione, Henry Greenwood, Semiramis superba, Cappei Charlesworthii, Lady Wigan, Remula, Prince Edward, Herode, and Hippolyta. We have a fine batch of L.-C. luminosa, and C. gigas saturata. C. Yellow Prince and C. Moranda are very good; also L.-C. Pallas, C. Mantinii nobilius, and C. Bowringiana triumphans. C. intermedia (Fowler's variety) is just throwing up a spike. In this house, also just in flower, are Phalænopsis Rimestadiana, and two fine plants of Dendrobium Brymerianum."

"In the East India house," continued Mr. Davis, "there are chiefly Vandas, the best varieties including a fine batch of Sanderiana. Then there is a batch of Miltonia Roezlii, one plant of Arachnanthe Lowii (a very good Orchid), and the Dendrobiums in flower include Apollo grandiflora, nobile Cooksonii, nobile nobilius, Balliana, and alba. There are also in this house a nice little batch of seedlings which will flower in about three years, and a batch of Cattleya seedlings which will flower next summer."

The next Orchid house contained Cymbidiums Lowianum, eburneo Lowianum, Traceyanum, and several new species which have not yet flowered. I asked the names of some of the varieties which have been shown.

"We had a first-class certificate last year for C. erythostylum, and we have shown, amongst

GLEBELANDS, FROM THE TENNIS LAWN.

others, C. insigne (Glebelands' var.). Here is an important batch of Dendrobium Wardianum, which are coming on splendidly, and will flower well this year for the first time."

Notable Cypripediums.

"What are your most notable Cypripediums?"

"One of these is C. calloso Rothschildianum, which received a first-class certificate from the Royal Horticultural Society, and among others are Troilus, Penelope, Milo (Cobb's variety), Miss Louisa Fowler, Acteus (Fowler's variety), Prospero majus, James H. Veitch, Annie Measures, Daisy Barclay, Captain Holford, Chapmanii, Gowerianum magnificum, H. Ballantine, I'Ansonii, Lawrenceanum Hyeanum, Hackbridgensis Leeanum, J. G. Fowler, magnificum, Clinkaberryanum, Mrs. E. V. Low, Œdippe, Mary Beatrice, Æson giganteum, Mr. W. Mostyn, Ville de Paris, Chrysotoxum Victor, Maudiæ, F. K. Sander, Phœbe, minos Youngii, Mrs. Alfred Fowler, and Ernest Read. Those now in flower include C. aureum Hyeanum (one of the best forms), C. Helen II., C. Olivia, and C. aureum virginalæ. In this house there is also a number of C. Fowlerianum, one of the finest specimens in the country of Eulophiella Elizabethæ, several plants of Eulophiella Petersiana (which are very rare), a fine bulb of Phaius Mishmiensis, and a very rare specimen of Bulbophyllum verescens."

"You have more Cattleyas?"

"This is a special house of Cattleyas, which contains several of the best white Labiatas, such as Gilmouriæ, Mrs. E. Ashworth, alba, Princess of Wales, Gaskelliana alba, F. W. Wigan, and The Baron; also Brasso-Cattleya and Madame Charles Marone. In this house, too, there is Cattleya Mantinii (Fowler's variety), for which we had an award of merit last year; a fine batch of C. Schroderæ, some of them throwing up as many as twelve or thirteen sheaths; and the finest plant in the country of C. Warscewiczii F. M. Beyrodt. Other choice Cattleyas are Harrisoniana alba, intermedia alba, Cecilia (Fowler's var.), Maronii, Mendelii albens Princess of Wales, Mossiæ Reineckiana, Victoria, Waganerii, Parthenia, Princess of Wales, Schroderæ alba, Fowler's var., Pitt's var., Frianei, Amesiana, alba, J. G. Fowler, Little Gem, Fabia, Iris, Davisii, Atalanta (Fowler's var.), and Hardyana. In the other Cypripedium house there is a large batch of insigne, embracing the Harefield Hall variety, Sanderæ, J. Davis, Luciana, Laura, gigantea, Dormaniana, montanum, montanum aureum, and Amy Moore magnifica. Here, too, are batches of Miltonia vexillarium, Zygopetalums, and Lycastes. Now we had better go to the Odontoglossum house, which was put up last autumn by Mr. Harris, of Ealing."

"It seems a very large and handsome building?"

Thousands of Odontoglossums.

"I believe it is the finest Odontoglossum house in the country. The double staging is all teak, and there is ventilation for summer use between the two stages. The sides are built with loose bricks, pigeon-hole fashion, to keep the cold air and dry heat from entering the house direct. In fact, every possible contrivance for perfecting ventilation and ensuring the temperature required for the cultivation of cool Orchids has been introduced, and I think that Odontoglossums can be grown here under the best possible conditions. All the plants you see here were potted up last autumn, and a great many are rare and costly. They run to thousands, both in number and in sovereigns. Several O. Crispum are in flower, and the varieties include Cooksonianum, Ardentissimum Dorothy Fox, The Jewel, Britain's Queen, Raymond Crawshay, Fowlerianum, Luciana, and Lindenii. Amongst the endless varieties of Odontoglossums are amabile (Glebelands' variety), for which we received an award this year; O. Wilckeanum and O. Ossulstonii, and O. Eduardii now in flower. Other varieties are Wilckeanum William Pitt, Pittianum, Fowler's var., Waltonense var., Othello, amabile Rex, Halli King Edward VII., Wiganianum, Lolbiæ, Loochristiense, Aliceiæ, and luteo-purpureum Vuystekeanum. There is also in this house a batch of Masdevallias, a few of which are in flower, namely, Melampus, Lindeni, Schlimii, Maccura, and Chelsonii. Of course, I could tell you a great deal more about Orchids, and give you a great many more names, but I think you would now like to see some of the other features of the gardens."

MR. J. DAVIS IN THE ODONTOGLOSSUM HOUSE.

"What shall we take next, then?"

"Here is a collection of Star Capsicums in variety, for which we got a silver medal at the Horticultural Hall last year. The award was given to the variety Celestial, but the collection includes nine or ten varieties, and from six to seven dozen plants. We sow the seed in February, grow them on in plenty of heat until the end of October; then, when they have coloured up, take them into a cooler house, and they last well all through the winter. Another plant which we find very useful for forcing, and may be treated in quite an ordinary manner, is Forsythia. We bring them in the first year, pot them up, and plant them outside, and then force the second year."

Strawberries and Peaches in Pots.

"I see you have a Strawberry house."

"We force about eight hundred plants, all Royal Sovereign. Four shelves you will notice are above the others. It is very useful to have them close to the glass and up to the roof. In the next house we grow Roses in pots. Instead of cutting back in accordance with the usual practice, we throw out all weak wood, and train the shoots round an iron band, with

A PART OF THE KITCHEN GARDENS AT GLEBELANDS.

the result that we get a great deal more flower. All the best varieties are grown."

"You also grow Peaches and Nectarines in pots?"

"Yes, we devote a house entirely to them, and have done so for six or seven years. I shake them out every year, pot them up in the autumn, plunge them outside, cover the roots with dung, keep the wood exposed to the weather, and, as a rule, take them in early in February, when I dip them in caustic."

"Have you suffered from any disease?"

"Some time ago the plants were attacked by a kind of fungus, but, by spraying them with caustic in the winter, and with sulphur in the summer, I have lately been able to keep them entirely free from it."

"They are now looking remarkably well. What are the principal varieties?"

"The Peaches are Dr. Hogg, Dagmar, Alexander, Royal George, Goshawk, Early Louise, Violette Hative, Condor, Early Beatrice, Sea Eagle, Grosse Mignonne, Crimson Galande, and Noblesse. The Nectarines are Cardinal, Darwin, Milton, Lord Napier, Humboldt, Early Rivers, Stanwick Elruge, Dryden, Precoce de Croncels (which does exceedingly well), and Pineapple."

The Vineries, and Selaginellas.

"Do you go in largely for Grapes?"

"In the early Vinery we have Madresfield Court and Black Hamburgh, and, in the late, Gros Colmar, Gros Maroc, Black Hamburgh, and Muscat. The Vineries are also used for Chrysanthemums, of which we grow about eight hundred; and we force Lilacs, Laburnums, double-flowering Peaches, and Rhododendrons. As to bedding plants, we have a large number of Border Carnations, and from five to six thousand Geraniums. There is still one house for you to see which contains a very special feature. We have the only complete collection in the country of Selaginellas."

"All grown in pots, I believe?"

"Yes. We use them to decorate the house, and three or four years ago we received a gold medal for the collection."

"What is your treatment of them?"

"Selaginellas require plenty of heat and moisture. The varieties include Douglasii, Griffithii, molliceps, viticulosa, amœna, Pitcheriana, divaricata, Poulterii, tuberosa, Lobbii, denticulata, Martensii variegata, lesta, Erythropus, Watsoniana, stolonifera, elegans, serpens, africana, cœsia, increscentifolia, and Kraussiana variegata. Three of the varieties (S. grandis, Lyallii, and atro-viride) are grown in a cupboard. I have not given you the whole of the names, but every variety is represented."

Hardy Fruit.

"Now, with regard to outside fruit."

"We have a great number of young trees, Plums, Apples, and Pears. Apples are grown as pyramids, espaliers and cordons on the walls, and as standards in the orchard. One of our great features in fruit are the Gooseberries trained as cordons, which were planted last year, the varieties embracing all the newest, and including Langley Gage, Brown Girl, Golden Gem, Careless, Sir J. Brown, Sir Prize, Scotch Nutmeg, Beauty, Railway, Talfourd, Eva, London City, Early Green Hairy, Leader, Yellow Smith, Early Sulphur, Mount Pleasant, Speedwell, Prince Arthur, and Rumbullion.

"Now," concluded Mr. Davis, "although there are other things of interest in the gardens, I think that you have a fair idea of what we chiefly cultivate at Glebelands."

ALFRED WILCOX.

THE finest form in cultivation of that charming plant, the Japanese Quince (Pyrus or Cydonia japonica), is that known as Simoni. It is not a new plant, but its exquisite colour should ensure it a place in every garden.

Letters from a Lady Gardener.

No. 253.—THE PRUNING OF SHRUBS, CLEMATISES, AND CLIMBING ROSES.

DEAR KATE,—Who prunes your shrubs? And what is the work done with? Not, I hope, with the shears, those dreadful implements which so rejoice the heart of the jobbing gardener who delights to tidy up at the expense of the unfortunate flowers. I observe that several unlucky people have no flowers at all on their Lilacs this year, although those in my garden are a mass of bloom; and the reason is not far to seek, i.e., they were all sheared off, either in the autumn tidying up, or in the early spring. Many shrubs are like the Lilacs in this—that the blossom is produced on the wood of last year only, and it is fatal to cut this off if you want flowers. But the ideal of the jobbing gardener is a stiff outline like that of a Privet hedge, and any unhappy shrub that dares to break this straight line is immediately decapitated with the aid of his favourite shears.

The Proper Method.

But I hope you don't let him do this, for the right thing is to study the natural outline of your various shrubs, and allow them to be as lovely as Nature intended, only thinning out the weaker growths a little if necessary. Many shrubs are planted far too thickly together, with the result that the stronger plants gradually crowd out and destroy those which are weaker; and usually the bullies amongst them are the most uninteresting, producing no blossoms at all to speak of, such as Euonymus, Box, etc. Do examine your shrubbery closely, with a view to help any poor dear shrub which is being crushed out of existence, and have those which are in fault removed at once, so as to give the sufferers a chance to recover during the summer. The holes made by taking away the roots of their enemies should be filled up with good soil and manure (for they are no doubt nearly starved to death), and they will soon find out the fresh food and enjoy it, so as to be able to make strong new growths quickly.

The time to prune many shrubs (but not all) is directly they have finished blooming, and any dead or half-dead wood should then be cut out cleanly with a sharp knife, as well as shortening such branches as may have wandered through being crushed by other plants; but don't cut the poor thing into the shape of a plum pudding, the usual fate of a single shrub in the hands of an ignorant gardener. Those shoots which would make the centre of the bush too close for the air and sunshine to penetrate may be cut away, too, in moderation, but don't overdo this; it is always easy to cut growths off, but you can't put them back again, and therefore think twice before you use your knife.

The upper shoots of Lilacs should never be interfered with, for it is on the due ripening of these that next summer's flowers depend; and this is the general rule with flowering shrubs, so that it is easy to see how mischievous the shears can be amongst them.

Rhododendrons and hardy Azaleas should not be pruned at all, but you should carefully pick off all their fading flowers as soon as possible, or those points will be blossomless next season. Myrtles and many rather delicate things are best left unpruned until the winter is past, for bitter winds and sharp frosts are apt to cut them back too much if exposed by the removal of their leaves, and as Myrtles blossom in the autumn, they can be pruned as late as this with impunity. Clematises are very puzzling plants to prune, for some of them blossom only on the wood of last year, whilst others make new shoots containing flowers, however much you cut their old wood.

The starry white Clematis from the Himalayas (C. montana), and its varieties, will not bloom at all if closely pruned, for it produces its lovely flowers at the axils of last year's shoots in long trails; the Jackmanni Clematises, on the other hand, will blossom on this year's shoots, and may therefore be more closely pruned after flowering, or in the early spring, a safer time for all Clematises if growing in a cold district, as the winter sometimes prunes

PACKING THE MARKET CART.
(See "A Talk with a Lady Florist.")

THE PLEASURE GROUNDS AT HIGHBURY, BIRMINGHAM.

Interview with Mr. John Deacon.

A FEW years ago, by permission of Mr. Joseph Chamberlain, M.P., I visited Highbury in order to inspect the Orchid houses under the charge of Mr. John Mackay; and this summer I spent an afternoon with Mr. John Deacon, the head gardener, who showed me over the pleasure grounds. So much has been said and written about Mr. Chamberlain's love for Orchids, that the remarkable and numerous charms of Highbury Gardens have scarcely received the attention they merit. The estate is about a hundred acres in extent, and quite thirty are covered by the pleasure grounds, whose natural charms have been greatly augmented from time to time. Originally designed and laid out by Mr. Edward Milner, many of the features owe their existence to Mr. Chamberlain himself, who, like Mrs. Chamberlain, takes the keenest interest in their development and cultivation.

A PART OF THE ROCK GARDEN AT HIGHBURY.

On my arrival, Mr. Deacon suggested that we should start with the terrace in front of the mansion. The mansion itself is partly clothed with creepers, embracing Ivies, Jasminum, and Ampelopsis in variety, with a few Roses, just sufficent for the purpose. The border round the house, which in spring was filled with Wallflowers in variety, and Myosotis, consists in summer of Heliotropes, Mignonette, and Musk, all grown near the windows for their fragrance as much as their beauty.

"The six large beds just below the terrace," said Mr. Deacon, "are devoted to Tulips in spring, and these are succeeded by Geraniums Mrs. Cannell, in two beds, Henry Jacoby in two, and Flower of Spring in two, edged with Pyrethrums, Lobelia, or Centaureas, according to colour. The Tulips used include Carmine Brilliant, Brutus, Chrysolora, and Artus. Surrounding the terrace walk are English Yews and Hollies in a half circle, alternating with beds of Tritomas. Sloping off the terrace is the tea garden, which Mrs. Chamberlain superintends."

The Tea Garden.

"It is a lovely spot," I said, as we stepped over flagstones into a delightful enclosure looking on the park, and a lake, adorned with a balustrade covered by leading varieties of Rambler and Wichuriana Roses, and an ancient sundial. "When was it made, and what is the aspect?"

"Six years ago; the aspect is due south. You see that chairs are placed on the flags, which are covered with rugs when used, and that between the flags are Mountain and Lemon Thymes, with the brown-leaved Oxalis. The prevailing colours of the outer border of the tea garden are pink and white, Roses in variety, and Lilium candidum. Later, there will be dotted about white, lilac, and pink Sweet Peas, with Stocks and Asters to match. The bed in the centre contains Heliotrope Lord Roberts, and a pale variety; and the Roses near are the common Sweet Briers and perpetual-flowering varieties of the China section."

"And the Rhododendrons in the shrubbery border?"

"Yes, chiefly Pink Pearl, to harmonise with the colour of the Roses. The principal Rose in the border is Baby Dorothy Perkins, with the light varieties of Lonicera. The colours are always maintained, and also the perfume."

"The furniture likewise matches with the garden."

"It is old English pattern, pale green colour, and for shade there is the fine old Oak, which extends over a portion of the seating capacity of the garden."

A Rose Garden.

Retracing our way up the slopes, we next paused in one of the Rose gardens, which has been cut out in the turf, with eight large beds and a fine specimen of golden Holly in the centre.

"Does your soil suit both Hollies and Roses?"

"Fairly well, though we have to enrich it. The eight varieties of Roses grown respectively in the eight beds are, Merveille de Lyon, Paul Neyron, Etienne Levet, Captain Christy, Mrs. John Laing, General Jacqueminot, Marquise de Castellane, and Baroness Rothschild. The large bed of standards has Crimson Rambler in the centre, with Gruss an Teplitz as half pillars, interspersed with the red China Rose Cramoisie Superieure, the bed being carpeted with pale blue and yellow Violas. Just outside the Rose garden are four small beds, with the miniature and bronze tricolor Geraniums in summer, and varieties of Polyanthus in spring."

Passing a large bed of Ericas in variety, and a corner filled by double-flowering Gorse, we came to a quarter dominated by Rhododendrons, from which there is a magnificent show of blooms in June. I asked when the Rhododendrons were renewed.

"Ten years since," rejoined Mr. Deacon, "the borders were renewed with peat and sandy loam to a depth of two feet six inches. The shrubbery at the back here is planted in blocks, with Laurels, variegated Hollies, Portugal Laurels, Golden Privet, and Aucubas, while on the undulation alongside the Rhododendrons is a very fine specimen of a drooping white Thorn."

"In the border, too, I notice a fine specimen of Berberis stenophylla, between two large specimens of dark green Holly."

"Now we approach the Old English Rose garden, surrounded by clipped Yew hedges. The beds here are of various shapes, and are bordered by Box."

"The seats, again, are in keeping with the garden?"

"Yes, the seats in the corner recesses are Old English, and the sundial in the centre is in its element. On the four entrance arches are Rambler Roses, Lonicera, and Clematis. The beds are confined to Roses of one variety of the Hybrid Perpetual section, and other strong growers are trained as pillars."

"Mention should be made of the striking border of Delphiniums on one side of the Rose garden, in which all shades of blue appear to be represented."

The Alpine Garden.

"I think they include the very pale to the very dark. Beyond is the Alpine garden."

Digitized by Google Original from CORNELL UNIVERSITY

"There must be many varieties thriving here?"

"One of the most beautiful is Daphne cneorum. Aubrietias are strongly represented. The finest I have yet seen of these is Jessie Baker; it is as large as a small Viola. Other prominent plants are double Arabis, Alpine Irises, Alyssums in variety, Alpine Violas, the old red Daisy, Iberis, Erigeron alpina, Pulmonia saccharata (with rose-coloured flowers turning to blue), Veronica rupestris, Alpine Phloxes, Arenarias, Sedums, and Saxifrages in variety."

The winding walks from garden to garden at Highbury are a feature to which justice cannot be done by description. Along one of these is another large Alpine border, with an aquatic pool below, which is rich in water-loving plants, such as Spiræas, Water Iris, Primula japonica, Caltha palustris, and Trollius japonicus.

"On the banks of the water," continued Mr. Deacon, "are varieties of Aconite, and at the point of the peninsula a large clump of Stenanthium robustum. The water is more or less surrounded by Rhododendrons, principally ponticums, in order to give a variation in colour to the hybrids. There are varieties of Lilies in the aquatic pool."

"Then there are the beds and borders at intervals on one side of the pool."

"The contents of these include varieties of Water Iris, chiefly of the siberica type. You might make a note of the fact that the Daffodil poeticus was flowered splendidly for six or seven years in poor soil."

"Can you tell me the dimensions of the drooping Ash which forms an arch along the side?"

"It is from thirty to fifty feet across. Willows, Thorns, Laburnums, and the Purple Beech are amongst the other ornamental trees. With regard to the larger beds, here is one with Campanulas pyramidalis, Pæonies (dark and light), and Iris Kæmpferi, which later will be occupied entirely by a scarlet bedding, semi-Cactus Dahlia."

A New Dahlia.

"What is its name?"

"Mr. Child, of Acock's Green, who raised it, called it after me, John Deacon. Carpeted with yellow Violas, it makes a fine show."

"You get a pleasing view from the rustic bridge here, including the boathouse in the distance. Many kinds of birds seem also to be at home in the water."

"There are moor-hens, wild ducks, Paradise ducks, and widgeons. In the park there is a horse show on Whit Monday, and a flower show on August Bank Holiday. We get from five to ten thousand here on some occasions, and Mr. Chamberlain allows them to have free access to the gardens and greenhouses."

"Your beds of late double and Darwin Tulips, carpeted with Myosotis, and edged with Violas, are very effective."

"I follow them with Lobelia cardinalis and Queen Victoria, edged by Violas. The next feature is the long herbaceous border."

"It must be broad as well as long?"

"The exact dimensions are ten by one hundred yards. The arches along the path are covered with varieties of Wichuriana Roses, and in the border are all the leading varieties planted in clumps. At the back are chiefly Hollyhocks, perennial Sunflowers, and tall Asters, below these being clumps of Phloxes, Monarda didyma, Pyrethrums, dwarf Asters, Sweet Williams, and Campanulas, with others, the whole being bordered with the choicest annuals in patches."

The Rock Garden.

Beyond this brilliant border is a narrow bed of Phloxes, backed up by blue and white Lupins, and Oriental Poppies in variety. A little further on is a long strip border filled with mixed Tulips, which challenged admiration, and is no doubt equally successful in its summer dress of Ten-week Stocks.

"How many Tulips does it take to fill this border?" I asked.

"Three thousand; and two thousand five hundred Stocks. The patch border opposite is edged with patches of the leading varieties of bedding Violas, mainly self colours. The steps at this junction mark an important addition, which was made about twelve years ago."

"You mean the rock garden?" I said.

"Yes; this was designed by Mr. Chamberlain, and executed by Messrs. Pulham and Sons. Care, you will see, has been taken so that the bold rocks lie on or push up through the soil in a natural manner, leaving plenty of space for choice shrubs with dwarf habit, and, at the same time, providing suitable positions for lovely creeping Alpines."

"What are the chief shrubs represented?"

"Acers, Cotoneasters, Berberis, Cydonias, Alpine Rhododendrons, Helianthemums, Rock Roses, and Ericas. The more noticeable Alpines, or, at any rate, those in flower just now, include Eryngium alpinum, Alpine Auriculas, Erianthus Ravennæ, Primula Sieboldi, Sempervivums, and Ajuga compacta."

"You have a very ornamental pergola at the top of the rock garden."

THE RHODODENDRON GARDEN IN THE PLEASURE GROUNDS AT HIGHBURY.

"It is built on square brick pillars, terra-cotta in colour, with a skeleton Oak top. The pillars match with the terra-cotta top of the balustrade. On the pergola are Rambler Roses, Clematis, and Honeysuckle, with a border of Lavender at the base on one side, and a Rosery on the other. Now we reach the Italian garden, the features of which are its big E-shaped beds, and its sunk lawn."

The Italian Garden.

"The beds are of different design?"

"Yes, and mixed: while the oblong beds outside are devoted to Liliums, Pyrethrums, Canterbury Bells, and other plants of similar habit. In the centre of the outer beds is a fountain with dwarf varieties of Lilies in the water. The Italian garden is broken up with specimens of Cupressus, and both the rock and Italian gardens are enclosed with a clipped Beech hedge, which is a great shelter."

"And materially adds to the beauty of the gardens."

The Dutch Garden.

"Finish is given to them by the fine pair of ornamental wrought-iron gates at the entrance. Adjoining the Italian garden is the Dutch garden, in three divisions, surrounded by a Holly hedge."

"How would you describe the design?"

"It is quite formal, and the plan geometrical. The paths and edges of the beds are all terra-cotta tiles, and the centre is adorned by a quaint sundial."

"How are the divisions made up?"

"The first section is confined to Irises, Spanish and German, named varieties. The second was originally used for spring Tulips, but is now devoted to annuals, the result being a mass of colour. The annuals embrace Coreopsis Drummondi, Chrysanthemum Morning Star and Evening Star, Centaureas Silver Queen, Salpiglossis (mixed), Shirley Poppies, Lupins in variety, Lavateras, Godetias in variety, Calceolarias, Nigella Miss Jekyll, Scabiosa (mixed), and Oriental Poppies from blush to cardinal. The third section, which we do not bed in summer, and renew every three or four years, consists entirely of Daffodils in beds of one variety."

"Judging by the size, you must plant an enormous number?"

"About ten thousand. They are arranged with a view to extending the flowering season as long as possible. The varieties represented in the beds and borders are principally Emperor, Empress, Queen Victoria, Barri conspicuus, Figaro, Mrs. Langtry, C. J. Backhouse, and Sir Watkin."

Leaving the Dutch garden, we proceeded past another small lake, with a good old Oak overhanging it, a small island in the centre covered with Willows and Rhododendrons, bordered with Iris Kæmpferi, I. orientalis, I. siberica, and I. clematida, to another modern feature of the gardens.

"This," said Mr. Deacon, "we call the shrubbery garden. It extends, with the Rosery adjacent, to about two acres, and is also Mr. Chamberlain's own design. He gave instructions as to the planting."

"There must be a very fine collection of flowering and other shrubs?"

"It will suffice if I mention flowering Cherries, Laburnums, Crabs, Peaches, Lilacs, Syringas, Brooms, Deutzias, Azaleas, standard Wichuriana Roses with umbrella heads in great variety, and Rhododendrons (Kew hybrids). These are bordered on one side by clumps of Bamboos, and on another with Rosa rugosa, and the Rose garden."

"That makes three Rose gardens?"

"Yes, there are three, and this contrasts very

Digitized by Google Original from CORNELL UNIVERSITY

much in situation with that of the Old English Rose garden near the terrace. The level here is of course much lower, and no Teas are grown, though we have a number of beds of Hybrid Teas. These and beds of the Bourbon Rose, the Moss and Damask Rose, and China Rose, are chosen for colour; while different varieties of pillar Roses break the monotony. On one side of the shrubbery garden is a border of Penzance Sweet Briers."

Then, pursuing our way in the shrubbery garden itself, I noticed a very fine bed of Ghent and mollis Azaleas, the shape of a scroll, bordered with Hypericums, and interspersed with varieties of Lilies.

"The paths, you will observe," said Mr. Deacon, "are winding, and kept short with the mowing machine, while the grass generally is left longer, and trimmed occasionally, with a quite different effect, which is generally considered more pleasing for the type of garden. At various points are either specimen trees, like that of Magnolia stellata, or beds filled with such shrubs as Forsythia suspensa and Pyrus japonica, carpeted with varieties according to the season. Along the drive, which is also winding, are more ornamental shrubs, including a good many Cedars and Hollies, with fruit trees scattered about."

Roses and Bamboos in the Shrubbery at Highbury.

Peaches and Grapes.

By this time we had reached the mansion again, and though I did not attempt to exhaust the kitchen garden, I was able to inspect some of its contents, and to go through the range of fruit houses.

"This is not," said Mr. Deacon, "a fruit-growing district, but inside we do pretty well. In the first of the Peach houses are Royal George and Nectarines Victoria and Pineapple. In the second, Princess of Wales and Bellegarde Peaches, and in the third Nectarines only, Hardwicke's, Elruge, and Lord Napier. The three large lean-to houses are from sixty to seventy yards long, and twelve feet broad. The three principal Grapes grown in the four Vineries are Muscats, Black Hamburgh, Alicante, and Madresfield Court. The Vines, Peaches, and Nectarines have been established in the last fifteen years."

"You have very good crops of all the inside fruit, especially the Peaches and Nectarines."

"Yes; they are very satisfactory so far, and should come out well. The Melons we grow are Sutton's Scarlet, Superlative, A1, and Countess, a pale red. With regard to plant cultivation, you may like to mention the Carnations, of which we have a large collection of Trees, Border, and Malmaison varieties."

"Please tell me a little about your experience in exhibiting Carnations."

"Last year, and the year previous, at the July show at Edgbaston, we were awarded a gold medal, and each year I have exhibited, I have been awarded medals and other prizes. We also exhibit cut blooms of Chrysanthemums, of which we have a large collection of both the older and the up-to-date varieties."

"There is another speciality in plants which ought not to be overlooked—I refer to your remarkable show of German double Wallflowers."

"Well, there are certainly a good many varieties of colour represented, from golden to violet. I sow them in June, prick off in boxes, and pot them up singly, getting flowers from one foot to eighteen inches in length. They are invaluable for conservatory work, and last in bloom for six or seven weeks. Violets are another feature, and several rows of frames are devoted to them. We get a supply from November to April, the varieties being Wellsiana, Princess of Wales, De Parme, and the single Czar. The kitchen garden is not large, though the vegetables grown are of the choicest kinds. But the pleasure grounds and the Orchid and plant houses are the principal attractions at Highbury. There are many other plants grown for the show houses at Highbury, namely: Aralias, Java and Himalayan Rhododendrons, Crotons, Anthericums, and general stove plants, Gloxinias, Begonias (tuberous-rooted and the Gloire de Lorraine), Primulas, Regal and Zonal Pelargoniums. There is also a large collection of Amaryllis, the greater part being hybridised and raised from very good plants. Mr. Chamberlain takes special interest in these."

"How long have you been at Highbury, Mr. Deacon?"

"Upwards of sixteen years. Before I came here as head gardener, I was for seven years at Bowden Hill House, Wiltshire, where we did a good deal of exhibiting."

Alfred Wilcox.

"The Evolution of a Modern Nursery Enterprise," will form the subject of next week's interview.

Perpetual-Flowering Carnations.

FINAL POTTING.

Many growers succeed until this stage is reached, and then spoil the results of their labours—overpotting, too rich a compost, and overwatering being a few of the mistakes made by the inexperienced. I assume that the plants are now well established in their "forty-eight" pots; that they have been gone over regularly each week, and stopped at the fourth or fifth joint; and have now strong breaks three to four inches in length. Should a winter crop of bloom be the aim, stopping must now be discontinued, and the work of final potting taken in hand at once. This is of no small importance. Three parts of fibrous loam, half a part of dry cow-manure, a quarter part of wood-ashes, one-eighth each of sand and lime-rubble, adding a "forty-eight" potful of bonemeal to each barrow-load, is an ideal compost.

Pots and Fertilisers.

I find that a 7-in. pot is large enough to carry the plants through the winter months. The risk of overwatering is not so likely to occur if the pots are well filled with healthy roots; while many varieties, such as Black Chief, Britannia, and Mrs. Burnett, give finer results when allowed to become moderately pot-bound.

The principle of adding inorganic manures to the compost is now looked upon as altogether unsatisfactory. A too liberal supply of manure is one of the causes of plants being attacked with stem rot during the winter months. Nitrogenous food should not predominate in a Carnation compost, phosphates and potash being used in greater quantity by the plants.

Care must be taken that the pots are perfectly clean. Place a reasonable supply of small crocks in the pot for drainage, and see that the compost is in perfect condition for use, neither too wet nor too dry. If the compost is in the right condition, no fear need be entertained that the plants will be waterlogged through too hard firming of the soil. It is important at this potting to ram the compost firmly in the pots—hence the need for having the compost in the right condition. Be sure that the plants are not placed deeper than they were in the "forty-eight" pots. Do not water them directly after potting if the weather is dull, but keep them close, and give a sharp syringing overhead for three days, after which the lights from the frames must be withdrawn entirely, placing them on only in the case of continuous rains.

Treatment of Old Plants.

In the case of plants that have been recently flowering under glass, it will now be advisable that they be cut back, and placed in a clean cold frame. Give them a sharp syringing overhead each day—twice a day if the weather is hot—to induce them to start into growth again. Directly the new growth attains three to four inches in length, give the plants a move on into the next size pot. On no account coddle them, for this stock must be grown perfectly hard. Some growers object to using the plants a second year, but I have found that if quantity of bloom is required, enormous crops of average size will be obtained. Some varieties even produce their finest flowers on two-year-old plants.

Few growers allow their flowering plants to be in the houses after July. Should it be desired to continue a batch of flowering plants, place them outdoors in a position where lights may be placed upon them in case of heavy rains which would spoil the blooms. Shading also must be carefully attended to over this section of the plants. Keep a sharp look-out for red-spider, thrip, and green-fly, and see that all stock is perfectly clean, or the health of the plants will be seriously affected.

Richard Brant.

LGM, 1831

Art. XI. *Obituary.*

Died, May 11., in his 64th year, at Croome Park, *Mr. Dean*, botanical gardener there during a period of nearly 40 years. Mr. Dean was the author of *A Description of Croome Park and Grounds, &c.* 1 vol. 8vo.

Blanche Burpee, Queen of England, and Snowdrift are good in their way.

Of blues, I would name Countess Cadogan, which has standards slightly hooded, of a bright, shining violet colour, overlaid with a charming light sky-blue; the wings are a pure sky-blue with lavender keel—this is undoubtedly a charming variety. Navy-Blue was sent out by Burpee last year; it is a dark blue flower, the standards of a brilliant royal purple, the wings violet with a lighter keel. Captain of the Blues and Emily Eckford are equally desirable varieties where a number are required, perhaps.

My choice of blush-coloured varieties includes Duchess of Sutherland, a pearl-white, delicately suffused with light pink; the standards slightly hooded; the blossoms widely placed on the stems, which improves the variety in effect—individually, it is one of the most charming varieties. Countess of Aberdeen, white, suffused with pale pink, has finely-formed standards, and altogether it is a pleasing flower. Mrs. Fitzgerald is of a soft, creamy tint, flushed and edged with pale rose.

In claret-tinted flowers there is Duke of Westminster, a deep rose-tinted maroon, overlaid with bright violet—a quite distinct, novel, and pleasing variety.

Flowers with cream-white grounds and tinted, are Venus, although somewhat old, still one of the best in this section, flowering freely; the colour is salmon-buff, and the standards are delicately shaded rosy-pink. Lady Beaconsfield has salmon-rose tinted standards, and pale yellow wings. Crown Jewel, Coquette, and Lemon Queen are also desirable where a larger number are required.

In crimson flowers there are several varieties which, if not synonymous, are too near alike to be separated, viz., Salopian, Mars, Wide-awake, and Firefly. Mars is, perhaps, the most preferable, as with age, it remains brighter than Salopian; the colour is a bright fiery crimson, deepening with age.

Flowers of indigo tint are Duke of Sutherland, standards deep claret, with a deeper flush of maroon on the back; the wings are a bright indigo-blue, very attractive, especially as the keel is of a pale blue tint—it is a handsome variety, either when growing, or as a cut bloom. Shazada and Indigo King belong also to this type.

In lavenders there are several charming varieties. Lady Grisel Hamilton is, perhaps, the most attractive of all; the colour is a shining pale lavender, deepening towards the base of the standard. Lady Nina Balfour, Lottie Eckford, and Countess Radnor, are distinct, but hardly desirable, except where a large collection is grown. Golden Gate is of an attractive tint of pinkish-lavender, with a rose-pink suffusion of the standard deepening towards the base.

The lilac section is represented by Lady Skelmersdale and Colonist, both distinct and desirable varieties. The former has bright, rosy-lilac standards, the white wings are slightly tinted with the same hue—a distinctly novel and pleasing variety. Colonist has soft lilac wings, and rosy-lilac standards—a distinct and pleasing variety, of vigorous growth, flowering freely on stout stems.

Magenta-coloured varieties are not numerous, although one of the finest varieties in cultivation. Calypso is included in this class; the standards of this variety are especially bold, of a rich bright magenta tint, flushed with mauve; the wings delicate mauve, forming a striking contrast.

Maroon-coloured varieties consist of no fewer than four names, each beautiful, but when compared with each other it is doubtful if they are all sufficiently distinct. They are named Black Knight, Othello, Stanley, and Boreatton. Black Knight, in my opinion, is the most desirable of them all. The colour is a deep maroon, with an intense metallic lustre on the standard; the keel pale purple, giving a distinct character to the flower.

In mauves, I include a variety which is regarded by many gardeners and others as the finest variety in commerce, viz., Fascination. The standards are of a delicate magenta-mauve, the wings deep mauve, and when on the plant or used in glasses, &c., it always charms; the growth is vigorous, and the blossoms abundant on stout stems. Dorothy Tennant, although several years older, is well worthy of cultivation, being very distinct, of strong growth, and free to flower; the colour of the wings is pucy-violet, with standards of a rosy mauve tint.

Of orange-coloured varieties there are no fewer than eight, viz., Gorgeous, Triumph, Chancellor, Countess of Powis, Lady Penzance, Meteor, Orange Prince, and Lady Mary Currie. In making a selection, I place the American raised Gorgeous at the head of my list. It is a striking variety; the standard of a salmony-orange tint, and the wings of soft rose, with deeper coloured veins. Lady Mary Currie has deep orange-pink standard, wings flushed with rose. Chancellor and Triumph have hardly enough orange in them to warrant their inclusion in this section.

Of pink-flowered varieties there are, as might be expected, no fewer than ten. Mrs. Gladstone, quite one of the first in the section to be sent out, received a certificate in 1891; it is distinct and pretty in colour, but in growth and productiveness is now surpassed. Lovely is a striking variety of a pleasing shade of pink, with a deeper suffusion at the back of the standard.

Duchess of Westminster has flushed pink wings, which deepens in the standard, terminating with a flushed apricot suffusion; the blooms are rather small. Prima Donna is in the way of Lovely, but inferior to it. Hon. F. Bouverie has coral pink standards, veined deeper, and pale pink wings. Countess of Lathom, too, nearly resembles this last.

In Purples, Monarch is the only desirable variety; the standards are bronzy-crimson tint, with wings of an intense deep blue colour.

The rose-coloured varieties, as might be expected, are many, rendering a selection difficult, for no fewer than twelve come under this heading. Her Majesty, a soft rosy-pink self, remains still one of the best. Prince of Wales is a handsome striking variety, with standard of a bright rose tint with deeper veining and paler wings; the flower possesses a strong flower-stalk and large blossoms. Mrs. Dugdale, too, nearly resembles the former to be included. Lord Kenyon is distinct from the above, in that the standards are flushed and veined more deeply with rose. Chancellor is classed as an orange-coloured variety, but it properly belongs to the rose-coloured section; it is a distinct variety, being a rose self heavily veined with a deeper tint. Triumph, too, comes under the same category, it has deep rose-coloured standards with paler wings and keel.

Of scarlet-tinted varieties, Prince Edward of York, Princess Victoria, and Duchess of Edinburgh, are supposed to represent the section. The first-named is a distinct type of flower, and an acquisition, but how it can be classed as scarlet is beyond my comprehension. The standards certainly contain some red-scarlet colouring, but the wings are pale puce; it is an attractive variety well worthy of attention by cultivators.

What are known as yellow-flowered varieties are represented by Queen Victoria, Primrose, Mrs. Eckford, Cream of Brockhampton, and Golden Gleam. The former is distinct, and therefore desirable; its flowers are of great size, supported on stout stalks. The colour is soft yellow with a suspicion of purple. Any one of the remainder named may be cultivated as a yellow-flowered variety.

The striped section has of late received many additions and found many admirers: Aurora, Gaiety, Mrs. Joseph Chamberlain, Mikado, Midnight, Princess of Wales, Senator, and Pink Friar, are all names that are selected as being representative of the type.

Midnight will appeal to the majority of cultivators; it much resembles Senator in colour, except that the standards exhibit a bronzy tint in distinct waves, rendering it quite conspicuous. America, or as some name it B. P., is perhaps the brightest form of a striped flower, and is scarlet on a white ground, and therefore attractive; Aurora, is a white flower flaked with orange-salmon; Mrs. Joseph Chamberlain, white striped and heavily flaked with bright rose, a fine bold variety; Princess of Wales is the best of those with purple or mauve stripes.

In addition to the above, Mr. H. Eckford has the following new varieties: Miss Wilmott, which is best described as an improved Gorgeous; the growth vigorous, with strong flower-stalks, and flowers of an immense size. Jeanie Gordon: this is a hooded variety, with pale rose-tinted standards and cream-white wings veined and flushed with carmine. Lady M. Ormsby Gore is after the style of Queen Victoria, excepting that the blooms are more inclined to pink than that variety. George Gordon is an effective variety, best described as a lake-coloured self. Coccinea hardly comes up to its name in colour, is more like Her Majesty, and it has the peculiarity of showing at times a double set of wing-petals, and may be the forerunner of a double-flowered variety—not that this would be an acquisition. *E. Molyneux, Swanmore Park, Hants.*

Obituary.

JAMES GODFREY DEAN.—We regret to announce the death in his seventieth year of Mr. James Godfrey Dean, head gardener at Titsey Place, near Limpsfield, Surrey, which took place very suddenly on the 2nd inst. at Titsey from apoplexy. Mr. Dean had been in failing health since an attack of influenza which he had about four years ago. For forty-seven years he had been in the family of the Leveson-Gowers and their relatives, as will be seen by the following record. He was born at Stoke Farm, Slough, his father being the steward. His apprenticeship was served at General Howard Vyse's, Stoke Place, under Mr. Patrick, one of the greatest fruit-growers of the day. He had a wish to become an artist, but was persuaded not to by Miss Vyse, and gardening, he then said, was the only other thing that he cared for. After serving his apprenticeship he went to Dropmore under Mr. P. Frost as an improver. He then took a foreman's place at Lord Boston's, at Hedsor. He next went to the Honourable Granville Ryder's (a relative of the Leveson-Gower family) at Westbrook Hay, as gardener under the bailiff, Mr. Tranter, remaining there two years. At the end of that time, viz., in April, 1855, he entered the service of Wm. Gresham Leveson-Gower, Esq., of Titsey Place, grandfather of the present owner of Titsey Place, Chas. Granville Gresham Leveson-Gower, Esq., as head gardener, staying there five years. After leaving Mr. Leveson-Gower's service, he went as head gardener to Joseph Ridgeway, Esq., brother-in-law of the before-mentioned Mr. Wm. G. Leveson-Gower, remaining there over six years. His next place was at Hams Hall, Birmingham, as head gardener to the Rt. Hon. Sir Chas. Adderley (now Lord Norton), brother-in-law of the late Granville Wm. Gresham Leveson-Gower, Esq., where he remained nine years. Owing to his wife's delicate health, Mr. Dean was compelled to leave there, and the head gardener's place at Titsey Place being vacant, he was invited by Mr. Granville W. G. Leveson-Gower to take it again, which he did in October, 1875, and has remained there ever since.

Mr. Dean was always willing to help all young gardeners, and give them the best practical advice in his power. He had a wonderful memory for the names of the different kinds of fruit and flowers, and was an excellent cultivator of them, as also of vegetables and plants generally, and has won many prizes and certificates at local horticultural shows, and at Chiswick and the Crystal Palace. In 1887 he won a Bronze Medal of the One-and-All Agricultural and Horticultural Association Show; and in the same year the Sir Joseph Banks Bronze Medal of the Royal Horticultural Society at the National Co-operative Flower Show.

The gardens and grounds under Mr. Dean's care

were always kept in excellent order, and all who paid him a visit were always made welcome.

He will be much missed by all who knew him; his cheery manner, kindness of heart, and good-nature, having greatly endeared him to them.

Much sympathy is shown to the widow and daughters (two) in their sudden bereavement, especially by the family with whom he had been so long connected.

The funeral took place at Titsey churchyard on Saturday last, the 4th inst.

Mr. Dean was a life-member of, and had for many years been an annual subscriber to, the Gardeners' Benevolent Society.

JOHN LAING.—We deeply regret to have to announce the death on the 8th inst., from apoplexy, of this distinguished and much esteemed horticulturist in his 77th year. Among nurserymen and hybridists he was in the foremost rank, and his genial qualities endeared him to all that met him. In early life he devoted much attention to botany in Edinburgh, his collection of Mosses being remarkable. At the moment we have no particulars of his early life, but when we first knew him he was a partner in the firm of Downie, Laird & Laing, of Edinburgh. Subsequently he represented that firm in London, but for many years past he was the head of the firm of John Laing & Sons, of Forest Hill.

As a hybridist and a raiser of florists' flowers, Pentstemons, Clivias, Streptocarpus, Gloxinias, and the like, he did good service; while his work with the tuberous Begonias completely revolutionised that genus. For that alone, his memory will stand out prominently for generations to come. To the gardening charities he did yeoman service, and in all public horticultural affairs he was an active participator till declining health necessitated his partial retirement.

THE LATE JOHN LAING.

ENQUIRY.

A CORRESPONDENT, "W. R.," would be glad to hear of the whereabouts of Mr. Thomas Reid, landscape gardener, and at one time a contributor to the pages of this journal.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

JULY 31.—*Present:* Dr. M. T. Masters, in the Chair; and Dr. Russell, Rev. W. Wilks, and Rev. G. Henslow (Hon. Secretary).

Diseased Peaches.—Mr. ROGERS, of Bridge Hall Gardens, Bury, sent samples attacked by the "Peach-mildew." The Peaches become arrested in patches, never ripening where the fungus is located. Sprinkling with sulphur is the best remedy.

Decayed Roses.—Mr. KELLY, Gardens, Greenwell Ford, Durban, forwarded shoots split and decayed. The appearance suggested their being cracked by frost, and subsequently attacked by fungi.

Synanthic Nymphæa.—Mr. HUDSON sent a specimen of twin flowers united, of the lavender-coloured Nymphæa stellata from South Africa.

Stanleya pinnatifida.—Flowering sprays of this Crucifer were sent by Mr. BUNYARD. It is remarkable for the long spreading filaments and yellow sepals. It is a native of California, and figured in Gray's *Gen. Flor. Amer. bor.*, pl. 65.

Figs dropping.—Dr. RUSSELL brought some Figs grown against a wall at Ringwood, Cornwall, which turned yellow, became shrivelled, and fell just before ripening. There was no fungus, but it was apparently due to want of water or nourishment. They were sent to Mr. WRIGHT for examination, who reports as follows:—

"There are several causes that will affect Figs like the examples just to hand; such as too much or too little water, insufficient atmospheric moisture, and sudden checks in the atmosphere, also over-cropping. Any one of these will cause the fruit to drop prematurely. No fruit requires so much care and attention as the Fig."

Pears decayed.—Dr. W. G. SMITH sent the following report on Pears received from the Rev. H. W. FLETCHER, Bicker Vicarage, Boston:—

"The Pears received were quite dried up, and full of mycelium; they had assumed the mummified condition which follows attacks by Monilia fructigena, the brown fruit rot of Apple, Pear, Peach, and other rosaceous fruits. Cultures in a moist chamber produced several forms of fungi, including the form of spores known as Monilia. There were some insect larvæ in one of the fruits. Your correspondent mentions that the check began during a south-east wind, and also that the very early sorts escaped attack. In view of this it may be safest to assume that the crop received a check by this wind, and that the fruit was thus rendered susceptible to attack by fungi, &c.; the Monilia form producing the mummified condition of the fruits received. The earlier sorts escaped because the fruit was further advanced and more resistant. All the dried fruits left hanging on the tree should be gathered and burnt."

Fruit Committee, Chiswick.

AUGUST 3.—In wild, stormy weather there was but a small attendance at the meeting of the Fruit Committee convened here on the above date.

It was mentioned that the First-class Certificate granted an early Potato at the previous meeting under the name of Sharpe's Early Kidney had been corrected, the proper name being Denby Castle. Some sixty varieties of Potatos were tried, chiefly of early and mid-season varieties, and there are several scores of later ones, old and new, to be seen at a future time. Nine varieties were cooked, amongst which the well-known Beauty of Hebron was one of the best. This was awarded three marks, and also was Pioneer (new), a very handsome free-cropping kidney. Awards of Merit previously made to Sutton's Harbinger (dwarf and free), Early Peter (very free cropper), and Sharpe's Victor, now as a border variety, were confirmed. One or two others, very fine croppers, are to be seen again.

A small trial of Dwarf Kidney Beans was next inspected, and three marks were given to Early Favourite (Veitch) as very early and free-cropping. A hybrid variety from the Dutch Runner and a dwarf, having white flowers, was of great promise, and is to be seen again at a later date.

DEVON AND EXETER HORTICULTURAL.

AUGUST 3.—This, the 191st exhibition of the Society, was held in the accustomed place, Northernhay Park, on the above date, and in rainy weather. The date was fourteen days earlier than usual, and as a consequence the exhibits were fewer, fruit was not fit, and specimen plants not sufficiently forward; and taken as a whole the exhibition was below that which is customary. It seemed as if some of the exhibitors were holding back their exhibits for the Taunton show, which is held at the usual time in the second week of August, and where the prizes are of higher value. The vegetable classes were as usual very well shown, and entries numerous.

CUT FLOWERS, OPEN.

The best twenty-four show and fancy Dahlias, and twenty-four Cactus varieties, were those shown by Mr. W. B. SMALE, nurseryman, Torquay; and Messrs. W. TUPLIN & SONS, nurserymen, Newton Abbott, were 2nd in each class.

The best twenty-four Gladiolus, distinct, were shown by Mr. S. DOBREE, Wellington; and Messrs. W. TUPLIN & SONS were 2nd.

The finest twelve blooms of Tea Roses were those exhibited by Messrs. JARMAN & Co., of Chard. In these classes the competition was very limited.

TABLE DECORATIONS.

There were four exhibits of these objects as compared with nine last year. The Silver Cup (value £5) went to Mr. BARNES, gr., Winslade, Exeter; and the 2nd prize fell to Mr. F. LOCK, gr., Newcombes, Crediton. The tables were prettily arranged in all cases, and flowers of Orchids were largely used in the various devices. The table which was awarded the 1st prize was remarkable for the lightness of the arrangement; fronds of Adiantum gracillimum were used throughout, and Oncidiums freely associated with Odontoglossums.

SPECIMEN PLANTS.

The 1st prize for twelve stove and greenhouse plants, half to be flowering, fell to Mr. Rowland, gr. to W. BROCK, Esq., Parker's Well, who showed the same plants he has shown for a number of years. The flowering specimens were rather late, and will be in bette condition in a week There was really no competition.

For six specimens, and for six stove and greenhouse plants, Mr. BROCK's gardener was again 1st, there being no 2nd prize awarded owing to lack of competition.

In the class for six stove and greenhouse exotic Ferns there were several entries, and the competition was fairly lively. 1st prize went to Mr. ROWLAND; and 2nd to Mr. J. Harding, gr. to J. H. LEY, Esq., Trehill.

GROUPS.

Miscellaneous plants arranged for effect in an oval 15 ft. by 11 ft., Mr. W. R. Baker, gr. to Lady DUCKWORTH, Knightleys, was 1st; and Mr. ROWLAND 2nd. In this class the competition was keener, but although Mr. BAKER's group was the more effective, it lacked brightness.

For the smaller group, 11 ft. by 6 ft., Mr. J. HARDING was awarded the 1st prize, no 2nd being forthcoming. Humea elegans, Galtonia candicans, Tuberoses, Gladiolus, Codiæums, Adiantums, and Draciænas were freely used in the groups. The Orchids failed to bring any competition.

PLANTS IN BLOOM.

Mr. Rowlands, gr. to W. BROCK, Esq., was 1st for six well-grown Fuchsias; and Mr. Cole, gr. to W. B. HEBERDEN, C.B., Elmfield, was 1st for six Gloxinias, having flowers and fine colour and size—an exceptionally fine lot. Rev. S. P. COLERIDGE, Alphington, was a close 2nd. Mr. W. R. BAKER, gr., Knightleys, was 1st for six Cockcombs of the Glasgow Prize strain; Sir JOHN SHELLEY was 2nd. Tuberous-rooted Begonias and Caladiums, were well shown by Mr. W. R. BAKER, who was 1st with both.

Six zonal Pelargoniums, single-flowered, Mr. T. Stark, gr. to MARK FARRANT, Esq., St. Thomas, was 1st, and Mr. ROWLANDS, 2nd, these awards changing places in the class for double-flowered varieties.

Oxford Dictionary of National Biography

Dickson, James (1738?–1822), *botanist*
by Anita McConnell
© **Oxford University Press 2004–14** All rights reserved

Dickson, James (1738?–1822), botanist, was born at Kirke House, Traquair, Peeblesshire, allegedly of humble parentage, and began work as an apprentice in the gardens of the earl of Traquair. He then went to London and worked as an improver at the famous nurseries of Jeffrey & Co. in Brompton. He held several posts as a gardener before opening his own shop in Covent Garden in 1772 and establishing a business as nurseryman and seedsman. Dickson could now count among his friends William Forsyth, the king's gardener, Sir Francis Drake, master of the household, and Sir Joseph Banks. With Banks's support he secured in 1781 the contract to maintain the British Museum's garden. Several of Banks's overseas correspondents enclosed with their letters plant material for Dickson.

The identity of Dickson's first wife is unknown, but after her death he married, on 24 October 1786 at Selkirk, Margaret (1762–1837), sister to his friend the then medical student and later explorer, Mungo Park (1771–1806). Their son, James (*b*. 1800), and daughters Isabella (*b*. 1796) and Jean (*b*. 1805) were baptized at the Scottish presbyterian church in Covent Garden. Before leaving for Africa, Park gave Dickson power of attorney, and in 1806 and 1807, when Park had been missing for some time, Dickson reminded the Treasury of the government's promise to support Park's family.

In February 1788 Dickson was one of seven who formed the first ‘fellows' meeting’ of the Linnean Society at Marlborough Coffee House. Sixteen years later, on 7 March 1804, he was one of seven who gathered in the house of bookseller John Hatchard to found ‘a society for the improvement of horticulture’. This body developed into the Royal Horticultural Society, with Dickson as one of its vice-presidents.

Although his daily work concerned cultivated plants and vegetables, Dickson's reputation as a botanist rested on his studies of mosses, begun in 1781, and on grasses and fungi, much of his material being gathered in visits to Scotland between 1793 and 1802. In 1785 he began publication of *Fasciculus plantarum cryptogamicarum Britanniae*, a quarto work in four parts with 400 descriptions. However, Dickson himself was ill-educated, as his correspondence shows, and the Latin texts were prepared by John Zier, a Polish-born London apothecary. Zier died in 1796, before the last volume was completed, and Dickson was then assisted by Robert Brown. Neither man was credited in the work, and Zier's role only came to light in the 1880s with the discovery of some of his manuscripts. Dickson also published *A Collection of Dried Plants, Named on the Authority of the Linnaean Herbarium* (1789–92), consisting of 425 species, followed by *Hortus siccus Britannicus* (1793–1802). Few copies of this work survive as many purchasers extracted the specimens to add to their own dried collections.

From the 1790s Dickson also had a nursery garden at Croydon, Surrey. He lived at Bedford Street, Covent Garden, from 1795 to 1799, thereafter at Broad Green, Croydon, where he died on 14 August 1822. On 22 August he was buried, at his own

request, in the churchyard of All Saints, Sanderstead, among the Surrey hills where he was accustomed to gather mosses. The Covent Garden nursery passed to Dickson's nephew, James Anderson (1800–1830), and Margaret Dickson inherited the Croydon house and garden; she was buried at Sanderstead on 17 June 1837, passing the property to their unmarried daughter Jean. Dickson's memory is preserved in the genus *Dicksonia*, consisting chiefly of tree ferns.

be worked by a valve, and only used when the ground thermometer indicated its necessity.

It may be asked, How about the bottom pipes in case of accidents? Now I do not see the use of burying so much money for the sake of gratifying a feeling of security against evils that may never came. Nor do I think it at all necessary or profitable to attempt to heat vineries except in the case of small houses for especial early purposes, and even then the advantage is only one of time. This has been my experience of bottom-heat—not that I have ever made it a point to select houses for Vines where I had bottom heat at command, but the force of circumstances has compelled me to have recourse thereto in order to fill up gaps which might otherwise occur while a process of renovation was being carried out. *W. Hinds.*

(*To be continued.*)

THE CHAMPION GRAPE GROWERS.

WE are glad to be able to lay before our readers the portraits of the two Vine growers whose successes at the International Fruit Show at Edinburgh last year, were so noteworthy. This year at Dundee, as will be seen in another column, they have well maintained their repute, for which reasons some account of their respective careers may be of unusual interest.

JOHN R. CURROR.

Mr. Curror served his apprenticeship in Fife, and then became gardener in a small place in East Lothian, from which he removed to his present situation, where he has been four years. He has two vineries, where the Vines were planted six years ago—the soil a strong yellow loam mixed with the dark sharp soil of the neighbourhood where they grow, with a large allowance of ground bones and some rotten dung. The early house produces splendid crops of Black Hamburghs and other early sorts; the late house grand examples of Black Alicante, Mrs. Pince, Lady Downe's, and, as all the world now knows, splendid bunches of Raisin d'Calabre. The Vine of this Grape that produced the largest and probably most handsome bunch of Grapes that was ever seen, produced last year besides it over 20 lb. of Grapes, showing that the monster had not swallowed all its neighbours, as is common in such cases. Mr. Curror makes no sacrifice of crop for the mere fame of producing great bunches, which makes his success the more creditable.

In his greenhouse are a number of very finely grown Heaths, as well as other greenhouse plants. His Orchid-house is filled with very healthy, well managed plants of that most interesting race. His cold and warm Fern-houses are also filled with well-grown Todeas, Dicksonias, Davallias, Adiantums, &c.

The whole place is in excellent order, and though not more than an acre in extent it well repays a visit at all times. Mr. Curror seems a gardener by intuition, and his skill is only equalled by his modesty; in fact he seems quite embarrassed when reference is made to his triumph as a Grape grower.

JAMES DICKSON.

I commenced my gardening career in 1853 (says Mr. Dickson), at the age of fourteen, under Mr. John Maclean, gr. to the late Wm. Forbes Mackenzie, Esq., of Portmore, Peeblesshire, under whom I served for three years, and during the greater part of that time I had charge of the houses. Mr. Maclean was famed as a first-class grower of Camellias; indeed, I have never seen a finer and more healthy collection of that favourite plant anywhere.

When leaving Portmore I engaged as an under gardener with Mr. James Baird, gr. to the late Captain Patterson, of Cunnoquhie, Monimail, Fifeshire, in which garden I had the privilege of assisting to renew the vineries, the Vines of which, Mr. Baird told me some time after, had turned out remarkably well. Few growers excel Mr. Baird as a grower of Pines and Grapes.

While at Cunnoquhie I was requested by Mr. John Pender, late gr. to David Anderson, Esq., of Moredun, Liberton, near Edinburgh, to come to him as a journeyman. Accordingly I engaged with him, and I had charge of a very extensive range of forcing-houses. I had good opportunities afforded me while there of improving myself.

After four and a half years' service at Moredun I came to Arkleton, my present situation, in the latter end of 1862. It is 5 miles north of Langholm, in the centre of Ewesdale, and surrounded by the finest hill scenery in the South of Scotland. It has for centuries been the property of the Elliots, an old and celebrated border family. The present proprietor, Wm. Scott Elliot, resides in Edinburgh. It is the residence of my present employer, John Jardine, Esq., of Thorlieshope, and has been the residence of his ancestors for upwards of a century. He is a retired country gentleman, who not only takes great pleasure in his own garden, but also patronises liberally the horticultural societies in the locality, and awards handsome prizes to the cottagers in the district for the best kept gardens and window plants—an example well worthy of imitation.

The house was erected in 1860, and occupies the site of the old Peel Tower of the Elliots of Ewesdale, and combines all the architectural features of the Border keep with the elegancies and conveniences of the modern mansion.

The gardens were planned in 1862 by the late Mr. Little, of the firm of Messrs. Little & Ballantyne, of Carlisle, and were laid out by me in 1863 and 1864. The ground occupied by the garden had evidently at one time been a watercourse, so that I had in a great measure to make the soil, but a deep stratum of gravel underlies it which makes an excellent drainage—a circumstance not without its advantages in a locality where the rainfall is so heavy.

The vineries consist of two houses (Shaw's patent), each 30 feet long, planted with the following Vines:—Black Hamburgh, Mill Hill Hamburgh, Golden Hamburgh, Duke of Buccleuch, White Frontignan, Black Frontignan, Black Prince, Alicante, Lady Downe's, Mrs. Pince's Muscat, Madresfield Court, Tyninghame Muscat, Archerfield Muscat, Gros Colman, and Syrian.

The Peach-houses are 180 feet long, in two divisions, each 90 feet long, with a drum trellis running along the front, and occupied both back and front with well-grown, healthy-looking and fruitful trees, principally Peaches and Nectarines, with the exception of a few Cherry and Plum trees.

Each of the Vine borders is 14½ feet wide inside and the same outside. In making the border I took out what soil there was, and gravel to the required depth, and in the bottom of the border I laid as a foundation a foot of stones, over the stones a slight covering of lime-rubbish, over this turf with the grassy side down, and then filled up the borders with the following compound:—The turf of a fine fibry loam taken from an old sheep pasture; to every twelve cartloads of this turf were added two cartloads of old lime-rubbish, one cartload of horse-droppings, one cartload of charcoal, and 5 cwt. of inch bones. The turf was fresh from the field, mixed with the other ingredients; and with this compound the borders were filled up to the required depth, 3½ feet deep inside, the same depth immediately in front of the houses, and 2½ feet next the walk.

In common with others similarly situated I was on the look-out for young Vines, so I heard from my old master (the late Mr. Pender) that Messrs. James Dickson & Sons, nurserymen, Edinburgh, had a superior stock. I therefore took train for Edinburgh, inspected them, and satisfied myself that they were really first-rate. I then ordered the number required, including one Syrian in the list. The number of bunches, with the weight this Syrian has carried, is seen by what follows:—

In the year 1865—3 bunches, 6½ to 8 lb. each
,, 1866—4 bunches, 6 to 8½ lb. ,,
,, 1867—3 bunches, 7, 8, and 9 lb. ,,
,, 1868—2 bunches, 8 and 8¾ lb. ,,
,, 1869—1 bunch, 16½ lb.
,, 1870—1 bunch, 19 lb. 5 oz.
,, 1871—1 bunch, 18 lb. 7 oz.
,, 1872—1 bunch, 19 lb. 6 oz.
,, 1873—1 bunch, 16 lb. 10 oz.
,, 1874—1 bunch, 12¾ lb.
,, 1875—2 bunches, 8 lb. 12 oz., and 12 lb. 10 oz.

The Vine that carried the bunch last year which weighed, when cut, 26 lb. 8 oz., is a young Vine grown from an eye taken from the above. The second year it was planted a bunch was cut from it that weighed 14 lb.; the third year, one of 16 lb. 6 oz. Another that I have of the same, growing on the back wall of one of the vineries, has carried some very big bunches, with which I have taken prizes at local shows. All the other Vines, with the exception of a few that I have added recently, were cropped the second year, each carrying seven or eight bunches.

I last year cut from a young Vine of Mrs. Pince's Muscat two bunches, each 5½ lb., one 6 lb., one 6½ lb., and one 8 lb. weight. From a young Vine of Alicante four bunches, which weighed 3 lb., 5 lb., 9 lb. 6 oz., and 10 lb. respectively, and Black Hamburgh bunches that weighed 6 lb., 7 lb., and 8 lb.

In the year 1869, at the Edinburgh International Show, I got 1st prize with a bunch weighing 16½ lb.; in 1870, at the Royal Caledonian Society's Show, with a bunch weighing 19 lb. 5 oz.; at the same place in 1871, 1st prize, with a bunch weighing 18 lb. 7 oz.; at the Glasgow International Show in 1872, I got 1st prize for the heaviest white, with a bunch 19 lb. 6 oz., and 1st for heaviest black, with a bunch of Hamburghs, 6¾ lb. In 1873, at the Manchester International, I was 1st for the heaviest white, with a bunch 16 lb. 6 oz.; and 2d for the heaviest black with a bunch of Black Prince, weighing 5 lb. 13 oz.; and in the same year, at the Royal Caledonian Horticultural Society's show in Edinburgh, I received the 1st prize for white, with a bunch weighing 16 lb. 10 oz. At the same Society's show in 1874 the 1st prize for white was awarded to me for a bunch weighing 12¾ lb.; and the 1st for black, for a bunch of Alicante weighing 8 lb.

In addition to the places named, I have been very successful as an exhibitor at local shows, where for fruits, flowers, and vegetables, I have taken over 400 prizes during the last twelve years. The bunches of Grapes shown for weight at the local shows have been of various weights—from 5 lb. to 16 lb.

Fruit trees thrive very well here; very few standards are grown, but the walls are covered with a very good selection of Pears, Apples, Plums, and Cherries, most of which bear annually fine crops of fruit. The following is a list of Pears that fruit remarkably well here:—Easter Bergamotte, Beurré d'Amanlis, Beurré Diel, Chaumontel, Crawford, Dunmore, Nélis d'Hiver, Green Chisel, Hessel, Jargonelle, Marie Louise, and Swan's Egg.

As a rule, Cherries do very well. May Duke and Royal Duke have done better than any other sort that I have tried.

I have a very good selection of Plums, but some of them have not done very well as to bearing fruit. The sorts that have been most productive are the following:—Blue Gage, Green Gage, Guthrie's Tay Bank, Huling's Superb, Kirke's, White and Red Magnum Bonum, Orleans, Victoria, and Reine Claude Violette. In regard to the growing of Gooseberries and Currants I have been very successful, attributing my success in that direction to a good mulching of manure which I give them annually.

Independently of having a good substantial Vine-border, I generally give the Vines a liberal top-dressing every year (to the depth of about 3 inches), with turfy loam, mixed with inch or half-inch bones. As to the growing of fine Grapes, I have great faith in inch or half-inch bones and liquid manure. Guano-water is very good; but, so far as I am a judge, it can never be compared with liquid manure. What I use here is taken from a tank in the farmyard, and with this I give the Vines a good watering, say three times, before they begin to colour.

As a grower of Peaches and Nectarines I have been very successful in taking prizes at the following places:—Edinburgh, Carlisle, Langholm, and Lockerbie.

NOMENCLATURE OF TIMBER.

"What's in a name?"—*Shakespeare.*

THE answer may be given in the words of the same poet—"more than's dreamt of in our philosophy." It is impossible to take up any feature or subject so closely associated with the common wants of man as that of timber, without finding in its name something of absorbing interest. As a material it ranks second to no other, either in connection with man in his rude and primitive state or under the high polish of civilisation; so closely is it associated with his everyday life that we may say of it as of his shadow—it is always with him.

A mere glance at the vocabulary pertaining to timber shows it abounds in monosyllables, and that words of a compound character are the exceptions. This fact points with unerring truth to the rude and simple language of our Saxon ancestors as the source from which it is drawn. We find, so far as this country is concerned, that the Celtic and the Roman "tongues in trees" have failed to reach our times, and that names of a Norman origin occupy no prouder position than parasites upon the grand old Teutonic stock.

The study of this subject carries us back to an early period in the Christian era, when our eastern coast was called the "Saxon shore," when every creek and river mouth of this fertile spot "set in the silver sea" was infested with the blue-eyed strangers of the North; it shadows forth a time when like a living wave this intruding race swept over the land, blotting out in its devastating course the vernacular of its predecessors, and setting up a standard tongue which, with sundry changes consequent upon the wearing effects of time, has endured to the present day.

In dealing with the nomenclature of timber it is impossible in the limits of a single chapter to give it the attention it deserves, hence we must confine ourselves to a simple abstract, leaving the question of its elaboration to be dealt with in the future.

Ash, in alphabetical order, claims our first attention; it is the "aesc" of the Anglo-Saxons, and the "ast" and "ask" of the Swede and Danish dialects. From being the wood of which the lances, spears and shields of our forefathers were made, it became *par excellence* the tree of war, and unlike its present feminine, the "queen of the woods," was endowed with masculine attributes. It held the high distinction of being the personification of strength and valour, and it was a tenet of the heathen faith of the northern nations that the first man, Æsc, was made from the wood of this tree. From this belief it became a personal name of the highest honour, to be worn only by those of royal blood. Æsc, the son of Hengish, is an instance of its application in historic times, in which case it implied that his genealogy was traceable to this ancient source. It is noteworthy that the Greeks and Romans made their spears or pikes of this wood, a custom also obtaining with the Saxons, who called this warlike instrument an "aesc."

Balk, or "baulk" as applied to a log of wood, is from the Saxon *balc*, the German *balken*, and the Dutch *balk*. In the former dialect it had a more extended meaning than it bears at present, as we find it implied a beam, a roof, a covering, or a balcony.

Batten is from the Saxon "bat," a boat or ship, and implies a piece of wood suitable for making or building such vessels. The club or bat of the cricketers, as applied to a piece of wood, is allied to this word.

Beam, from the German "baum," a tree: in the sense of a tree, the word still lingers with us in Hornbeam—Horn tree; its primitive meaning was a rough hewn tree, used for constructive purposes.

Board is the Anglo-Saxon "bord," and German "brade," a thin plank. This word has been highly wrought upon; from being made of boards, we find it applied to the deck of a ship, also to a table, and

hence those that assemble round it and even the food placed upon it.

Charcoal is a compound of the Russian and Anglo-Saxon tongues; "char" is to burn or reduce to coal or carbon, and "coal" is a term referable to a black substance. Charcoal means literally wood reduced to impure carbon by expelling the volatile matter. In the early history of the iron trade of this country it was an ingredient of the first importance; our present name for fossil coal is borrowed from this material. When made from Beech wood it was called "Beech coal." Charcoal burners were called colliers—an occupation or calling which furnished the family names of Collier, Collyer, and Colyear.

Chestnut, sometimes called Spanish—from the fact of the best fruit coming from that country—is from the Anglo-Saxon "cyst-beam," literally the fruitful tree. Being a tree requiring a warmer climate to ripen its fruit than that prevailing in this country, it is naturally inferred that it was a tree little known to our rude ancestors. Be this as it may, the fact remains that they were present at its christening. The Horse Chestnut was so called upon its introduction from Asia in 1629, the term being a mere translation of its classic name, *Hippocastanum*.

Deal is the Anglo-Saxon "dael," and the German "diele," a part or portion; hence a piece of wood. In early times it most probably referred to a riven piece, as a riving axe was called a "deal axe." We still retain the word in "a deal of cards," meaning a division or portion of the whole. So far as the timber trade is concerned, the term "deal" appears to have been applied alike to the Fir and the Spruce, the "mast tree" and "deal tree" being common terms long before it was known what trees they were the produce of.

Elm, from the Anglo-Saxon "elm" "ellm," or "ulme," and the Dutch "olm." This name occurs with slight variations in all the Celtic dialects. From the fact that the Elm rarely ripens its fruit in this country, coupled with the resemblance of its name to the classic *ulmus*, it is looked upon as a doubtful native. The term "Wych Elm" is supposed to refer to its ancient use for water pipes, especially in connection with salt-springs, erroneously supposed to have been called "wycs" and "wics," as in Nantwich, &c. The writer is of opinion that the term "wych," also referable to the Hazel and the Mountain Ash, is merely a varied form of "withe"—a lithe or pliant rod or twig.

Fir, as a term, embraces all the best known coniferous trees, such as the Scotch Fir, the Spruce Fir, and the Silver Fir; it applies to trees of a resinous character, easily ignitible, and consequently suitable for fuel, for torches, and firebrands. Gerard says "the Fir tree" was originally the "fire tree"—an inference that all investigations confirm; and there can be no doubt upon comparing the Anglo-Saxon "fyr," fire, with the Scandinavian "fyrre," Fir, that the terms "firewood" and "Fir-wood" are synonymous.

Forest is an Italian or Armenian word, which has reached us through our French or Norman collections; it appears in the German language as "forst." Our ancient forests were called "woods," as in Sherwood; but the intruding term, although superfluous, has tacked itself on behind, hence the common phrase "Sherwood Forest." The Saxon "woodward" from this change of dialect became the Norman "forester;" as an occupation it was of sufficient importance to found a large family of personal names, hence those of Forrester, Forster, and Foster.

Log is an old Dutch term for "heavy," hence a heavy piece of timber is so called; the equivalent in the German tongue is "klog." In America, where the mother tongue is subject to great mutations, the act of rafting timber has got corrupted to "logging."

Lumber—dry household rubbish—has taken the place of the term "wood" on the American continent. With the early settlers, whose all lay in the cultivation of cereals, timber was an incumbrance to the land; and although it has long since raised itself into a marketable commodity, it has failed to free itself from this term of ridicule.

Oak, the Anglo-Saxon "a'c," "aec," and "aac," and German "eich;" the first form is preserved to us in the fruit "a'ccorn," the corn of the Oak. In ancient times it was a tree prized for its fruit, being used for fattening swine, and in time of dearth as human food. Oak woods were estimated by the number of hogs they would fatten, proof of which we find in the Doomsday Survey, where woods of a single hog are enumerated. Pliny says in his time acorns formed the chief wealth of many nations. The etymology of this word is difficult to arrive at; it appears to be a term peculiar to the North of Europe. We find it in "ac-drenc," oak-drink, a drink made from acorns, and "ac-wern," a squirrel. This interesting animal was known by this ancient name before we borrowed the present one from our French neighbours.

Plank runs through the French, Dutch, German, and Danish languages with little variation. It implies a flich of wood thicker than a board. It is a term which no doubt reached us through our early trading connections with the Low Countries.

Poplar, like all other trees whose names rise above simple monosyllables, is supposed to be introduced. The white and the Aspen Poplars are the trees with which our forefathers were familiar, the black and the

THE GARDENS AT SEZINCOT HOUSE, MORETON-IN-THE-MARSH.

THREE miles from Moreton-in-the-Marsh, high up on the Cotswold Hills, is the picturesque residence of Mr. J. F. Dugdale. The drive from the railway station is party through a finely-timbered and undulating park, with overhanging Oaks and Elms forming a striking avenue. Situated in a glorious position, the mansion, with its wonderful copper dome, is quite unique. It was erected by the late Sir Charles Cockerell, and the style is that of an Indian palace. The surroundings are worthy of the stately house, and since Mr. Dugdale bought the estate, great improvements and developments have been made in the gardens. These are on an extensive scale, and they are remarkable for absence of conventionality, wealth of colour, variety of attractions, and consistent beauty. The conservatory is a singularly handsome and imposing building, harmonising with the character of the mansion to which it is contiguous. Entering it with Mr. J. H. Dines, the head gardener, soon after my arrival on a pleasant spring morning, my attention was attracted to a couple of notable plants of Datura. and I enquired their age.

DATURAS FOR FIVE MONTHS.

"They are at least sixty years old," he rejoined. "One is red and the other yellow, and they are in flower from May to September. The blooms hang down naturally, and are most decorative. We do not cut them, but allow them to remain a feature of the conservatory. Every spring I prune them hard back. Otherwise they are left alone. Growing here also are the Lily of the Valley tree—Clethra arborea—and Brugmansia sanguinea. We plant the big things out, and the remainder are all in pots, except, of course, the baskets. For the latter purpose Oxalis cernua is very useful. It has pretty yellow flowers. The treatment is similar to that of Freesias. After flowering the plants are ripened off, and I start them again in autumn."

SERVICEABLE CLIMBERS.

"Is there more than one variety of Rose on the roof?"

"No; it is entirely covered by Bouquet d'Or; but as climbers in different parts of the building, there are also Lantanas salvæfolia, yellow Abutilons, Passiflora cærulea, and Tacsonias."

"Then there are the numerous flowering plants in pots, such as the pink Impatiens Oliveri. How do you treat it?"

"As a cool greenhouse plant, and I have no trouble with it so long as it gets plenty of root room and moisture. The Primula obconica varieties have been selected for some years, and do well in a cool temperature. They last in flower for several weeks. Fuchsias, too, contribute materially to the brightness of the conservatory, and we have just finished with Clivias.

"The only formal bedding at Sezincot is on the south front, and in order to relieve it as much as possible from stiffness, grass is used instead of gravel as a setting. The spring scheme now in evidence embraces Wallflowers Cloth of Gold, with wide edging of Sutton's Myosotis Royal Blue; beds of white Polyanthus and scarlet Tulips, yellow Polyanthus and Picotee Tulips, double Arabis with Couleur Cardinal Tulips, and Wallflowers Miss Willmott and Blood-red. Here we have Rose beds frequently occupied with Violas later on. Most of the varieties are old favourites, but there are some of the newer. The principal are Augustine Guinnoisseau, Caroline Testout, Frau Karl Druschki, Killarney, Lady Ashtown, Liberty, Lyons Rose, Pharisaer, Richmond, Viscountess Folkestone, and Lady Roberts. Later on the stone jars on the terrace wall will contain specimen plants of Hydrangea hortensis."

THE SPIRAL FOUNTAIN IN THE GROUNDS AT SEZINCOT.

From the south front, which includes a charming fountain, we proceeded to the south side of the mansion, where an immense improvement was carried out eighteen months ago by the removal of a bank from fifteen to twenty feet high, which blocked the view. One of the tennis-courts gives access to the wild garden.

ERICAS IN THE WILD GARDEN.

"How long does this date back, and how do you manage to obtain such a glorious display of Heaths?" I asked.

"It is the new ground, twelve years old. With regard to Erica carnea, which has been in flower on the slopes since February, owing to the presence of too much lime in the soil we prepare the beds, and use plenty of leaf-soil in making them up. Erica mediterranea hybrida is more robust. The plants are finer, and they are in flower for months. Here we are always trying to naturalise fresh plants, so as to secure new patches of colour in the grass. Anemone appenina is used for this purpose."

"Bamboos seem to be thoroughly at home."

"Yes, the varieties japonica, nitida, and palmata make fine specimens. Other shrubs and tree include groups of Acers, dissectum roseum marginata atrosanguinea, septemlobum japonicum, and palmatum; Berberis stenophylla and Darwinii; Spiræa Thunbergii, now in bloom, with small white flowers in elegant sprays; a specimen Magnolia soulangeana; the Maidenhair tree; Taxodium distichum; a Cedar quite a hundred feet high; and Abies pinsapo and nobilis glauca. By the side of the stream are Saxifraga peltata and Iris sibirica."

AN INDIAN TEMPLE.

Perhaps the most lovely of all views at Sezincot is afforded from Buffalo Bridge, so called because there are buffaloes carved in the stonework. The bridge itself spans a wide stream, and this feeds a lake about five acres in extent, some distance below. But a greater fascination still attaches to the outlook on the high ground. Between six and seven hundred feet above sea level is an Indian Temple, containing a stone idol. Below the temple is a sparkling stream or cascade, which is widened into three pools at intervals, with a fountain playing in the centre of each. On either side of the temple figures of oxen keep guard, and just at this point is one of the finest pieces of Larch in the county of Gloucester.

"On the lower side of the bridge," continued Mr. Dines, "the banks are planted with Bambusa palmata, japonica, and nitida, and Rhododendrons in variety, chiefly Pink Pearl, Cynthia, and Cunningham's White. On the adjoining slopes Hypericum calycinum, and Viola cornuta purpurea find a congenial home."

"Do you prepare the soil for the Rhododendrons?"

"Yes; they would not flourish in the natural soil, but in that specially prepared they flower profusely. Japanese Maples are also at home, and in the beds near these there are displays of Deutzia crenata flore pleno, and likewise of Diervillea rosea."

"You adopt very much the system of planting in groups?"

"Whenever we can. For example, near the group of Acers is a group of Magnolia stellata, and right through this portion of the grounds, which we call the Thorneries, the same system is observed. Among the most noteworthy trees in this locality is the Hornbeam, and a pair of yellow-flowering Chestnuts. This is one of the best of the Chestnuts."

FOR WATER BANKS.

"What varieties do you find flourish on the banks of the lake water garden?"

"Saxifraga cordifolia, S. peltata, Primula japonica, Lythrum salicifolia, Senecio Veitchii, clivorum, and tanguticum; Artemesia lactiflora, and Spiræa aruncus are all excellent plants for the banks of water. To these may be added for covering rocks, Saxifraga Clibrani, muscoides, and Rhei; Daphne cneorum, Viola gracilis, and Arenaria (balearica). The water garden is the newest extension, and at present we are somewhat in the dark as to the varieties which will do best under the conditions. Aubrietia Dr. Mules is one of the first to justify its selection —it is flowering bravely. The Roses near the

summer house, planted over forest trees, are Mrs. F. W. Flight and Blush Rambler."

THE FRUIT HOUSES.

Lack of time and the distances to be traversed rendered it impossible to go further into detail, especially as two important features of the gardens had yet to be visited. These were, first the range of glasshouses and then the series of walled-in kitchen gardens. Entering one of the three Vineries, I inquired the varieties grown.

"Muscat of Alexandria, Madresfield Court, Black Hamburgh, Mrs. Pince, Lady Downe's Seedling, and Alicante are the varieties grown in the three houses. The Muscats and Madresfield Court were only planted in 1908. They yield large crops. In the Peach house the varieties are Stirling Castle and Belgarde; Nectarines Humboldt, Early Rivers, and Dryden."

"I see that in one of your two plant houses you grow Streptosolen Jamesoni as a pot plant."

"We propagate each year, and it lasts in flower in pots for twelve weeks. I can strongly recommend it for purposes of decoration. Varieties of Hippeastrum, raised here, flowered in batches from January to April. Another useful plant, not very much used, is Scutellaria mociniana."

"Yes, the orange flowers are very pretty. Is there anything special in the treatment?"

"Practically ordinary stove treatment answers, and if the cuttings are taken every spring, there is no difficulty in flowering them. The Schizanthus, with fringed edge to the flowers, you will notice, are selected varieties grown from year to year, care being taken to select the best."

"Do you care to mention any other good pot flowers?"

"You have already seen varieties of Primula obconica. Another very useful flower for pot purposes is Clarkia Firefly, a very showy flower. Browallia speciosa major, Vinca rosea, and Verbena Miss Willmott are used considerably, and in their season all the most useful decorative plants are grown in succession, including a representative collection of Chrysanthemums."

"What is the extent of the three divisions of kitchen gardens within walls?"

"Between six and seven acres. The whole of the walls are covered with fruit trees, Pears, Plums, Apricots, Peaches, and Nectarines—the last two on a south wall, with a glass coping. The varieties that do best are Waterloo, Royal George, and Dymond. It is necessary to use glass copings here to protect the trees when in flower, so that the fruit may set freely."

"Do you grow many varieties of Strawberries?"

"Royal Sovereign, Fillbasket, Vicomte de Thury, Sir Joseph Paxton, Givon's Late Prolific, and Alpine St. Fiacre."

SUCCESSION OF VEGETABLES.

"Have you anything particular to say in respect to vegetables?"

"Our best early Potato is Sutton's Supreme, and there follow in succession Ringleader, Myatt's Ashleaf, Duke of York, British Queen, Edward VII., Factor, and Up-to-Date. The varieties of Peas are Langley Gem, Alderman Selected, Gradus, Gladstone, and Veitch's Maincrop. Onions Ailsa Craig are grown under glass, and planted out for big bulbs. The other varieties are James' Keeping, Bedfordshire Champion, and Veitch's Maincrop. The Onion bed is trenched in autumn, pricked over in spring, and the seed is sown as soon as the ground works well in March."

THE FLOWER BORDER IN THE GARDEN AT SEZINCOT.

THE GARDENER'S HOUSE AT SEZINCOT.

"You have some striking herbaceous borders in the division of the kitchen garden close to your own charming residence."

"The principle adopted in planting in the borders is to secure bold masses, and all the well-known varieties of the most popular flowers are fairly well represented. We keep up a show for several months, and, in addition, we cut from these borders for decoration in the mansion. In the long bed in front of my house Roses of many varieties are grown for cutting purposes, the groundwork being composed of Violas. There is no doubt that the association of Roses and Violas is a very happy one. The aspect, the soil, and the general conditions which suit the one are appreciated by the other, and it is perfectly easy to avoid any clashing of colour."

KEW EXPERIENCES.

"Where did you start your gardening career, Mr. Dines?"

"In the School of Horticulture at Chelmsford. I was then at Kew for nearly seven years, and went through most of the departments, being at one time sub-foreman in the propagating department, and afterwards in the Arboretum. Then I came here to take charge of these gardens four years ago last September."

ALFRED WILCOX.

NEXT week: Interview with a Celebrated Amateur Rose Grower in Hampshire.

SWAINSONIAS.

SWAINSONIA GALEGIFOLIA ALBA is one of the most useful plants to grow in a greenhouse, over a roof or pillar, especially where white flowers are valued because of their adaptability for wearing in coat or dress. This plant is most reliable, and flowers for a considerable period in a house which is kept but moderately warm, and therefore it can be depended upon to do well in the hands of the amateur.

Give it a compost made up of loam and leaf-soil, see that the drainage is good, and one may grow it in a pot or tub, or plant it out on a border in the house.

To keep it in good condition, it delights in rather a humid atmosphere, and therefore one should slightly syringe it in the early part of the day. A dry state at the roots is likely to engender insect pests, which may be avoided by keeping the plants syringed occasionally.

The Swainsonia may be propagated from seeds, which should be sown in spring in a slight hotbed. They germinate better if soaked for a little time in warm water. Cuttings strike readily under a hand-glass. CAPEL CURIG.

and articles advising the eating Potatoes ("ware" we call them) to be carefully placed on the latticed shelves of the Potato houses we see in large gardens, I then think that gardeners do not know what good tubers are like, for I assure you they will not retain their quality if kept out of the pits more than a fortnight or so. The advice, too, that the diseased haulms ought to and must be burned is no doubt very good, or sounds so; but, given suitable weather and a tender variety of Potato, the all-pervading countless myriads of spores will attack the leaves, resulting in the present sad condition of the Up-to-Dates, which were smitten at the same period of warmth and moisture that sprouted sadly our Wheat and Barley in the stook. The very best Potato farmer on the very best Potato farm in the kingdom, when I saw it, was feeding 180 bullocks, and every morsel of haulm was saved for them to tread into manure for the next Potato crop. And no one grows sounder tubers.

The great Potato show at the Crystal Palace is no earthly use if held when everybody is taking up their tubers and no one knows how this or that sort has yielded or withstood the disease. If the society could take the minor hall at the Smithfield Show we should all put in an appearance, and we might then buy a few pounds of one boomed variety or 100 tons of another. NORTH LINDSEY.

NURSERY GARDENS.

MESSRS. W. WELLS AND CO.'S CHRYSANTHEMUMS.

MESSRS. W. WELLS AND CO.'S large double-span greenhouse, 126 feet in length by 54 feet in width, is at the time of writing one of the finest sights within easy distance of the great Metropolis. The collection of Chrysanthemums is a remarkably comprehensive one, and the blooms of all the season's novelties are always produced in such a way as to enable the connoisseur to form a pretty accurate judgment of their capabilities in the future.

Novelties abound, many of them Continental, many of them home-grown seedlings, and others from our distant Australasian Colonies. There are some excellent examples of recent additions, which have proved worthy of a second, or even third, year's trial. Among them we note a fine batch of noble blooms of General Hutton, a grand Japanese of unusual dimensions, deep golden yellow, slightly tinted bronze. Miss Elsie Fulton is a noble white, already well known to the grower for show; and the more recent Mrs. J. Dunn is also conspicuous in a number of capital examples. Rich and attractive is W. R. Church, a massive broad-petalled Japanese that needs no recommendation, as its peculiar shade of crimson makes it everywhere an effective variety. William Duckham is a deep solid-looking variety with incurved florets, colour silvery pink; and other shades of varying intensity in this colour are represented by such varieties as Mrs. George Mileham, Mrs. Barkley, Countess Harrowby, &c. Among the very biggest is Mrs. White Popham, pale purple; and hard by is Florence Penford, a big Japanese with grooved florets, globular in form and deep in build, colour pale buff. Mrs. W. Knox, a fine deeply-built flower, close and compact, with intermingling florets, colour pure pale yellow, is also worthy of note. Miss Mildred Ware is now well known, and maintains its reputation for size and colour wherever we have seen it. Very fine are the noble examples of Mme. Paolo Radaelli, pale blush pink, a big solid flower peculiarly useful on the showboard. Mrs. Henry Weeks, Mme. Ferlat, and Miss Stopford are among some of the best of the whites.

Yellow is essentially the primary colour of our famous flower from the Far East, and, indeed, it is the colour most esteemed by the Chrysanthemum specialists of the Celestial Empire. A Chinese author, who wrote about Chrysanthemums in 1783, tells us that this colour is more highly appreciated than the others, and in his descriptive list he places the yellow kinds first. At Merstham among the yellow varieties are many examples of the best novelties of recent introduction, the most striking and effective being Colonel Weatherall, Merstham Yellow, Mand du Cros, Chelton, the yellow sport from Miss Nellie Pockett, and another, a sport from Miss Elsie Fulton called Souvenir de Mme. Buron. Mrs. W. Duckham is also a grandly-built globular flower with medium-sized florets, in which the body colour is slightly tinted carmine. Bessie Godfrey has been seen everywhere in good form this season, and is certainly one of the finest in its form and shade, while Calvat's grand seedling, named after that champion grower Mr. F. S. Vallis, is one of the most popular of its kind.

A few others of various tones occur to us as worthy of a brief mention. They are Mrs. F. W. Vallis, which has long drooping florets, colour crimson, shaded apricot yellow, reverse old gold; Henry Perkins, a large bloom of great depth, florets long and drooping, colour bright red-crimson, reverse golden; W. A. Etherington, also of great size and of excellent form, colour flesh pink, shaded mauve; Leila Filkins, fine blooms of very deep build, close and compact, the florets intermingling, soft pinkish lilac-mauve.

Novelties of much more recent introduction abound, but our space will only allow of the most superficial mention, as they would form a sufficient theme for a special article to themselves. Of these we like Valerie Greenham, a fine seedling of English origin, with medium-sized florets, colour lilac-mauve; Dora Stevens, long drooping florets curly at the tips, bright shade of rosy amaranth with straw reverse; Mrs. H. W. Partridge, florets of medium size, colour rich fiery crimson, old gold reverse; Hettie Wedge, Japanese, with florets grooved and incurving, colour lovely shade of golden amber; J. H. Doyle, the colour of this may be described as a salmon cerise with golden reverse, big fine blooms with long florets; Mrs. George Heaume, a fine novelty, globular and deep in build, the florets are of medium width, colour golden buff; E. J. Brooks has rather broad florets, blooms big and solid, plum-coloured amaranth; Mrs. J. E. Dunne, a grand flower of great size, florets long and drooping, colour salmon rose, passing to golden buff in the centre. C. H. P.

MR. GEORGE DINGWALL.

A WELL-KNOWN SCOTCH GARDENER.

MR. GEORGE DINGWALL.

IN the course of this month Mr. George Dingwall, head gardener and forester to the Right Hon. Sir Henry Campbell-Bannerman, G.C.B., at Belmont Castle, Meigle, N.B., leaves Belmont after a long period of service. Mr. Dingwall is a native of Ross-shire, and served his apprenticeship at New Tarbatt House, Parkhill, in that county, under the late Mr. James Laing, brother of the late Mr. John Laing of Stanstead Park, London, and, as Mr. Dingwall remarks, one of the best all-round gardeners he ever knew. In 1857 Mr. Dingwall left for the Lothians, where he was a journeyman for two years. In 1859 he went to East Bank Gardens as foreman, remaining there until November, 1860, when he left to enter upon his first appointment as head gardener. This was with Mr. John Hall Maxwell, C.B., Dargavell House, Renfrewshire. In 1863 Mr. Dingwall entered upon a similar appointment with Mr. G. Kelly McCallum, Braco Castle, Braco, Perthshire, where he remained until 1869, when he was appointed gardener to Mr. G. Stirling Home Drummond at Ardoch House, Braco. At Ardoch Mr. Dingwall laid out the gardens anew and made a new flower garden. To the successful carrying out of these works Mr. Dingwall largely attributes his securing his next appointment in 1886—that of gardener and forester to Sir Henry Campbell-Bannerman, who had recently purchased the estate of Belmont, Meigle. At Belmont Mr. Dingwall remodelled the whole of the gardens and grounds, and carried out the important works which have made Belmont such a beautiful and well-kept property. Mr. Dingwall has purchased a property at Newtyle, not far from Belmont Castle, where, it is to be hoped, he may long be spared to work. He does not intend to relinquish horticulture entirely, however, as he means to devote a part of his time to seed-growing. Some of his strains are already well known for their excellence, and he purposes to enter still more largely into seed-growing, as he has a greater demand for his stocks than he can meet. Mr. Dingwall is a most able all-round gardener, and the gardens at Belmont Castle show the evidences of high cultivation in every department. He takes great pleasure in landscape gardening, for which he has a special aptitude, and he has contributed papers of great ability upon this subject to meetings of such horticultural associations as that of Dundee, where he lectured last year. He has also frequently acted as judge at flower shows, where his services were highly esteemed. Among his other acquirements is that of basket-making, and he has taken prizes at industrial exhibitions for his handiwork of this kind, which is exquisitely done. He is a keen antiquarian, and a man full of interesting information on many other matters besides those connected with his calling. S. ARNOTT.

SOCIETIES.

REDHILL, REIGATE, AND DISTRICT GARDENERS' ASSOCIATION.

THIS society held its fortnightly meeting on Tuesday, the 25th ult., in St. Matthew's School, under the presidency of Mr. W. P. Bound, when a most interesting paper was read by Mr. C. J. Salter of the Gardens, Woodhatch Lodge, Reigate, on the "Zonal Pelargonium and its Culture." As usual there was a very large attendance, over 100 members being present. That the lecturer was thoroughly at home with his subject there was no doubt, judging by the very able manner in which he dealt with it. The introduction of the zonal Pelargonium was briefly touched upon; then followed notes upon striking the cuttings, potting, soil, temperatures, and the best houses. Many members took part in the discussion which followed. A hearty vote of thanks was accorded the lecturer, which brought the meeting to a close. F. C. L.

DULWICH CHRYSANTHEMUM SOCIETY.

THE eleventh annual exhibition of the Dulwich Chrysanthemum Society took place on the 8th and 9th inst. The society is in a most flourishing condition. The initiation of a summer show of Sweet Peas, &c., and the remarkable support given to it, especially by the amateur members, points to increasing interest in the neighbourhood. A capital programme of lectures for the winter session has been arranged. The first, by Mr. R. B. Leach, on "Begonias," on Tuesday, October 18, was of a most interesting character, the various stages of Begonia culture, from the initial difficulties of seed fertilisation to the finished and dried-off tubers, were practically and minutely described. The peculiarities of various types were referred to. The hearers were greatly interested and instructed, and the questions which followed the paper were answered in a manner which can only come from a life-long intimacy with the subject.

Later papers on "Sweet Peas," by Mr. C. H. Curtis; "Horticulture in Canada," with lantern, by Mr. Cheal; "Members and their Gardens," &c., are included in the programme.

MR. W. H. DIVERS,

Lathom House, Ormskirk.

houses, excessive railway rates, uncertain markets, and other drawbacks, I am of opinion that there is scope for extended cultivation of choice early vegetables. Englishmen need fear no foreign competition, but one must be quick to learn the requirements of markets."

MR. NORMAN DAVIS,
Cultivator of Early Crops of Vegetables,
Framfield.

Mr. W. H. DIVERS

is well known as gardener to the Duke of Rutland, Belvoir Castle, Grantham, and is a frequent and valued correspondent to these pages. He says:—

"Born at Wierton Place, near Maidstone, where my father was gardener for upwards of forty years, I owe much of my success to his encouragement and teaching; I used to get into the garden at every opportunity, and at the age of fourteen commenced work there in earnest. After four years I went to Linton Place in the same neighbourhood, as journeyman under the late Mr. J. Robson, and remained two and a half years. The estate at that time belonged to the late Lady Holmesdale. Vegetables were grown well here, also hardy flowers, and the extensive flower gardens contained a fine collection of Conifers, planted by the late Mr. Masters, of Canterbury, in 1844; a large collection of flowering shrubs also succeeded well—much of my spare time was spent in examining these. Mr. Robson was chairman of the Maidstone Gardeners' Mutual Improvement Association, and all the young gardeners attended the meetings, which were very instructive.

"I next obtained an introduction to the late Mr. Arthur Veitch, who kindly arranged for me to go

MR. DAVID THOMSON, V.M.H.,
Late of Drumlanrig Gardens, N.B.

as journeyman at Brantingham Thorpe, East Yorkshire, a much smaller place, but where I got acquainted with vegetable-growing in the North, also with a fine collection of New Holland plants and Heaths, and a small collection of Orchids.

"My next move was to the Earl of Scarborough's, Sandbeck Park, where a good establishment was kept, and garden produce had to be grown on a most unfavourable soil. From there I went to Lord Salisbury's, Hatfield, where the gardens had begun to improve under Mr. Norman's management, frequent changes in head gardeners having previously reduced them to a very bad state.

"I next went to Tandridge Court, Surrey, as general foreman, and found the sandy soil very favourable to vegetable growing. After some few months spent in the stoves and Nepenthes house at Messrs. Veitchs' nursery, Chelsea, my next move was to Burghley House Gardens, Stamford, under the late Mr. R. Gilbert, who was well known at that date (1879) as an exhibitor of vegetables, having recently won the 50-guinea Challenge Cup offered by Messrs. Carter, and various other cups and prizes. While I was there, the new vegetable Chou de Burghley was distributed; this had been raised by Mr. Gilbert, and was a cross between a Broccoli and a Cabbage, and the demand for it was so very great that upwards of £200 was

MR. W. L. BASTIN,
Gr. to SIR ALEX. HENDERSON, Bart.,
Buscot Park.

realised by the sale. The Marquis of Exeter, with his usual kindness and liberality, presented me with £5 for keeping the accounts, and gave all the men a present besides. When I had been there

MR. W. H. DIVERS,
Gr. to His Grace the DUKE OF RUTLAND,
Belvoir Castle.

five years the late Mr. Hopwood of Ketton Hall, called to see Mr. Gilbert, and after going through the houses, asked if his foreman could be spared to take charge of his garden; I was called in, and he explained that he had spent a large sum of money in building Peach-houses, and he wanted

a gardener who could grow Peaches better than anyone else in the kingdom. I found on arriving there some very fine houses, and the largest private collection of Peaches and Nectarines in

Mr. R. A. Horspool,
Gr. to Richard Middleton, Esq.,
Chirk Castle, Denbighshire.

the country, but I had to lift the whole of the trees and remake the borders before they fruited satisfactorily. Both Mr. and Mrs. Hopwood often complimented me afterwards on the success I

Mr William Pope,
Gr. to the Earl of Carnarvon,
Highclere Castle.

obtained eventually. I also found vegetables had been very scarce there, and that large quantities had been purchased, but after a few months more were grown than the family required. Hardy flowers and Carnations were in great demand, and good collections were established. In the winter of 1889-90 I went to Florida to inspect and report on an estate there belonging to Mr. Hopwood; this gave me a good insight into American life and methods of business, and proved most interesting and instructive. I collected, dried, and mounted all the wild flowers I could find, and took many notes on the cultivation of the various fruits. As a change of ownership was contemplated at Ketton Hall I resigned my appointment there in 1894, after staying nearly ten years, and commenced my duties at Belvoir Castle, as gardener to his Grace the Duke of Rutland, immediately afterwards."

Mr. Robert Fenn

is very well known as one of the first seriously to attempt to improve Potatos by cross-breeding. It was in 1837 that he first crossed the old "Red Regent" with an indigenous variety of America, given to him by a Mr. Pringle; and as the seedlings proved to be different from their parents, he continued the work and achieved

Mr. Robert Fenn,
A Celebrated Raiser of Potatos.

most gratifying success. He has raised very many excellent varieties, which have been distributed by the firm of Messrs. Sutton & Sons, Reading. Mr. Fenn was born in Suffolk in 1817, and he is therefore eighty-six years old, but in spite of his years he is enjoying excellent health and keenly interested in his garden at Sulhamstead.

Mr. R. A. Horspool,

the gardener at Chirk Castle, Ruabon, Denbighshire, is a young man who developed an interest in vegetable culture at the very outset of his career. He is rapidly making a reputation for himself in the Principality. The following notes afford further evidence that a garden is not necessarily useless or "worn out" merely because it is old:—

"I have always had much liking for growing good vegetables, but it was not until five years ago that I commenced to grow for exhibition. In the first year I was beaten at Chirk and Wrexham Pomological show, but it gave me greater energy for the next season, when I was placed first at both shows. After this success I showed also at Shrewsbury, Birmingham, &c., and have been fairly successful during the last three seasons.

"These gardens are very old, and the date 1651 is cut in freestone over a doorway in one of

Mr. S. Mortimer,
Raiser of Cucumbers and Tomatos,
Rowledge Nursery, Farnham.

the walls. Nevertheless there is a good vegetable and fruit garden of about 8 acres. It lies between three terraces of walls, there being a mile of walls covered with fruit-trees. The two uppermost gardens slope gently towards the

Mr H. W. Ward,
Market Nurseryman, Rayleigh, Essex.

south, so that the situation is all that can be desired, and there are soils in the different quarters to suit every kind of vegetable grown, for there are five or six different kinds. The lowest part of the garden used to be a fishing lake, about

VOL. LIII.—No. 2,938. SATURDAY, FEBRUARY 19, 1910.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

The Superintendence of London Parks.

To the majority of our readers it will appear as passing strange that there should be any difference of opinion with regard to the qualifications that should be possessed by those who are entrusted with the charge of the parks and gardens of great cities or towns of the first magnitude. They will, and not without good reason, assume that the officer should have a practical knowledge of the work that has to be accomplished in the conversion of a tract of land, agricultural or otherwise, into a place of recreation for the public, either as a beautiful garden or a playing field. They will also recognise the necessity of a knowledge of the art of design in relation to open spaces, and of a thorough knowledge of the various classes of trees and shrubs, and of tender and hardy plants, that can be the most successfully utilised in the creation of garden scenery, and especially in districts in which the conditions are so unfavourable to plant life that only a small proportion of the trees and shrubs available will thrive. In other words, they will consider that the qualifications should be such as those only can possess who have had a thorough training in the several branches of scientific and practical horticulture. With those who hold such views we are, it is hardly necessary to say, in full agreement. The necessity of placing the Parks Department of a city or town under the charge of an experienced horticulturist, who, at the same time, is a gentleman and a man of business, is so obvious, that it is well nigh inconceivable a public body such as the London County Council should have elected by a substantial majority as the Chief Officer of its Parks Department a military man, who, it would appear from the discussion at the Council meeting when the appointment was made, did not claim to be fully versed in the art of gardening. That he had shown remarkable ability in the discharge of his military duties, and achieved much success in his vocation there can be no doubt, but that does not affect the question at issue. The London County Council had in their advertisement inviting applications for the post stated that, "The person appointed will be responsible for the laying out and proper management of the conservatories and the horticultural and other buildings therein, and for the management and discipline of the staff employed in the parks service." Here we have evidence that at the outset the Council had in view the advisability of the successful candidate having an acquaintance with horticultural matters. We have a further proof of this in the paragraph in the advertisement, which stated that, "A knowledge of surveying, landscape gardening, forestry, and horticulture is desirable." Yet, having stated that the officer appointed would be responsible for the management of the horticultural buildings, and that it was desirable he should have a knowledge of landscape gardening, forestry, and horticulture, the Council passed over the claims of the candidates who had obtained eminence in horticulture. It was stated in the course of the discussion that the Council did not want a gardener, but an officer who could supervise the large staff engaged in the Parks Department; but, it should be hardly necessary to point out that a thorough acquaintance with the science and practice of horticulture does not preclude the possession of administrative ability of a high order. So far from this being the case, the most highly trained and successful gardeners have invariably the most efficient control over their staff. If we require proof of this, in relation to public parks, we have only to point to the extensive parks and gardens at Cardiff, Edinburgh, Glasgow, Leeds, and Liverpool, all of which are in charge of gardeners There are others, but the mention of these will suffice for our present purpose, especially as they are well known for the efficiency that is evident on all sides. It should be remembered that all the more important of the magnificent open spaces which are under the authority of the London County Council were designed and planted by gardeners, and only those who know something, by repute or otherwise, of the original sites can fully appreciate the magnitude of the task or the success achieved in its accomplishment. When Victoria Park, Battersea Park, and some other of the great open spaces were about to be formed, the authorities did not engage officers in the army or navy to design and plant the areas. They engaged gardeners of known ability, with the result that we have parks so beautiful that the citizens of London have good cause to be proud of their possessions. If it was advisable to entrust the formation of these parks to gardeners, it is certainly not less desirable they should be under the control of a gardener who, by his accomplishments, has shown his fitness for the post. It is not sufficient that the superintendents of the respective parks are gardeners, the chief officer should be one also, so that he may be in a position to advise, when advice is needed,

MR. C. DIXON.

on difficult points; to see that such improvements as may be necessary are carried out on proper lines, and, what is certainly not less necessary, be in a position to appreciate the difficulties under which gardening is carried on amid unfavourable surroundings. The London County Council has shown such a singular want of appreciation of its responsibilities in this matter as to have given rise to much criticism; and the council of the British Gardeners' Association has passed a resolution expressing its disapproval of the appointment of a military officer as chief of the Parks Department, instead of a properly qualified gardener, and with this protest we cordially agree.

Mr. Charles Dixon, head gardener to Mary Countess of Ilchester, has charge of the famous Holland House Gardens, Kensington, gardens that have become very well known in recent years because of the Holland House exhibitions, held in an adjoining meadow, the gardens being opened to the visitors on payment of a small sum. The amount thus received has always been given to a deserving charity, and the Royal Gardeners' Orphan Fund and the Gardeners' Royal Benevolent Institution have benefited materially from this source owing to the kindness of the Countess and her late husband. Mr. Dixon was apprenticed at Rossie Priory, Perth, and following his apprenticeship he gained experience at various gardens in Scotland, and presently became foreman at Belton House, Lincolnshire, where he remained five years. The following two years he spent with Messrs. Lee at their Hammersmith Nursery, and acted as pot-vine grower; and while there he was the first to discover the Phylloxera on the vine leaves. In 1864 he entered the service of the late Lady Holland, at Holland House, and at her death was engaged by the late Earl of Ilchester at the same gardens; and he is now serving Mary Countess of Ilchester, and has been continuously in the service of the family at Holland House for forty-five years—a splendid record. Mr Dixon's abilities as a gardener are well known, and they are exerted under the none too favourable conditions obtaining in busy West London. Mr. Dixon is modest to a fault, a quiet man, ready to discuss any horticultural matter, but not his own doings. Mr. Dixon is one of the veterans, and very few people would imagine him to be well over three-score years and ten. He is a member of the Royal Horticultural Society's Floral Committee, and of the committee of the Royal Gardeners' Orphan Fund, and in both bodies his ripe experience is highly valued.

Retirement of Mr. John Wright.—After eighteen years of strenuous work on behalf of the Surrey County Council in the extension of horticultural science and practice, Mr. John Wright, V.M.H., has retired from the position of Chief Instructor in Horticulture for the county. So many of the masters and teachers in the Surrey schools have been associated with Mr. Wright in his work that it was fitting they should give him some expression of their regard, and this they did recently, presenting the veteran horticulturist with a handsome illuminated address, in which, among other things, they state: "We rejoice that you should have been appointed the first Horticultural Superintendent in Surrey, the pioneer county in school horticulture. We fully recognise the fact that it was due to your expert knowledge and great personal influence that the establishment and systematisation of school gardens were so successfully carried out in the county, that Surrey has always been recognised as holding the premier position in school gardening. We also desire to offer you our hearty good wishes, and hope that there may be many years of health and happiness for you in your retirement."

Our Spring Number.—Our next issue, dated February 26, will be the Gardeners' Magazine Spring Number, and it promises to exceed all previous issues of a similar character both in usefulness and interest. The number will be enlarged, and freely illustrated throughout. Chief among the many subjects to which special attention will be directed are the "Making of a Large Rock Garden," "Rockeries for Small Gardens," "Alpine Pinks," "Columbines," "Borders of Annuals," "Seed Sowing on Clay Soils," "Summer Crops of Tomatoes," "Preparation of Vegetables for Exhibition," "Summer Salads," "Vegetable Marrows," "Runner Beans," "Evergreen Dendrobiums," "Zonal Pelargoniums," and "Annuals for the Conservatory." These are sufficient to show the varied character and wide interest of the contents, but we would add further that the contributors to the special issue include Messrs. Charles Foster, G. Gordon, V.M.H., E. Beckett, V.M.H., T. B. Field, H. J. Chapman, T. Slade, Walter Irving, Thomas Coomber, P. S. Hayward, J. C. Newsham, S. Arnott, Thomas Stevenson, and W. Hedley Warren, all of whom are well known to our readers. As we anticipate a big demand for this issue, those requiring extra copies should communicate with the publisher as early as possible to prevent disappointment.

Shrewsbury Floral Fete is to be held on August 17 and 18 next. This will be the thirty-sixth show, and if the great attractions of the new schedule count for anything the display will be as fine as ever. Besides cups and medals, the sum of £1,100 is offered in cash as prizes, in a total of 200 classes. We notice that the leading seed firms are again offering substantial prizes for collections of vegetables grown by their customers. Fruits, cut flowers, and plants are splendidly catered for, and great interest will centre in the dessert table and leading grape classes. A special new class is for a display of indoor and hardy flowering plants and flowers, cut and growing, the whole to occupy a space of 250 square feet. All cut flowers must be in water, and the exhibitor is expected to produce a novel and artistic exhibit. This takes the place of the old class for a group of foliage plants, and the prizes are, in order: Large gold medal and £20; small gold medal and £15; silver-gilt medal and £12 10s.; and £10. The judges will be instructed to consider quality, general attractiveness to visitors, and novelty in arrangement, and it is hoped the class will be the means of bringing forward some really attractive groups of novel interest.

Visitors to Kew in 1909. — From the official publications of the Royal Gardens, we learn that 3,360,221 visitors to the Royal Botanic Gardens were recorded during the past year. These figures show an increase of 397,507 over those for the year 1907, which up to the present were the largest numbers on record. During the last ten years (1899-1908), 17,861,093 persons visited the gardens, giving an average of 1,786,109. The total number of visitors on Sundays during 1909 was 1,384,369, and on week-days 1,975,852. Sunday visitors have increased by 62,985; in this connection it is of interest to notice that until the year 1907 visitors to the gardens on Sundays had only on three occasions exceeded 700,000. The number of visitors on week-days shows an increase of 281,639 over the previously-recorded maximum in 1907. The greatest attendance on any one day was 103,895 on Whit Monday, May 31. The smallest number on any one day was 191, on November 29. The largest and smallest Sunday attendances were 71,584 and 492 respectively, and in the former figures a slight increase has occurred.

The B.G.A. and the London Parks Appointment.—The following letter of protest has been sent to the clerk of the London County Council by Mr. J. Weathers in connection with the recent appointment of a soldier to the post of chief officer of the parks department: "Sir,—I am directed by the Executive Council of the British Gardeners' Association to forward the following resolution, and to ask that you will kindly call the attention of your Council to it at their next meeting: Resolved, 'That this meeting of the British Gardeners' Association in Executive Council assembled, desire to express their strong disapproval of the appointment of a military officer to the post of chief officer of the parks department, instead of a properly qualified gardener, possessing the requisite technical knowledge and powers of organisation and control.'"

Forestry Exhibition at Liverpool.—At the recent meeting of the Royal Agricultural Society proposals were submitted for a plantations competition, on somewhat similar lines to that held in connection with the Gloucester Show of last year. It was decided that, if sufficient financial support were forthcoming, a competition, confined to the districts of Lancashire, Cheshire, and North Wales, should be carried out for plantations under varying conditions—namely (1) growing on a rich or growing on a poor quality of soil, (2) mixed or unmixed, (3) conifers or hardwoods, (4) from five to thirty years from date of planting. The forestry exhibition to be held in connection with the Royal Show at Liverpool will be on the same general lines as that at Gloucester last June.

Botany at the British Association.—At the meeting of the British Association, to be held at Sheffield, on August 1 and following days, Professor T. G. Bonney, F.R.S., will preside. The president of the Botany Section is Professor J. W. H. Trail, F.R.S., while Professor A. P. Coleman has charge of the Geology Section, and Dr. Herbertson of the Geography Section.

British Gardeners' Association.—The following "open letter" is being circulated to candidates for the London County Council by the Executive Council of the British Gardeners' Association: "Dear Sir,—I am directed by the Executive Council of the British Gardeners' Association to ask if, in the event of your election to the London County Council, you will be good enough to use your influence to secure the following recommendations of the British Gardeners' Association, viz., (a) To secure a minimum wage of 30s. per week for those gardeners employed by the London County Council who can produce the credentials of the British Gardeners' Association as to their being duly qualified gardeners. (b) To secure an alteration of the system which allows the appointment of a military officer to the post of chief officer of the parks department—an appointment which, in the opinion of the Executive Council of the British Gardeners' Association, should be held by a properly qualified gardener possessing the requisite knowledge and powers of organisation and control.—Yours faithfully, John Weathers, General Secretary."

FAMOUS GARDENS :: IN WAR TIME. ::

HOW THEY ARE BEING MAINTAINED WITH REDUCED STAFFS.

III.—Interview with Mr. Charles Dixon, at Holland House, London.

BUT for the difficulties of transit, and the lack of labour, this week would have seen the holding of the Royal Horticultural Society's great summer show in the grounds of Holland House. This is always one of the pleasantest gatherings in the gardener's year, and brings visitors from all parts of the kingdom. Apart from the show, however, the house and gardens have much of historical interest. Built in 1607, the house has sheltered beneath its roof men whose names are world-famous. Cromwell and his son-in-law, Ireton, were visitors here; General Fairfax, William Penn, Joseph Addison, Henry Fox, Macaulay, and the Earls of Holland figure among its list of residents. It is now the property of the Earls of Ilchester, and is the only great estate in London untouched by the builder.

The grounds were laid out a hundred and fifty years ago, when most of the fine trees were planted, and the turf formed; and since then many developments and improvements have been carried out, for succeeding owners have taken great interest in them; while the late Earl of Ilchester was an enthusiastic horticulturist, and Mary, Countess of Ilchester, who now resides at Holland House, is well known as a warm admirer of the gardener's art.

A VETERAN GARDENER.

Mr. Charles Dixon, who is in charge of the gardens and grounds, has the record of fifty-three years' continuous service, for he was appointed to his present position as long ago as 1864. He is thus one of the veterans of the profession, but I could scarcely credit the fact that he is eighty-three years old, for he is as active as most men twenty years younger, and still does much of the work, as I learnt on the occasion of my visit a few days ago.

I had noticed, on the way to his cottage, rows of Dwarf Beans between the lines of Carnations in one of the borders, and mentioned this to Mr. Dixon, who replied:

"Every inch of our space is cultivated. I will show you how we are growing vegetables in the flower beds, and also in the houses."

"What staff do you keep now?"

"There are six men and one woman, where formerly we had nine men—young ones. Those we have are over military age."

"What is the full extent of the grounds?"

"All told, including fields, it amounts to fifty-five acres. At the present time we have numerous allotments on the land, some being taken through the Borough Council, while others we let direct."

There is a considerable range of houses here, and we started our tour of inspection by visiting them. Entering the earliest vinery, where Mill Hill Hamburgh was showing many bunches of Grapes, though rather late in colouring, Mr. Dixon drew attention to a number of pots of Dwarf Beans. "The variety," he said, in response to my question, "is Ne Plus Ultra. It has borne remarkably well, and is, I think, the best for forcing.

A HOUSE OF CYPRIPEDIUMS.

In the next house, largely given over to Cypripediums, I was shown a batch of three dozen, lately purchased at auction for a shilling each.

"They look well, and as they have not flowered yet you may find you have a treasure amongst them," I suggested.

"That is so," was the reply. "All the Cypripediums are coming on nicely and are starting to make fresh growth. As you see, they sadly want repotting, but that cannot be done with the present shortage of labour. As a matter of fact, the last job two of my young fellows did before joining the colours was to break up one of the clumps, which now occupies these seventeen pots."

"With all the plants you have here, it would be a formidable task to break up and repot them," I agreed. "Do you specialise in Cypripediums?"

"No; but they do best with us. Cattleyas seldom do good in London, though we get fair results now and again. At present, however, they are neglected, as we cannot spare time to attend to them."

From this house we passed through several of those devoted to succulents, for which Mr. Dixon is famous. In one is a collection of choice Aloes and Mesembryanthemums, all of which he raised from seed; and in another some fine Sempervivums and Echeverias were to be seen.

ASPARAGUS NANUS NOT DWARF.

"These Echeverias usually go out in the summer, but we have no room for them in the beds this year, as vegetables are taking the place of bedding plants. Here is a nice foliage plant on the wall," continued Mr. Dixon.

"And its name?" I said.

"Asparagus plumosus nanus," was the answer.

"But this is a plant eight or nine feet high, and nanus means a dwarf plant," I urged.

"So it does," replied my guide with a smile, "and this is a dwarf—until it commences to grow, and then there is no stopping it. It was dwarf enough for some years, while I had it in pots, but since I planted it out you see how it has run up."

Stepping out from these houses we next passed a number of frames.

"The Marrows are following Calceolarias and other bedding stuff which we wintered here," explained Mr. Dixon. "Melons, you see, are in fruit. These eight frames without lights are filled with Saxifrages and Sempervivums."

"Of course, they are taken in for the winter?" I said.

"Yes; in the winter we put them in the Perpetual-flowering Carnation house, and bring the Carnations into a heated house."

"Do you grow many of these Carnations?"

"As you see, we have all the best varieties, for the flowers are wanted for indoor decoration. We get plenty of blooms in summer, but are not so successful in winter—the light is too bad in London."

"I notice that you dry off your Cyclamens after flowering," I remarked.

"Yes; some people keep them growing, but I prefer to dry them off," was the answer.

"And the Liliums which look so healthy in these pots—how do you treat these?"

"They have been in the same pots for three years, and have not been repotted. They are plunged out of doors all the winter, and brought in some time in spring. There is promise of good blooms again this year."

MR. CHARLES DIXON AND THE STAFF AT HOLLAND HOUSE.

GOOD CROPS OF TOMATOES.

We were now approaching a further range of houses, but stopped to look at a batch of Tomatoes planted out, and already carrying good trusses of fruit.

"Thanks to the fine weather, the outdoor crop will ripen almost as soon as those indoors," remarked Mr. Dixon.

"Do you use the same variety for outdoor and indoor work?" I asked.

"Yes," was the reply; "the only variety we grow is Comet. The first batch is planted in one of the propagating houses, after the other plants are moved out; the second batch is planted in the open; and for the third we strike cuttings, and grow them on under glass."

The house we now entered was filled with Cucumber plants, but it was explained to me that it was really a propagating house. Adjoining this is a house where Gardenias and Stephanotis are the principal features.

"The Gardenias used to be very fine," said Mr. Dixon, "but the plants are worn out, and

Digitized by Google Original from CORNELL UNIVERSITY

last winter did them no good—indeed, they suffered badly. But the Stephanotis does very well, and makes a good show."

"Both seem very clean," I remarked. "Are they not troubled with insect pests, as a rule?"

THE WATER HYACINTH.

"They are subject to attack by mealy bug, but that we keep down by cyaniding. There is a plant here that you will like to see—it is called the Water Hyacinth."

I looked at the plant Mr. Dixon indicated, and saw a truly handsome flower, of large size, pale mauve in colour, with a blotch of blue and yellow, and leaves of light green. It is in a tub, and floats on the water, the roots not being attached to soil.

"Is it difficult to grow?" I asked.

"No," was the answer; "but it requires the temperature of a stove. It comes from Brazil."

Moving on, we came to another house with a number of pots of Primulas of different sorts, and Azaleas.

"The Primulas are principally obconica. Some are seedlings, the others have been for three years in the same pots."

"How do you manage to get them to flower so well without renewing the soil?"

"They are fed with liquid manure now and again. Primula capitata has mostly died off. It is a 'miffy' subject. But Primula malacoides does excellently, and is greatly liked for decorations. The Azaleas are young plants, and will be all the better for repotting. I shall do this when I have time, but there is so much to be done, and I am at it early and late."

A glance at the Japanese Hop, Origanum dictamnus—which bears pink flowers and makes a pretty basket plant—and another uncommon plant, Solya heterophylla, of a rich blue colour, and we then wended our way to the Palm house. This structure has a tank filled with choice Water Lilies, and many rare exotics.

RARE PLANTS IN THE PALM HOUSE.

"We lost several fine Water Lilies last winter," said Mr. Dixon, "partly owing to lack of labour, so that we could not attend to them, and partly because we were unable to get coke, and the temperature consequently fell too low. Moschosma riparium was also cut back by frost, but it is breaking away at the base. A splendid specimen of Hibiscus rosea died right down. Another plant that I thought was lost is this, Petrea volubile"—and he indicated a climber with a curious, spirally twisted stem, and many flowers, bluish mauve in colour, on twiggy shoots—"for it lost all its leaves in the fogs of last November; but you see it still flowers. It is not unlike a Wistaria. Here is a tree that you might like to notice—the Guava tree, Psidium cattleianum. I raised this from seed many years ago, and it bears regularly edible fruit, something like a purple Plum. Lasiandra macrantha is another rare plant, which you can see is growing in just a few inches of soil, on slates over the pipes. Its flowers are a rich purple, and very large for the size of the plant."

There were many other uncommon plants which were pointed out to me; then, leaving the Palm house, we passed on to the early vinery, where a Black Hamburgh vine had just had its first thinning, while the girl was busy thinning the berries from Muscat of Alexandria, which, with Madresfield Court, are also in this house.

EASILY-GROWN WATERCRESS.

But before entering this house, Mr. Dixon had called my attention to a narrow border outside the Palm house.

"This is where we grow our Watercress," he said. "We manage to cut plenty of nice, succulent growths."

"How do you manage about water?" I asked.

"We simply water with a rose on the can. It is very easy to grow, all it wants being to be planted in shade—it doesn't like sun. We pick it over every day, and the more you pick the more it grows?"

"Does it survive the winter?"

"No; but in spring we buy a few bunches in the market, and plant them here, and that is all the trouble it gives us."

After leaving the early Vinery we passed in succession through several greenhouses—in one of which Mr. Dixon showed me a collection of Nerines, now drying off, and subjected to a sun-baking—then made our way towards the kitchen garden and orchard.

"The herbaceous borders show how we are pressed for labour," said Mr. Dixon, "for they have not been regulated for two years, and in consequence are overgrown."

GOOD PROSPECTS FOR FRUIT.

Stopping to look up the Pear Tree Walk, my guide remarked:

"They have had good crops in their time, but they are getting worn out. They are on the Quince stock, and that does not last."

"And what are the prospects for fruit this season?"

"They are everywhere excellent. As you will see when we get further round, all the trees are loaded with fruit, and the bush fruits are equally good. Strawberries are not so good, however, as last year's weather was against them."

"You have a fine lot of Cherries in the cage."

"Yes; there are many varieties, and they are carrying enormous crops. We had a great deal of trouble to get the overhead netting, and could not get wire netting at all, so we had tanned netting specially made with a small mesh."

"Your Loganberries seem very full of buds, and have plenty of nice young growths."

"The Loganberry is a very profitable fruit to grow. We tried the Lowberry, but found it no good, and so turned it out."

"You have vegetables in the borders, I see?"

"Yes; we are growing all sorts of vegetables in place of the flowers that we usually have here. The only thing we have not disturbed are the Pinks, and they want taking up and replanting, but we cannot spare the labour."

"This bed of Broad Beans will soon be ready for using," I said.

"It is Early Longpod, a very good variety for the earliest crops, giving Beans of nice size. I do not like Beck's Green Gem so well. Other varieties that we grow in a bed farther round are Green Windsor, Improved Green Longpod, and Improved Green Imperial. Bunyard's Exhibition Longpod is a good old variety."

"Why are the leaves of all the Cabbages in this bed perforated with holes?" I asked, as we came to a large patch of otherwise healthy-looking plants.

A DESTRUCTIVE HAILSTORM.

"The holes were caused by the hail we had a few days ago. We had a thunderstorm that lasted two hours, and a downpour of rain equalling four inches. The water poured down the slopes and the gravelled paths, carrying quantities of earth with it, and leaving huge holes in some places. As a consequence, the drains were choked up, and we had quite a flood. You will see the effects when we get farther round. Other Cabbages have suffered as badly as this, which is Enfield Market. On the other side that large bed is filled with Christmas Drumhead Cabbage."

"I see you are growing plenty of Potatoes."

"Yes; besides the space we usually give, we have grubbed up a good collection of Michaelmas Daisies—keeping just two or three of each of the varieties for future use."

"And what Potatoes are you growing?"

"Midlothian Early and Myatt's Improved Ashleaf for earlies; and for maincrops, King Edward VII., Queen Mary, Great Scot, and Arran Chief—these two we are trying for the first time—while we also have a few rows of Up-to-Date. Early varieties do quite as well in London as in the country, but the maincrops do not."

Continuing our walk, Mr. Dixon next pointed out a bed of Jerusalem Artichokes.

"This is an old border where we used to grow flowers, but we have turned them out. Next to the Jerusalem Artichokes is a plantation of Globe Artichokes, which do splendidly here. We cover them with litter in the winter, and they come through quite safely. Parsley is very uncertain here; one year it is good; another, it rots in the ground. I would recommend those who like Spinach to grow Spinach Beet—it is quite as good, and you can keep on cutting."

"You certainly have a nice lot of it," I agreed. "What Cauliflowers do you find best?"

"Early London for the earliest crop, then Snowden, and Walcheren for a succession."

There were other vegetables to be seen, all giving promise of excellent returns, but leaving the kitchen garden we turned into a small orchard, and Mr. Dixon explained:

"This was formerly the donkey paddock, but we have now put it down to fruit. Under the trees on this side we have planted Brussels Sprouts, and on the other side have sown Swedes. We are not letting an inch of ground go to waste, and in some of the borders have sown Buckwheat, which we were asked to raise."

By this time we had reached the Peach house, where a good crop is promised, while on the wall outside Peaches Royal George, Prince of Wales, and Dr. Hogg, and Nectarines Rivers' Early and Pine-apple were in flourishing condition.

"I have started tying and thinning these myself," said Mr. Dixon (the ladder was, indeed, still against the wall, and I marvelled at a man of his years undertaking the task). "I do this in the early morning, while it is cool."

CARROTS AND BEET AS BEDDERS.

Turning in through an archway at the end of the walk we came to the Water Lily pond, where lovely blooms were open in the water. The beds surrounding this pond, instead of the ordinary occupants, are filled with vegetables.

"Although we have banished the bedding plants," said Mr. Dixon, "we are trying to get as much ornament as possible, so we are filling the beds nearest the windows with Carrots and coloured Beet, while Turnips, dwarf Beans, and dwarf Peas are in the other beds. We are thinning the Carrots and Turnips every day for the house. The Peas are Chelsea Gem, William Hurst, and American Wonder—but this is not doing so well as the others, and seems to lack vigour. The Turnips are Early Milan, which comes in first, and Early Snowball."

THE ITALIAN GARDEN.

From this section we strolled to the Italian garden in front of the house. Here the beds are all edged with Box, but their usual occupants have given place to food products.

"This bed," said Mr. Dixon, "which used to be a mass of Ageratum, is now Cauliflower Walcheren; here last year we had a striking bed of Calceolarias—now it is filled with Cabbage Earliest of All, which will soon be turning in; another bed of Calceolarias now has Dwarf Beans, Wythes' Early Gem and Progress, which will be ready for picking next week. Some of the Beans are inclined to run, but by pinching them we shall keep them dwarf. I had to beg hard to be allowed to keep some of the bedding plants for stock, so we have a few plants of Geranium Paul Crampel and Marguerite Mrs. F. Sander, while the bed of Calceolarias has been edged with Sutton's Sugar Bean, a strong grower, which fruits early, though it was sown a month later than the others."

"How often do you take up and replant the Box edging?" I inquired.

"Some parts of it were done thirty years back" was the answer; "but others have never been touched. So far as we can trace, the scroll beds of Box were planted a hundred and eighty years ago, and have never been replanted."

ROSES FOR A TOWN GARDEN.

Stopping only for a few minutes to admire the fine shrubs in bloom in front of the house, we next visited the north lawn. Here the Roses are planted, and here it might be said that Caroline Testout holds her court, for without doubt it is the Rose of this garden. It occupies both sides of a long row, backed by Ramblers and Wichuraianas, and is planted freely in many beds. I asked how many plants there were, and Mr. Dixon answered:

"Two thousand. They were planted twenty-four years ago, have always done well, and are still vigorous."

"What other varieties do you find thrive here?"

"Snow Queen is very free-flowering; Madame Abel Chatenay is very good; so is Grace Darling; and Hugh Dickson comes well in colour. Earl of Warwick is one I can recommend; and Lady Ashtown would be excellent if it did not mildew so badly."

"And what are your principal failures?"

"Well, as you see for yourself, Kœnigin Carola is not wanted where Caroline Testout is grown, for it is poorer in habit, not so free, and the colour is similar. Lady Hillingdon is a poor doer—in fact, so are all the Teas, for we had a collection of them, but very few survive. General MacArthur is not satisfactory; and Lyon Rose is another with poor growth."

"You seem to have success with pillar and Rambler Roses," I suggested.

"Yes; we have a good show of these. Amy Robsart, one of the hybrid Sweet Briers, fairly roots in the hedge of Laburnum; Zephyrine Drouhin, the thornless Rose, always gives plenty of fragrant flowers; and for pillars and large bushes Gruss an Teplitz wants beating. One of our beds of Dorothy Perkins is twenty feet through, and is a fine sight when in flower. But all our Rose beds want more attention than we can give them in these times. It is two years since we were able to do anything to them, except to prune, which is done by our girl gardener."

Time was now pressing, and I could spare but a few moments to go through the Japanese garden, where many of the Bamboos were throwing up suckers, and others wanted thinning, though the Hydrangeas and Viburnums were looking well, having been trimmed last autumn by Mr. Dixon himself. So, too, in the shrubbery, some of the choice Magnolias and ornamental Oaks were sadly in want of thinning, and the Azaleas and Rhododendrons were carrying their seed pods. Across the old pleasure ground we went, where the grass, which was formerly kept so short, is now going for hay, and I asked how many acres would, under normal conditions, be mown.

"There are twelve acres of short grass, and a further ten acres which might be called optional; but it is all going this year, for we cannot possibly mow it, and beside this, hay is wanted, and our men are cutting it."

We ended our tour on the south front, where the big Water Lily pond is now a wonderful picture.

"The Lilies," said Mr. Dixon, "were not divided this spring, as they should have been, and by autumn the leaves will be so crowded that they will be out of the water."

"But still," I remarked as I wished him good-bye, "you are doing remarkably well under the circumstances." W. J. CHITTENDEN.

(Next week, the gardens at Buscot Park, Faringdon, Berks, will be described).

PINK CLARKIA.

In reading my GARDEN LIFE of June 16th, under "Gardening Experiences" I see Clarkias highly spoken of. I would like to suggest to other readers to grow them as pot plants in the greenhouse. I did so this spring, and am delighted with the result. They are perfectly beautiful in the drawing-room—Salmon Queen is the admiration of all.—A. I. E. B.

Gardening Experiences.

A free subscription for one year (value 10s. 6d.) is offered for the most interesting contribution to this column. The contribution must be original, and should, as far as possible, be descriptive of the writer's gardening practice. Mark the envelope "Experiences," and address to the Editor, "Garden Life," Hatton House, Great Queen Street, London, W.C. 2.

THE FERTILISATION OF FRUIT BLOSSOMS.

So much has been and is being done as regards this important subject, that a little experience of my own may help those who have not the time or sufficient experience to do the work. Where young trees have been planted it is quite necessary—if there is not time to fertilise artificially—to attract bees to do the work for you. This season, especially, very few flowers were in bloom during the blossoming period of fruit trees, and, of course, in the case of young trees there were very few blossoms on the fruit trees themselves. To attract the bees next season, especially in a new garden, or where very few flowers are grown, plant, a few yards away from fruit trees, a patch of Brussels Sprouts. After the picking season of the sprouts is over next spring, do not pull them up, but allow them to blossom. The result will be that, during the blossoming of the fruit trees, a few yards away there will be one mass of yellow bloom, which will attract to it the bees in thousands, and consequently to the fruit trees themselves.—Harpley House, Worcestershire.

(Prize Letter.)

EXPERIENCES OF FAILURES.

From time to time, through the kindness of our Editor, we have accounts of the experience of readers of GARDEN LIFE, and many very helpful hints I have gathered from this source.

I well remember, some years ago, a friend drawing my attention to a note in the paper, from a correspondent, describing how he had succeeded in getting Narcissus triandrus to flower and do well. His plan was to plant these tiny bulbs on the edge of the paths. I had never had success with mine, and was glad to try a new plan, and was amazed at how well it looked. That hint gave me the clue to the difficulty—not that these subjects must be on a path, but that they require similar conditions—a gritty, unbroken soil, moist but well drained.

But nearly always the correspondent tells of how success has been attained. Now, I want to tell of how I have failed, in hope that somebody may be able to tell me why. It is in the rock garden that my difficulties lie. I know well that many very beautiful and desirable subjects are admittedly difficult. When I was given the two Shortias, I received my treasures in fear and trembling. And though I spared no pains to suit their requirements, one (uniflora) declined to be satisfied; the other has thriven well, and this year has a fine batch of flowers, and is flourishing.

ASTER ALPINUS.

In like manner I was distressed, but not surprised when Gentiana verna, after giving a good account of itself for a couple of seasons, began to dwindle slowly away. I recognised it as "the common lot" in its case; but when a hardy subject like Aster alpinus behaves badly one feels ill-used. Five years ago this spring I got a fine clump from one of our best nurserymen in Yorkshire. The plant was well set with buds, and was lovely that season—one of the prettiest sights in the rock garden. I left it where it was first planted, in a moist, sheltered spot, and not exposed to the hottest sun. To my surprise, it seemed to grow up out of the ground, and got brown and leggy; and though I kept on top-dressing and covering it, by the spring following it appeared dead. It did revive, however, as the season went on; and as I had by this time found that it should be divided and replanted after flowering, I thought I would be all right, for the new growth was quite strong and good. But I have never suited it, and though I have now a fair number of healthy-looking plants, they seem to come on each season just too late to flower. I had, I think, one bloom on the lot last year, and two this year. I wonder what is wrong? I have tried several aspects, and both rich and poor soil.

POTENTILLA NITIDA.

Puzzle number two is Potentilla nitida. It thrives well, and yet never gives a flower. I have it in the hottest, driest spots, and often "glaze" some of the plants in winter, but all to no purpose. Our soil is light, the position is high and exposed, and it puzzles me to know why it is so refractory. This season the growth is particularly fine: perhaps it is going to repent at last, and reward me. I know it is not always a satisfactory bloomer, but as far as I can judge it has all the conditions necessary here.

AQUILEGIA GLANDULOSA.

A great disappointment comes third in Aquilegia glandulosa. I have had this plant for four seasons. It has shelter, but not shade; a fine depth of light, peaty soil; never has been disturbed since first planted; is top-dressed each spring; and protected with a zinc ring to save its fresh shoots from the depredations of the slug. And there, year by year, it grows finely, the foliage the picture of health; but not a single flower has it ever blessed me with. I see in catalogues it is often mentioned as liable to "go off." It shows no inclination to anything of the kind here, and A. cærulea evidently is well satisfied, for it flowers better every season, and we have had it quite a long while.

PRIMULA ROSEA.

One other disappointment—Primula rosea. One season I had it in great condition, but it had to be moved, as that part of the garden was re-made, and it has only existed since, though I have made every effort to give it just the same position. We have no running water to "put its feet in," but there is no difficulty in getting moist and sheltered spots, so I cannot understand why it fails. Primroses do particularly well here, seeding themselves, and appearing in every nook and cranny.

I suppose everyone has his own particular history of failures. I once remarked to a very experienced and most successful gardener that I was sure he seldom lost anything. He looked at me almost with contempt as he said, rather bitterly, "If you only knew the half of what we lose!"—H. S. W.

NAPHTHALENE-LIME.

One of the very best mild materials for the summer disinfection of the soil is what I call naphthalene-lime, or, more shortly, naphtholime. It is made of naphthalene, salt, and good quicklime, and from experiments I have carried out myself, and others which I have witnessed, it appears to stimulate the crops as well as drive away soil pests.

To make it, take one stone of the very best fresh ground quicklime, four pounds of rough salt, and to these add from two pounds to four pounds of napthalene. If the crude naphtha is used, two pounds will be sufficient, but if the less smelly, purified material be obtained, double the quantity will be required. Mix these all together, and store in a strong, air-tight tin.

This material may be dusted over the ground during the growing season very freely, and it may be forked into vacant ground after early Peas have been taken off it, and it ensures a good crop following. About an ounce per square yard may be used. For very bad, pest-ridden land, and for cleaning land in winter, something stronger is needed, and this is found in the proprietary soil fumigants advertised in this paper.—EXPERIMENTER.

Obituary.

WILLIAM DODDS. — This veteran Dahlia-raiser and exhibitor died recently at his residence at Bristol, at the advanced age of ninety-two, having outlived nearly the whole of those who had personal knowledge of him forty years ago, when in the very heyday of his popularity. Coming south more than half a century ago from his native country, Scotland, he became under-gardener to Colonel Baker at Salisbury, subsequently rising to the position of head gardener, and remained in Colonel Baker's service for a period of thirty years. More than half a century ago the county of Wilts was famous for its activity in improving the Dahlia. The brothers Cove and Squibbs, at Salisbury; Wheeler, at Warminster; Heale, at Calne; with Skillman, at Marlborough, were all noted dealers and exhibitors, and Mr. Dodds, having a desire to raise seedlings, found himself in congenial company, and, assisted by the active interest of his employer, he began to raise seedlings with considerable success, his varieties being sent out by his old friend, John Keynes. Dodd's Mary, a light ground flower tipped with purple, made a great reputation in its day. Not only did Dodds raise seedlings, but he was also a skilful cultivator and exhibitor, giving a good account of himself at Dahlia shows. On the death of Colonel Baker, he went as head gardener to Sir Greville Smythe at Ashton Court, Bristol; but while taking a warm interest in his favourite flower, practically his career as an exhibitor was finished. Dodds remained at Ashton Court for some years, and then went into retirement at Bristol. He made a point of coming to London once a year to attend the annual exhibition of the National Dahlia Society at the Crystal Palace, and acted as a judge until prevented by growing infirmities and deafness. But few remain who had knowledge of him when in the height of his successes as an exhibitor. His death lessens by one the number still living who acted as jurors at the great International Horticultural Exhibition held at South Kensington in 1866. One of his oldest personal friends was Mr. H. Eckford, of Wem, who was for a time under Mr. Dodds when at Colonel Baker's. *R. D.*

OBITUARY.

MR. WILLIAM DODDS.

THIS old Dahlia grower and exhibitor, who made a great reputation half a century ago as a raiser, died a short time since at Bristol at the advanced age of ninety-two. Coming south from Scotland—of which country he was a native—in 1847 he went into the garden of Colonel Baker, at Salisbury, and in a short time he became head gardener, occupying that position for the space of thirty years. Colonel Baker was a great enthusiast with the Dahlia, and at that time it was being rapidly improved, and Mr. Dodds threw himself into the work of raising new varieties with considerable ardour, and not a few of his productions were put into commerce by his old friend, the late John Keynes. As an exhibitor and cultivator he took a high position. Leaving Salisbury on the death of Colonel Baker, he went as head gardener at Ashton Court, Sir Grevette Smythe's seat at Bristol, where he remained until he went into retirement. Until his infirmities prevented him, he came every year to London to act as judge at the exhibition of the National Dahlia Society at the Crystal Palace, meeting there old associates like Mr. H. Eckford, who was under Mr. Dodds at Colonel Baker's for a time. Mr. Dodds may be said to have outlived his contemporaries, and men who do that are speedily forgotten.

Gardeners' Chronicle, 1886

Obituary.

Mr. D. Doig.—The horticulturists of Scotland and many on the other side of the border will regret to learn that this long well-known gardener has passed away. He died at his house, Rossie Priory Gardens, a few days ago. Nearly a year since he was seized with paralysis, and in June last he was laid aside from active duty, but took a keen interest in the work at the gardens to the last day of his life. He was born at Kirkinch, parish of Meigle, in 1821, and served his time as an apprentice under Mr. James Kidd, who was gardener at Rossie Priory for fifty years. Mr. Doig also prosecuted the study of botany, and was well acquainted with the wild plants of Britain. After serving his apprenticeship he was gardener to various gentlemen, and on the retirement of Mr. Kidd, twenty years ago, he was appointed head gardener at Rossie Priory, the seat of Lord Kinnaird, where he gave great satisfaction. His services were often in requisition at horticultural exhibitions, and he was widely known as a writer in the *Gardeners' Chronicle* and in other horticultural and botanical journals.

of the Royal Horticultural Society; Mr. Philip Crowley, Treasurer of the R.H.S.; Mr. H. R. Williams, Past Master of the Fruiterers' Company; Mr. J. Butcher, Solicitor to the Nursery and Seed Trades' Protection Society; the Rev. F. H. Gall, Messrs. T. W. Girdlestone, Harry J. Veitch, J. Herbert Veitch, C. T. Druery, Henry J. Pearson, H. Wallis, C. E. Pearson, Geo. Prince, H. Herbst, H. Turner, George Bunyard, W. J. Jefferies, A. F. Barron, Joseph Cheal, &c. There was a selection of vocal and instrumental music, kindly given by some amateurs, which had been arranged by Messrs. Bunyard and Turner, and a most pleasant and successful meeting was enjoyed by all present, the only matter of regret being that the venerable and venerated Chairman announced his intention owing to increasing years to retire from his office, which he has found latterly to be somewhat of a burden. The announcement was received with universal regret. He has been Chairman since the formation of the Club, and has always shown great interest in its welfare. The toast of the Royal Horticultural Society was proposed by Mr. Harry J. Veitch, and responded to by the Rev. W. Wilks, who spoke encouragingly of its prospects, and was glad to bear witness to the fact mentioned by the Secretary, that the first step in the improvement of its position was made at one of the dinners of the Club, when the outside Committee was nominated, and he hoped that both the Society and the Club might go on and prosper.

CULTURE OF GREENHOUSE RHODODENDRONS.

[Prize Essay read by Mr. R. G. WATERMAN, Woolton, before the Members of the Woolton Gardeners' Mutual Improvement Society, February 5th, 1891.]

(*Continued from page 132*).

COMPOST AND POTTING.—These details require the attention of intelligent and practical workers. When it is stated a plant may be kept in the same pot for seven, ten, or even more years it is sufficient to prove that the work must be carried out in the best possible manner. Although they vary considerably in growth and appearance their requirements as to soil are similar. Good selected peat, with all sour portions removed, may be broken up into pieces the size of walnuts, and for very large plants double that size; to this add fully one-fourth of sharp silver sand and a little broken charcoal, to be carefully and thoroughly mixed. Pots should be selected of good shape and well burned, which will be less liable to become green, which is obnoxious to the eye and detrimental to the health of the plant. The pots and crocks alike should be scrupulously clean, and in arranging the drainage select well fitting pieces to cover the holes, placing the hollow side downwards; follow carefully with piece after piece until sufficient is arranged, which should be from 1 to 3 inches in depth, according to the size of the pot. A layer of sphagnum or rough moss over the drainage will prevent the soil being washed down or blocking a free water course. A portion of the roughest of the material can be put in next to the depth required, making it firm, and everything is in readiness for the plant, which must undergo close inspection.

The ball or root should be like the compost, just a happy medium between wet and dry. If the ball or potting soil be soddened or wet the whole will become an impervious mass, in which the young rootlets cannot thrive, as an open porous mixture is one important item towards success. If too dry it will be impossible to thoroughly moisten it after potting, which means death to all the fine fibres that may come in contact with it. If there be any doubt that the plant may be dry at the bottom or centre of the ball place it in a tub of water, just covering the rim of the pot, and let it remain an hour or so, and then after a day or two it will be in safe condition for repotting. Like all other hardwooded plants these require firm potting, using a blunt-pointed stick for a rammer at intervals until the pot is sufficiently full which should be within three-quarters of an inch in small pots to 1½ inch in those of very large size.

No rule can be laid down as to how often a plant should be repotted. Whilst in a young state a small shift may prove beneficial every year or two, but in large specimens seven or ten years will be sufficient. Old plants may remain in the same pots while they continue to make fair growth and are in good health. After potting the plants may stand a day or so before watering, and if a sprinkling of sand be scattered on the top it will wash down the sides if there is the slightest crevice. When planted out in beds or borders the above instructions should be followed. The most approved times or seasons for repotting are spring, early autumn, or immediately after the young growth is made, those especially advised being after the growth is completed for the Java section, and early autumn for the Himalayan and their allies.

THE TEMPERATURE.—That of a greenhouse is required for the general collection, not less than 55° while making their growth, which can be reduced to 50° afterwards, and in the winter to 40°. These are extreme minimum temperatures. The Javanicum type will require 5° higher than those named. After the growth is completed ventilate freely to ripen the young growth. In the case of young plants a span-roofed frame at this juncture will prove an admirable position. Syringing will prove very beneficial during the season of growth, refreshing the plants and producing a humid atmosphere which they much enjoy.

INSECTS.—Rhododendrons are fairly free from these pests. At times mealy bug will prove troublesome by getting under the scales of the flower buds. If such is the case, great care must be exercised while the foliage is young and tender, but when it is ripened and hard stronger measures can be resorted to in the form of insecticides. Fir tree or lemon oil, Gishurst compound or petroleum mixed at regulation strength and dropped on the buds will have the desired effect, a washing of clean water to follow the operation. Scale occasionally gets a foothold, but a careful sponging with one of the above-named mixtures will make itself felt. Some of the woolly foliaged varieties, such as Edgeworthi, are more difficult to manage, but determination will win the day.

FEEDING AND WATERING.—An occasional supply of soot water, or a sprinkling of Standen's manure will prove of service if the pot is full of roots and the growth puny and weak. The general management as regards watering is very similar to most hardwooded plants, a plentiful supply during the season of growth, but limiting the amount somewhat after that period, or a second growth may start, which will probably mean the loss of a crop of flowers, and a tendency to weak immature wood. Special care should be taken when the plants are placed on ash or earth spaces to prevent worms entering the holes at the bottom of the pots, which will soon mean defective drainage, sour soil, and unsatisfactory plants. A slate, or some other hard flat surface should be placed for the pots to stand on, or for large specimens three small pots placed in triangular form will prove a secure base.

TRAINING.—All Rhododendrons require some attention in this matter. The strong growers must be watched, or leggy plants will soon be the result. Nuttalli, and those of like growth, must be pruned back occasionally while young, or the growing buds rubbed off; otherwise the plants will represent a series of broomsticks with a tuft of leaves at the point. Veitchianum and Countess of Haddington should be watched, and occasionally a shoot may require stopping, or a tie may be given to keep the plant in bush form. Lady Alice Fitzwilliam, fragrantissimum, Gibsoni, Edgeworthi, and others of similar character will require supporting, which can be done by wire frames in pyramid or globular form. This section can also be utilised as climbers, or for covering walls, where their large evergreen leaves prove effective even when not in bloom. Many of the Java section will require some slight support, which should be done with as few sticks as possible, and fine ties.

SELECTION OF VARIETIES.—Although no mention is made of this matter in the title, yet it appears requisite, for to have a thorough knowledge of the cultural requirements of any class of plants it is essential to have a full acquaintance with their habits, size, and any peculiar traits they may possess, and for this purpose the species may be divided into two sections—the Java, or perpetual flowering, and the Himalayan. In the first named we have the brilliant and beautiful hybrids, for which we are chiefly indebted to Messrs. J. Veitch & Sons of Chelsea, and Messrs. Fisher, Son, & Sibray, Sheffield; and in addition to those well known in our gardens we have R. balsaminæflorum varieties, with exquisite double flowers which have been compared to the Tuberose, Gardenia, &c. The three varieties in commerce bear white, yellow, and rose coloured flowers. Among the stronger growing varieties the following are recommended:—Dalhousiæ (an epiphyte), Falconeri, fulgens, Maddeni, Nuttalli; and for moderate-sized houses the following will be found suitable:—Veitchianum, fragrantissimum, Lady Alice Fitzwilliam, Edgeworthi, Virginale, and others.

THE LATE MR. JOHN DOMINY.

WE hear with much regret that Mr. John Dominy died at the age of seventy-five on February 12th, after two days' illness, from inflammation of the lungs and pleurisy. The following account of his career, with the portrait, was given in this Journal in 1880, when, after a term of forty-three years' service with Messrs. J. Veitch & Sons, he retired on a substantial annuity. He was born at Gittisham in 1816, and in due time was apprenticed to Mr. Guscott, gardener to the Misses Putt, Pomeroy House, Gittisham, Devon. At eighteen years of age—namely, in 1834—he went to Messrs. Lucombe, Pince, & Co.'s Nursery at

Digitized by Google

Exeter, and remained there three months. From thence he removed to Messrs. Veitch's nursery in the same town, and remained there until June, 1841. He then went as head gardener to J. Pellagor, Esq., Redruth, and remained in that capacity four and a half years. During that time he took between seventy and eighty prizes for fruit, vegetables, and flowers. He returned to Messrs. Veitch's Exeter Nursery, working in conjunction with the late Mr. James Veitch until his removal to London, and he remained at Exeter with Mr. James Veitch, senr., twelve years. During his stay at the Exeter Nursery he commenced his first attempts at the hybridisation of Nepenthes and Orchids, the results of which have now become so widely known. In 1864 he removed to London to take charge of the Royal Exotic Nursery, Chelsea. On Mr. Dominy leaving Exeter he was presented with a silver tankard and cream jug, value £20, by the Devon and Exeter Horticultural Association, "in acknowledgment of his valuable services to the Society during his connection with Messrs. Veitch," who also presented him with a cream jug to match "in commemoration of his having been the first successful hybridiser of Nepenthes and Orchids in Europe." He also had the large silver medal of the above Society "for his perseverance and success in raising the first hybrid Orchid," this medal being dated 1858, and refers to Calanthe Dominii, the result of a cross between C. masuca and C. furcata. About twenty-nine hybrid Orchids, Nepenthes, and Fuchsias were also raised during Mr. Dominy's service at Exeter and Chelsea. In late years he has been a member of the Orchid Committee of the Royal Horticultural Society, at whose meetings he was a regular attendant.

FIG. 28.—THE LATE MR. JOHN DOMINY.

AMERICAN AZALEAS AND AZALEA MOLLIS.

These beautiful and floriferous plants are worthy of more extensive cultivation, as few are so easily forced during the early spring months or give a better return for the labour bestowed upon

Don, George (1798–1856), *botanist and plant collector*
by William T. Stearn
© **Oxford University Press 2004–14** All rights reserved

Don, George (1798–1856), botanist and plant collector, was born at Doo Hillock, Forfarshire, Scotland, on 17 May 1798, the eldest of the five sons of George Don (1764–1814), clockmaker turned nurseryman, who discovered many highland plants new to Scotland, and principal gardener (1802–6) at the Royal Botanic Garden, Edinburgh. David Don (1799–1841) was a younger brother. After horticultural experience in the nursery of Messrs Dickson at Broughton, near Edinburgh, Don worked from 1816 to 1821 as foreman gardener in the Chelsea Physic Garden. In December 1821 he began a voyage with Captain Edward Sabine to Madeira, Sierra Leone, São Tomé, the West Indies, and Brazil, his task everywhere to collect seeds, plants, bulbs, and herbarium specimens for the Horticultural Society's garden. He returned in February 1823 having successfully assembled many new plants but, as he violated an agreement not to publish on what he had collected, the society dismissed him in 1825. He published, in 1827, *A Monograph of the Genus Allium*, a preprint from *Memoirs of the Wernerian Society* (6, 1832, 1–102). This and his 'Review of the genus *Combretum*' in *Transactions of the Linnean Society* (15, 1826, 412–41) made evident his botanical ability and he was commissioned to prepare *A General System of Botany and Gardening* (4 vols., 1831–8), an excellent work, but one which was financially unsuccessful and never completed. He later provided the botanical section for the *Encyclopaedia metropolitana* (2, 1843). Don was elected an associate of the Linnean Society of London in 1822 and a fellow in 1831. He died, unmarried, in Kensington on 25 February 1856.

Obituary.

WILLIAM DODDS. — This veteran Dahlia-raiser and exhibitor died recently at his residence at Bristol, at the advanced age of ninety-two, having outlived nearly the whole of those who had personal knowledge of him forty years ago, when in the very heyday of his popularity. Coming south more than half a century ago from his native country, Scotland, he became under-gardener to Colonel Baker at Salisbury, subsequently rising to the position of head gardener, and remained in Colonel Baker's service for a period of thirty years. More than half a century ago the county of Wilts was famous for its activity in improving the Dahlia. The brothers Cove and Squibbs, at Salisbury; Wheeler, at Warminster; Heale, at Calne; with Skillman, at Marlborough, were all noted dealers and exhibitors, and Mr. Dodds, having a desire to raise seedlings, found himself in congenial company, and, assisted by the active interest of his employer, he began to raise seedlings with considerable success, his varieties being sent out by his old friend, John Keynes. Dodd's Mary, a light ground flower tipped with purple, made a great reputation in its day. Not only did Dodds raise seedlings, but he was also a skilful cultivator and exhibitor, giving a good account of himself at Dahlia shows. On the death of Colonel Baker, he went as head gardener to Sir Greville Smythe at Ashton Court, Bristol; but while taking a warm interest in his favourite flower, practically his career as an exhibitor was finished. Dodds remained at Ashton Court for some years, and then went into retirement at Bristol. He made a point of coming to London once a year to attend the annual exhibition of the National Dahlia Society at the Crystal Palace, and acted as a judge until prevented by growing infirmities and deafness. But few remain who had knowledge of him when in the height of his successes as an exhibitor. His death lessens by one the number still living who acted as jurors at the great International Horticultural Exhibition held at South Kensington in 1866. One of his oldest personal friends was Mr. H. Eckford, of Wem, who was for a time under Mr. Dodds when at Colonel Baker's. *R. D.*

We also regret to have to announce the death of Mr. James Donald, for many years gardener at Hampton Court, a situation to which he was appointed by Lord Llanover, then Sir Benjamin Hall, and which he has filled with so much credit to himself. Mr. Donald was fond of natural history and had a good herbarium, as well as a tolerable collection of geological specimens. His knowledge of British plants was extensive, so much so that when foreman in the plant department at Chiswick, some thirty years ago, he offered 6d. to any of the young men in the garden who would bring him a native flowering plant which he could not name. He had long been ailing, but at last died somewhat suddeuly from heart and lung disease.

The Garden, 1873

DONALD James.
Effects under £300.

20 January. The Will of James Donald late of The Palace Hampton Court in the County of **Middlesex** Superintendent of the Palace Gardens who died 13 December 1872 at "The Palace" was proved at the **Principal Registry** by Caroline Donald of "The Palace" Widow the Relict the sole Executrix.

Oxford Dictionary of National Biography

Donn, James (1758–1813), *botanist and gardener*
by S. Max Walters
© **Oxford University Press 2004–14** All rights reserved

Donn, James (1758–1813), botanist and gardener, was born in Perthshire. He began his horticultural training under William Aiton at Kew, and was appointed curator of the university botanic garden in Cambridge in 1794, in which post he remained until his death in 1813. His name is associated with a remarkable publication, *Hortus Cantabrigiensis*, the first edition of which Donn published in 1796. In the preface he explains that his book 'is not simply a catalogue of the plants actually grown in the small Walkerian garden, but contains also [plants] that are yet required to render the collection more worthy of [the botany student's] notice'. This book ran to thirteen editions, the last one dated 1845, and became, long after the original author's death, a standard reference work for both botanists and gardeners, giving compact information on the world's flora, native or exotic, as represented in British gardens. The preface to the tenth edition by John Lindley explains that Donn himself greatly enlarged the scope of his book from the fifth edition, so that it ceased to be in any way limited to what he grew in the Cambridge garden.

Donn owed his appointment at Cambridge to Sir Joseph Banks. He greatly extended the plant collections in Cambridge, especially with gifts from Kew. There are several testaments to Donn's skill in cultivating plants. Thus the entomologist William Kirby recorded in his journal his impressions of a visit to the garden in July 1797: 'Mr Newton of Jesus accompanied us to the Botanical Garden, which, by the abilities and industry of Mr Don [*sic*], the Curator, is now in excellent order; the collection of plants is greatly augmented, and the labels are in general accurate' (Freeman, 106). Donn became a fellow of the Linnean Society in 1812. He died in Cambridge on 14 June 1813.

James Donn (1758–1813): doi:10.1093/ref:odnb/7816

LGM, 1828

Art. XIII. *Obituary.*

Died, at Hull, on the 17th of December last, William Donn, C.M.H.S., Curator of the Botanic Garden of that place, which situation he held since its establishment sixteen years ago, and discharged the duties thereof to the entire satisfaction of the subscribers. It is but justice to the memory of Mr. Donn, to say that his knowledge of plants, and their mode of cultivation, was equal to that of most men of his day. His experience in horticulture commenced in Scotland, where he was born in Fifeshire, in 1787. He lived some years at the late Dr. Swainson's, of Twickenham, and afterwards at Sion House, under the late Mr. Hoy: thence he went to Hull. Mr. Donn was the nephew of the late Mr. Donn of Cambridge. —*B. Jan.* 1828.

duced into this country a hundred and twenty years ago—in 1789. For some reason or other it has dropped out of cultivation here, but does that make it new? The new shoots are said to have an excellent flavour, and as they start into growth very early, they can easily be forced throughout the winter.

Naturalised Crocuses.

April 29th.—Lord Avebury includes two species of Crocus (C. nudiflorus and C. vernus)

MR. T. DOWN.

among native plants. It is true that they do grow wild in certain parts of the country, but they came originally from Western Europe, and have merely become naturalised here. The conditions under which they came to produce their annual corms, the new on top of the old, must have been different from those which exist in England. Though all the material of the old corms is used up in the growth of the year, it seems rather a waste of labour. The nectar plentifully secreted at the bottom of the tube, though useful in attracting insects, often leads to the destruction of the flowers in gardens, for, in order to get at it, sparrows peck them to pieces. Possibly, a grain of some unsavoury compound dropped inside might act as a deterrent.

How Eelworms Destroy Plants.

April 30th.—Some years ago a French botanist propounded the theory that bulbs or tubers had a bacterial origin. It would, of course, be very difficult to prove, and was, no doubt, suggested by the fact that insects, bacteria or fungi, frequently do cause abnormal growths at the points attacked, whether on the stems or on the roots. Such growths may be actually beneficial, as in the case of the nodules on the roots of leguminous plants, such as Peas, for they result from the operations of the bacteria which "fix" the free nitrogen in the atmosphere, and so render it available for the plants. But there are others which are the forerunners of death—those, for example, which are sometimes found on the roots of the Tomato and the Melon. The plant is growing well, when more or less suddenly the leaves begin to flag—at first generally during the hottest part of the day. The cause is attributed to drought or excessive heat, and shade and water being followed by revival, the idea is supposed to be correct. But gradually the trouble gets worse; it becomes permanent, even night bringing little relief; and eventually the plant dies. If it is then taken up, nodules of various sizes, sometimes a quarter of an inch through, will be found on the roots. They have been caused by eelworms, organisms so small that they can be seen only under a microscope, but terribly destructive. The soil will probably be full of them, and will be a source of danger for the whole garden unless it is disinfected by saturating it with a strong solution of carbolic acid. Of course, it must not be again planted for several months afterwards.

Uses for Bulbs.

May 1st.—One excellent way of using Daffodils, Hyacinths, Tulips, and other bulbs is to grow them in pots in the conservatory in spring, and, when they have finished flowering, to plant them out in odd corners of the garden. In this way many places which would otherwise be neglected may be made beautiful in the course of a few years, and, as one wanders round, the eye meets many delightful surprises. If there is a bank at the base of the surrounding hedge, it is an admirable site for bulbs which have served their purpose in pots.

H. C. DAVIDSON.

The Gardens at Basing Park, Alton.

INTERVIEW WITH MR. T. DOWN.

THE gardens at Basing Park, which I visited in March, by the courteous permission of the owner, Mr. William Nicholson, J.P., owe much to a delightful position, and to careful attention. On my arrival, the head gardener, Mr. Down, suggested that we should begin by inspecting a portion of the gardens which is now in process of development. It is called a wild garden, but, with many natural charms, it has lately received important and interesting additions; and for all practical purposes it forms a continuation of the beautiful and extensive shrubberies.

"We do not go in for modern styles," said Mr. Down, as we proceeded up the slopes, "but do the best we can to preserve the charms of the gardens on old-fashioned lines, introducing new varieties, and taking, of course, full advantage of the best-known methods of cultivation."

"What is the nature of the soil?"

"Clay. It is very dry in summer, and very wet in winter. Conifers do well, as you can judge for yourself."

"You have some fine specimens of Abies?"

"Yes, there is a very fine specimen of grandis, and other notable specimens are A. orientalis, A. cephalonica, and A. Albertiana. Cupressus are represented by Lawsoniana and gigantea, Pinus by insignis, and Sequoia by sempervirens. The younger specimens of Conifers include Abies concolor, A. Smithiana, A. grandis, A. Nordmanniana, A. fulgens glauca, and Sciadopitys verticillata."

"I see you have a number of Rhododendrons. Do you give them much assistance?"

THE CONSERVATORY AT BASING PARK.

"We trench the ground, and add peat and cow manure. The varieties comprise a number of the newest and several of the older, including Pink Pearl, Charles Dickens, Duchess of Connaught, Frederick Waterer, Giganteum, John Henry Agnew, John Waterer, Kate Waterer, Lady Godiva, Michael Waterer, Mrs. Tom Agnew, Mrs. William Bovil, Nobleanum, Prince Camille de Rohan, Sefton, The Queen, Titian, and Catawbiense. In order to brighten the Rhododendron beds in summer, we have a few Dorothy Perkins Roses, which show up well against the foliage of the Rhododendrons. In the same way we mix Liliums with Azaleas in the summer. Last year we had fifty-two flowers on one spike of Lilium tigrinum."

"Do you use peat for the Azalea beds?"

"Both peat and loam. A quantity of manure is also used. We put five loads on the large bed of Azaleas, which is five yards wide and thirteen yards long. It was only planted in April of last year. The Liliums are taken from the pots in which they are grown."

The Newer Shrubs.

"When did you start your clumps of Bamboos?"

"Four years ago. The varieties which are doing specially well are Arundinaria metake, Phyllostachys viridi-glaucescens, and P. nigra. Just about here we are going to naturalise a quantity of Anemone japonica, which thrive under similar conditions."

"You might, please, indicate some of the newer shrubs?"

"Clethra canescens, Buddleia variabilis, B. variabilis Veitchiana, and B. magnifica, Cornus macrophylla, Clerodendron trichotomum, Eucryphia pinnatifolia, a fine plant of the New Zealand Lace-bark tree, Plagianthus Lyalli, Escallonia Langleyensis, and Exochorda grandiflora. The varieties of Berberis grouped together are stenophylla, Darwinii, japonica, aquifolium, Wallichiana, buxifolius, and b. nanus, vulgaris, and aristata. Menziesias (Irish Heath) are planted in masses."

"I notice that some of your shrubs have suffered from the recent severe weather."

"It played serious havoc with the Escallonias, Azara microphylla, Choisya ternata, Olearia Haastii and Gunniana, Euonymus Griselinia, Laurustinus, Pittosporum Mayanum, Abelia rupestris, Erica arborea, and Podocarpus Totara; and it absolutely killed Carpenteria californica, Cæsalpinia japonica, the Metrosideros (Bottle-brush), and Loropetalum chinense."

Apples on Mounds.

"You have an orchard adjoining the shrubberies, full of standards."

"With young trees on mounds, and old trees planted on the level; but they all yield good crops. Bush Apple trees are grown in the walled-in garden. It may interest you to know that for all Apple trees on mounds the stations are thoroughly dug, but holes made. The trees are then placed in position, and a mixed compost of loam, lime-rubble, and wood ashes is mounded up over the roots. The mounds are about ten feet in diameter and are enlarged as required. We find that the results of this system are very satisfactory."

The Rosery.

At this point we crossed the road, and entered the pleasure grounds, close to this entrance being a pretty little Rosery, with a fountain in the centre, and a bank of Rhododendron Doncaster—a scarlet variety—at the back.

"Are the Roses mixed?" I asked.

"Many of them, but in one bed Frau Karl Druschki and Captain Christy are planted alternately; in another, pink and white Maman Cochet; and there are beds of Madame Abel Chatenay and General Jacqueminot. Then Duke of Edinburgh and Richmond are grouped together; and there are beds of Killarney, Papa Gontier, and La France. Some of these varieties are planted in the Rose beds on either side of the walk to the orchard house, where Roses alternate with Irish Yews and standard Portugal Laurels. Under the front of the orchard house are Lilies of the Valley, with Asters and Scabious on either side."

"Then, there is the long walk in front of the orchard house?"

"It is a hundred yards long, the feature being the clipped Laurels, the common Yews grafted with Golden Yews, and the clipped Portugal Laurels. Behind these are plants grown for cutting flowers, in separate beds, such as Larkspurs, Antirrhinums, Nigellas, Phlox Drummondi, Lupins, Cornflowers, Statice, and Gypsophila. Just here are some old standard Pears, covered with climbing Roses Hiawatha, Alberic Barbier, Lady Gay, Ards Rover, and Lady Waterlow; these were only put in twelve months ago. Speaking of flowers grown for cutting, elsewhere we have quantities of Salpiglossis, Gladiolus, Montbretias, Nemesias, and Stocks, of which about two thousand were grown last year, all planted for that purpose."

The Culture of Alpines.

Passing on to the front lawn, I was much impressed with the rockery, which was only made last May, and here we spent a considerable time.

The Fruit House at Basing Park Gardens.

"The most important point in Alpine culture," said Mr. Down, as we noticed the plants coming into flower, "is thorough drainage. As to construction, the main portion of the rockery is made of Purbeck rock, which is a limestone, and the compost consists of road-grit, sand, loam, a little well-decayed manure, and leaf-soil, with lime-rubbish added when required. The nice group of hardy Cyclamen now in flower was planted in a mixture of peat, leaf-mould, sand, and lime-rubbish."

"And the Ericas also in flower?"

"They were planted in peat. The varieties are mediterranea and carnea. The clumps of Lithospermum prostratum are almost always in flower. This plant detests lime, so we use very sandy peat for it. Saxifrages Burseriana and Elizabetha are also in flower. We are very careful about soil and aspect for particular plants. Thus, a group of Ramondia pyrenaica is planted in shade and peat at the side of a wall. In fact, one portion of the rockery is constructed with sandstone and peat for peat-loving plants, such as Rhododendrons hirsutum, ferrugineum, and kamschaticum, Azaleas rosæflora, Daphnes, Cypripediums spectabile and Tibeticum, Shortia galicifolia, Campanula pulla, Tricuspidaria Hookerianum, Philesia buxifolia, and Dianthus alpinus."

"The treatment of any other varieties would be helpful."

"Androsace sarmentosa we cover with glass, to keep out winter rain. Androsace lanuginosa does well planted in very sandy soil, to which peat is added. Gentiana verna is planted here and there all over the rockery, in order to give a splash of its lovely blue over the whole. This is an idea of Colonel Nicholson, M.P., who takes a keen interest in rock plants. With Miss Gertrude Nicholson, he personally superintended and assisted in making the rockery. The Sphæralcea is very pretty hanging over rocks. It does well in any soil, but is not hardy. Cuttings rooted in autumn, wintered in a cold frame, and planted in April or May, make fine plants in a few weeks. There are many varieties of Thymus, notably lanuginosa, which is pretty hanging over rocks."

The Italian Garden.

"Just beyond the rockery," continued Mr. Down, "we have taken up a large Cupressus, and put in its place a bed of hardy Fuchsias. Facing this is a bank of Pentstemons, which we grow in masses of distinct colours. They are wintered in cold frames, cuttings being struck in September, and planted in April where they are to grow and flower, the ground being deeply dug and heavily manured. Now we come to the Italian garden, which is adorned on the south side with Rhododendrons, in front of which, and running over in the summer, is a mass of Tropæolum speciosum, which is admired as much as anything in the gardens."

"How do you fill the beds with Box borders in summer?"

"The colouring is yellow, scarlet, orange, and white, the flowers being Begonias Lafayette, Heliotropes Madame du Buzzy and President Garfield, and white Phlox, a carpet bed in front having Alternanthera, Mesembryanthemum, Alyssum maritima, and Begonia Miniature Crimson Gem."

Noticing on the lawn some fine specimens of Cedar of Lebanon, Taxodium distichum, Cypress, and the Venetian Sumach, and on a long wall near the mansion a number of shrubs, including Garrya elliptica, Wistaria sinensis, Choisya ternata, Myrtles, Hydrangeas, Ceanothus Veitchi and Gloire de Versailles, Cydonia, Clematis and Jasminum, I enquired how the vases on the terrace, which seemed to be a feature, are filled.

"No less than five hundred plants are required for these. We use chiefly Ivy-leaved Geraniums Souvenir de Charles Turner and Madame Crousse, with Geraniums Achievement, and Fuchsias Madame Aubin and Olympia, which blend well with the rose-coloured Begonias. We have also four vases filled with Phlox Drummondi."

"That is quite a novelty; do you find them a success?"

"So great a success that we have had them for eight years; they show a great mass of colour, and are most useful, but, of course, they have to be fed well for the purpose."

Features of the Conservatory.

"You have a noble conservatory, and some good climbers on the roof."

"The climbers include Lapagerias rosea and alba, Tacsonias, Habrothamnus, Plumbago capensis, and Bougainvillea glabra."

"What is the name of the plant with the flesh-coloured flower?"

"Luculia gratissima. It is beautifully scented, and lasts in flower about eight weeks, but it needs a good deal of shade. The plants in flower include Narcissus, Polyanthus, Hyacinths in variety, Freesias (one raceme with thirteen flowers), a number of Lachenalia Nelsoni on a marble bust (a mass of golden flowers in winter), Cineraria stellata (which are coming into flower), Camellias (white, pink, and blush, all on one stem, which are very much appreciated because they do not drop), and a large

batch of Primula kewensis. Then there are some fine specimens of Tree Ferns which are a handsome addition to the conservatory. Just outside is our other formal flower garden, with a fountain in the centre, and a number of vases. The latter are filled with Wallflowers, and in the water are several choice varieties of Water Lilies."

"What is your scheme of summer bedding?"

"In the circular beds we plant Geraniums Niphetos (white), Begonias (rose colour), and pyramid Heliotropes, seven or eight feet high. The carpet bedding is much the same as in the Italian garden, except that we use, in addition, dwarf Iresines and single Lobelias."

The Orchard House.

"How long has your orchard house been planted?"

"The plants are all about six years old, except that of Stirling Castle Peach, which is eight years old, and from which we got three hundred fruits last year. Half the house is devoted to Peaches and Nectarines, with Cherries at the back, and the other half to Plums and Pears. For at least the last four years we have begun picking fruit in June, and continued to the middle of November."

"What are the varieties of Pears in the orchard house?"

"Doyenne du Comice, Glou Morceau, Belle Julie, Marie Louise, Marie Benoist, Beurre Bosc, Beurre Fouqueray, Comte de Lamy, Josephine de Malines, Knight's Monarch, Marguerite Marillat, Nouvelle Fulvie, Pitmaston Duchess, Williams's Bon Chretien, etc."

Root-pruning Peaches.

"Do you grow many varieties here of Nectarines and Peaches?"

"The Nectarines are Downton, Dryden, Humboldt, Pitmaston Orange, Precoce de Croncels, and Spencer. The Peaches are Bellegarde, Dymond, Early Alfred, Hale's Early, Peregrine, Early Alexander, and Stirling Castle. All the trees in this house are mulched in summer."

"How often do you root-prune Peaches and Nectarines?"

"Every two years for the first few years. Loam, with lime rubble, is freely used, being the staple soil; and during the growing season the trees are well watered and syringed. They are never allowed to become dry either in winter or summer, except when they are maturing their fruit. Basic slag is used as a winter dressing, with kainit and bonemeal. Cherries are kept a little drier at the roots, and, as soon as fruit is fully developed, syringing is discontinued to prevent cracking. The varieties are Early Rivers, Black Tartarian, Bigarreau Napoleon, and Bigarreau."

From the orchard house we naturally made our way to the fruit garden, where a large cage containing Gooseberries immediately attracted my attention.

"They are all dessert varieties," said Mr. Brown, "of which Langley Gage, to my taste, is the sweetest, and Whitesmith still one of the best."

"You might, please, describe the training."

"The Gooseberries are palmate-trained, and cordons are planted against iron supports, which are split at the top to allow the wire-netting to fit in, and serve the double purpose of supporting the trees and the top wire-netting against snow. The leaders of the cordons are trained to a height of six feet, and instead of spurring closely (as usual), the side-branches, which are mainly disposed, are allowed to extend eighteen inches to two feet, and afterwards kept spurred. This is an idea of my own. The fruit looks very pretty, hanging from the thinly-disposed branches, is easy to gather, and sun and air are freely admitted. Before the ground was planted, it was trenched and manured, and in dry weather the trees are mulched. Red and Black Currants are also grown under the cage. Boskoop Giant is the favourite Black, and the Reds are La Versaillaise, Raby Castle, Red Dutch, and Fay's Prolific."

"How long do you keep your Strawberry plants?"

"Only three years, a third of them being discarded annually."

Sweet Peas and Chrysanthemums.

"How do you grow Sweet Peas?"

"In rows and clumps, in trenched and heavily manured ground. Three layers of farmyard manure are used, and superphosphate is worked in during February and March. If the summer is dry, periodical waterings with sulphate of ammonia are given. The Marquis, Evelyn Hemus, and a few other new Sweet Peas are being tried this year. We sow a few in autumn, winter them in a cold frame, and plant out in April, for early cutting. The others are sown in March and April."

"Do you go in largely for Chrysanthemums?" I enquired, as we passed the frame grounds, and entered the houses.

"About six hundred are grown for cutting and conservatory decoration. The predominating colours are white and pink, but yellows and crimsons are used; also a few Pompones and singles."

"Your Malmaison Carnations are looking very healthy."

THE GARDENER'S LODGE AT BASING PARK.

"They do remarkably well in this little house, and we have cut as many as a gross at once. The favourite varieties are Old Blush, Princess of Wales, Horace Hutchinson, and Maggie Hodgson. Duchess of Westminster, Prime Minister, King Oscar, Lady Grimston, Nell Gwynne, and Iolanthe are grown only in small quantities."

"What about Cannas?"

"We grow them in pots, and one bed only is planted out annually. Cannas are at their best in fine, warm weather. The varieties used for bedding are Queen Charlotte, Mrs. Strohlein, Duke Ernst, Alphonse Bouvier, and Elizabeth Ho s In the Orchid houses, the features are Cœlogyne cristata, Cattleyas, and Dendrobium nobile, of which, as you see, we have a number in flower. Rather a feature is also made of Calanthes Veitchii. In one of the propagating houses we have a batch of Schizanthus Wisetoniensis, which is splendid for cutting."

How Cyclamens are Grown.

"And a fine batch of Nerines?"

"Yes, and the best of these is, I think, Fothergilli major. The principal Pelargoniums are Edward Perkins, Kingston Beauty, Sunbeam, and Madame Thibaut. Then we grow about two hundred winter-flowering Geraniums for colour, the scarlet including The Sirdar and Scarlet Tunis; the pink, Zenobia and Phyllis; and the white, Dr. Nansen and Eucharis."

"What is your system with Cyclamen?"

"We do not keep the plants more than two years, and use them largely for decoration. Cyclamen generally flag the first day, but if they are dipped in hot water, and the ends cut off, they will last a considerable time. We grow about two hundred in 5-in., 6-in., and 7-in. pots. They are all Sutton's strain, and chiefly white and pink. They begin to flower in October, and go on till April."

"I notice that you grow Pines."

"We get a fair number of good fruits, the varieties being Smith Cayenne, and Queen. As to other inside fruit, you see we have several Vineries. In the early house, Black Hamburgh and two rods of Foster's Seedling are grown; then there is a young house of Muscats, with two rods, inarched on Foster's Seedling, for trial against shanking; a late Vinery with Gros Maroc; and the latest of all with Lady Downe's Seedling. Beyond the Vineries is a Peach house, with one Peach and three Nectarines (Early Rivers, Lord Napier, and Pineapple), which, I think, you will consider are well set."

Notable Vegetables.

"Your vegetable garden is some distance from the main garden."

"About four hundred yards away, and it is enclosed by an Arbor-Vitæ hedge. One of the most important vegetables is Onions; a large quantity is required, and they do well in this heavy soil."

"When do you sow?"

"I have no fixed date for sowing, but believe in getting the seed in as early as possible. This year it was sown the second week in February, as the ground was then in excellent condition. I am glad to say that upon examination the seed does not appear to have been injured by the severe weather, and now they are showing well. Part of the crop is sown in a cold frame early in February, and the young plants are planted out as soon as they are large enough to handle. This is both economical in seed and labour, because it saves weeding and thinning in May. All weeds are kept in check by the Dutch hoe, and the varieties grown are Ailsa

Craig, Veitch's Maincrop, Sutton's Long Keeping, and Bedfordshire Champion."

"What about Potatoes?"

"Early Potatoes only are grown in the garden, the main crop being raised on the farm. The first crop of Peas is grown in a cold frame. This year we use Langley Gem in place of Chelsea Gem. Early Giant and Duke of Albany are two favourite kinds. The ground is always deeply dug and heavily manured for Onions and Peas."

"How do you grow Seakale?"

"In rows, the varieties being Beddard's Improved and Lilywhite. Some of the Seakale is lifted for forcing. but the bulk of it is forced by fermenting material, long boxes being placed over the rows, and a loose board fitted on the top. The ground requires draining for Asparagus to do well. Of Carrots, Matchless and Model are favourites. Celery is grown in large quantities in the usual way, the varieties being Early Rose, Solid White, and Standard Bearer."

Mr. Down's Career.

"Where did you commence your gardening career, Mr. Down?"

"My first five years of experience were gained in Mr. Edgecumbe's market garden, near Malvern, where Peaches and Nectarines were grown for Covent Garden in pots. Strawberries and French Beans were also forced for Covent Garden, and Strawberries and Raspberries were the principal outdoor crops, though Apples and Pears were an important feature. I was next for a short time at Elm Grove, Walton-on-Thames; and then in the Palm house and aquatic house at Kew. From Kew I went to Lathom House Gardens, Ormskirk, where I found a soil that could grow almost anything. At the end of three years I proceeded to Croxteth, remaining there also for three years, the last two being spent in the inside fruit department. My next appointment was as general foreman at Headington Hill, Oxford, where we used to exhibit largely; and then I became head gardener at Lyons Hazlehatch, County Kildare."

"That was your first appointment as head gardener?"

"Yes, and I remained at Lyons until the death of Lady Cloncurry, who was devoted to her garden. Then, after four and a half years' service, I was offered and accepted the post of head gardener to her aunt, Mrs. Strickland Constable, Wassand Hall, Hull, which I filled for seven and a half years. As my prize cards show, I exhibited with much success at Wassand Hall, especially Chrysanthemums and hardy fruit. I won the challenge cup at Beverley for eighteen Japanese blooms the first year it was offered, and at Hull Chrysanthemum Exhibition, then reputed to be one of the best shows in the country. For the rest, my prizes include four silver cups for Chrysanthemums in classes for eighteen blooms of Japanese, and classes for eighteen Incurved. In February, 1901, I came to Basing Park."

Alfred Wilcox.

A very successful exhibit of early English vegetables grown out of doors on the intensive culture system was held at the St. George's Hall, Canterbury, on April 24th, under the auspices of the Anglo-French Stour Valley Gardening School, of Westbere, Canterbury. Various medals and certificates were awarded, and there was a numerous and influential attendance.

The spring exhibition at the Horticultural Hall, Boston, closed on Sunday, April 3rd, after a phenomenal run of eleven days. The "gate money" amounted to nearly 7,000 dollars, the Massachusetts Horticultural Society being about 5,000 dollars in pocket as a result of the event. The great feature of the show was a wonderful Japanese garden, for the design and construction of which Mr. J. F. M. Farquhar was honoured with a special diploma for distinguished service.

Letters from a Lady Gardener.

No. 353.—VIOLETS.

Dear Kate,—We all love Violets, and most of us might have plenty of them in our gardens, unless we live in a city, where, I am told, they will not flourish, for they need pure air. This is the time to make a Violet bed, if you have not already done so; April is better, but the spring is late this year, and much work has been put a little late by the dreadful weather of March; but don't lose any more time now, if you wish for early Violets next autumn. The border for Violets should be well dug, and the soil mixed with plenty of leaf-mould or quite old manure (the contents of last year's hotbed, for instance); also crushed mortar from an old wall, or, failing that, slaked lime. Violets do best in a light but rich compost: heavy clay soils need an admixture of sand, burnt vegetable refuse, soot, or charcoal, to lighten them, but these things are not necessary in a light gravel soil.

Violet Marie Louise.

Planting Violet Runners.

Having made your Violet bed, get in the plants without loss of time. They should be rooted runners, and, to secure the best possible plants, the runners should be pegged down into a little rich top-dressing in January or February, when they will have made strong roots by this time, and be ready for transplanting. Each should be placed one foot from its next neighbours, and it is best to "puddle them in," *i.e.*, to make a small hole for each with a trowel, fill this with water, and place the plant in this before it sinks away, filling up the hole with fine good soil, and making the Violet firm in this. It is of great importance that the leaves should not droop at all, and unless you can plant your Violets in wet, dull weather, it is better to shade each of them for a few days with an inverted flower-pot during bright sunshine, taking the pots off at night and during rain. In a week or two, if they were well planted, they will have taken to the fresh soil, and be quite independent; but they should not be allowed to want for water during a drought.

Here, however, I must give you a word of caution. A light sprinkling given every evening is far worse than none, for it results in a hard crust of soil, baked daily by the hot sunshine, which effectually prevents the dew from penetrating to the roots of the plants, and also interferes with the beneficent action of the sun in drawing moisture through the soil to the help of he roots. A constantly loosened surface soil is far better in most cases than watering; but if it should be necessary to supply water, it must be in copious quantity, so as to soak the roots thoroughly, after which you can loosen the surface soil with great advantage, and the plants will need no more water for some days. Mulching, too, with leaf-mould, old hotbed stuff, or even with fresh good soil, helps them greatly through a dry time; but if you never allow the surface soil to harden (and, of course, keep down all weeds in forking it up), the Violets will need little else, if growing in a well-prepared bed to start with. Here (in South Devon) we only care to grow the double Violets under frames in winter, as the enormous flowers of the single kinds (Princess of Wales, etc.) appear to be perfectly hardy; but probably in a colder district they may need the protection of glass after October.

The best double varieties are Neapolitans, early and very fragrant; Marie Louise, in a

HORTICULTURE AT UNIVERSITY COLLEGE, READING.

IT is nearly eight years ago since the late Earl of Onslow, in the capacity of President of the Board of Agriculture, opened the Horticultural Gardens of University College, Reading. The teaching of horticulture was organised two years earlier. It was then that Mr. Alfred Palmer generously offered his garden, already well stocked and equipped, for the use of the College.

The site in London Road, six acres in extent, was subsequently presented to the College by Mr. Palmer, and here, in due course, the existing buildings in connection with the faculty of science, and the departments of fine art, commerce, and of agriculture and horticulture, were erected.

In 1903 the College authorities, by arrangement with Messrs. Sutton and Sons, took over five acres of land contiguous, together with the glass and other buildings standing on it, and these form the horticultural garden existing. In the autumn of the same year the College purchased Lane End Farm, Shinfield, for the purposes of practical teaching and experimental work in agriculture. In 1906 and 1907 eleven of the one hundred and fifty acres acquired were planted with fruit, and passed into the charge of the Lecturer and Practical Instructor in Horticulture.

The present instructor, Mr. F. G. Drew, has now filled this post for nearly three years. Previous to taking up his duties at Reading he had enjoyed a wide and varied experience, obtained in some of the best nurseries and gardens in the kingdom, including the oversight of the gardens at Wych Cross, Forest Row, which he helped to create.

On the occasion of my visit to Reading last month, I learnt that the growth of the department, and the development of horticultural education, compels the College to contemplate further extension. The College authorities believe in thoroughness, and it is certain that whatever their ultimate policy, it will lack nothing in this respect. As Mr. Drew says: "A prudent and well-considered scheme will commend itself, while an indifferent one, or one of a patchwork nature, will utterly fail to arouse either enthusiasm or support." The exigencies created by the growth of other departments and faculties seem to indicate that such extension must take place in proximity to the fruit station.

The Culture of Small Fruits.

"What is the nature of the soil at Shinfield?" I asked Mr. Drew, in the course of our conversation.

"Heavy loam over London clay. It is land that repays for deep and thorough cultivation, but it is land that must be handled at the right time."

"Does it grow small fruits well?"

"Yes. Strawberries, Raspberries, Currants, and Gooseberries are very satisfactory, provided the manure cart calls sufficiently often. In 1910-11 we had good crops in spite of wet and drought. Last season we sold over two tons of Strawberries, and between two and three tons of Black and Red Currants, and of Gooseberries about one ton. In 1910 we gathered a ton of Raspberries. Last season, owing to the drought, the crop was about four hundred-weight less. Loganberries have an increasing sale, and I think they are equally as profitable as Raspberries, if not more so."

THE FRUIT FARM OF THE UNIVERSITY.

"Do you grow many kinds of Strawberries?"

"We depend chiefly on Royal Sovereign. Givon's Late Prolific we are trying. We have also a number of varieties kindly presented to us by Messrs. Laxton, which we are giving a fair trial, both at Shinfield and at the garden in Reading."

The Best Apples.

"But your principal feature is the larger fruit?"

"Apples especially; but, so far, the returns have not been large, as the trees are young, and we want to form our trees before cropping them. I may say the same of Plums. As to Pears, we are trying a few varieties, but so far we have failed to obtain a crop from any single tree. The subsoil is unsuitable for Pears, and even the use of the Quince stock does not get over the difficulty."

"Are you an advocate of severe pruning?"

"No; not as generally understood. We prune somewhat severely in the early years of growth, but once having originated a sufficient number of shoots to form a well-shaped head, with branches thinly disposed, we prune less, and rely more on summer pinching and winter thinning of shoots. For once vigorous trees, or rather for trees which do not show fruit buds liberally when growing strongly, I advocate careful lifting of the strong roots, and encouraging surface roots by manurial dressings. It is not such an expensive operation as many think. Besides, if it is a question of either lifting or to be satisfied with unsatisfactory crops, and dirty fruit, which are not worth putting on the market, commonsense says raise the roots. It certainly has a marked effect on the health of the trees. You would, in some cases, hardly recognise the fruits of root-lifted trees, and of unlifted trees of the same variety, as being the same."

"Do you spray the trees?"

"Probably few growers of similar extent have sprayed as much as we have in the past two years, and at the present moment it is a difficult matter to find a trace of scab in the whole plantation. Scab is our greatest trouble, but the fine summer no doubt was a great help in exterminating it. On the light soil of the garden at Reading we have not yet seen scab."

"What spraying fluid do you use?"

"For scab we rely on Bordeaux mixture, and the lime-sulphur or Oregon wash, as it is termed sometimes. Bordeaux mixture needs considerable care, and much damage may be done to both leaves and fruit. If we find the lime-sulphur wash equally satisfactory we shall discard Bordeaux mixture, on account of the less liability to scorching and russeting with lime-sulphur. We think, too, that lime-sulphur wash is not so detrimental to the general health of the tree."

"What is your best variety of Apple?"

"Well, it is rather early yet to say definitely. Newton Wonder promises to be as good as any kind, but last year was a Newton year. The Apples coloured brilliantly, are as clean and sound as a bell, and entirely free from bitter pit. We grow Cox's largely, but I do not think the farm soil is ideal 'Cox' land. However, they were good this year. Other kinds we grow are Worcester, Ecklinville, King of Pippins, and Transparent. We may, however, regraft the last two with Bramley's Seedling."

"What is your system of planting?"

"As to arrangement, the bush Apples are planted twelve feet each way, and the standards eighteen feet. The former are intercropped with Gooseberries and Currants, which will eventually be cut out as the Apples extend, and occupy the space."

"Do you manure heavily?"

"Not so heavily at the fruit station as on the lighter soil of the garden, where lack of moisture is the chief difficulty. We employ both stable manure and artificials for vegetables and small fruits. The larger fruits have as yet needed no manure."

Profitable Vegetables.

"What vegetables flourish best here?"

"The heavy land suits Celery, Sprouts, and Savoys remarkably well, and Onions also; but we have to raise the Onions in boxes. Onions were a very profitable crop this year to those who 'did' their land well, and put out good plants. Forty bushels from a plot nine yards by fifty, realising four shillings and sixpence

Digitized by Google Original from CORNELL UNIVERSITY

per bushel, may be considered satisfactory. Several bushels obtained as much as six shillings, and we have had as much as seven bushels from a single pole."

"Do you sow outside in spring?"

"The pricking out system is, I think, better than sowing outside in spring, particularly where there is much difficulty in obtaining a good seed-bed early; but the plants must be pricked out thickly, or the bulbs grow too large, and do not realise as good a price. Three inches between the plants is quite sufficient, and provided students are careful in hoeing, ten inches between the rows."

"What about Peas?"

"The heavy land also suits Peas. We grow about half an acre, and stake all the early varieties. I think the finest large-podded early kinds pay for staking, provided it is not too elaborately done. The labour must, of course, be kept to a minimum. Appearance counts a good deal in marketing Peas."

The Work of the Students.

"The students, I presume, spend a good deal of time in the garden?"

"I think, if you examine their time-tables you will see that during the College terms rather more than one half of their time is spent at practical work, in addition to ten weeks of the vacations, when, of course, there are no lectures. The strong feature in their first year's work is the raising and cultivation of hardy fruit trees, together with the culture of vegetables.

"Naturally," continued Mr. Drew, "in two years it is impossible for them, or anyone under similar circumstances, to attain any great degree of technical skill in the varied operations connected with horticultural practice. There is, of course, a good deal of difference in individuals in this respect. A person who had but this one object in view would be better advised if he made friends with, and worked alongside a good garden labourer, than come to us. He could then concentrate his attention on the operation itself, without any mental distraction as to why it was being done. Such distraction, at the moment, would be inimical to mechanical accuracy. A man who wanted to bore and lay a drain evenly would not be likely to make a brilliant job of it if he attempted at the same moment to wrestle with all the principles of sanitary science, or even one of them. He must do the latter part of the business, either before, or better still, afterwards. No good farmer would think of sending his son to an agricultural college to acquire dexterity in harnessing a horse, cleaning out a cow-stall, or making a scare-crow. Certainly our people are instructed in methods, but the measure of our success is not so much the skill they attain, as the degree to which they have been enabled to think clearly about them."

The Instruction Given.

"As to the course of instruction?"

"The courses of instruction to be attended are at least two sessions, of forty weeks each. In the first year an elementary knowledge in the theory and practice of Horticulture is afforded. The syllabus includes the site of a garden, its aspect and shelter, the composition and classification of soils, the cultivation of the land, and drainage; the methods and results of digging, trenching, hoeing, raking, and rolling; the tools used in these operations, and the uses of manures and their modes of application. Then, there is the vegetable garden, as to which they are instructed in the propagation, culture, and management of green vegetables, roots, and tuberous and bulbous crops."

"You might give some examples."

"The green vegetables include salads and herbs; the Cabbage tribe, Spinach, Lettuce, Parsley, Mint, and Sage; the roots, Carrot, Parsnip, Radish, Turnip, Beet, Horse Radish, Salsify, and Scorzonera. The Potato, the Artichoke, the Onion, and its allies, such as the Leek, embrace tuberous and bulbous crops. We teach the culture of Asparagus, Celery, Seakale, and other stem and leaf crops; the Legumes, such as Peas, Broad, Dwarf, and Runner Beans, and other outdoor fruit-bearing vegetables, such as Tomatoes, Vegetable Marrows, and Cucumbers."

The Utilitarian Side of Gardening.

"Do you sell all the crops you grow?"

HERBACEOUS BORDER AT THE READING UNIVERSITY.

"Everything. In other words, we grow for teaching purposes, at a loss; and we grow for profit also. Quite a feature is made of the utilitarian side of gardening. Fruit, vegetables, marketable plants, and plants valuable for cut blooms are all grown in order to add to the income as well as to convince outsiders that we can grow for profit."

"Growing so many different things, I presume, militates against your success from a profit-making point of view?"

"Naturally, the number of subjects we grow for teaching purposes is a serious handicap to profitable production, and students do not come here with the idea of running a profit-making Tomato and Cucumber farm for the benefit of the College, neither is it our idea that they should. If it was, they would soon disillusion us on the point. They come here primarily, to learn, or rather to acquire a reasoned, common-sense attitude toward horticulture, and the details of horticultural practice. Still, many of our crops are most profitable. This plot, as you see, exactly six poles in extent, sown with Asparagus, realised, as the result of the sale of the crowns, and within one year, £7. Nine poles of early Cauliflower, yonder, produced £8 10s., and subsequently a crop of Brussels Sprouts, of which I have no account. Savoys made at the rate of between £50 and £55 per acre. The two plots in front of us each cropped successively with Cabbage, Celery, and Lettuce, gave a gross return of £25. Their combined area is just over seven hundred square yards. You will judge from these figures that there is ample margin for spade, manure, and a profit."

"Have you a good local market for your produce?"

"Most of our produce is disposed of in Reading. Although there is here but a limited demand for high-class produce at top prices, we have not yet had to go outside to any extent."

Student Labour.

"Does student labour worry you?"

"Do I look as if it did? I think I can say that the students are keen, and, as a whole, painstaking. But as I have already said, they come here to learn, and our object is to endeavour to fulfil the purpose for which they come."

"Do you cultivate flowers for sale?"

"Yes; we grow flowers, and they add considerably to the income. For teaching purposes we have, in addition, the use of the garden attached to the botanical laboratory, as well as that belonging to the new women's hostel, St. Andrew's Hall. The hostels are a feature of the College, and it now possesses four — two for men, and two for women."

"What is the number of students you take at one time?"

"The average number is about thirty. A few do not take the whole of a course, but come in for a set of lectures on a particular subject."

"What is the proportion of women to men?"

"About equal, and, as a whole, they are, I think, the better workers."

"And their ultimate object?"

"Their objects are various. Some students enter in order to be able to teach horticulture, nature study, eventually; others, to be able to follow the work of their own gardens intelligently; some to run market establishments of their own; and others to take posts as gardeners. The same reasons prevail among the men, though we find fewer taking up teaching than is the case among the women."

"I take it that you attach most importance to the severely useful phase of horticulture?"

"We emphasise the utilitarian side of horticulture, because the greatest demand for instruction lies in that direction; but we do not ignore it from the æsthetic point of view, and are at this moment contemplating further provision for those who are not under the necessity of being interested in such objects, say, as the 'fragrant' Onion, or the 'noble tuber.'"

"What about the large incomes some women gardeners are reported to make?"

"I cannot say that the statement that some of our women students are making an income of a round £1,000 a year from market gardening is correct. Of course, some of them may have struck a vein of this 'golden soil' about which we have heard so much, but even so, from what I know of our women students, they would, I feel sure, with true business instinct, withhold any information on the point from

Digitized by Google Original from CORNELL UNIVERSITY

myself or anyone, for fear others might exploit their 'claim' before they had exhausted it. But I think I may tell you this, that when they have arrived at that stage of their enterprise, there are a few with distinct literary ability, who may be trusted to see that a book on the subject might, on assay, yield more ore than 'golden soil 'itself. Most of them are aware that the success of a moderate or small undertaking or holding depends as much on their own personal labour and personal supervision as on anything; that it is a question of working 'while there is light.'"

"How many students did you start with?"

"The first year there were seven or eight. These, as I have already said, have grown to thirty, and following the application of the development grant to rural education, we can confidently look for a large increase. We may, too, look for additional men from among the sons of the better type of market grower and nurseryman, many of whom are beginning to see the advantage of such a training.

"You do not contemplate giving up your present quarters?"

"We should be sorry to leave London Road. The soil is light, and very responsive. It can be handled at almost any moment, and is therefore admirably adapted for working by student labour. The situation, too, is convenient, and it is pleasant to do most of our work under the shadow of the College."

ALFRED WILCOX.

NEXT week, the gardens of Captain Fryer, at Worthy Park, Winchester, will be described.

Correspondents will greatly oblige by observing the following rules when sending Questions for publication in these pages:—

1. Letters must be addressed to the Editor, GARDEN LIFE, Hatton House, Great Queen Street, London, W.C.
2. Only one side of the paper may be written on.
3. Not more than six questions may be asked at one time.
4. Fruit, Flowers, or Vegetables for naming, must be sent separately, and, if possible, packed in a tin or wooden box—cardboard boxes should on no account be used.
5. The full name and address of the sender must always be sent, but a nom-de-plume may be given for publication.
6. Letters can on no account be replied to through the post unless a special postal fee of 1s. is forwarded.

SWEET PEAS in Tubs.—Will you give me a list of twelve Sweet Peas suitable for garden decoration and cutting, including one similar in colour to Henry Eckford, which I like very much, but consider small flowered? Most of them will be grown in tubs, owing to lack of accommodation—one colour in each tub—so will you name them in the best colour arrangement? The following were grown last season, so I should like a change:—King Edward Spencer, Aurora Spencer, George Herbert Spencer, Henry Eckford, Evelyn Hemus, Maud Holmes, Lord Nelson, Zephyr, Asta Ohn, Othello Spencer. They were sown in pots on January 30th, transplanted April 18th, and in flower on June 9th, and did very well in tubs, only giving over rather early (S. S. R., Dublin).———I am afraid I cannot recommend a Pea similar in colour to Henry Eckford for garden decoration, as most varieties in that colour burn in the sun. Earl Spencer, Barbara, and Melba are all good growers, and much larger in the bloom, but they all want shading. Stirling Stent is rather better in respect to standing the sun, but the flowers are decidedly smaller. In place of a salmon I should be inclined to try Mrs. W. J. Unwin, which is a grand stripe. If you grow your tubs in a row, you might start with this variety, and run them left to right as follows:—Mrs. W. J. Unwin (salmon stripe), Jack Tar (deep blue), Hercules (pink), Tennant Spencer (mauve), Thomas Stevenson (orange), Isabel Malcolm (cream), Lancashire (cream-pink), Scarlet Emperor (scarlet), Elsie Herbert (white-ground Picotee), Loyalty (bright blue stripe), Constance Oliver (deep cream-pink), and Colleen (bicolor). These are all very good growers and profuse bloomers. Your date for sowing is good. Do not stint manure water when blooming, and keep all stale blooms picked off, and they ought to keep going some time.—THOMAS STEVENSON.

Treatment of Budded Briers.—I have successfully budded a few Briers, but am in doubt as to their after-care. (1) What protection, if any, do H.P. and H.T. buds need during winter? (2) What is the best method of tying up shoots when buds start into growth? (W. C. G., Letchworth.)——(1) No protection at all is necessary during mild, open weather like the present. If the Briers are low, you can protect the buds by earthing them over. In the case of standards, tie bracken or hay over the buds, in the event of frost of any duration setting in. (2) Short stakes may be used for dwarfs, or the Briers themselves may be used as supports, also in the case of standards. As the buds begin to grow, you can rub off the buds on the Brier above the Rose buds, but retain the shoots for support as long as they are necessary.

Eighteen Sweet Peas for Exhibition.—(1) I have the following Sweet Peas (seed saved from my own plants last season):—Etta Dyke, Maud Holmes, Helen Lewis, Earl Spencer, Mrs. H. Bell, Miriam Beaver, John Ingman, Marquis, Prince of Orange, Primrose Paradise, Masterpiece, and Picotee. I want eighteen varieties for exhibition. Will you tell me if I need throw any of the above out and replace, and also what varieties to add? (2) Which is the better Sweet Pea, Prince of Orange or Thomas Stevenson? Can you tell me of a clearer pale blue than Guy Hemus? (F. C., Diss.)——(1) You might very well continue to grow all but Miriam Beaver, Prince of Orange, and Picotee, adding, to make up eighteen varieties, Thomas Stevenson, Mrs. C. W. Breadmore, Elsie Herbert, Elfrida Pearson, Nubian, Anglian Blue, Scarlet Emperor, Prince George, and Spencer America. (2) From the bunches exhibited and the trials I have seen, Thomas Stevenson is decidedly the better Pea. Also, I think Anglian Blue is to be preferred to Guy Hemus, as it is rather deeper in colour.—THOMAS STEVENSON.

Forked Beetroot and Exhibition Onions.—(1) Last year my exhibition Beetroot was forked and coarse. Can you tell me the cause of this, and the cure? There was a good depth of soil, and no recently-added manure. (2) Which do you consider is the darkest coloured Beetroot in cultivation, and best suited for exhibition? (3) My land is a good deal infested by wireworms, and as I should like to grow some first-class Carrots, is there any artificial preparation which I could mix with the soil with which I fill the holes I make before sowing the seed? (4) Would Onion seed, if sown in a cold frame now, make good exhibition bulbs by the end of August? I mean to thin them out to the necessary distance, and remove the glass by degrees until I can take it off altogether, leaving the plants to mature in the same place as sown. (5) Last year I bought some prizewinning Potatoes at a show, and I think they are too large to set as they are. Should I cut them in two, or cut all the sprout holes out, except one, and plant them as they are, or keep all the sprouts broken off, except the main one? (6) Is there any special kind of Sweet Pea which, with good cultivation, grows four blooms on each stem invariably, or is it cultivation which produces them? (Subsoil, Whitby.)———(1) The end of April is early enough to sow Beet. Your soil may be hard and lumpy. It should, of course, be trenched two feet deep at least, and, if lumpy or stony, you can get good exhibition roots by boring holes with a dibber, and filling them with a sifted compost of light soil, leaf-mould, wood ashes, and sand. Make the compost firm, and sow three or four seeds on the top of each hole, and pull up all but the best seedling when two inches high. (2) Pragnell's Exhibition is one of the best, but the colour is best preserved by frequent selection of the best roots of each variety from year to year by the seedsmen. Dell's Black is another, but we do not think the roots are better than Pragnell's. (3) Use one of the soil fumigants, such as Kilogrub. Trapping by means of Carrets and Potatoes, buried in the soil, will also reduce the pest. (4) The plan you propose is a good one, though not so effective as a heated house. Harden them off to stand full exposure by the end of April, if the weather is settled then. We believe they would grow better if the frame is removed altogether, for the benefit of the foliage, after that date. It is worth trying. (5) You can cut them in half, making sure of a good sprout to each. Rub off the extra sprouts. There is no necessity for gouging them out, because you can always pull out superfluous stems when well above the soil. The top sprout is the strongest. (6) Four flowers are not invariably the case, perhaps, with any variety. Some are more inclined to produce four than others, but good cultivation is the most reliable factor in the case.—ED.

Burning Clay Soil.—Last season was not a very successful one with me as regards vegetables, but I am now bastard trenching a good part of my garden, which will better enable me to withstand similar climatic conditions. The advice as to autumn sowing of hardy annuals has been a revelation to me, especially with Cornflowers; the size of the bushes and the continuous blooming have been splendid, and every amateur ought to give it a trial. I have, this winter, burnt a portion of my garden, which was heavy clay land, overrun with Lily (wild Convolvulus), and other weeds, which choked a few Gooseberry bushes, which had not been cultivated on a single standard, and which I found it impossible to keep clear. This was a heavy job with the torrential rains, to which we have been subjected. This has now the appearance of frost-crumbled bricks; this I have dunged with stable manure, and spread about six inches of road-sweepings over all. What would you suggest putting into it? It is on a good slope facing eastwards, and sheltered by a wall on the north, and receives the sun up till midday, when it is shaded by a tall building. I thought of using a portion as a seed-bed for flower and vegetable seeds, as likely to be free from vermin, and planting the rest with Potatoes. The last season was good for flowers, many of which seeded, and became self sown, so that there was quite a crop of seedlings early in the autumn; a good many of these I pricked out into a nursery bed, and protected with Pea sticks. I now notice some Hollyhock seedlings which I have pricked out and given the shelter of a cold frame. Will these flower the coming season? (Learner, Cowes.)———The effect of burning part of a clay soil is to improve its mechanical condition, enabling the roots of plants to penetrate it freely and deeply. This is a great advantage gained, but it would not be good policy to carry it too far, because it destroys all the vegetable matter in the burned portion. You may occasionally be able to get clay from another source to burn, and that would bring about the same effect. It may, however, be regarded as of little account, provided you have a great depth of soil to fall back upon, but even in that case it would be economical of the existing fertility of the top soil, if you use the subsoil only for burning. The mixture you now have will be suitable for both flowers and vegetables. The soil will be distinctly improved for Potatoes, which like a light, open, and rich soil, so that you need not hesitate in planting them, if you prefer them to other vegetables. The afternoon shade caused by the building will be disadvantageous to Potatoes, which like open situations. Leeks, Carrots, and Parsnips would be good crops for these conditions, and others can be grown with varying success. The Hollyhocks will most likely flower in autumn, if you plant them in a sunny position in March or early in April. Their flowering is a question of strength, and even if they fail to flower this year, they will make grand plants for the next. As a rule, autumn-sown Hollyhocks bloom the following year, and if they had a greenhouse in winter to keep them growing slowly, their flowering would be certain. Thanks for your appreciative remarks.—ED.

Unsatisfactory Chrysanthemums.—I am a fairly successful Chrysanthemum grower, but I do not think that more than a third of my plants finish up to the mark. I have got about two hundred and seventy cuttings in. I started early in December, and all look well, and many are rooted already. Cold treatment only. I have appended my list of varieties, and as I only grow ninety-nine plants, it is hard to know which to discard and which to grow the most of. I exhibit both groups and cut. Master David and Master James, last season with me, had immense eyes. The growth throughout was perfect, and the blooms immense. I grew eight of each, and the plants came from three different places, and I cannot put the failure down to the season, as although I saw many more like mine, I saw others done remarkably well. I took the buds, natural first, David, and natural second, James. Do you think the feeding might have been at fault? Should both be grown without any forcing? I cannot master Mrs. N. Davis or the Hon. Mrs. Lopes. I follow H. J. Jones' method of stopping. Could you, in selecting from my list, class them as varieties which want plenty of forcing, and those which are best when not forced? (Pomper, Leytonstone.)———This is a letter from a Chrysanthemum

James Drewett
Gardeners' Chronicle 1874, n.s. 2

The name of Mr. Drewett is well known in the world of horticulture, being very prominently associated with the production of some of the handsomest Muscat Grapes which have perhaps ever graced an exhibition table. We now present his portrait to our readers, as that of one of the veterans amongst British gardeners.

Mr. James Drewett was born in the year 1803 in the neighbourhood of Bristol, and entered on his horticultural career in the gardens at Himley Hall, Staffordshire, the seat of the Earl of Dudley and Ward. In 1825 he came to London, and was employed over a period of seven years in the Royal Forcing Gardens at Kensington and Cumberland Lodge, and in the Royal Botanic Gardens, Kew.

Mr. Drewett has held three head situations; the first as manager of the estate, gardens, woods, &c., for the late D. Baillee, Esq.; the second as gardener to Sir W. Heathcote, Bart., at Hursley Park near Winchester, Hants; the third with the late Thomas Cubitt, Esq., at the Denbies, near Dorking, Surrey. This latter situation he entered in 1850, and has held to the present time. During this period very extensive ground-work operations have been carried out under his direction, and much planting has been done; while a new kitchen garden and fruit orchard have been formed. Mr. Drewett designed the range of forcing-houses at this place, and planted the Vines, which are assisted by heated chambers under the outside borders. It is these Vines which produced the fine samples of Frontignan, Canon Hall Muscat, and Muscat of Alexandria Grapes, which were so much admired at the metropolitan exhibitions in 1857 and in succeeding years, and which were, moreover, so successful in obtaining first prizes.

We learn that Mr. Drewett will shortly retire from the management of these gardens, of which he has been the director for nearly twenty-four years, and that he will be succeeded by his foreman, Mr. Beesley.

amateurs' class; Mr. H. James, of Castle Nursery, Lower Norwood, being 2d in the former class; and Mr. C. Rann, gr. to J. Warren, Esq., Handcross Park, Sussex, 2d in the latter.

GREENHOUSE AZALEAS

were exhibited in the form of large specimens, and in capital condition. The contest for the premier position in the class for nine large specimens was between Mr. G. Roach, gr. to R. Thornton, Esq., The Hoo, Sydenham Hill, and Mr. Turner, of the Royal Nurseries, Slough, the 1st prize being awarded to the amateur. Mr. Roach was the only exhibitor in the amateurs' class for Azaleas, and received the highest award.

Mr. Turner and Mr. Roach also competed in the class for eighteen Azaleas in 9-inch pots, the first-named being easily 1st, with superb specimens, in beautiful variety. The best of them were—Apollo, Baron N. de Rothschild, Comtesse de Flandres, Grandis, Jean Vervaene, Louise Pynaert, Mdlle. Marie Lefebvre, fine white variety; Mdlle. Marie van Houtte, Marquis of Lorne, Mrs. Turner, Reine des Pays Bas, Roi de Hollande: these should all be in the most select collection.

ORCHIDS.

The competition for these was very spirited, many well grown specimens being exhibited.

In the class for nine distinct Orchids, Mr. J. H. Hill, gr. to H. Little, Esq., Hillingdon, near Uxbridge, obtained the 1st prize. He had two good varieties of Cattleya Mendelii, Dendrobium thyrsiflorum, many spikes; Cattleya Mossiæ, nine fine flowers; C. Leopoldi, a handsome Lycaste Skinneri, Aërides Fieldingii, a large pan of Cypripedium ciliolare, and one of Odontoglossum crispum. Mr. Salter, gr. to J. Southgate, Esq., Selborne, Streatham, was a good 2d; Cymbidium Lowii had two fine spikes, Cœlogyne pandurata, with its singular green and black flowers, had two spikes; Dendrobium Falconeri was also fine. Mr. H. James was 3d.

The best specimen Orchid was sent by Mr. S. Cooke, gr. to De B. Crawshay, Esq., Sevenoaks; it was a well grown specimen of Vanda suavis with four spikes and fifty-five flowers. Mr. Salter was 2d, with a fine Dendrobium Falconeri.

In the amateurs' class for six Orchids, Mr. Cooke was well 1st, with, amongst other fine things, a Cattleya Mossiæ, eleven splendid blooms; a Vanda suavis, two spikes; Epidendrum vitellinum majus, &c. Mr. Salter was 2d. Mr. A. Luff, gr. to R. R. Hyatt, Esq., Hitherset, Leigham Court Road, was a good 3d; he had a fine Phalænopsis amabilis, and a good plant in fine bloom of Cattleya gigas.

Collections of not less than forty Orchids "arranged with a few Ferns and Palms for effect," made an interesting exhibition. Mr. Salter easily gained the 1st prize, followed by Mr. H. James and Mr. A. Luff. Odontoglossum polyxanthum, Cattleya Mendelii, C. Mossiæ (white form), Lælia purpurata, &c., were fine in Mr. Salter's collection, Mr. James showing fine forms of Odontoglossum crispum and O. Pescatorei.

FINE-FOLIAGE PLANTS

were very large in size, and most of the specimens were well cultivated. The whole of the 1st prizes were awarded to Mr. Rann, who grows this class of plants to a large size, and maintains them in good condition. His Cycas revoluta was a splendid specimen, so also was C. circinalis and Croton albicans, distinct and good. In the class for six specimens his Bonapartea stricta was very pretty; Gleichenia Mendelii well furnished to the base, and Croton Queen Victoria rich in colour.

Mr. J. W. Penfold, fgr. to the Rev. Canon Bridges, Beddington, also exhibited good foliage plants.

Mr. J. R. Bird, gr. to H. Causton, Esq., Lodgemore, Alleyn Park, Dulwich, was awarded both prizes for Crotons; the plants were large in size, though not so well coloured as the smaller specimens from Messrs. Hooper, of Covent Garden, who obtained the 2d prize in the open class; Mr. Wakeham being 2d in that for amateurs.

Messrs. Hooper were 1st in the open class for Dracænas, and Mr. Bird in that for amateurs. They made a good feature in the show.

Caladiums made a grand display of rich and varied colour. Perhaps no finer specimens were ever exhibited than the nine huge plants which gained the 1st prize for Messrs. Laing, of Stanstead Park, Forest Hill. The most distinct of them were Leopold, Robert, candidum, albo-luteum, Souvenir de Madame Bernard, Mithridate, and Madame Marjolin Scheffer. Mr. J. Sharpe, gr. to F. Hatchett, Esq., Parkfield, Lee, S.E., was a good 2d.

FERNS

were well exhibited by Mr. Penfold; his six specimens comprised Davallia Mooreana, D. polyantha, both of large size; D. fijiensis, Adiantum cardiochlæna, with large massive fronds: the 1st prize was awarded, Mr. J. Wakeham also exhibited well in the open class for nine specimens, beating Mr. James.

Several miscellaneous collections of plants were exhibited, which added greatly to the interest of the exhibition, particularly the hardy plants from Mr. J. Vander Rees, of Tooting; Messrs. Paul & Sons, of Cheshunt; and Messrs. Carter, of High Holborn. Messrs. W. Paul & Son, of Waltham Cross, and Mr. Rumsey exhibited excellent cut Roses; Messrs. Barr plants and cut flowers, Messrs. Hooper a good group of Tree Carnations, and Messrs. Jackman pot Roses.

FIRST-CLASS CERTIFICATES

were awarded to Mr. V. Rees for SAXIFRAGA MACNABIANA.

Mr. F. Perkins, for VOLONTÉ NATIONALE ALBA PELARGONIUM.

Messrs. Laing, for BEGONIAS FORMOSA, LADY HULSE, SIR PETER LUMSDEN; and also for NEPENTHES MASTERSIANA and N. MASTERSIANA "red variety."

And to Mr. J. Ford, for CALCEOLARIA GOLDEN PLUSH, a neat dwarf-growing variety.

Law Notes.

IS A HOTHOUSE A BUILDING?—The adjourned hearing of the case against Mr. Haynes, nurseryman, of Penge, reported in our issue of May 23, was taken at the Lambeth Police Court, before Mr. Chance, on Thursday week. Mr. E. B. Haynes, nurseryman and florist, of Penge Nursery, Beckenham Road, appeared to answer an adjourned summons taken out at the instance of Mr. G. Elkington, surveyor of Penge, with regard to the non-payment of a fee of £1, alleged to be due in surveying a greeenhouse or hothouse upon the defendant's premises, according to the terms of the Act of Parliament dealing with the erection of buildings. Upon the first hearing the defendant declined to admit that the structure in question was a building within the meaning of the Act. The defendant still contended that, according to the meaning of the section of the Act, the erection in question was not a building, and pointed out certain decisions given by magistrates upon the point. Two cases had been so decided in this court. He further contended that as a trade adjunct the structure could not be termed a building according to the terms of the Act.—Mr. Chance said, according to the terms of the section of the Act, it was clear a greenhouse, so far as all sashes, doors, and frames were concerned, would be exempt; but the other part of the section clearly showed, where there was a foundation of brickwork, &c., that it would come under the terms of such Act. The Act distinctly pointed out that greenhouses were exempt under certain circumstances.—The defendant said he had purchased the structures in question for £5, and the surveyor knew nothing about it until it was placed upon the ground, and now he wanted £1 for fees. A discussion then followed as to what fees were allowed under the Act, supposing the structure in question should be considered as a building. Mr. Chance said no doubt there was a great difficulty in deciding what really was a building, but it was to his mind clear that greenhouses would be exempt under certain conditions, but not where brickwork was used in the construction.—The defendant said doubtless that was Mr. Elkington's best point, but five magistrates had decided in favour of the points raised.—Mr. Chance said he had decided against it. He had full respect for the decision of his colleagues, but he certainly could not agree with them entirely. He was against the defendant upon the points raised, and certainly must look upon the structure in question as a building within the meaning of the terms of the Act. Under all the circumstances, he must therefore order the defendant to pay the amount claimed. He made an order upon the defendant to pay the amount claimed, but declined to grant anything beyond the ordinary costs.

Obituary.

JAMES DREWETT.

ON Wednesday, May 20, was laid in his last resting place, at the Norbiton Cemetery, Kingston-on-Thames, all that remained of one that belonged to the good old English school of gardeners, Mr. James Drewett, late of The Denbies, near Dorking, who died on the 14th inst. at Kingston-on-Thames (where for the last seven years he has lived in retirement with his brother), at the ripe age of eighty-five. He carried his age wonderfully well, and up to a few weeks before his death he took his daily long walks in the neighbourhood, with the firm step of a man much less advanced in years. He retained his faculties to the end, and passed peacefully away, highly honoured.

For twenty-five years the deceased was in charge of the gardens of G. Cubitt, Esq., at the place abovementioned, retiring from them about eleven years ago, on a comfortable stipend from his late employer. In a series of notices and portraits of British gardeners published in the *Gardeners' Chronicle*, Mr. Drewett's labours were thus referred to:—"The name of Mr. Drewett is well known in the world of horticulture, being very prominently associated with the production of some of the handsomest Muscat Grapes which have perhaps ever graced an exhibition table. Mr. James Drewett was born in the year 1800, in the neighbourhood of Bristol, and entered on his horticultural career in the gardens of Himley Hall, Staffordshire, the seat of the Earl of Dudley and Ward. In 1825 he came to London, and was employed over a period of seven years in the Royal Forcing Gardens at Kensington and Cumberland Lodge, and in the Royal Botanic Gardens, Kew.

"Mr. Drewett has held three head situations, the first as manager of the estate, gardens, woods, &c., of the late D. Baillee, Esq.; the second as gardener to Sir W. Heathcote, at Hursley Park, near Winchester, Hants; the third with the late Thomas Cubitt, Esq., at The Denbies, near Dorking, Surrey. This latter situation he entered in 1850, and has held it to the present time. During this period very extensive groundwork operations have been carried out under his directions, and much planting has been done, while a new kitchen garden and fruit orchard have been formed. Mr. Drewett designed the range of forcing-houses at this place, and planted the Vines which are assisted by heated chambers under the outside borders. It is these Vines that produced the fine samples of Frontignan, Canon Hall Muscat, Muscat of Alexandria Grapes, which were so much admired at the metropolitan exhibitions in 1857, and in succeeding years, and which were moreover so successful in obtaining first prizes."

MRS. HERBST.

We regret to hear of the sudden death of Mrs. Herbst, at Richmond, on last Saturday, May 23. It appears that during a thunderstorm (of which she always experienced a dread) she was stricken with an attack of apoplexy, from which she never rallied, and died on the same evening. Mr. Herbst was, previous to coming to Richmond, Curator of the Botanic Gardens, Rio de Janeiro, and it was there where Mrs. Herbst, during a violent thunderstorm, experienced a severe shock, which she could never forget. Mrs. Herbst was in her fifty-second year.

MR. GEORGE BAKER.

By the death of Mr. Baker, of Reigate, the National Rose Society has lost a most useful supporter and constant exhibitor, and Reigate will have sustained a great loss, and especially the district Rose Association, which he had assisted in raising to a very high pitch of eminence. His communications to the *Rosarians' Year Book* will have endeared him to a wide circle of readers. In the last issue of the *Year Book* a valuable article on Rose pruning appeared, which ended with a premonition of what has actually happened.

MR. W. J. EPPS.

The death is announced of Mr. W. J. Epps, of Somerley View, Ringwood, which occurred on the 18th inst., in the sixty-eighth year of his age. Mr. Epps was formerly in business as a nurseryman at Maidstone, and became well known as a cultivator of Cape Heaths; he was also one of the first raisers of seedling Fuchsias.

Personal Estate £105 8s.

9 June. The Will with a Codicil of James Drewett formerly of Denbies near Dorking but late of 1 Bethel-villas Canbury-Park-road Kingston-upon-Thames both in the County of **Surrey** who died 14 May 1885 at 1 Bethel-villas was proved at the **Principal Registry** by John Drewett of 1 Bethel-villas retired Gardener the Brother one of the Executors.

Oxford Dictionary of National Biography

Dugdale, Richard [*called* the Surey Demoniack] (*b. c.*1670), *demoniac*
by A. C. Bickley, *rev.* Richard D. Harrison
© **Oxford University Press 2004–14** All rights reserved

Dugdale, Richard [*called* the Surey Demoniack] (*b. c.*1670), demoniac, was the son of Thomas Dugdale of Surey, near Whalley, Lancashire, who was a gardener and servant to Thomas Lister of Westby, Yorkshire. An otherwise obscure individual, Dugdale owed his contemporary notoriety to a series of pamphlets published in the late 1690s concerning his alleged possession and exorcism. According to these pamphlets, Dugdale and his father approached the dissenting minister Thomas Jolly on 29 April 1689, informing this divine that in July 1688, when about eighteen years of age, Dugdale had attended a rush-bearing at Whalley where, having drunk to excess, he ‘offered himself to the Devil, on condition the Devil would make him a good dancer’ (Jolly, *Surey Demoniack*, 2). Dugdale subsequently quarrelled and fought with one of the revellers, and having returned home began to experience a ‘burning pain’ in his side. Jolly was further told that during subsequent nights Dugdale had been alarmed by the door to his room opening and a mist entering, followed by various supernatural appearances, and that he had become subject to violent fits and an uncontrollable urge to dance. Despite the ministrations of a local physician the fits had continued and increased.

Jolly was convinced that Dugdale's illness was attributable to demonic possession, and initiated a series of meetings at which he and a number of other nonconformist ministers prayed and fasted for the exorcism of Dugdale. Dugdale's fame spread throughout the county, and several thousand people attended these prayer meetings, held at a variety of locations in and around Whalley. Such crowds were attracted by reports of the startling physical manifestations of Dugdale's possession, some of which were detailed by the dissenting ministers and, in declarations before local magistrates, those who attended these meetings. In addition to violent fits of rage and anger, it was claimed that Dugdale foretold future events; spoke languages of which he was ignorant, on occasion with two voices at once; was at times wildly blasphemous, and at others preached sermons. Progress towards curing Dugdale proved slow, however, and by September 1689 the demoniac was threatening to seek other remedies and had complained to his father's landlord, Sir Edmund Assheton, third baronet, of Whalley Abbey, of his frustration at the ineffectiveness of the dissenters' ministrations. Though Dugdale's fits and the dissenters' prayer meetings continued, Assheton arranged for Dugdale to be given a ‘physic’ on 25 March 1690. Dugdale's symptoms ceased from this date, though the nonconformist ministers claimed that this was due to the effects of their final prayer meeting on 24 March rather than the medicine administered the following day.

Despite uncertainties as to the nature of Dugdale's affliction and the reason for its apparent cure, the young man's plight attracted the interest of such leading figures as Richard Baxter and Increase Mather, both of whom, it was claimed, wished to quote the case in their works upon witchcraft. Publication of such details did not, however, occur until the appearance in 1697 of *The Surey Demoniack*, which prompted the Anglican clergyman Zachary Taylor to publish *The Surey Impostor*

(1698), a critique of both the claims made for Dugdale's actions and the behaviour of the dissenting ministers, which in turn led to further pamphlets on the topic.

Little more is known of Dugdale's life. *The Surey Demoniack* claimed that shortly after his exorcism Dugdale married and returned to his duties as a gardener, and all the pamphlets generated by this controversy agreed that down to the late 1690s Dugdale had not suffered a significant recurrence of his malady of the late 1680s.

THE GARDENS AT CHIPSTEAD PLACE, SEVENOAKS.

AMONGST historic residences in the fair county of Kent, Chipstead Place is entitled to a foremost place. It dates back from the reign of King John. The name is said to be derived from the fact that the fish merchants of Rye and other ports on the South Coast made it one of their stages on their way to London, and held a market of fish there. As a result of this custom the name of Chepstead, or Chepe—from the Saxon "ceapan," to trade or cheapen—was given. In the reign of Queen Elizabeth the residence was occupied by Robert Cranmer, who was buried in Chipstead Church. Later it came into the possession of the Polhills—a family well known in the county—one of whom married Elizabeth Ireton, a grand-daughter of Oliver Cromwell, whose memory is perpetuated in the steep ascent over the Downs. Since April, 1911, it has been the home of Mr. and Mrs. John Duveen, under whose care it has gained new beauty and interest. When I inspected the gardens under the auspices of Mr. A. Dumbleton, who has been in charge of them since Mr. Duveen acquired the lease, they were looking their best.

Situated in the most lovely part of a delightful district, the Chipstead Place of to-day is a noble mansion. Approached through an imposing gateway, the house is almost obscured from view by a wealth of luxurious trees. Here the outside feature is an avenue embracing both shrubs and trees, which terminate in a wide stretch of lawn and pleasure grounds, dotted with specimen Rhododendrons, Azaleas, and beds of various plants. Conspicuous in this direction is the sunk garden, which has been so well conceived and carried out that it is almost impossible to tell where the lawns end and the park begins. The statuary, thanks to a judicious arrangement, enhance the attractions of the scene.

CHIPSTEAD PLACE, SEVENOAKS.

THE TERRACE, CHIPSTEAD PLACE.

THE TERRACE BEDDING.

At one end of the terrace, immediately in front of the principal windows of the house, is a series of beds, and I asked Mr. Dumbleton to describe the combination.

"They are filled," he replied, "with Zonal and Ivy-leaved Pelargoniums, Heliotropes, Ageratums, and Lobelias. Of the Zonals, you will notice that Paul Crampel is used in abundance, and that Madame Crousse is first favourite amongst the Ivies. The arches of Rambler Roses, we think, break the flatness that might otherwise have arisen, and the employment of them as a circular temple is generally considered effective. The small plants of Taxus baccata, which are used in some of the beds, were included in order that their rather sombre foliage might throw the brilliancy of the flowers into greater relief. The whole of the beds are edged by Box, which is always kept neatly trimmed. You may like to mention that at one corner of the lawns there is a striking display of Rose General McArthur, which is rendered all the more attractive by the presence of Viola Kitty Bell as ground work."

Making our way towards the Arboretum, which contains a representative collection of specimen trees, I enquired the dimensions of an Abies Douglassi, which dominated the situation.

"I can only tell you that it has branches measuring thirty-nine feet from the trunk. Amongst others of the more prominent occupants of the Arboretum are some Cedrus glauca, Liquidambar styraciflua, Liriodendron tuliptera, Thuja lobbii, and Abies orientalis. The Copper Beeches add their glowing colour to the scene, and in fact, the effect of colour is one of the most pleasing features of an Arboretum. Colour, of course, is always a matter of great consideration, and the stretch of Antirrhinums, which forms a long border, was selected for massing purposes. The varieties include Fiery Belt, Scarlet Flame, Goldcrest, and Crimson. They were sown in January, and kept very sturdy."

"The result gained appears to be a capital object-lesson in the value of Antirrhinums, which are not always appreciated as much as they should be. I must also congratulate you upon the beauty of the high Box hedge, which divides the Arboretum from the orchard."

THE ROSE GARDEN.

"We do our best to make that hedge one of the features of the place, and to keep it all the year round in a healthy condition. Another feature is the Rose garden, which is purposely placed in a quiet spot some distance from the Arboretum. Absence of formality has throughout been aimed at, the Roses for the most part being arranged in one impressive mass, though several of a variety are planted together."

"I observe that here, too, General McArthur is in splendid form."

"Yes; it is usually a good doer, but here it is really superb. Other varieties which specially thrive in the Rose garden are Hugh Dickson, Lyons, Sunburst, Madame Melanie Soupert, and Lady Hillingdon. The boundary on one side consists of a tall Sweet Briar hedge, and on the other of a wall covered with climbing Roses. You may be interested to learn that on the 30th of May two of these Roses were in full bloom, namely, The Dawson and Reine. The best climbing Roses include Marie Henriette, Veilchenblau, The Farquhar, White Dorothy, Wedding Bells, Francois Guillot, Crimson Rambler, Felicite et Perpetue, Dorothy Perkins, Francois Foucard, Hiawatha, Euphrosyne, Thalia, Mrs. Flight, Evangeline, Paul Transon, The Garland, and Princess Marie.

"All the plants in the border of Decorative Chrysanthemums close by were cuttings in the early spring. Amongst the most satisfactory are Nina Blick, Hector, Polly, Rio de Blancs, Wells' Scarlet, Normandie, Market White, Leslie, Goacher's Crimson, and Firefly."

THE KITCHEN GARDEN.

Entering the Kitchen Garden, the appearance of both vegetables and fruit indicate the existence of a genial soil, and wise management.

"I can only tell you," continued Mr. Dumbleton, "that not a single sowing of any crop has failed. Peas are all planted on one large plot, and afford a very fine chance for comparison. The first sown of the taller sorts were Carter's Early Morn, Early Giant, and Early Duke. But more notable than these is the border, with its wonderful crop of Eight Weeks. This is quite a week or two in advance of the other early

Digitized by Google Original from CORNELL UNIVERSITY

varieties. The mid-season and late Peas are Harvestman, Duke of Albany, International, The Gladstone, and Autocrat."

"When do you sow your Onions?"

"Both in autumn and in spring. The spring crop is sown in boxes under glass, and planted out early in April. Those sown in autumn, particularly Ailsa Craig, Ronsham Park Hero, James's Keeping, and Record, promise a fine harvest; and those sown in spring are, I think, in advance of the general run."

"Have you many varieties of Potatoes?"

"We grow in large batches May Queen, Sharpe's Express, Sharpe's Victor, Early Favourite, Sir John Llewelyn, Eclipse, Royalty, Duchess of Cornwall, Snowball, Goldfinder, Up-to-Date, and Dalhousie. Carrots, Beets, Parsnips, Broad and Runner Beans, are all extensively grown, and we find no serious difficulty in making them flourish."

"And you make full use of the walls surrounding the kitchen garden."

"You mean in respect to trained fruit trees? Kent has long held the distinction of being the finest growing county in England, and the crops carried by the fruit trees in this part of it do not appear to contradict the fact."

Not only the crops, but the cleanliness sof their appearance, impressed me, and I asked how it was done.

"By persistent syringing and spraying. Locality has really very little to do with it. Most of the trees are young, and we go in for various shapes, chiefly bush, cordons, and espaliers."

THE BEST APPLES.

"Which do you consider the best varieties of dessert Apples?"

"James Grieve, Rival, Wealthy, Charles Ross, King of Pippins, Ribston Pippin, Allington Pippin, Blenheim Orange, Wyken Pippin, Langley Pippin, and Cox's Orange Pippin. Culinary kinds do equally well, or even slightly better. At any rate, Bramley's Seedling, Bismarck, Foster's Seedling, Gloria Mundi, Annie Elizabeth, Peasgood's Nonsuch, Lord Derby, Newton Wonder, Lane's Prince Albert, Tower of Glamis, Lady Henniker, Warner's King, and many others are carrying crops considerably above the average.

"Pears are in great request, and a very comprehensive collection has been planted. The most important of the varieties are Santa Claus, Doyenne du Comice, Marie Louise, Louise Bonne of Jersey, Beurre Hardy, Beurre Bosc, Beurre Alexandra Lucas, Charles Ernest, Durondeau, Beurre Superfin, Williams's Bon Chretien, and Pitmaston Duchess. Plums, Cherries, Raspberries, and Peaches all do well on the walls; and Strawberries occupy a very large plot with very satisfactory results. Whenever the opportunity occurs we try to supplement the useful with the beautiful, and the herbaceous border, backed by a high wall, is thickly planted with the most choice varieties, interspersed with annuals."

PEACHES IN FORCE.

"The fruit houses must be on a considerable scale?"

"The Peach houses alone are one hundred and eighty-five feet in length. The varieties grown here are Violet Hative, Duke of York, Bellegarde, Royal George, Thomas Rivers, Barrington, Lady Palmerston, and Princess of Wales. Besides these, there are grown in the orchard house, Waterloo, Royal George, Early Grosse Mignonne, Hale's Early, and Dymond. Some little time ago there was trouble in respect to Peach cultivation, but since I established root pruning and making up the borders there has been no difficulty. Nectarines are not grown so extensively, but Stanwick Elruge and River's Orange look particularly well."

"Then there are the Vineries."

"Of which we have three. The first contains Foster's Seedling, Black Hamburgh, and Madresfield Court; the second, Muscat of Alexandria; and the third, Lady Downe's. In connection with the Vineries, the large house of herbaceous Calceolarias deserves to be indicated. Melons are grown in large quantities, and there is a house full of ripe and partially ripe fruit of extraordinary size."

AN OLD-FASHIONED CONSERVATORY.

"There remains the conservatory."

"It is one of those old structures, rarely seen, except in ancient places. Camellias still flourish on the walls, but leave plenty of room for flowers in season. Just now it is the day of the Schizanthus; of late plants of Primula obconica; and of Canterbury Bells, which are between four and five feet high. Carnations, particularly the Tree varieties, are grown extensively; and Chrysanthemums, large Japanese, Singles, and Decorative varieties in large batches. Thirteen hundred of the latter are grown, and the varieties are very up-to-date. Amongst them are Francis Rowe, Reg. Vallis, Mrs. G. Drabble, Lady E. Letchworth, Miss Rodwell, President Viger, Bob Pulling, Francis Jolliffe, White Queen, Thorpe's Beauty, Miss R. E. Roope, His Majesty, Thomas Lunt, Master David, H. E. Converse, Alice Lemon, Master James, W. Turner, King George V., Ada Kitchingham, and Rose Queen. The Singles include Juno, Caledonia, Mrs. A. Middleton, Sandown, Radiance, Autumn Tints, Phyllis, M. Lloyd, Hilda Paice, Mrs. J. Peed, E. Forbes, Mrs. F. D. Humphries, Sylvia Slade, Metta, and White Pagram. Other favourite plants are Plumbago rosea, Begonias (both summer and winter-flowering varieties), Cinerarias, Gloxinias, Malmaison Carnations, Primula sinensis, and Gardenias.

"So far as my own work is concerned, it is a great help to me to know that Mr. and Mrs. Duveen are both gardeners at heart, and are always ready to afford me the utmost assistance and encouragement."

ALFRED WILCOX.

A HANDSOME GREENHOUSE SHRUB.

An Evergreen Plant that is both Beautiful and Uncommon.

Many an owner of a greenhouse desiring to get "off the beaten track" in his selection of plants, will be glad to make the acquaintance of Clethra arborea minor. This is a dwarf, close-growing form of C. arborea, and is very suitable for cultivation in comparatively small pots, as it averages only two feet in height. It comes from Madeira, and is a decidedly handsome evergreen shrub, with pure white blossoms, which are borne in profusion in late summer and autumn. C. arborea itself is taller, and being of free growth, in a few years attains to a considerable size, and is consequently very useful in a greenhouse or conservatory of fairly large proportions.

This plant belongs to the Ericaceæ, and therefore does best in a peaty compost. Large plants may be potted in a mixture of turfy loam and peat, with a little leaf-mould and a liberal amount of sand; smaller plants may have three parts of peat to one of loam, with sand.

When well established, with the pots full of roots, weak liquid manure will be found very beneficial; while, being evergreen, the plants should never be allowed to become very dry at the root.

They may be propagated by means of cuttings of half-ripened wood, taken in July or August, and inserted in pots of sandy peat in a propagator, or under a handlight. Pot them off singly when rooted.

FORCING STRAWBERRIES.

How to Obtain the Luscious Fruit in Early Spring.

Now that the days are lengthening, and the sun may soon be expected to increase in power, a batch of Strawberries in pots may be brought indoors and started into growth. Examine the pots, and select those plants that are well rooted, and whose crowns are plump and firm.

STARTING THE PLANTS.

The best place to start the plants is a brick pit, filled with gently fermenting leaves or tan. The ordinary hot-bed of manure will be too strong, as it is only necessary to ensure a night temperature of about forty-five degrees. Plunge the pots almost to the rims in the material, which should be so built up that the plants are a few inches from the glass. Give air freely on all mild days, with just enough water to keep the foliage fresh. When the flower-buds are ready to expand the supply may be increased a little, but it should not be given freely until the fruit is set and beginning to swell.

Do not let the roots grow through the bottom of the pots into the plunging material, because, when coming into bloom, the plants should be removed to a sunny and well heated house, where they can stand on a shelf close to the glass. At this time, too, a constantly moist atmosphere must be maintained about the plants, by damping the paths and other surfaces frequently. When the blossoms are expanded they must be artificially fertilised, a camel-hair brush being used for this operation. Keep the plants well supplied with water and weak liquid manure while the fruit is swelling.

ome Richardias. Instead of growing vigorously, s they ought to have been doing for the last few nonths, leaf after leaf has been turning yellow, nd, in consequence, green-fly has been per-istently attacking them. As soil and roots were ll right when examined, I felt that the cause nust have something to do with the foliage; but what it was I could not for a long time discover. Now, however, it is plain enough. I find that when the soil in the pots was top-dressed, the eaves were washed with an insecticide, one of he many offered for sale with soft soap as their basis. I do not know what tests manufacturers make of their preparations before placing them on the market, but my experience of some of these insecticides is that, if used at the strength recommended (as this, I am told, was), they are very apt to injure the leaves of a good many plants. Again, it is essential that they should be washed off after they have done their work—say, in the course of twenty-four hours—and this is not always stated in the directions. Unless it is done, the soft soap, or the sticky substitute for it, clogs the pores in the leaves, and practically suffocates the plants. Personally, I prefer fumi[illegible]on to spraying or sponging; it is safer, and [illegible]ess troublesome. If for any reason insecticides, or fungicides, must be used, they should be applied weak and often, rather than strong. Out of doors they may possibly be less injurious, but, even there, spraying with Bordeaux mixture has proved disastrous to Peach-trees. This fact has for some years past been the subject of investigation at the United States Experiment Station at Tennessee, and it has been found that the leaves of the Peach have the power of absorbing copper, the principal ingredient in Bordeaux mixture.

May 9th.—Here is something which may be useful to housewives as well as to gardeners. According to the Bulletin issued by the Experimental Station in Colorado, Pyrethrum powder, made by crushing the dried flowers of certain kinds of Pyrethrums, has proved a very effective insecticide in America. One ounce of the powder is mixed with three gallons of water, and the mixture is sprayed in the air of a greenhouse, or of a room—not, of course, all of it, or anything like all, but enough for the purpose, which can be ascertained by a few experiments. It is best done in the evening, the room or greenhouse being then closed up for the night. In the morning, it is said, every fly, mosquito, and other similar insect will all be found on the ground. Many will still be alive, but it is an easy matter to sweep them up and destroy them. This sounds a very simple way of clearing flies out of a room. If it is equally efficacious in ridding a greenhouse of green-fly, it will be much better than fumigating or ordinary spraying. Two questions of importance which it suggests are: Does it succeed with wasps? And is it harmless to Grapes—and to the eater of the Grapes? In the autumn my Vinery swarms with wasps, and I have tried every known means of keeping them out, and of killing them, but all to no purpose. If Pyrethrum powder will do this, it will be a boon to me, and to many others in similar plight. If it can be procured in this country—and I believe it can—I shall certainly try it; but at first, at any rate, I shall keep the spray low, so as to avoid the Grapes.

H. C. Davidson.

(To be continued.)

FAMOUS GARDENERS AT HOME.

No. 85.—Mr. George Duncan, F.R.H.S., at the Gardens, Warnham Court, Horsham.

Before I paid my visit to the gardens at Warnham Court, I was warned that I should be too late to see the Daffodils at their best, and too early to see the Tulips in all their glory. Yet the Daffodils presented a brave show, and the Tulips were unfolding their leaves in the most promising manner on the afternoon Mr. Duncan showed me round. This occupied a good deal of time, for the gardens, though only a small portion of the large estate which Mr. C. J. Lucas owns, are both extensive and full of interest, while the houses are numerous, and their contents well worth lingering over. When I had made many notes, and we had at any rate inspected the most notable features, we returned to the pretty and pleasantly situated cottage in which Mr. Duncan resides. In this instance I was not in doubt as to which of the features is considered to be entitled to priority, for the rock garden at Warnham is one of the finest in the country. Mr. Duncan admitted that he was proud of it, though he was concerned to assure me that its charms, like others in the gardens, are largely due to the knowledge which Mr. Lucas possesses of horticulture, and to the enthusiasm with which he sanctions improvements.

"When was the rock garden made?" I inquired.

"Nine years ago, by Mr. Backhouse, of York. About fifty trees, chiefly Oaks, were cut down in order to provide space for it, and for the wild garden adjacent. The rockery covers quite half an acre of ground."

"Which of the Alpine plants do you think flourish most?"

"The Dianthus family, a very large one, does exceedingly well. Daphnes, Campanulas, Saxifragas, Sedums, Primulas, and Gentianas also invariably thrive. The Soldanellas Mr. Lucas brought from within walking distance of the Lake of Geneva, and he also obtained from Switzerland a number of the more lovely Gentianas, as well as the yellow Auriculas. I have been to Switzerland with him on two occasions, and brought home sufficient to plant the rockery round my house, which Mr. Lucas calls 'The Little Alps.'"

"You have a quantity of Ramondias?"

"Yes; they are grown in the chinks of the rocks, and flourish in the shade. We have had a very fine show of Anemones this year; the later varieties still last well."

"Which variety do you prefer?"

"I like Appenina, the blue, particularly, and Robinsoniana (the pale levender) is also very pretty. In summer Gypsophilas hang down the stones, and are very effective. We have Androsace in three varieties: the white, with pink eye, the pink, and the pink with white eye. Other plants grown in the rockery are Veronicas in variety, and Linums. Coloured Maples, kept cut back, help to maintain the character of the rockery. There are two pools, one at the bottom full of Marliac Lilies, and another adjoining the wild garden."

"I gather that the name is a reflex of the contents?"

"Our object certainly is to justify the title. The wild garden contains a number of different flowering shrubs, which are allowed to ramble at their will. We planted Honeysuckle, with Sweet Brier below. One of the features is Eremurus himalaicus. The plants have suffered a good deal from the cold spring, but the spikes, with their star-shaped flowers, are very attractive. Then we have different Lilies, including Tigrinums, and Clematis swarms up most of the trees. Close by is the hardy Fernery."

"When was that constructed?"

"Five years ago. It was formerly a pond, and was adapted for its present purpose. The collection consists entirely of British Ferns."

"And the Pinetums?"

"The smaller Pinetum was made twenty-four years ago. The collection of Conifers is exceptionally good, and up to date. I believe that Mr. Veitch has a standing order to send to Warnham anything fresh that comes out. By the way, Abies Veitchi is not happy with us."

"How do you account for that?"

"I suppose it is because the soil is all clay. As a matter of fact, a number of Abies, when they

Warnham Court, from the Park.

in the same ground two years in succession, and every affected root should be burnt. It is in the latter respect that owners of gardens, as well as farmers, so often fail. They are left in the ground, "because it does not pay to pull them up," though, as a matter of fact, it would be hard to find a more profitable investment. For the spores are in the roots and stems, and when the latter decay the former escape to the ground, and lie there in readiness to prey upon the next crop that appeals to their taste.

May 22nd.—Some time ago I read in a gardening book or paper—I forget the exact source—a statement which implied that fruit-buds might change into leaf-buds. It seemed to me incredible, but as there are more things in heaven and earth than are dreamt of in our philosophy, I resolved to keep my eyes open. In early spring the Apple trees in this garden were well supplied with fruit-buds, but, except in the case of two or three trees, we have no blossom—literally none. Is this an instance of fruit-buds changing into leaf-buds? I do not think so; indeed, I will go further, and say I am sure it is not. For careful examination of what were the fruit-buds reveals the fact that, although leaves are actually issuing from the side, as they would do in any case, the centres are gone. Some of these centres appear to have been damaged by birds, but before that, I am inclined to think, they had been damaged and entered by insects, which are very prevalent on all the trees. In others I can distinguish the little stalks to which the embryonic blossoms were attached. As the ends are brown and withered, I suppose the mischief must be attributed to the severe weather in April. If so, the popular idea that fruit blossoms are not injured by frost unless they are fairly well developed at the time is a delusion; though, to be sure, the frost this spring was exceptional. Yet, even against it, in two instances which came under my notice, a very slight protection sufficed to prevent injury. The flower-buds on a number of Azaleas standing outside were all destroyed, with the exception of those which happened to be under the projecting end of an unused light. Also, while all the Raspberry canes in this district suffered severely, mine escaped almost entirely—I suppose, because the wire netting by which they are surrounded, for the purpose of protecting them against birds, took the keen edge off the wind.

May 23rd.—A week or two ago I noted down some interesting French methods of propagating Roses from cuttings. I find that they are not confined to Roses; nor, indeed, do I see why they should be. In the "Revue Horticole" there was a description of a similar method of propagating Nicotiana colossea variegata, the object in both cases being quite the same—to induce the formation of a callus before complete severance took place. The shoot is cut through one-third at first, then another third a few days later, and finally, a few days later still, taken off, and inserted in sandy soil and treated in the ordinary way. Altogether, the idea seems an excellent one.

H. C. Davidson.

(To be continued.)

Belvoir Castle from the Drive.

FAMOUS GARDENERS AT HOME.

No. 87.—Mr. W. H. Divers, F.R.H.S., at the Gardens, Belvoir Castle, Grantham.

For beauty of situation, the gardens of Belvoir Castle are unsurpassed by any others in the Midland counties. Everybody knows Macaulay's reference to "Belvoir's lordly terraces," on which the bonfire was lighted which sent the message of the arrival of the Spanish Armada on to Lincoln, and thence to the far North. Those terraces, and the fair domain of woodland and dell falling away from them on every side, have long since been made a treasure-house of all that is rare and beautiful in the world of plants. At least three generations of the noble owners of Belvoir have been lovers of gardening, and so it has come to pass that their combined efforts, aided by the best expert horticultural advice they could command, have resulted in one of the most wonderful collections of plants in the country.

There is probably no other private garden which is so well known as this one. To go to Belvoir is one of the most popular outings for the dwellers in Midland towns. At Belvoir they are allowed to wander about at their own sweet will. If there is one thing that the Duke of Rutland is more anxious about than another, it is that his lovely gardens shall be enjoyed by the people. So trippers go out there, from the crowded Midland towns, by the hundred, and take their fill of pleasure amid some of the loveliest surroundings in the country.

From Redmile, the nearest station to Belvoir, it is an uphill walk of three miles. On leaving the station, which has an imposing covered entrance, and an aristocratic look about its architecture generally, which stamps it as a station apart from other roadside stations (it was built, I was told, under the late Duke's supervision), it takes some minutes to get to the village. You enter it past an ancient church which stands by the side of a disused canal. Two or three equally ancient inns, one of which had hung out a notice that parties were "cated for"; some low stone-built cottages behind well-stocked gardens; a school-building that looked very small even for such a small village; and the last house,

A Corner of the Flower Garden at Belvoir Castle.

In reference to the fruit show at Chiswick, on September 29th, 1903, we are desired to state that Class 52 is an open class, and not confined to amateurs. The schedule can be obtained by sending a postage stamp to the Royal Horticultural Society's office, 117, Victoria-street, S.W.

a substantial farmstead, set back at some distance from the road, with a wide intervening space of old-fashioned kitchen garden—these were the chief features till the open country was once more gained. Then the road made almost a bee-line for the wooded heights, at one extremity of which the majestic Castle formed the topmost point in the picture. A deep dip in the road made the way longer. Just beyond this I watched a heroic attempt at ploughing the wet clay; four horses, urged by two men, were drawing an ordinary plough at a snail's pace through the soil. The land was sodden after the recent rains, and almost unworkable. A newly-built lodge, in excellent style, gave entrance to the Park. The road deviated to the left, and got steeper. Trees closed in, and then, in a clearing, were to be seen a saw-mill and the estate buildings, and, a little farther, the Peacock Inn, where gardening enthusiasts sometimes stay for a week. The Castle towered close overhead. A gentle descent, past the stables, which a century ago were barracks, and then a part of the view was flanked by the walls of the kitchen garden. Through a shrubbery I reached the pretty house of Mr. W. H. Divers, who for nearly ten years has held the important position of head gardener at Belvoir.

It had been in my mind, for a very long time, to go to Belvoir when the spring garden, which is the chief of its many attractions, was at its best, and the earliest question was to ascertain if I had timed my visit aright.

Mr. Divers said that I had. "We expected the spring garden to be at its best," he added, "about April 20th, but the season is three weeks behind. This has made a very long season of it, and things have not come together quite so well as usual. The rain, too, has 'dashed' some of the flowers a little, as you will see."

"Has not the spring garden at Belvoir been established a long time?"

"Yes. Belvoir has been noted for spring flowers for ages. Years ago old Fleming and Ingram started the system of spring bedding."

"The show grounds must be of great extent?"

"They are; but it is such a difficult place to measure, being all up and down hill, and so irregular in shape that I cannot tell you the exact acreage. From my house to the end of the flower garden it is about a mile, and there is one walk two miles and a-half in length. The kitchen garden is just over fourteen acres, seven of which are inside the walls. There are sixteen gardeners, and seven other helpers. The Castle rises two hundred feet above the kitchen garden."

From Mr. Diver's house we went along a winding path, which meandered up the hillside. We stopped, from time to time, to look at the most interesting trees and plants, but, unfortunately, space will not allow of my commenting fully on all that I saw.

Expressing some surprise at the luxuriance of the growth of everything, my companion said that this was due to the sheltered position of the grounds, and to the fact that the soil, a blue lias clay, was of unknown depth. "It grows Rhododendrons and all peat-loving subjects," he said, "remarkably well. Down the main drive, to Grantham, there are some splendid specimens of the old Rhododendron ponticum."

I noticed various Narcissi growing in clumps in the grass.

"That is, in my opinion," observed Mr. Divers, "the best way to grow them. They should be grouped, not dotted about. The only disadvantage of growing bulbs in grass is that it makes the place look rather untidy up to June, as we cannot cut the grass until their blooming period is over. The Duke is very much interested in the spring garden. Many of the things have been brought home by him from abroad. Here, for instance, is a Photinia japonica (Japan Medlar), which came from the South of France."

Close by was a fine specimen of Arbutus Andrachne, a native of Greece, which blossoms in March and April. It is not often seen growing as it grows at Belvoir. The flower is like a big bunch of Lily of the Valley.

In Janetta's Walk, named after the late Duchess, who died in 1899, Mr. Divers drew my attention to the "Manuka" (Leptospermum scoparium), a beautiful New Zealand shrub, which flowers here profusely. It is always regarded as a very tender thing, but at Belvoir it has been quite unharmed by frost.

Some magnificent Scotch Firs compelled my admiration. "Most timber does well in this blue clay," said my guide, and there is, besides, plenty of moisture. This shrub is worth noticing. It is the Rhaphiolepis, or Japanese Hawthorn, and flowers about July. Look at that Abies pectinata (Silver Fir), rising straight up from the hollow on our left. It is one hundred and fourteen feet high. That Tilia tomentosa (Lime Tree) was brought from Hamburg by the late Duchess, in 1898."

"It must be very difficult to cut the grass on these steep banks?"

"All our mowing has to be done with the scythe. On those arches we grow scarlet Honeysuckles, and three or four kinds of Clematis. Our soil, however, is rather too clayey for Clematis."

By this time we had reached the flower gardens. My first impression was of masses of soft colours, beautifully blended, and curtained by the fresh spring green, in innumerable shades, of the surrounding shrubs and trees. It was a picture of rare floral beauty.

I spent some time examining the beds in detail. One exquisite bed had in the centre Wallflowers (Salmon Queen), dotted with Tulips (Golden Eagle). Outside of this was Symphytum officinale. Then came Heucheras, Violas (Robinson's Standard), Phloxes (Newry Seedling), and an edging of Golden Feather. Another bed had for its chief subjects White Swan Tulips and Aubrietia Leichtlini (the latter was distributed from Belvoir, having come originally from the gardens at Baden-Baden). Another bed consisted almost entirely of Double Arabis and bright red Tulips (Elegans); another, of bright yellow Tulips (retroflexa), Phlox divaricata, and Old Clevedon Purple Pansies (this grand old thing is, unfortunately, not much grown now); another, of Veitch's yellow Polyanthus (this comes true from seed), and red and yellow Tulips (Keizerskroon); another, of Veitch's dark red Wallflower, dotted with White Swan Tulips; another, of purple Aubrietia and yellow Waldsteinia (Trifolia); another, of Proserpine Tulips (lightly feathered black on white), with variegated Crown Imperials amongst them; another, of Blue King Pansies (this comes very early) dotted with Cottage Maid Tulips; another, of Belvoir Castle yellow Wallflowers, and Duchesse de Parma Tulips (red and yellow).

In one bed there was a fine display of Couleur de Cardinal Tulips. This Tulip is one of the most beautiful that can be grown. Not only is the colour exceptionally brilliant, but there is a rich bloom all up the stem, and it is a Tulip that keeps its form remarkably well. The double white Arabis looked most effective. Referring to this plant, Mr. Divers said it was an old plant revived. At the same time, he thought it was one of the best introductions of recent years.

I asked if the Belvoir Castle Wallflower was Mr. Divers' own introduction.

"It has been grown here," he replied, "for years. It is a well-known thing, and you get it in the trade, but it is not always true."

Speaking of spring-bedding plants generally, Mr. Divers strongly recommended Saxifraga mus coides atropurpurea, "a very nice, neat thing for edging, which lasts a long time." He was also very pleased with a new thing they were using as an edging, Waldsteinia, which I have already mentioned.

In the statuary garden, which we entered next, were two very tall Spruce Firs, one of them being about one hundred and twenty feet high. There was a great bank of Rhododendrons, of mixed colours, which would be in bloom later. The statues, of Ketton stone, were the work of Cibber, and are over two hundred and fifty years old. They were done for £35 each, including the stone. In this garden I was surprised to see some flourishing Palms.

"They are quite hardy," said Mr. Divers, "but we put a mat round them in the severe weather. It is the cutting winds that try tender plants more than the frosts, and here we are well sheltered from all winds. Another thing is that plants, when at rest, do not feel the cold so much. These Palms weigh about two hundred weights each, and are over nine feet in height. This is our latest garden. It does not get so much sun as the others. We have here a fine clump of Kerria japonica (Jew's Mallow), a beautiful spring-flowering shrub."

Beyond the statuary garden was a piece of wild garden, which gets well covered, I was told, with Ferns, particularly Lady Ferns. There were many Rhododendrons here, and some grand specimens of the common Laurel, grown twenty-five feet high. Near to this is a spot

A Terrace Walk at Belvoir Castle.

known as the Duchess's favourite view. The Castle is seen, across a well-wooded valley, half a mile or more away. From this point two sides of it are visible—the south and the west sides.

Referring to the wild Cherry trees, two fine specimens of which were growing at this place, Mr. Divers observed that the woods were full of them.

In the Duchess's garden, named after the Duke's mother, who planned it out, we spent some time. It has been added to at various times, and now comprises about eight acres. The form of many of the beds—some of these are bell-shaped—has never been altered. A favourite Wallflower, used for bedding purposes here, was Ruby Gem. Under a Cedar was a bed of these Wallflowers, edged with single white Arabis. In such a position I was surprised to see them doing so well, but Mr. Divers explained that they had been well watered in the middle of the winter. Close by was a nice bed of double Violets, Lady Hume Campbell, with an edging of Golden Feather. Mr. Divers considers Lady Hume the hardiest of the double Violets.

In a cross-shaped bed, a blaze of colour came from a mass of bright yellow Pansies (Bullion) in full flower. "They have been out like this," said Mr. Divers, "for a long time—quite ten weeks. Bullion has a rather delicate constitution, but it is a wonderful thing to flower." The edging in this case was crimson Daisies. Another bed contained a new Forget-me-not (Dyeræ), much larger than the ordinary one. "This is a seedling Pansy of our own," said Mr. Divers, pointing to a nice yellow flower; "we have named it Canary." Hereabouts stands a memorial pillar, the date on which is 1825, to the noble lady who planned the garden. It was this Duchess, a woman of extraordinary gifts, who designed the present picturesque Castle. The old one, as I saw from engravings which I was shown subsequently in the Castle itself, was a most common-place looking building.

I noted, in this part of the grounds, a Eucryphia pinnatifolia, from Chili, which has large flowers, like a Rose of Sharon; Cunninghamia sinensis, the broad-leaved China Fir, a very rare tree, planted in 1842; some fine specimens of Araucaria, or Chili Pine, better known, perhaps, as the "Monkey Puzzle"; a Tsuga (Hemlock Spruce), about a hundred years old; a couple of very healthy Palms, which had been planted by Mr. Divers, out of 6-in. pots; a beautiful bit of rustic work, an illustration of which appears in the new edition of the "Gardener's Assistant"; two sets of verses, inscribed on stone, by Fanny Kemble, one set written during a visit to Belvoir in 1842, and the other, on her next visit, in 1883; an Azara (A. microphylla, the best known of the species), which, when it is in flower, emits a powerful vanilla-like perfume; a Japanese Maple, supposed to be the finest specimen in the country; a curious Oak tree, growing horizontally from the hill side, instead of perpendicularly (Mr. Divers has some seed from it, to see if this character will be perpetuated); and a beautiful South European dwarf trailing evergreen, Lithospermum fruticosum, which has a bright gentian-blue flower, with reddish-violet stripes.

The view from this end of the gardens embraces the country north-east of Grantham, with Woolsthorpe village in the foreground, and the lake (one and a-half miles long) in the park just below.

We halted in front of a small Eucalyptus.

"That is E. coccifera," said Mr. Divers. "It is the only variety we can grow here, and we have tried eighteen varieties."

"I see several fine clumps of Bamboos in the hollows there. How do you get on with them?"

"Very well. Arundinaria japonica has been grown since 1882. A. falcata, the best known of all the hardy Bamboos, also does well. Bamboos want plenty of moisture. They don't mind the cold so long as they get plenty of moisture in summer. Of course, we have to give them a good deal of water in a dry season. We put the hose on, and let it run all day."

"Do you ever take up the Daffodils that are growing in the grass and in the wild garden?"

"No, we never disturb them. Some of them have been in the same place for twenty years. They do not deteriorate. They never have manure, or any attention at all."

Coming to the rock garden, I enquired if any particular system is followed in it.

"We keep the rockeries as distinct as we can. In one we grow white Arabis, in another Montbretias, in another Forget-me-nots, in another blue Arabis."

"Ferns seem to do well with you?"

"Yes, the woods are full of them. The Ostrich Fern, which grows vigorously here, has got a little touched by the frost. A cascade comes down through the rock garden sometimes. Just now the water is being held up."

"Tell me about your Rhododendrons, which, I know, are a great feature at Belvoir?"

"We often get the early kinds to flower about Christmas. On Easter Sunday they were looking grand. The three early varieties that we grow are R. Nobleanum, bright crimson; R. altaclerense, scarlet; R. Jacksoni, pink. Of the later varieties I should think we have fifty or sixty. Among the most interesting of the Himalayan varieties that we grow are R. Falconeri, the leaves of which are a glossy green above and russet-brown below, and the flowers yellow; R. Thomsoni, another beautiful thing, with blood-red flowers; R. niveum, yellow and lilac; and R. campanulatum, pale lilac. Some of these are eighteen feet long."

SALVIA PATENS.

Proceeding on our walk, we stopped to look at a Staphylea colchica (Bladderwort), a shrub which bears flowers like a bunch of white Lilac; a clump of Phyllostachys viridi-glaucescens, the finest of the hardy Bamboos; Bambusa tessellata, a Bamboo with purple-green stems, and remarkable for bearing larger leaves than any other species of hardy Bamboos; a Canadian evergreen shrub, Myrica cerifera (Candleberry Myrtle); a very sweet-scented evergreen shrub, Daphne pontica, which flowers in April and May; a very pretty Cornus sanguinea variegata (variegated Dogwood); and a New Zealand shrub, Veronica Traversi, which flowers late in the autumn. A fine effect is obtained in one place by growing variegated Maple amongst the purple-leaved Hazel.

A patch of Anemone Robinsoniana made a lovely sight. This variety is grown at Belvoir for one reason because the pheasants eat the roots of all the other varieties except this.

"The gardens are kept, I see, in as natural a state as possible?"

"Yes; that is our great aim. Even the steps are formed out of the rough rock."

"The planning of the spring beds must take you a long time?"

"Very few people have any idea of the amount of work involved. I change the beds every year, so as never to have the same bedding twice. I shall plan out next year's spring bedding in a day or two."

W. C. SAMBROOK.

LETTERS FROM A LADY GARDENER.

43.—BEDDING-OUT PLANTS.

DEAR KATE,—Bedding-out has had its day, and is no longer the fashion; yet, as you say, where there are small beds set in the grass, one must fill them with something, especially where, as in your case, you have lately taken a new house, and the beds are all bare and empty.

Now, if you go to the local nurseryman, he will, no doubt, suggest scarlet Geraniums (Zonal Pelargoniums), edged with Golden Feather (Pyrethrum), and this with blue Lobelia, but don't, on any account, be led into any such a dreadfully common arrangement. I don't say it is not pretty, or easily grown, for it is both; but when one has seen five million beds just alike, one doesn't care about the next that comes along.

The prettiest of all small beds on a lawn is one filled with tuberous Begonias, and if the weather is going on as it has begun this year, with one continual drip, and no particular sunshine, these flowers will do far better than Pelargoniums, which always lose their petals in a shower of rain, whilst Begonias like a damp season, and rejoice in a wet day. Then there is such a range of rich, delicate colours amongst Begonias; you can have salmon-pink in shades, or apricot, edged with crimson (a most brilliant bed), or white, shading to scarlet, or all the tints mixed together, if you like, and each will be sure to look well if you select good single varieties, and give them rich soil, without fresh manure, planting the tubers just below the soil, and mulching the bed later on (in July) with old hotbed stuff, leaf-mould, and a little soot, when they will go on blooming until the frosts of autumn cut them down, when you can store the tubers in a dry corner of the greenhouse (or even in a cellar, only beware the mice!) until March, when they can be started again, in boxes of light soil. They are not half the trouble that Geraniums are, for you need not take cuttings (although you can do, if you like, in June), and they are dormant in winter, taking scarcely any room.

You can raise these Begonias from seed, without fire-heat, at the end of June, to keep up a good supply of tubers, but of this I will tell you when the time comes to do it.

Another very pretty bed can be arranged with seedling plants of Nemesia Suttoni, which is in many brilliant colours, sometimes showing two or three distinct shades in one flower. But you must be sure to get sturdy, well-hardened plants, which were sown in warmth two months ago, and put them in, about eight inches apart, with an edging of the dwarf Nemesia (nana compacta), if you like, or Sedum sempervivoides, with its neat rosettes of foliage, and scarlet flowers, always makes a pretty edging. This plant is, however, a biennial, and not quite hardy, so that it has to be sown early every spring in warmth, and potted off singly, growing them on all that summer with plenty of moisture, but keeping them rather dry the next winter, when they will be fit for use the following spring. They are, as you will see, a good deal of trouble to grow, but the plants can be bought by the dozen, in pots, now, which is probably the best thing to do for an amateur, with limited space.

If your beds are large enough, they will be much improved by having taller specimen plants

flower really well they need a long growing period, and this can be managed only by starting them early under glass. The season outside is much too short for them.

June 9th.—Forty-one varieties of Potatoes were grown for trial last year at the Royal Horticultural Society's gardens at Wisley. The high-priced Eldorado was not among them; Northern Star was, but does not appear to have distinguished itself. No first-class certificate was given, but General Buller, Syon House

MR. GEORGE DUNCAN.

Prolific, Sir John Llewellyn, Peckover, Queen Alexandra, and The Factor received, either during the year or previously, awards of merit. The last three were among the seven varieties which, on account of their heavy crop, fine appearance and freedom from disease, were ordered to be cooked, in order to test their table qualities. The other four were Daniels' No. 1, Great Central, Highlander, Monarch, and Sir Walter Raleigh. Of the Factor it is reported, "This variety maintains the high opinion formed of it by the committee in 1901, and was excellent in every respect." With so many varieties which are excellent to choose from, there is no excuse for growing worn-out and worthless Potatoes. It is said that the useful life of a variety does not exceed twelve or fourteen years at the outside. When that period is reached—before then, indeed—it should be discarded in favour of some younger and more vigorous variety. That is the best way to prevent an attack of disease, though even then it is not wise to abandon such safeguards as an annual change of soil, spraying, and so forth.

June 10th.—In many gardens the lawn is completely surrounded by paths. Personally, I like to see it—at any rate, on one side—come right up to the mixed borders. The effect is well shown in the illustration. This is a very beautiful lawn, one such as, unfortunately, we cannot all have, but the same principle may be applied to others. Paths are useful, and, indeed, necessary, but there are often too many of them in the garden. The flowers look far better when they spring from a setting of grass.

H. C. DAVIDSON.

Famous Gardeners at Home.

No. 193.—MR. GEORGE DUNCAN, AT THE GARDENS, MERSTHAM HOUSE.

THE pretty village of Merstham, still retaining on one side a good deal of its old-world appearance, in spite of the erection of a few modern houses, is dominated by Merstham House, the historic mansion now in the occupation of Mr. Andrew Walker, with its splendid iron entrance gates and its very extensive pleasure grounds. Mr. George Duncan, the head gardener, lives close to the gates, and on the occasion of my visit, towards the end of April, I met him just outside his pretty house, so that we were able at once to begin the tour of inspection. A charming feature of the drive is a vista which was made in recent years, while, owing to the undulations and the general arrangement of the gardens, there is an absence of stiffness which is very delightful.

An excellent specimen of Cupressus attracting my attention, Mr. Duncan said,

"The Cupressus does very well here, and the soil, which is chiefly clay, also suits the Thuja Lobbii. Other evergreen ornamental trees and shrubs which thrive at Merstham are Cedrus deodara, Abies morinda and Abies canadensis, Yews, Laurels, Aucubas, and Rhododendrons."

"What about deciduous trees and shrubs?"

"The most notably successful include double Cherry trees, Tulip trees, Acer negundo variegata, Lilacs, of which there are great masses, the Persian Lilac being the most conspicuous, Ailanthus glandulosa (the Tree of Heaven), and Azalea mollis."

Turning aside to look at the Parish Church, which dates from 1018, and is in close proximity to the grounds, we spent a few minutes watching the swans on a pond near by. Here the quantity, the effect, in consequence of the judicious blending of colours, being exceedingly good.

"Forty-three yards," replied Mr. Duncan. "The Violas will probably be backed with Hollyhocks and Marguerites, and edged with Alyssum procumbens."

"How many varieties of Viola are there?"

"About thirteen. We use Violas, as you will see, very much for mixed borders. Altogether, I suppose we have a score of varieties. The best, I think, are William Niel, Royal Sovereign, Redbraes Bronze, Redbraes White, Stobhill Gem, Lark, Venus, and William Haig."

"I suppose you find them easy to grow?"

"Very. We propagate in September and October, and plant out the first week in April. These varieties came from Edinburgh."

"Tulips are also, I observe, grown in masses?"

"Yes, there are six hundred in the oval bed, and about the same number in the long bed on the lawn. My great object is to have a mass of colour in each bed."

"And you seem to be highly successful. What Tulips do you specially recommend?"

"Among the best are: Dussart, Joost van Vondel, Keizer's Kroon, Proserpine, Chrysolora, and Princess Marianne. In the bed under the conservatory are Hyacinths, Daffodils, and Wallflowers, which in summer will be followed by Marguerites, Geraniums, and Calceolarias."

"Daffodils, too, are planted in borders and amongst the grass?"

"Yes, in considerable quantities. The varieties which do particularly well are Golden Spur,

MERSTHAM HOUSE, SOUTH FRONT.

Cow-Parsnip (Heracleum giganteum) grows to an immense height, and in addition is a bed of Oriental Poppies, planted the year before last. Proceeding on to the lawn, on which stands a venerable Mulberry tree, possibly two hundred years old, propped, and still bearing fruit, I asked the length of a border planted in sloping patches, instead of in squares, with Violas in Horsfieldii, Emperor, Sir Watkin, Princeps, and P. Van Sion."

Entering the commodious conservatory, which is kept well supplied with bloom, I noticed the popular Rhododendron, Pink Pearl, just coming out, and Mr. Duncan said,

"I think that, of all Rhododendrons, Pink Pearl is the best. It has often struck me that

Rhododendrons might with advantage be grown more indoors. For instance, a few in tubs would be very showy."

"Your Camellias make a good background."

"They flower very freely. The varieties are chiefly the old white. We grow Ghent Azaleas in quantity for forcing, and in the winter we had a few nice specimens of Amaryllis, all seedlings. The warm end of the conservatory is used for Palms—Kentias, and Phœnix. My favourite is P. rupicola. The Malmaisons are just coming out."

"Magnolia grandiflora does well on the house?"

"Yes, and a Pyracanthus, which, though only planted three years ago, is quite fourteen feet high. It berries very nicely, but I shall have to net it, to prevent the birds from getting them. The Calycanthus occidentalis (which flowers about the first of August), Virginian Creeper, and Japan Honeysuckle are also grown on the house."

"Have you any idea of the age of the splendid Yew hedge close to the front door?"

"I should say that it is about the same age as the house itself, which was built about a hundred years ago. The hedge is from ten to fifteen feet through. Three years since, I planted about forty of the English Yews, to fill up."

On our way to the Rose garden, passing a brilliant bed of Tulips on the slant of the lawn, I inquired whether the bulbs of the latter are lifted.

"Yes, after they have flowered, I lift the bulbs in their sorts, covering them with ashes two or three inches thick, and I find that they are almost as good as I can buy. Some of the bulbs are three years old, and they are still doing well. I cannot ripen Hyacinth bulbs so well as the bought bulbs are ripened."

"Has the Rose garden been in existence many years?"

"No, when I came, four years ago, it was a mass of weeds. I cleared the ground, and planted Roses three years since last winter. The Rose garden consists of two pieces connected by an archway, the climbers being Paul's Crimson Pillar and Dorothy Perkins. The winding beds are five feet wide, with paths of the same width, so that one can walk round and cut flowers without treading on the beds. Mr. Walker is very fond of Roses, and takes a special interest in this little garden."

"You grow most of the leading sorts, I conclude, but which classes do the best?"

"Teas and Hybrid Teas. The soil is not the best conceivable for Roses, but they do pretty well, none the less. The Teas include Maman Cochet, Catherine Mermet, Jean Ducher, Anna Olivier, Madame Hoste, Innocente Pirola, Rubens, and Ernest Metz; the Hybrid Teas: Bessie Brown, Mildred Grant, Captain Hayward, Horace Vernet, Countess of Caledon, Caroline Testout, and Frau Karl Druschki. The standards are similar varieties."

"You have not named the Hybrid Perpetuals."

"They are, chiefly, General Jacqueminot, Duchess of Edinburgh, Prince Camille de Rohan, Duke of Teck, Mrs. John Laing, Comte Raimbaud, Earl of Dufferin, and John Stuart Mill."

"Roses," continued Mr. Duncan, "are the favourite flower here, and the other leading flowers are Carnations and Violets."

"Not Orchids?"

"No, and I think that ladies generally have a preference for the blooms of the flowers I have named. They are certainly much easier to grow. The Malmaison Carnations, which are grown in the little house, begin to flower on the 1st of May."

"How many Carnations of various kinds do you grow?"

"In addition to those in the house, about a thousand plants are grown in the borders. The varieties include: Malmaisons, Prime Minister, Nell Gwynne, and Uriah Pike; Trees, H. J. Cutbush and Sundridge; and Lady Nina Balfour, Red Border, Boadicea, Minerva, and Trojan, of the Border kinds."

"And Violets?"

"They are grown in frames, and outside. I suppose that there are about a thousand plants and a dozen varieties, of which Marie Louise, Mrs. J. Astor, Neapolitan, Lady Hume Campbell, and de Parme are the best doubles; and La France, Princess Beatrice, and A. Avellan the best singles. I divide the Violets up, and keep them in a shaded frame until they take better root."

"When do you divide them?"

"About the end of April, and I plant out a fortnight or three weeks later."

Quite a feature of the pleasure grounds is the glade, as seen through an archway of Yews, and here also are some excellent specimens of flowering Thorns and scarlet Horse Chestnuts.

Then, after inspecting a flourishing collection of Rhododendrons, mostly seedlings planted fifteen years ago, we reached the houses. In the Vineries are Black Hamburgh, two rods of Muscats, Lady Downe's Seedling, and Alicante. Mr. Duncan is known as a successful Peach grower, and in the Peach house, a new building which was put up a couple of years ago, I inquired the names of the best varieties.

"We only grow Royal George, Noblesse (one of the finest of Peaches), and Early Rivers' Nectarine."

The Gardener's Cottage, Merstham House.

"You have grown Peaches of considerable size, I believe?"

"Seventeen years ago, when I was at Warter Priory, in Yorkshire, I grew a Peach which weighed eighteen ounces, and measured sixteen inches in circumference. The variety was the Princess of Wales, which, of course, is a large-fruiting variety."

"What is your opinion as to the cause of the Peach dropping its buds?"

"I do not think, as some allege, that drought is the cause. I am not an advocate of dryness, but Peaches like to be moderately dry in the winter, when they are resting. Only last year I allowed a young tree of Early Rivers' Nectarine to get as dry as it could be, until it was almost in flower. Not a single bud was dropped, and there were two hundred and fifty-four good fruits on it. The cause of dropping must be sought elsewhere."

"You have a number of Pelargoniums in the Peach house?"

"We grow a quantity for cutting. There is an Ivy-leaf variety, Souvenir de Charles Turner, which I find about the best for bedding and also for pot work. There are about fifty of the Fancy varieties grown. Other plants used for the same purpose are sweet-scented Verbenas, Genistas, Freesias, Arums, and Calceolarias. The last are seedlings."

"When were they sown?"

"In June last year. During the winter I kept them in a cold frame. With careful watering—it is important to prevent damping—they can be got to flower for six or eight weeks in summer."

"You have not mentioned Chrysanthemums."

"We do not go in specially for them. There are between four and five hundred plants altogether, including about a hundred varieties of most of the leading sorts, with a few of those certificated last year. There are a number of bush kinds, but the majority are Japanese."

"What else do you grow in the frames at the entrance to the kitchen garden?"

"Potatoes—Sharpe's Victor and Duke of York. In the pit here we grow Tomatoes, Melons, Cucumbers, and Strawberries; also plants as fast as we can find room for them."

"How large is the kitchen garden?"

"About three acres, and it is regular in shape. The border near the frames is fifteen feet wide, with herbaceous plants below, and Wallflowers at the top."

"When did you plant the fine fruit archway in the centre of the garden?"

"Three years ago. It is two hundred feet long, twelve feet wide, and ten feet high. With the exception of ten Plum trees trained fan-shaped, all the trees are on the single cordon system, and include Apples, Pears, Plums, and Cherries. I may say that I firmly believe in the value of the extension system. I do not cut back the Plum shoots, and I think that, generally speaking, it would be better to use the knife less. It is frequently employed too often on fruit trees as well as on human beings."

"How many varieties of Apples do you grow?"

"About twenty-four. Among the best are Cox's Orange Pippin, Ribston Pippin, Lady Sudeley, Worcester Pearmain, Blenheim Orange, Peasgood's Nonsuch, Gascoyne's Scarlet, Warner's King, and Mere de Menage."

"And Pears?"

"The same number of varieties, of which I think the best are Williams's Bon Chrétien, Louise Bonne of Jersey, Triomphe de Vienne, Conference, Jargonelle, Doyenné du Comice, Le Lectier, and Beurré Diel. Of Plums we grow

fifteen sorts, including Greengage, Reine Claude de Bavay, Denniston's Superb, Coe's Golden Drop, Early Orleans, Transparent Gage, Kirke's, Jefferson, and Bryanston Gage."

"Of course, you have Royal Sovereign among your Strawberries?"

"It is the most grown of any variety, but we also have Dr. Hogg, the Viscomtesse, and, for autumn fruiting, St. Joseph and St. Antoine de Padoue. With regard to bush fruit, we have Gooseberries and Currants. Some of the Gooseberries are trained on wires, fan-shape."

"Have you anything special in vegetables?"

"We grow quantities of the principal kinds, and double-crop all the garden. The Peas are Bountiful and William I. I have grown the latter for twenty years, and there is no Pea to beat it, in my opinion."

MALMAISON CARNATION—LADY ROSE.

As we strolled along the golf course, which extends for some seventeen acres, I asked Mr. Duncan to tell me something about his own career.

"I started my apprenticeship at Lauriston Castle, Kincardineshire. Next, I was under the veteran Mr. Lunt, who has been gardener at Ardgowan, Greenock, for more than fifty years. Then I went to Gosford, East Lothian, and thence as decorator and propagator to Wentworth Woodhouse. There I remained for two years. I was next foreman at Dupplin Castle, Perthshire, for eighteen months, and then at Blythewood, Renfrewshire, for a short time. My first appointment as head gardener was to Mr. C. H. Wilson, M.P., at Warter Priory, York. At the end of five years I went as gardener and forester to Letham Grange, Forfarshire, remaining seven years, and afterwards was head gardener at Overstone Park, Northamptonshire, for two years. In 1901 I came here."

"Have you done much showing?"

"When I was at Letham Grange I showed fruit; and also during the time I was at Warter Priory. I believe in young men shifting about, and visiting good houses between the shifts, so that they may learn as much as possible. Such success as I have met with I attribute largely to the fact that in my early days I exchanged visits so frequently."

"From what you have said, I infer that your employer here is keenly interested in your work?"

"He is not only interested, but encourages me in every possible way. The young men have a comfortable bothy, and cricket and other sports are provided for them. By the way, flowers are used largely in the rooms of the house. There are always from fifty to sixty vases to be filled."

ALFRED WILCOX.

Letters from a Lady Gardener.

No. 149.—STRAWBERRIES, MALMAISONS, AND BRIERS.

DEAR KATE,—This year should be a good one for flowers, as I see it has already beaten the record for sunshine, but everyone is crying out for rain for the Strawberries as I write. Our Strawberries, however, are already swelling, and show no sign of drought, but this is because they were well mulched at the end of March with cow manure, and under the straw, now clean and dry, there is still a layer of moist, rich food in which their surface roots feed, however dry the weather may be. Strawberries which are mulched in the autumn or the winter have none of this help left, and, therefore, are unable to produce large berries in abundance; besides which the armies of slugs which find such a comfortable home under the straw of a winter mulch (quite secure from the eye of the blackbird, who is always on the lookout for them), are apt to march out in battalions, and spoil the fruit, under the old system of covering the soil in winter, just when the purifying and fructifying effects of the frost and snow should be allowed to do their work on the ground without interference.

But yet I find that many gardeners in this neighbourhood cling to the old, mistaken idea, and mulch their Strawberries, Raspberries, Roses, etc., in the autumn, *hinc illæ lachrymæ* when the Strawberry season arrives, and the poor plants encounter a dry season.

Peas, too, want rain; but if well mulched on either side of the rows, piling up the soil as high as possible after one good watering, they will fill out their pods without difficulty. Watering without mulching is worse than useless in the case of Peas, unless the rain comes shortly after it, for the Peas will be as hard as bullets, and only half their size in a drought, if the lower six inches of their haulms are exposed to the heat, as these turn brown and shrivel away, so that the plant cannot obtain sufficient sap, whilst if that tender part is kept cool and moist (even with soil alone heaped up over it) the crop will fill out. We have tried this by experiments, and I am quite sure that mulching is far better than continual watering in dry weather, although it is a good plan to loosen the soil (if hard) first on the surface, then soak it with water or liquid manure, and cover it with loose soil, so as to allow the dew, which is always heavy in warm weather, to penetrate to the roots. A hard, baked surface (caused by the action of the sunshine on the soil after watering) is the worst possible thing for the roots of the plant below it, as it prevents the moisture below from rising to help the plant, and also keeps out the dew at night; therefore, if you have been watering diligently during the dry weather, the best thing you can do is to take a Dutch hoe and loosen the surface thoroughly between the plants, so as to give Nature a chance to help them.

In the conservatory we have some very beautiful Malmaison Carnations just now, of the newer varieties, which are very various in colour, and of enormous size. Lady Rose, in pale pink, produces a quantity of blossom, and is very lovely (I send you her portrait); Mercia is in rich salmon-pink, and Prime Minister in brilliant scarlet-crimson, and of perfect form. I find these Carnations do better in my new cool greenhouse than with fire heat, except in the depth of winter, when they are moved into a Vinery with enough warmth to keep out the frost for a few weeks; but they are almost hardy, and suffer much if shut up in close, heated air, from which, probably, the diseases which attack them proceed, just as we poor mortals become delicate and ill if we do not live in pure, fresh air. Some of my older plants have become leggy and untidy-looking; these will now be planted out and layered at once, the young plants being ready to be potted up at the end of September, and we shift them into larger pots in the early spring without disturbing their roots. Equal parts of good loam and leaf-mould will suit them, with a little soot and some charcoal in small lumps, but we always char the soil over a fire (or else let it become perfectly dry), to destroy possible wireworms and other insects which infest the roots of Carnations, and soon destroy them. Never shake out the soil in potting on a Malmaison, but merely remove the drainage (which should be ample, and have a wire-crock at the bottom of it) and the soil at the top (which is always exhausted), and pack the fresh compost round the ball of roots in a pot two inches broader than the last. Although the compost is made so dry to kill the insects, it should be used in a moist but not sodden state; you can easily add a little water and stir it up (just like a Plum-pudding) until of the right consistency. If the plants have any dead leaves about them, snip these off neatly with a pair of scissors, and keep them fairly dry (after one watering to settle the roots) until they begin to grow. Malmaisons should stand in the sunshine and the open air all the summer, and must never be overwatered; they like to be on the dry side both summer and winter, and must always have fresh air. Many gardeners do not know this, and kill them by over-kindness, keeping them in a warm, damp atmosphere, and watering them daily; they are not the easiest of plants to manage with others, for this reason, as they are almost sure to be overwatered in winter, when they need water very seldom, but should then have enough to moisten all their roots thoroughly, and be allowed to get dry again before their next watering. Unfortunately, if one tells a boy to give a plant but little water, he usually gives it none at all, or else a driblet daily; a deadly plan, which results in sour surface soil, starved roots below it, and consequent death. The only solution is to do it one's-self, and if you want to grow good Malmaisons, you must look after them.

The garden is full of Roses, and the Briers are in great beauty, Lord Penzance's Sweet Briers scenting the air, and the delicious little white Scotch Briers in masses in the shrubbery. Their scent is different from that of any other Rose, and most refreshing, with an "old-world"

SCOTCH BRIER ROSES.

fragrance impossible to describe. They give no trouble, growing and flourishing from year to year without much attention, and each June they are one mass of lovely little blossoms. The Austrian Brier, too, in rich yellow, is most effective; this is one of the parents (with the common Sweet Brier) of the Lord Penzance Sweet Brier,

Mr. J. Duncan.—We regret to hear of the death, on the 11th August, of Mr. James Duncan, of Calne, Wilts. Mr. Duncan was born at Aberdeen in 1802, and was brought up to the profession of a gardener. In 1849 he was appointed Director of the Botanic Garden, Mauritius, from which responsible office he retired in 1864. He very greatly improved the gardens under his charge, and sent many good plants to this country and also to the Australian Colonies.

189

The Garden, 1876

DUNCAN James.

Effects under £10,000.

9 September. The Will with two Codicils of James Duncan late of Beaumont Villa Calne in the County of **Wilts** Gentleman who died 11 August 1876 at Calne was proved at the **Principal Registry** by James William Duncan of Calne Gentleman the Son one of the Executors.

DUNCAN John.

Effects under £1,500.

19 May. Administration of the effects of John Duncan late of Sunderland in the County of **Durham** Master Mariner who died in or since November 1875 at Sea was granted at the **Principal Registry** to Mary Duncan of Sunderland Widow the Relict.

DUNCAN Robert M.D.

Effects under £3,000.

Resworn April 1878 under £4,000.

11 October. The Will of Robert Duncan late of Tunbridge Wells in the County of **Kent** M.D. and Surgeon who died 30 July 1876 at Tunbridge Wells was proved at the **Principal Registry** by the Reverend Robert Duncan of Corporation-road in the City of Carlisle Clerk and John Thornton Duncan of St. Bartholomew's Hospital in the City of London Esquire the Sons the Executors.

DUNCAN Rosalie Elizabeth.

Effects under £100.

23 September. Administration of the effects of Rosalie Elizabeth Duncan late of 233 Queen's-road Peckham in the County of **Surrey** Widow who died 19 July 1876 at 233 Queen's-road was granted at the **Principal Registry** to Frederick Allen of 1 Westwood-terrace Hollydale-road Peckham Chemist the Son and one of the Next of Kin.

DUNCOMB William.

Effects under £100.

5 October. The Will of William Duncomb late of Easton-on-the-Hill in the County of **Northampton** Gardener who died 22 May 1876 at Easton-on-the-Hill was proved at the **Principal Registry** by William Duncomb of Stamford in the County of Lincoln Baker John Duncomb of St. Martin's Stamford Baron in the County of Northampton Butcher and Thomas Duncomb of Easton-on-the-Hill Butcher the Sons the surviving Executors.

DUNCOMBE Thomas.

Effects under £1,000.

20 October. The Will of Thomas Duncombe late of the City of **Lincoln** Corn Dealer who died 16 June 1876 at Lincoln was proved at **Lincoln** by Jane Duncombe of Lincoln Widow the Relict the sole Executrix.

DUNCUM Charles Esq.

Effects under £35,000.

16 October. The Will of Charles Duncum late of Broomfield Weybridge Heath Weybridge in the County of **Surrey** Esquire who died 23 September 1876 at Broomfield was proved at the **Principal Registry** by Elizabeth Duncum of Broomfield Widow the Relict and William James Duncum of Broomfield Esquire the Son the Executors.

DUNDERDALE John.

Effects under £200.

3 June. The Will of John Dunderdale late of 10 St. Austin's-road Preston in the County of **Lancaster** Porter who died 29 March 1876 at 10 St. Austin's-road was proved at **Lancaster** by Ellen Dunderdale of 10 St.-Austin's-road Widow the Relict the sole Executrix.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, *as well as specimens and plants for naming, should be addressed to the* **EDITOR, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.*

Illustrations.—*The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.*

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

APPOINTMENTS FOR THE ENSUING WEEK.

SUNDAY, JUNE 14—Brussels Orchidéenne Meet.

WEDNESDAY, JUNE 17—York Floral and Hort. Fête (Roy. Hort. Soc. deputation). (Three days.)

THURSDAY, JUNE 18—Linnean Society. Colchester Rose and Hort. Show. Royal Gardeners' Orphan Fund (Annual Dinner).

FRIDAY, JUNE 19—Roy. Bot. Soc. Lecture.

SALES.

THURSDAY JUNE 18—Clearance Sale of Greenhouse Plants and Garden Utensils, at Hollywood, Putney Heath, by Protheroe & Morris.

FRIDAY, JUNE 19—Imported and Established Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK—**61°.1.**

The Royal Horticultural Society.

THE vitality of the Royal Horticultural Society is really astonishing. Who that remembers the evil days it passed through could have anticipated the measure of success it has attained since it made horticulture its first consideration, and abandoned those ruinous attempts to conciliate the fashion and frivolity of the town? To come to this present week, who could have anticipated, so soon after the Temple show, that the next ordinary meeting would be so extensive and so brilliant? The Drill Hall, which was adopted as a temporary meeting-place in default of any other, is now seen to be all too small in the summer season. The fortnightly meetings have developed into large shows. It may be ungracious to say so, in view of the magnificent exhibition of Tuesday last, but we fancy most plant-lovers would prefer the old fortnightly meetings, when it was possible to see and examine carefully the relatively small number of new and interesting plants that were brought together for the consideration of the experts. As things are at present, the exhibits are so numerous that anything like critical inspection is out of the question, especially when the number of committee and other meetings which are held on the same day is considered. To take one instance which attracted our attention: never we suppose was so extensive a collection of the species of Brodiæa brought together as was done by Messrs. WALLACE of Colchester on Tuesday last. How valuable this was for botanical purposes, how interesting from the point of view of decorative horticulture, but, as careful examination was out of the question, the opportunity was necessarily lost. The same may be said of some of the Orchids, the Roses, the Alpine plants, the Streptocarpus, and the Cinerarias shown by Mr. LYNCH. But, after all, the fine show of hardy shrubs, the specimens of Streptocarpus, the noble plant of Carpenteria in full bloom, the brilliant Roses, Pæonies, and Larkspurs—but are not all these duly chronicled in another column?

Among the special proceedings of the day we may note the presentation by the President of the Society of the Medals awarded by the trustees of the VEITCH Memorial Fund to the distinguished recipients selected for the honour. Unfortunately, M. H. L. DE VILMORIN was unable to be present by reason of a family bereavement; whilst the broad Atlantic prevented the presence of Professor SARGENT. The other two—Mr. MALCOLM DUNN and Mr. F. W. BURBIDGE—were happily present, and the applause with which they were greeted suffices to show that the trustees had exercised a wise discretion in their choice. The work done by all four of the medallists is too well known, and too highly appreciated by the horticultural community, to necessitate any lengthened comment; but we may appropriately avail ourselves of the words of the President in making the respective presentations:—

HENRI LEVÊQUE DE VILMORIN, "for distinguished services to scientific horticulture."—The head of the firm of VILMORIN, ANDRIEUX & CIE., of Paris, which originated more than 150 years ago, and was established in the same locality in which the principal offices now stand—the Quai de la Mégisserie, in Paris. M. VILMORIN's great-grandfather became the head of the firm in 1781, after his marriage with the only daughter of the former head, M. ANDRIEUX, and from thenceforth it became known under its present title. From him (PHILIPPE-VICTOIRE DE VILMORIN), the headship has descended to the present M. HENRI DE VILMORIN, under whose direction it has grown in importance still more rapidly than under his predecessors, and has extended its business relations to all parts of the world where agricultural and horticultural seeds are in request. Besides the central establishment on the Quai de la Mégisserie, it has extensive seed warehouses in the Rue de Reuilly, large nurseries at Verrières near Paris, and at Antibes on the Mediterranean coast, for the cultivation of choice flower seeds; also seed-farms for the production of vegetable and other seeds. In these various establishments upwards of 400 hands are employed. All the Vilmorins who have directed the firm have been distinguished not less by their scientific acquirements than by their sound practical knowledge of horticulture and its requirements, but none in so high a degree as he whom we honour to-day. Under their direction various useful treatises on horticultural subjects have been issued by the firm from time to time, and among these the recently-published *Les Plantes Potagères*, prepared under the immediate care of M. HENRI DE VILMORIN, is unquestionably the best of its kind that has ever been compiled; it is not only a work of the highest utility to the gardening public at large, but it also possesses great merit from a scientific standpoint. It is worthy of note that the firm of VILMORIN & CIE., under the able direction of its present chief, has not only effected great improvement in many of the ordinary vegetables, but it has also pressed into service edible plants previously neglected, and introduced others for the first time into cultivation. M. HENRI DE VILMORIN is the recognised chief authority on horticulture in France, he is premier Vice-President of the Société Nationale d'Horticulture de France, he has travelled much and often, and has acquired an experience of horticultural matters probably unsurpassed by any living horticulturist.

F. W. BURBIDGE, "for eminent services to scientific horticulture."—Mr. BURBIDGE commenced his horticultural career as a student in the Royal Horticultural Society's gardens at Chiswick, whence he removed to Kew, where he attended the lectures on "Botany and Vegetable Physiology." While at Kew, he also attended the examinations in botany and horticulture held by the Society of Arts, at which he obtained several first-class prizes and certificates.

From 1873 to 1877 he was one of the most active of the staff of *The Garden* newspaper started by Mr. W. Robinson. During this period he wrote several works on gardening subjects, including *Cool Orchids* (1875), *Domestic Floriculture*, still the best of its kind in the English language; *A Monograph of the Genus Narcissus, and Cultivated Plants* (1877), an excellent text-book for young gardeners.

In 1877—1878 he went on an exploring mission to North Borneo for the Veitchian firm, during which he visited the little-known Sulu Archipelago. This mission resulted in the introduction of several plants new to British gardens, including Cypripedium Lawrenceanum, one of the finest of the genus. Mention may also be made of Burbidgea nitida, a Scitamineous plant previously unknown to science, and upon which Sir J. D. HOOKER founded the genus, "in recognition of his eminent services to horticulture" (*Botanical Magazine*, t. 6403). After his return, Mr. BURBIDGE published a narrative of his mission entitled *Gardens of the Sun*, a work of considerable literary merit, and which doubtless did much to secure for him the honorary degree of M.A., conferred on him by the Dublin University in 1888.

In 1879 he was appointed Curator of the Botanical Garden of Trinity College, Dublin, to which was added the Keepership of the College Park in 1894. Mr. BURBIDGE is a Fellow of the Linnean Society of London, a member of the Royal Irish Academy, a life member of the Royal Dublin Society, a member of the Scientific Committee of the Royal Horticultural Society, and an honorary life member of the Scottish Horticultural and Botanical Society.

MALCOLM DUNN, "for eminent services to horticulture and Forestry."—Mr. DUNN was appointed to the Dalkeith Palace Gardens in 1871 in immediate succession to WILLIAM THOMSON, one of the most successful Scotch gardeners of his time, and the best cultivator of the Grape-vine. By his untiring energy the high reputation of the Dalkeith Gardens was fully maintained by Mr. DUNN, and they are known far and wide to be among the best managed north of the Tweed.

Mr. DUNN's exertions in the cause of horticulture have not been confined to his own immediate sphere. In the same year in which he became head gardener at Dalkeith he was elected to the Council of the Royal Caledonian Horticultural Society, a position he has held ever since with the exception of short intervals of one or two years at the end of every six years, the term for which every councillor is elected. He has also been on the Council of the Scottish Arboricultural Society since 1872, and has served twice during this period a three years' term as Vice-President, a position that involves many onerous duties. He was one of the originators of the great Forestry Exhibition held in Edinburgh in 1884, which contributed much towards bringing before the British public the importance of scientific forestry as applied to the profitable planting of trees on waste and other lands in this country. But Mr. DUNN's most enduring service to arboriculture has been the collecting of materials from which he compiled the statistics of Conifers published in the Report of the Conifer Conference of the Royal Horticultural Society held at Chiswick in the autumn of 1891.

Besides the official positions held by Mr. DUNN in the above-named societies, he is also a member of the Scottish Horticultural Association, instituted in Edinburgh in 1877 to promote the cultivation of florists' flowers (Chrysanthemums, &c.), of which he filled the office of President for the first five years. He is also a Fellow of the Royal Horticultural Society, of the Edinburgh Botanic Society, of the Highland Agricultural Society, and several others.

Professor C. S. SARGENT, "for eminent services to scientific forestry and arboriculture.—The Director of the Arnold Arboretum, near Boston, Massachusetts, the most complete of its kind in North America, and planted under his own superintendence. The Pro-

certificated subjects. On these, Orchids, florists flowers, border flowers, hardy shrubs, hothouse, greenhouse plants, bulbous plants, hardy fruit, hothouse fruit, and vegetables might each be assigned a place, and not mixed up promiscuously. The tables should occupy a prominent position in the Hall, and be readily accessible by the visitors and those whose business it is to attend these meetings. We are sure that the new superintendant of Chiswick, who, at present, it may be hoped, is unfettered by red tape or long usage, could readily carry out this welcome change.

FRUIT FROM AUSTRALIA.—Mr. J. B. THOMAS, of Covent Garden Market, showed in the Floral Hall, Covent Garden, on Wednesday and Thursday, 10th and 11th inst., a quantity of choice Australian fruit sent over by the Government of Victoria for exhibition here. The fruit, which consisted principally of Apples, had an extremely fine appearance, high in colour and clear of skin. The varieties included London, New Rock, Sturmer, and Stone Pippins, Stewart, Gooseberry, and King of Tomkins County, which are names well known in gardens in this country; others less well known, or not at all, were the varieties Jonathan, Rokewood, Yate's, Callasaga and Nickajack. The few Pears included in the consignment were well-developed nice fruits, but their names did not transpire. Most, if not all, of the fruit came from the colony of Victoria, and some Pumpkins and Squashes were included. This lot of seventy-five cases, which are, we suppose, merely samples of what the colony can send us, should find ready sale at remunerative prices.

POTATO BACTERIA.—M. E. ROZE has recently published a paper on the Bacteria affecting the Potato. The researches which he chronicles were undertaken with a view to ascertaining how best to prevent or combat with the species of micrococcus known to produce the scab. The conclusions at which he arrives are the following:—That it is absolutely necessary to avoid planting such tubers of Potatos as have more or less corky defects upon them as it is probably through these spaces that the micrococcus, capable of infecting the parenchyma, are introduced. Again, it is essential most carefully to test tubers of RICHTER'S Imperator before planting them. And, as it is to be feared that these micrococcus exist in a latent state in the soil of the field whence tubers are harvested containing the germs of infection, it is advisable, after a time, to use the ground for some other crop than that of Potatos. It is by these preventive measures that those infinitely small creatures known as micrococcus can be most successfully fought against.

"BULLETIN DE L'ASSOCIATION POUR LA PROTECTION DES PLANTES."—The Association was founded in 1883, to check the extermination which threatened many of the rarities and interesting plants of Switzerland. By directing public attention to the subject, no doubt much good has been effected. It will be a misfortune if the increased attention given to these plants prove the cause of their destruction, as is happening with some Orchids. The necessity for botanic gardens and herbaria is emphasised by the fact that those institutions bid fair in some cases to be the only refuges left.

MALCOLM DUNN.
(Veitch Medallist. See p. 734.)

"THE BOTANICAL GAZETTE," the representative of botanical progress in the United States, has passed into the hands of the University of Chicago. No change is made in the editorship, and the journal is to be not merely the organ of the botanical department of the University, but is to be more freely open to the botanists of the world than it has been in the past.

PHOTOGRAPHS OF ORCHIDS.—In the last number of *Knowledge* is a series of representations of Orchids, from the collection of the Right Hon. J. CHAMBERLAIN.

THE BROTHERS KING.—It will interest some of our readers to learn that Messrs. H. T., S. J., and L. G. KING, seed merchants, of Coggeshall, have retired from the football field, wherein they played so long and successful a part. The three brothers are well known in Essex and Suffolk, and their prowess won them many friends, many of whom will doubtless regret their retirement.

A NEW VEGETABLE.—In a recent number of the *Revue Horticole* M. André calls attention to the use of the roots of Aralia edulis, *alias* A. cordata. The plant is a native of Japan, and its roots have an aromatic taste which may not be agreeable to all palates. We hope the Royal Horticultural Society may see its way to try it at Chiswick. It may be had from M. Sallier of Neuilly, near Paris.

A GIFT TO ABERDEEN.—We learn that Mr. HARPER, the head gardener at the Duthie Park, Aberdeen, has received from Sir WILLIAM BROOKS, Bart., of Glen Tana, Aberdeenshire, a very fine collection of Orchids for cultivation in the park. The gift is much appreciated.

A ROSE FETE AND BAZAAR will be held at the Queen's Hall, Langham Place, W., on Tuesday, Wednesday and Thursday, June 23, 24 and 25, in aid of the North-Eastern Hospital for Children, Hackney Road, Shoreditch. Chairman of the Rose Show Committee: J. B. Scott, Esq., Hillhead, Broxbourne. The Committee are organizing a great exhibition of Roses, and appeal to our readers to help them. Prizes (gold and silver medals) will be offered in the following classes:—

Amateurs.

A. Class I. 24 Cut Roses in Stands (distinct varieties named), 2 prizes; Class II. 12 ditto, 2 prizes; Class III. 6 ditto, 1 prize; Class IV. 12 ditto (of one variety), 2 prizes; Class V. 6 ditto, 1 prize; Class VI. 12 ditto, Teas and Noisettes (distinct varieties named), 2 prizes; Class VII. 6 ditto (in threes), 2 prizes; Class VIII. 12 Button-hole Roses, in bunches of three, 2 prizes; Class IX. 6 ditto, 1 prize; Class X. Basket of Roses, 2 prizes; Class XI. Table decoration of Roses (6 feet × 3 feet), 3 prizes; Class XII. Garden Roses in bunches of six, 1 prize; Class XIII. Lady's spray of Roses, 1 prize.

Professional Growers.

B. Class I. Group of Roses for a space not exceeding 50 square feet, 3 prizes.

C. The Committee also ask for quantities of cut Roses for decoration (in baskets or otherwise), and will be much obliged for any kindly forwarded for that purpose.

Donors of Roses for decorative purposes are requested to forward them to the Queen's Hall, between 9 and 11 a.m. on one of the three days. The prizes will be awarded by well-known Rose growers. Each exhibitor will receive a free admission to the bazaar. Further particulars may be obtained of T. GLENTON-KERR, Esq., Secretary, 27, Clement's Lane, E.C.

NEW PUBLICATIONS.—*Journal of the Kew Guild* (will be noticed shortly.)—F. BOYLE, *Über Orchideen*, translated by Professor KRÄNZLIN (Berlin: PAUL PAREY).—*Cottage Gardening*, edited by W. ROBINSON, F.L.S.; Vol. 7 (CASSELL & Co.)—*Lloyd's Natural History*: British Birds, Part 1, by W. BOWDLER SHARPE (E. LLOYD).—*Die Rüben Nematoden*, by JOHANN VANHA and JULIUS STOLASKA (Berlin: PAUL PAREY). *Natur und Haus, illustrirte Zeitschrift für alle naturfreunde*, fourth year of issue, No. 9, ROBERT OPPENHEIM (GUSTAV SCHMIDT), Berlin.—*English Mechanic and World of Science*, May 29 (Strand Newspaper Co., Limd., 332, Strand; also the International News Co., Canada and U.S.A.).—*Les Nepenthes et Leur Culture*, par JULES RUDOLPH (OCTAVE DOIN, 8, Place de l'Odéon, Paris). A useful illustrated handbook containing descriptions and cultural notes of various species of Nepenthes.—*27th Annual Report of the Fruit Growers' Association of Ontario*, 1895. This contains papers on Apple Culture, Fruit Exhibitions and how to make them educative, Top-grafting on the Tolman Sweet, Spraying and cultivation of Orchards, and other important subjects.—*The Farm Magazine*, May (W. M. GOODMAN, Editor and Manager, OGDEN BROS. & Co., Publishers, Knoxville, Tenn.). A very satisfactory number—*Le Jardin du Crest*, par MARC MICHELI.

formed a net-work of the healthiest roots in the leaf-mould of the country, sphagnum-moss being only employed as a top-dressing, and as a means of judging the condition of the whole mass in reference to moisture. A fine stock of Sweet Bays as pyramids and standards were noted in all stages of development, from the rooted cutting up to the perfect saleable specimen, and growing in the open ground and in tubs and pots.

As showing the manner in which every available space is turned to use in this remarkable nursery, beds for the germination of Palm-seeds occupy the spaces under the stages and lateral brick-pits in all the houses in which Palms are grown, as well as in many others.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

Present: Dr. M. T. Masters (in the chair); Prof. Church, Mr. Sutton, Rev. W. Wilks, Rev. Prof. G. Henslow (hon. sec.).

Cattleya Malformed.—Dr. Masters exhibited a blossom having only one petal, one sepal, and a straight column. This reduction to a symmetry of "two" is not uncommon in Orchids.

Parasitic Fungi.—Some interesting communications, with specimens of Polyporus ulmarius, showing how it appears to cause the decay of the interior of the tree, and fructifies in the hollow, were sent by Dr. Plowright; also descriptions of parasitic fungi on Alders and Willows. Figures of these will appear in the *Gardeners' Chronicle* shortly. A vote of thanks was given to Dr. Plowright for his communication.

BRISTOL & DISTRICT GARDENERS'.

AT the annual meeting held recently at St. John's Parish Room, Redland, Mr. W. A. GARAWAY, who presided, stated that the Society, though started only a year ago, now numbers over 100 members. Meetings are held, and lectures given on subjects of interest to horticulturists, the average attendance being seventy. MR. H. CARY BATTEN was again elected President.

WARGRAVE AND DISTRICT GARDENERS'.

MAY 3.—On the above date, Professor GROVES, F.L.S., gave a lecture on "Mosses," tracing the similarities and differences between them and Ferns in a very clear manner.

The way in which the moss-plant produces spores for reproduction, and the quick growth of the plant, by which large patches of land are covered in a short time, were carefully explained. The reasons why moss is always found in damp places were pointed out; and the diagrams explanatory of the lecture were most useful.

Mr. T. Haskett, gr. to J. W. RHODES, Esq., Henwerton, exhibited some beautiful Rhododendrons, which were much admired.

NATIONAL AURICULA.

(Northern Section.)

MAY 5.—The annual exhibition was held on the above date in the Coal Exchange, Manchester. Notwithstanding the lament of our old friend Mr. D'Ombrain, that "the popularity of the Auricula is on the wane," there can be no doubt the Auricula has still many enthusiastic votaries in the North, who love the flower well enough to give it all the attention so essential to its well doing.

On this occasion the quality of the flowers was of a high order of merit, bearing in mind the very treacherous season that has been experienced. As old Ben Simonite remarked, "they had every reason to congratulate themselves, both on the quality and quantity of the exhibits." General regret was expressed at the absence, through indisposition, of the Rev. F. D. Horner, whose plants are always an interesting feature of the show. Over 600 plants were staged, and the principal prize-winners were Mr. T. LORD, Todmorden; Mr. B. SIMONITE, Sheffield; and Mr. A. R. BROWN, Birmingham.

New exhibition varieties were exhibited by Messrs. LORD and SIMONITE, Mr. SIMONITE showing a very fine, new, green-edged variety of great promise.

New alpines were shown by Messrs. R. GORTON, Eccles; and R. HOLDING, Birmingham.

The best six Auriculas, dissimilar, were from Mr. T. LORD, Todmorden, who showed Geo. Lightbody, Acme, F. D. Horner, R. Headley, Mrs. Potts, and Abram Barker—a fine lot; 2nd, Mr. BEN SIMONITE, Sheffield.

or four Auriculas, dissimilar, Mr. T. LORD was again 1st, and Miss WOODHEAD 2nd.

The best collection of six Alpines (six dissimilar), was that from Mr. A. R. BROWN, Birmingham; and for four Alpines (distinct), those of Mr. J. BESWICK.

The premier Auricula was Mr. T. LORD'S Abram Barker (First-class Certificate); and the premier Alpine, Mr. A. R. BROWN'S J. F. Kew.

Mr. FRANK LAW, of Sale, exhibited a fine collection of Narcissus.

Obituary.

MALCOLM DUNN, V.M.H.—Just before going to press we are shocked by the news of the death after twenty-four hours acute illness, of our valued contributor, Mr. Dunn, head gardener to the Duke of Buccleuch, Dalkeith Palace, since 1871. We are unable, for the moment, to write more than an announcement of this sad event, but in our next issue we hope to give some particulars of the life and work of this excellent gardener, who for many years has been the best known of Scottish horticulturists. His extreme willingness to assist every deserving cause was most remarkable.

T. A. DICKSON.—It is with deep regret we learn of the decease of Mr. T. A. Dickson, head of the firm of T. A. Dickson & Co., florists, Centre Row, Covent Garden. Mr. Dickson was taken ill in August of last year, and subsequently had a paralytic stroke, which, together with general weakness and debility, prevented him from again resuming the active part he had taken in the management of the business, and he passed peacefully away on Tuesday, the 9th inst., in his sixty-fifth year.

The firm of Dickson has been associated with Covent Garden Market for almost a century, and fifty years ago deceased's father had a stand in the market, and a nursery at Brixton. The site of the nursery has long since been built upon, and changes almost as great have taken place in the firm's position in the market. From the "stand" that used to be erected opposite the church, which had to be cleared away every Saturday evening, Messrs. Dickson moved to a position in the Centre Row, and later to the shop nearest to the church, which they at present possess. The business is now purely that of a florist's, and a number of young persons are employed continually in the making up of bouquets and other floral devices. A considerable trade is done in moderate-sized plants of a decorative character, and a group of the flowering plants in season could always be seen outside of the shop. A brother of deceased was, at one time, superintendent of the market previously to Mr. Assbee.

Mr. T. A. Dickson had been employed in the market from his youth. His wife, who was also engaged in the business, pre-deceased him, and he leaves one son. The business, we are informed, will be carried on, as usual, and under the same name, by Mr. F. S. Lucy, a nephew of the deceased gentleman.

Deceased was greatly respected by all frequenters to the market, and his unobtrusive and kindly personality will be much missed. He at one time was a member of the Board of Works, and was also much interested in the Covent Garden Lodge of Freemasons, and in various horticultural charities. For ourselves, we have been indebted to him for valuable information respecting market prices from week to week. The funeral will take place at Norwood Cemetery on Saturday, at 12 noon.

THE LATE MALCOLM DUNN, V.M.H.

THE PANSY.

ITS NAMES AND ITS EVOLUTION.—Though the Pansy is deservedly admired at the present day, it is open to question if we now regard it with the same affection as did our forefathers. The names they have left us—some thirty in number—are, for the most part, indicative of a deep-rooted sentiment. To explain some of these names, much ingenuity has been exercised during the last hundred and fifty years. Dr. Johnson provides an instance of an extreme nature. In his *Dictionary*, Pansy is explained as a corruption of Panacey (Opopanax); while in his edition of *Shakespeare*, he declares the word "is for thoughts, because of its name Pensées." In this case we may perhaps question the great lexicographer's ingenuity, but not his learning. It is perhaps not so well known that Pansy was at one time a designation applied not to the whole plant, but to the flowers only. In a description of the plant, Dodoens says:—"The French call the flowers 'pensées.'" The Belgians and the people of Brabant employed the word in the same sense. Pansy as a name was not in common use until the present century was well advanced;

of Veronica repens placed on dry cork, some Cornflowers and even Polyanthus blooms stuck into pots of sand to be adorned by their own foliage, also similarly inserted, Isolepis, Abutilons and tender Marguerites being thrown in for "hardy." It is the worst thing of its kind we have ever seen at any exhibition in or near the metropolis. Messrs. Barr obtained the gold medal as well as the first prize for their Tulips, the prizes being offered by the Royal National Tulip Society.

THE NEW STYLE.

The following items are culled from the pages of a young and enterprising contemporary devoted to the ancient art of gardening:—

What has been the matter with gardeners lately, that we hear of so many suicides amongst them?

***

That big Violet grown by Signor Emilio Borgiotti is getting bigger as the notice of it hops from journal to journal. Another round or two and a bushel basket won't hold it.

***

The longevity of gardeners is so well known that a person has been heard to state that a defunct gardener is almost as rare as the proverbial dead donkey. Be that as it may, another veteran of the fraternity has gone over to the majority in the decease of Mr. ——.

***

One of the prettiest things I saw in Regent Street a day or two since was a bicycle covered with Violets and Lilies of the Valley. The handle-bar was smothered in Violets, and a huge bunch of Lilies of the Valley and Violets was suspended from it. The rims and spokes were clothed in Violets.

***

Miss Ellaline Terriss, the charming actress of the Gaiety Theatre, recently gave an interviewer her impressions of the Americans. She seemed particularly struck by the lavishness of our transatlantic cousins in regard to floral gifts. On one occasion she was presented with a colossal shoe made up entirely of choice flowers.

***

The sight of a young lady delightedly waggling a bunch of Neapolitan Violets at an individual of the other sex when the competing boats passed Hammersmith with the Light Blue well ahead was suggestive. *The* ——— is not going to imitate the narrow pedantry which has prompted many professed horticulturists to speak contemptuously of the popular use of flowers. May it extend.

***

After the first night performance of Mr. Pinero's brilliant comedy, *The Gay Lord Quex*, the name of Miss Irene Vanbrugh was on every lip. The young actress had achieved a remarkable personal triumph. It may not be generally known that Juliette Frobel is a pronounced flower lover, but her tastes are so catholic that she found herself rather in a quandary when asked by a representative of *The* ——— which she liked best of all.

***

Mr. G. Bernard Shaw on flowers is—well, he is Mr. G. Bernard Shaw, just as he is on the drama and things generally. As thus: "A well-balanced mind has no favourites. People who have a favourite flower generally cut off its head and stick it into a button-hole or a vase. I wonder they do not do the same to their favourite children. It is a crime to pluck a flower. I dislike formal gardens. At any given moment two-thirds of its blossoms are dead.

The weather in West Herts.—During the past week the day temperatures were on the whole about average, while the nights were nearly all warm. The ground is still of seasonable warmth both at 1 foot and 2 feet deep. Rain fell on four days of the week and to the aggregate depth of about half an inch, but no measurable quantity of rain-water has yet passed through either of the percolation gauges. The record of bright sunshine was poor, averaging only 4½ hours a day. A Lilac growing in my garden came into flower on the 12th, which is three days later than its mean date of first flowering in the previous thirteen years, and one day later than last year. —E. M., *Berkhamsted.*

Fritillaria recurva.—This is one of a very remarkable race, a race at once embracing a large array of greenish and dull purplish shades—more interesting, it may be, than beautiful—and from these through yellow and golden yellow, reds and tawny reds, with here and there a white more or less freckled with something else. All this diversity of colouring in one genus is certainly out of the ordinary, and when to this we add the sterling beauty of the above, we have not merely its colour, but in the beautifully recurving blossoms a feature almost unique. Most flowers of this group have bell shaped blooms, some perfectly so, as, *e.g.*, F. pudica, while others, like F. aurea and F. latifolia vars., have a partially globular outline in their drooping forms, while the Crown Imperials, the giants of the race, come intermediate between the two, though more generally favouring the pendent bell shape. Thus the finely recurved form here noted is as exceptional as it is beautiful.

Moltkia petræa.—As an interested reader of The Garden in matters relating to hardy plants, and on behalf of others equally interested, I would like to know how "E. J." comes to record this as a synonym of Erodium petræum (April 29, p. 293). I thought it might have been a slip, but as I have not yet seen a correction, one may reasonably suppose that what was written was intended. Erodium belongs to Geraniaceæ, and Moltkia to the widely and totally different order Boragineæ, and is also a synonym of Lithospermum petræum, consequently coming nowhere near an Erodium species. The error is all the more conspicuous from the fact that Moltkia petræa is one of the most attractive and desirable species for the rock garden.—J. Wood.

*** In my recent notes on this genus (p. 293) I have thoughtlessly bracketed Erodium petræum with Moltkia as being synonymous. This, of course, is an obvious error, and as such misleading.—E. J.

OBITUARY.

MR. MALCOLM DUNN.

The death of this well-known gardener took place on Thursday morning, the 11th inst., and caused a severe shock and surprise to a large circle of friends and acquaintances. Virtually he died in harness. Throughout Tuesday he was active and energetic as usual, and in the evening attended a meeting in Dalkeith. It was a wet night with a north-east wind, and it is thought he caught a chill on his way home. What is known with certainty is, that on Wednesday morning he complained of general illness and acute internal pains. His medical adviser was called in and made several visits in the course of the day, remaining with him till he passed away early on Thursday. Mr. Dunn was unmarried. He took a lively interest in the garden charities and in the rise and progress of the young men under his charge.

Born in, or near, the town of Crieff, Mr. Dunn, after receiving the ordinary education given in Scotch parish schools, served his apprenticeship in the gardens of Strathallan. Soon afterwards he turned his face southwards in search of knowledge. He, I believe, was at several places in the south, the most notable being Trentham, then in its glory under the late Mr. Fleming. The next move for Mr. Dunn was to the gardens of Powerscourt, County Wicklow, Ireland, and it was from the latter, in November, 1870, that he came to the Palace Gardens, Dalkeith, in succession to the late Mr. Wm. Thomson.

It will be sufficient praise of Mr. Dunn's management for nearly thirty years to say that he maintained the high level of his two immediate predecessors—Mr. Charles McIntosh and Mr. William Thomson. Heavy as must have been the labour and great the honour of Mr. Dunn's position as head gardener to the Duke of Buccleuch at Dalkeith, it only seems to have whetted his appetite and energy for more work in connection with the Press and public societies. He was the author of several treatises on fruit culture and a frequent contributor to the horticultural papers and learned societies' literature. He took a very lively interest in the conifer conference in connection with the Royal Horticultural Society in 1891, and did much for the Forestry Exhibition in Edinburgh in 1884. For many years he was a leading spirit in the excursions of the Royal Scottish Arboricultural Society, of which he was a member of the council. He held similar and other offices in connection with the Royal Caledonian Horticultural Society and the Scottish Horticultural Association, of which he was one of the first presidents. In fact, Mr. Dunn died full of honours as well as work. He was a Victoria and Veitch medallist. He was buried at Dalkeith on Saturday, the 13th, most of the principal gardeners and nurserymen from Edinburgh and the vicinity being present. D. T. Fish.

PUBLIC GARDENS.

Dollis Hill to be purchased.—The Willesden District Council has decided to purchase Dollis Hill for £50,000 as a public park, the option expiring on Monday. Lords Hobhouse and Aberdeen had headed the deputation yesterday to the Parks Committee of the London County Council, and another deputation visited the Gladstone Memorial Committee, but received no definite promise. Private gifts, in addition to Willesden's £30,000, the Middlesex County Council's £12,500, Hampstead's £1000, and Hendon's £500, had left £5726 out of the £50,000 still to be collected, and, pending the decision of the L.C.C. and the Gladstone Committee, and having regard to the subscriptions in prospect, the purchase is to be made subject to the Local Government Board's approval.

Making weed-killer.—Will any reader kindly inform me of the proportions of arsenic and caustic soda and water, if any, for making weed-killer, together with any instructions that are needed as to making it?—J. E. P.

Holly dying.—One of an old avenue is dying without any apparent cause. Fresh soil and manuring have been tried. Can any reader suggest a remedy?—H. de S.

*** It may be a question of age, but in any case only one seeing the tree can give a useful opinion. —Ed.

Wireworm in a garden.—I have recently purchased a small property in Sussex. Two acres have been laid out, trenched, manured, and planted as a fruit and vegetable garden, which promised a splendid crop of vegetables at any rate. But the wireworm has made a clean sweep of the greater part of it—Carrots, Lettuces, Potatoes, and what not, and a quantity of very choice Carnations has also been ruined. Will some reader kindly help me?—Agriculturist.

Names of plants.—*R. G. Clayton.*—Dendrobium Bensoniæ.——*A. Kingsmill.*—1, probably Scilla italica; 2, specimen too poor to identify.——*S. Redstone*—1, Buxus balearica; 2, Othonopsis cheirifolia. ——*W. M.*—Odontoglossum luteo-purpureum.

"The English Flower Garden."—*Thoroughly revised, with full descriptions of all the best plants, their culture and arrangement, beautifully illustrated. Medium 8vo, 15s. Library issue bound in sage-green morocco, one guinea nett. Of all Booksellers.*

GARDEN DESIGN.

INTERVIEW WITH

MISS L. A. DUNINGTON,

AT BELGRAVIA CHAMBERS, VICTORIA STREET, WESTMINSTER.

A GREAT compliment was paid by the Society of Architects to Miss Lorrie Dunington in February. They invited her to lecture before them on "Garden Planning in Relation to the House," which in any case would have been an honour, but in this instance it was accentuated by the fact that Miss Dunington is the first lady who has lectured to the society. Judging by the interest which her lecture provoked, she is not likely to be the last. When I had the pleasure, shortly afterwards, of a chat with Miss Dunington in her office in Belgravia Chambers, Westminster, she expressed herself in appreciative terms of the reception given to her at Staple Inn Buildings, and my first question was in reference to her own experience as a garden designer.

"My first start," she replied, "was made about sixteen years ago as a practical gardener. I went through the usual two years' course of training at Swanley College. Before I took up gardening, it was my intention to devote my life to art, but health reasons necessitated an outdoor life. My first garden work was in Ireland, managing a large estate. I gave this up, and, on my return to England, decided to take up garden design. But then I found that there was no institution in which I could be taught—I am speaking now of thirteen years ago. However, I studied for a considerable period in the office of Miss F. Wilkinson, now principal of Swanley College, who was then superintendent to the Metropolitan Public Gardens Association, and presently, after I had obtained a good knowledge of garden planning, the making of estimates, and other essential matters, I received a commission to lay out and plant a garden."

The First Commission.

"It would be interesting to know the locality of the first garden you designed."

"The late Miss Eleanor Grove, of Abbey Hall, Byng Place, gave me my first commission. The garden was quite small, but it gave me the chance of showing what I could do, and the result of my work was that I began to be asked to execute other commissions. Then, for two years, I acted as hybridist to the late Mr. Selfe Leonard, the well-known authority on Alpines, and I assisted him in designing and laying-out gardens. In one way or another, including attendance at technical classes for building construction and architectural design, I secured all the training I could. It was obtained in a piecemeal manner, but there was no other way possible. Now I have pupils of my own, who go through a regular course of training in garden design."

A Dutch Pupil.

"How many pupils do you take?"

"Not more than two at once. My first pupil, by the way, was a Dutch woman, who came to learn English methods, and then returned to Holland, where she has gained prizes and made a name in her profession. I was very proud of my first pupil."

"Have you had any other foreigners?"

"No, the other pupils have been English. I refuse a great many applications because I only care to have pupils who are in earnest, and desire to undergo the full period of training. Before a pupil comes to me, it is essential that she should have had at least two years' training in practical gardening; and I consider that two years' training in garden design is necessary to gain adequate knowledge."

The Importance of Training.

"Do you have any trained assistance?"

"In the work of planting, I sometimes employ a trained lady to help me. But I am very particular as to the training. Just now, a great many women are taking up jobbing work, both in the suburbs of London and in the provinces. They go out for 5s. or 7s. 6d. a day, using their own tools. I know of one at Hampstead who is making £150 a year, and several who are doing well at Sutton and Croydon. The method is to settle in a likely district, send out circulars with terms, and indicate the school of training at which they have derived their experience. But as I said a moment or two since, it is no use for a girl who has not a knowledge of horticulture coming to me. If she possesses that, she can acquire the higher training, learn office routine, how to draw up estimates, make plans, construct buildings, and all the branches of garden architecture."

Miss Dunington.

A Public Appointment.

"Did you commence on your own account in London?"

"No, at first I worked from the country, but I found that it was inconvenient in travelling, and that London was the best centre. Accordingly, about two years and a half ago, I came here."

"Of course, you still travel a great deal?"

"Yes, my work is very scattered, and I go all over the British Isles. I fill one permanent public appointment, that of garden adviser to the National Society for Epileptics, at Chalfont St. Peter. I have done all their estate planning for eight years."

"Then you laid out the beautiful grounds at the Colony?"

"I have designed everything there since I took up the work. I am now planting an avenue of trees and designing a garden in connection with new Children's Homes at Chalfont. I go down there periodically to see how the trees are getting on, and if they want thinning. All the rest of my work is private."

Private Work.

"Do you prefer private work?"

"Yes, because it gives one greater scope, and embraces all kinds of work, from designing an herbaceous border to colour, to the laying-out of a large estate. Sometimes I have to remodel an old estate, and then I try to design the grounds so that they shall harmonise with the house. In public work, as at Chalfont, for instance, the temperament of the patients has to be considered, and care exercised not to plant what they are likely to destroy; also the cost of the upkeep has to be borne in mind."

No Permanent Staff.

"I suppose you do not always carry out your own designs?"

"Some people merely require a design with full working instructions, but others like me to do the carrying-out also. In the latter case, I employ young men. I have no permanent staff, but I can always secure the help I want."

Lectures to Students.

"Some of my time," continued Miss Dunington, "is occupied in giving lectures. Formerly I lectured at St. George's School, Harpenden, where I had a large class of boys and girls, who learnt practical gardening. But I have given up lecturing on practical gardening. Now, most of my lectures are delivered, at drawing-room meetings, on 'Gardening as a Profession for Women'; and to scientific societies on 'The History of Gardening.' The latter are lantern lectures. I also lecture to the students of the Architectural Association on 'Garden Design.'"

"How long have you been lecturer to the students of the Architectural Association?"

"For more than two years. The students are all men, and I was the first woman who ever lectured to them."

"Perhaps, before I ask you for details in respect to garden designs, you would kindly say something as to general opinions?"

Digitized by Google Original from CORNELL UNIVERSITY

"In the latter part of the 17th century, and the early part of the 18th, the beauty of the gardens depended chiefly upon design. But in modern days, with the introduction of a greater variety of trees and shrubs, and an increased interest in their culture, we shall improve upon this Nowadays, planting for colour and effect, and to get the greatest possible number of blooms, is aimed at. Our forefathers' gardens were graveyards for half the year, but we want something bright all the year."

Garden Lovers and Garden Furniture.

"But do you not find that some people still only care to have their gardens bright for a short period?"

"Oh, yes, there are some who like the whole garden to be designed for August and September; others for hunting in November; and others again for early spring. But the number of what I may call all-the-year-round people is steadily increasing. They are the true garden lovers; the rest merely like their gardens to be furnished."

The Planning of Gardens.

"The design depends upon whether the true garden-lover or the purchaser of garden furniture is the client?"

"Very much, indeed—much more than upon the money expended on construction, for a cottage garden is frequently more beautiful than the pleasaunce with its park gates. On the other hand, the successful designer must be practical as well as artistic, and in preparing plans must bear in mind the depth of the client's purse. There is an impression that a simple design must be inexpensive, whereas in reality it may prove to be the most costly. With regard to the planning of grounds, hard-and-fast rules cannot possibly be laid down. The architecture of the garden is in its way as important as that of the house; it must be subservient, but it requires just as much attention. I do not believe in putting an old-fashioned garden round a modern villa. A modern villa must have a modern garden; and there is nothing artistic in ready-made antiquity."

The Clean-Slate Method.

"But you take into account existing features?"

"I never sweep away, and I have a strong objection to the clean-slate method. A good designer makes the most of existing features, and has often to give up cherished ideas in order to preserve a fine piece of timber, or a handsome shrub. In my own experience in the city of Lincoln, I found an exquisite Silver Birch in the wrong place. But I so planned the garden as to fit in the tree, and never thought of abolishing it. Any departure from convention is good if there are obvious reasons for it. But I have strong leanings to the formal school of gardening, though I would not carry it to excess. Thus, the lines close to the house should be controlled by the building. I always try to study the style of architecture, and sometimes design a feature in the garden so as to link it with the house. If the garden is far away from the house, you can do as you like."

A Passing Fashion.

"Do you consider garden planning as important as architecture?"

"In its way, I certainly do, because a house may be designed for to-day, and is complete when the last workman has left it. But gardens are made for a future generation, and when we think we have finished, the laying-out is only begun."

"Have you anything to say about pergolas?"

"I know that scarcely any garden is considered complete without one, while it is often a sad and useless object leading from nowhere to nowhere. But it is probably only a passing fashion, and, like the sundial as a centrepiece in the suburban garden, will only have its day."

"You are much opposed, Miss Dunington, to incongruities in gardens?"

"Strongly, and for that reason I attach great importance to the use of particular materials. If possible, architectural introductions into the garden should be of similar materials to those used in the construction of a house. For instance, if a house be built of London yellow brick, any other structure should also be formed of yellow brick. The use of stone or other materials of greater refinement outside the building only emphasises its mediocrity. In some quarters there is almost a mania for collecting dilapidated wrought-iron work in the shape of gates, railings and screens. But because a gate or a screen was wrought a couple of centuries ago, it is not necessarily worth looking at. No design, however beautiful on paper, is of any value unless it is suited to the successful growing of flowers and trees"

"Will you elaborate that point a little?"

"There are, first, the trees and shrubs which are used architecturally in garden making when they supplant more permanent materials, but are made to fulfil the same duties. These include the clipped Yew or Beech hedge, the thin Box edging and the topiary tree. They are not intended to replace trees of natural growth, but to act as foils to them. I believe that most people allow that a wall of sombre green is the most effective background for a herbaceous border, and that the judicious use of trees of formal outline adds to the attraction of the terrace Then there are trees, shrubs and flowers which are used entirely for decorative purposes, and these are usually allowed to grow naturally. Attention should, however, be paid to the artistic grouping of colour, the value of light and shade, and the planting for bold effect."

Colour Grouping.

"I should like you, please, to say more about colour grouping."

"One portion of the garden should be devoted to trees and shrubs which colour in the autumn, and another to trees and shrubs which flower in the spring. I mean that they should not be mixed up, but kept quite separately."

"Then there is the herbaceous border?"

"Personally, I prefer a border including all the colours, but separated so as not to clash. This, however, is not always practicable. Some clients will not have any yellow flowers in the border, and others insist upon dispensing with pink or red. With respect to the separation of colours, after the flowers are separated, they should be grouped to their own advantage. The space between the scarlets and crimsons should be great. This may be accomplished by beginning at the end of the border with the scarlets, and allowing them to merge into the oranges and yellows, and so on to the blues and purples, arriving eventually at the crimsons and pinks. White can be introduced throughout whenever the grouping invites its presence; and to tone and subdue the whole, grey foliage plants should be brought in and used freely in connection with pink and yellow. I need scarcely say that in following a general scheme of arrangement, there should be no hard lines of demarcation visible between the colours, and no slavish adherence to colour rules."

Chance Colour-Combinations.

"Do you advocate the liberal use of annuals and biennials in the herbaceous border?"

"I do not see how the succession of the various colours throughout the summer can be uninterrupted without them. Without these short-lived helpers, the garden tends towards overmuch blue and scarlet in the early part of the season, whilst in the autumn the yellows have the monopoly. Every garden lover should aways be on the look-out for chance colour-combinations. Frequently these prove more successful than the most elaborate design. For example, what is more effective than such a grouping of crimsons and pinks as may be formed by the feathery sprays of the rosy-scarlet Larkspur, rising behind unstinted clumps of deep crimson Sweet Williams and carmine Eschscholtzias?"

A Design for a Border.

"Are you at the present time engaged upon any herbaceous borders, Miss Dunington?"

"Yes, I happen to have a design in hand, over a hundred feet long, and ten feet wide. It begins with scarlets and oranges, and deeper yellows, and passes on into lighter chromes, pale blues, deeper blues, purples and lavenders, ending with crimsons and pinks, all the colours being kept together. In this border, all the seasons are represented, so that there will be continuous blooming from early spring till late summer With regard to arrangement, the tall varieties are at the back, sloping down to the shorter at the front, though sometimes I prefer a few tall varieties in the front, just to break the line To supplement my design of a border, you may like to have the idea of one of my clients. Here are his plans. You see, from the drawings, that they set out the contents of the whole garden, so that if anything dies either in the herbaceous border, the Rose beds, or the shrub borders, it can be replaced, and a record made on the diagram. There is no doubt that these plans will be found very useful, because they enable the owner of a garden to see its contents at a glance."

ALFRED WILCOX.

NEXT week's interview is with Mr. T. W. Herbert, at the gardens, Nutfield Court, Redhill, Surrey.

A Neglected Race of Plants.

THE CROWEAS.

THESE form a very distinct and valuable class of cool greenhouse plants, deserving much more extended cultivation. They possess evergreen foliage, and are of a remarkably neat and compact habit of growth, with pretty flowers of a rich pink hue, which are chiefly produced during the autumn and early part of the winter, when most flowering plants are over, and this, of course adds considerably to their value. They come from New South Wales, but only require cool greenhouse treatment, and are of a very vigorous and accommodating nature. If started into growth in a gentle warmth early in the year—in February or March—they will bloom as early as August, while other plants, allowed to come on naturally, will maintain the succession until Christmas, or later.

The plants will grow and bloom well in either loam of a fibrous or turfy nature, with a little leaf-mould and sand added, or in peat, but as in the latter they seem to make better progress, and, on the whole, to thrive rather more, this (peat) should be preferred, but that of the best quality only, with some sand, should be used. It must be made quite firm in the pots, and these, as usual with all plants of this class, should be well but not excessively drained. Although they are strong-rooting subjects, as compared with many others, they do not need very large pots, and seem to thrive better in comparatively small ones.

Propagation.

This is effected, as usual, by means of cuttings, which will generally be found in good condition in April or May. Take them off, thin them, and insert them firmly in 5-in. or 6-in. pots, placing several in each, the pots being, of course, freely drained, and partly filled with a mixture of peat and sand in equal portions, with a good surfacing of pure sand. If placed in a close case in a warm house, they will soon form roots, and should then be potted off singly in small sizes, keeping them moderately warm and close until rooted out again. Pinch out the point of each as soon as they begin to grow, and winter them, if possible, in a temperature of forty-five to fifty degrees at night. By about

Annuals and Roses at Westwood Gardens, Tilehurst.

THE two great features in the gardens of the Countess of Eldon, at Westwood, Tilehurst, are annuals and Roses. Westwood itself, which was purchased for a summer residence eight years ago by Lady Eldon, comprises a comfortable modern residence on high ground, and about ten acres of pleasure grounds and kitchen gardens. It is just outside the village of Tilehurst, and within a drive of three miles from Reading. In the short carriage drive, which forms the approach to the house, there is an excellent collection of flowering shrubs, especially Lilacs, Flowering Cherries, Laburnums, Hawthorns, Weigelas, and Berberis. Conifers are also represented on a considerable scale. But on the occasion of my visit in the middle of March the special features almost immediately claimed my attention. Mr. W. H. Durose, who is in charge of the gardens, is a recognised authority on colour effects with annuals, and I asked him first of all to tell me about his arrangement and treatment of them.

"With regard to arrangement, it might be mentioned at the outset that in the carriage drive itself is a broad belt of Antirrhinums, in number about five thousand. This is the second year, and they are being used here as perennials, though grown in the first instance as annuals. I do not advise that they should be grown for bedding purposes after the first year; the flowers are not so good."

"When do you sow them?"

"Towards the end of January, in brisk heat, preparing them gradually for removal into a cool house. During the third week in March, I prick them off into frames, then keep them closed for a few days until they are well started. Afterwards, I harden them off, admitting as much air as possible, in order to prevent them from getting drawn or leggy. The time of planting out depends upon space; but it is wise to plant them out as early as possible, say, the middle of April. I prefer not to pinch, and they do not require pinching if they are planted out with a space of eighteen inches between them.

WESTWOOD, TILEHURST, THE RESIDENCE OF THE COUNTESS OF ELDON.

"The tall varieties," continued Mr. Durose, "are Bright Pink, Carmine Pink, Crimson and Gold, and Yellow. The Intermediates consist of Rose Queen, Orange King (which is better than Fire King), Apricot, Cloth of Gold, White Yellow, and Coral Red. The only two Tom Thumb varieties used are Crimson King and Yellow Prince."

BRILLIANT SUCCESS OF NEMESIAS.

"But last year, which was the first I was able to show results of the policy I decided to adopt with the sanction of Lady Eldon, the most brilliant success was obtained with Nemesias in the pleasure grounds which slope down from the front."

"Did you make use of the ordinary soil?"

"Yes; the soil fresh turned up was practically used. The only manure I put in was a sprinkling of Clay's Fertilizer. I am opposed to farmyard, peat moss, or any other strong manures in the culture of annuals in the time of planting. The best plan when it is possible is to incorporate strong manures with the soils in the autumn, and in the spring to give the beds a sprinkling of soluble manure of some description. There is then something always working which does not have the disadvantage of inducing rank growth of any description.

"With regard to the particular Nemesias, I prefer Sutton's hybrids to Suttonii mixed. The blossoms are of distinctive colours, the two most effective being a very brilliant gold and a very charming scarlet. The flowers are very large for the hybrid type, and the average height of the plant is from twelve to fifteen inches. I may say that I plant Nemesias and other dwarf varieties of annuals about twelve inches apart. Last year the long border contained two rows in the front eighteen inches apart, and between each of the hybrids I planted the Suttonii. It is a large-flowering variety, rather taller than the hybrids, though not so compact, but the colours are very brilliant and varied."

"How long did your flowering season of Nemesias last?"

"From May until October there was a continuous display in front of the long border. Nemesias are useful also for cutting, and for pot plants—of which we make a feature. They are very decorative in the water, and if it is changed will last for eight or ten days. I sow the seed the third week in March in a cool house or a cool frame. They will not bear heat, and must be kept cool until they are ready to handle. They are pricked out three inches apart into boxes, and planted when the ground is prepared for them. This year I sowed on March 13th. The plants will be ready to prick off the third week in April, and if the ground is at liberty they can be planted straight out in the borders the first week in May. It is worth remembering that Nemesias do not make much progress until the blooms begin to show. They require no more than ordinary care and attention, but in dry weather it is essential to water them. If they are not watered, the plants fall and often do not recover."

PENTSTEMONS AS ANNUALS.

"Next to Nemesias, I find Godetias, Larkspurs, Clarkias, Eschscholtzias, Nigellas, and Jacobeas among the most satisfactory of annuals. These are all grown in masses, and I am raising them outside at the present time. The only Nigella used is Miss Jekyll; the Eschscholtzias are Ruby Queen, and Dainty Queen—pink; the Godetias, Satin Rose, Double Rose (which is preferable), Scarlet Queen, and Lady Bird; and the Clarkias, Fire Fly, Salmon King, and Delicate Pink.

"I prefer to treat the Pentstemon as an annual. One of the reasons is because of the length of its flowering season. Sown in January, and pricked out the second week in March, it is ready to plant out the first week in May at the latest. You will readily understand that I have to choose annuals that flower at the same time as much as possible. Otherwise the principle of massing cannot be carried out effectually."

LARKSPURS AND SCHIZANTHUS.

"How do you treat Larkspurs?"

"I prefer to sow them in the open ground, the second week in March; lay a light over for a short time, held up by a hard brick; and then I plant out at the same time as the other varieties. Nigellas respond to the same treatment as Larkspurs. We also treat the retusa variety of Schizanthus as an annual. It is sown at the end of February, potted when large enough into small sixties, and planted out as space permits. We use Veitch's grandiflora hybrids for the same purpose. They do well outside, but require attention in the way of staking. A few Asters are very effective, and require practically the same treatment as Nemesias, but should be sown three weeks earlier. Stocks, too, are pressed into service. I sow about the end of February, and deal with them afterwards much the same way as Antirrhinums.

Digitized by Google Original from CORNELL UNIVERSITY

"The large-flowering varieties of Phlox are Delicate Pink, Bright Crimson, Maroon, and White; the dwarfs Delicate Pink, Salmon Rose, and White. I sow in February in heat, or in a gentle hotbed, prick off in the same manner as other annuals, either into boxes or into another gentle hotbed. The plants are hardened off about the end of March, and in planting, care must be taken not to let them get drawn, which means spoiling the effect.

"A new variety of Sunflower is very useful for the back of borders. I refer to Sutton's New Red, which is worth its place in every garden. The best of the other varieties are Stella, Miniature, and Dwarf Miniature. I sow one in a small "sixty" pot the first week in March, planting out as soon as it becomes pot-bound.

THE ECONOMY OF ANNUALS.

"These are the principal annuals used, but I generally grow a batch specially for cutting, including Shirley Poppies, the Giant Poppies, and Papaver orientalis; also the mixed strain of Clarkias, Godetia Double Rose, several varieties of Sunflower, Schizanthus, and Antirrhinums. As a matter of fact almost any kind of annual can be used for cut flowers, and they have the advantage of coming when there is a scarcity of greenhouse flowers. They are not expensive, and you can get, in my opinion, a better result more cheaply from them; you can plant them out at any period, and need not be afraid of a few degrees of frost. It is very necessary, however, in all cases to water regularly, and to be careful not to use the hose-pipe with too much force, because annuals are delicate.

"As to the bedding this season, Nemesias, Intermediate Antirrhinums, Asters, and Phlox Drummondii will be planted separately. The borders will consist of various subjects, such as Sweet Peas, tall Antirrhinums, Eschscholtzias, Godetias, Clarkias, Larkspurs, and Pentstemons. A bed will no doubt be found again for the dwarf Single Dahlia, and the majority of the varieties already named will be used for borders in different parts of the garden."

"Have you anything to say about the treatment of Sweet Peas?"

"They are sown in January in 'sixty' pots, five seeds in a pot, transferred into 'thirty-two's' or 'forty-eights,' and planted out about the first week in May in the borders. I do not coddle them, but just keep the stakes in the pots, and in the borders I dig a hole about eighteen inches deep. In this I put a shovelful of manure, cover with six to eight inches of soil, and then plant the ball, covering the top of the ball with an inch of soil. I grow about five plants in a clump in separate colours, and stake them as soon as they are planted. Last year we had Sweet Peas from the second week in June until the third week in October—five months."

"I see that you go in for spring bedding considerably."

"Wallflowers in variety are the principal feature. They are planted in separate rows, and we use only four dwarf bedders, Sutton's Fire King, Blood Red, Purple Queen, and Yellow. Fire King is useful in a bed by itself. Polyanthus is used in quantity, and so is Myosotis Royal Blue. Two beds are filled with Tulips Kaiserskroon, Prince of Austria, and Chrysolorum. We also use a quantity of Narcissi, Scillas, Crocuses, Aubrietias, Arabis, Alyssums, and other subjects, under the trees on the slopes; while under the hedges the bulbs make a show.

"There are thousands of bulbs down in the wild garden," continued Mr. Durose, "and here, as you will observe, we have just made a water garden. The water is planted with Lilies, and we intend to clothe the banks with bog plants, Bamboos, and Pampas Grass, while all around shrubs and trees will be made the most of. As soon as possible, a representative rockery will be included."

ROSES ON THE SLOPES.

"Now I think it is time to refer to the Roses."

"First of all, there are the Roses on poles, the standards and dwarfs in the front. The varieties on poles are Climbing Captain Christy, American Pillar, and Conrad Meyer; standards, chiefly Hugh Dickson, Frau Karl Druschki, Mrs. John Laing, and Lady Hillingdon; dwarfs, Madame Abel Chatenay, Richmond, Liberty, and Madame Cochet. We choose the best, and keep rather to large quantities of a few, than to a few of many.

"Then in the Rose garden with the two tennis courts recently made, is a long border on the high level. This contains not fewer than one hundred and fifty Roses, with standards of Frau Karl Druschki and Hugh Dickson, dwarfs of Frau Karl Druschki being planted in between. The rest of the border is planted alternately with Caroline Testout and La France. In the beds below the slope are more Roses, two or three of several of the best and newest varieties being used. These include Queen Mary, Irish Fireflame, British Queen, Sunburst, and Willomere. The fine Rose hedge consists entirely of Dorothy Perkins, and a border of French Roses mixed almost completes the contents of the Rose garden. Yet I ought to add that even here we reserve space for annuals, and that under the hedge facing south is a small herbaceous border, with varieties chosen to suit the position and aspect."

THE PLANT AND FRUIT HOUSES.

"We must not entirely omit to notice the kitchen garden and houses, which appear to be admirably arranged, and quite up-to-date."

MR. W. H. DUROSE, HEAD GARDENER AT WESTWOOD.

"Of the houses, which are few in number, one is at all times kept for flowering subjects, according to the season. A second house consists of Beans, Tomatoes, and Strawberries now in flower, with seedlings of various kinds. Peaches and Nectarines in pots fill another house, and a fourth is occupied with bedding plants, including Malmaisons; and a fifth with Ferns in variety. Various pits are used for bringing on Potatoes, Lettuce, Cauliflowers, and Violets. Of the last we grow about twelve lights in the winter, and keep up a supply from September until April. We then divide and plant out, using the natural soil, which is generally black sand or gravel, and getting a very fine show of flowers. The two varieties are Princess of Wales and Marie Louise.

"Great attention is paid to early and forced vegetables, such as Seakale, Asparagus, Peas, Potatoes, and Beans.

"With regard to hardy fruit, Pears, Apples, Plums, Peaches, Nectarines, and Gooseberries are grown in quantity. The south wall is devoted to Peaches, and we have just finished a glass coping, which I think will be a considerable protection. The east wall is devoted to Plums, and the west to Pears. All the fruit trees are fresh since I came here two and a half years ago, and you will notice that the cordon Pears are now in bloom. Pears are also grown on espaliers. Apples are chiefly bush trained, but a number of these will be found in the orchard outside, which is quite as large as the kitchen garden within walls. The Peaches grown outside include Stirling Castle, Belgrade, and Waterloo; the Nectarines, Violette Hative, Royal George, and Cardinal. Royal Sovereign is the Strawberry used for forcing, and we also grow Givon's Late Prolific and Waterloo."

"Have you done any showing since you have been here?"

"I began last year, and was successful at the local show in the open class. In spite of strong competition, I took two firsts and two thirds. The firsts were for twelve vases of Sweet Peas, and for a group of plants, and the thirds for collections of vegetables in each class. I started my gardening experiences at Norbury Hall, Derbyshire, and was afterwards in succession in the gardens at Wootton Hall, Staffordshire, Westfield, Lancashire, Avon Castle, Ringwood, Leigh Park, Havant, and finally before coming to Westwood, I was foreman for two years and a half at Caversham Park." ALFRED WILCOX.

Green-fly is already in evidence on Rose trees on walls and trellises, and spraying should not be delayed, or the plants will suffer.

A Successful Amateur Exhibitor of Chrysanthemums.

MR. EDWIN WOOD, OF THE TYROL, UPPER NORWOOD.

AT the National Chrysanthemum Show last month high honours were carried off in the amateur classes by Mr. Edwin Wood. The number of exhibits staged by Mr. Wood was seven, and he was awarded seven prizes. Four of these were firsts. He was first for the large vase of decorative varieties; first for a vase of Singles; first in the Pompon class; and first for six incurved blooms of one variety. In the competition for six incurved blooms distinct, he was second; he obtained third prize for twelve Incurveds, distinct; and third for five Japanese blooms in one vase.

Mr. Wood is "a prophet with honour in his own country." His residence, The Tyrol, the oldest house in Church Road, Upper Norwood, is a very short distance from the Crystal Palace, the scene of his successes. Proximity to a great show is an advantage, but it does not secure prizes in strenuous competitions, and when I visited The Tyrol a few days after the show I had to ascertain other reasons for such a remarkable record. Mr. Wood, with whom I had a brief chat, takes a keen interest in his garden, but the credit for growing prize Chrysanthemums largely belongs to his excellent gardener, Mr. A. Dyer, who readily answered my questions and gave me all the information in his power.

"You have come to the front with a rush," I said, as we proceeded down the slope, a quarter of a mile in length, to the end of the garden, where the Chrysanthemums are planted out.

"Yes, this is the best year we have had, but Mr. Wood has shown for five years at the Crystal Palace.

"We usually make a start at Croydon. One year we had nine exhibits, and were awarded nine prizes. Prizes have also been gained at Bromley, and on more than one occasion at Thornton Heath. In the five years we have shown, about fifty prizes have been won. But this year the results at the Crystal Palace were most gratifying, and naturally more than we expected to achieve."

"But how did you manage to score such a succession of triumphs?"

"I suppose that careful cultivation all round is the chief cause. There are no special features so far as I know, but my methods are entirely at your disposal.

THE PERGOLA IN THE GARDENS AT THE TYROL, UPPER NORWOOD.

HOW THE PLANTS ARE GROWN.

"With regard to treatment, after the Chrysanthemums have done flowering, I put them in a cold frame, and subsequently start them there in the spring. About the beginning of December I strike the cuttings. In June they are placed out on the ground, close to where we are now standing. In due time the Japanese and Incurved varieties are tied up to wires in straight rows, and the sun ripens the wood. This garden backs on to the pleasure grounds of the Normal College for the Blind, and we get the benefit of protection from trees, and of plenty of open space.

"As the plants become larger I transfer them from this space to ground a little higher up the slopes, previously occupied by vegetables. I should have mentioned that I start them in small pots, transfer them to forty-eight's, and finally into their flowering pots. They stay outside generally until the second week in September, and then I move them to the single house, which represents all the glass in the place. Before doing this I take the stages out, wash the frames, and do not allow any other plants except the Chrysanthemums inside the house."

"Do you transfer them to the flowering house in any special order?"

"I take the Japanese first; the Incurved next; and the Singles and the Pompons I take at the same time. They are usually all in flower together, but I arrange things so that if a Pompon is in flower a little earlier than one of the other varieties, I leave it out rather longer. The idea is to make as good a collection as possible for the shows. When the shows are over the flowers are used to decorate the rooms of The Tyrol.

EARLY-FLOWERING VARIETIES.

"Facing the show Chrysanthemums are early-flowering varieties. This year we had about thirty, but for next season we shall have fifty, including two dozen of the newest varieties. It is intended to exhibit next year at the Crystal Palace early show."

"Have you gone in for any particular shades of colour in choosing the new varieties?"

"They are principally pinks and whites. We already have plenty of bronzes and yellows. Hitherto, the early-flowering varieties have been used to decorate the house. They commence to bloom in August, and keep on until the end of October, coming in when everything else has finished.

"We do not go in for a large number of varieties of Incurves. For example, we grow Miss Cora Stoop, Fanny Lemon, Matthew Russell, Mrs. P. Wiseman, Frank Tristram, Clara Wells, and Eva Smith. The Japanese varieties are Mrs. A. T. Miller, F. S. Vallis, C. H. Bromhead, Mrs. C. H. Totty, Lady Letchworth, White Queen, and Mrs. Gilbert Drabble.

"With regard to Singles, I have discarded several this year, and have a number of new ones coming to take their places in March. The seven varieties grown this year were J. B. Lowe, Florrie King, Sylvia Slade, Roupell Beauty, Celia, Mrs. John Peed, and Mrs. W. Garner. Pompons are very nice, but we do not go in for many varieties. The four I find most satisfactory are Prince of Orange, Rubra Perfecta, Madame Martha, and Mademoiselle Elsie Dourdan."

BUYING NEW VARIETIES.

"Do you buy the new varieties as they come out?"

"No; as a rule they are too expensive, and we wait a year or two and see if they become popular. But it is, of course, very important to keep up-to-date sorts if you want to show, because the old varieties very often disqualify. On the other hand, the difference in the cost of buying a variety the first year and the second is very considerable. If you pay 10s. 6d. for a plant and don't get a flower fit to show, it is very disheartening, and that is another reason why I so often wait for a year to see whether a new flower is a striking success or a comparative failure."

Digitized by Google Original from CORNELL UNIVERSITY

"Which do you consider the best colours for showing, Mr. Dyer?"

"Whites are the best, I think, then golden varieties, and next to golden, crimson."

THE ROSE PERGOLA.

"Chrysanthemums are evidently by no means the only feature of the garden at The Tyrol. What is the extent of the very fine pergola which runs down the slope almost as far as the summer-house?"

"Three hundred feet. The Roses on the pergola are chiefly Dorothy Perkins, Hiawatha, Crimson Rambler, Duchess of Portland, and Margaret Dickson, which has an enormous stem, and is one of the finest Roses for a pergola. There are several singles, but they were here before I came. On the left hand of the pergola is a fine collection of Dahlias from the nurseries of Messrs. Cheal, of Crawley. There are thirty-eight varieties, one plant of each, all belonging to the Cactus section. I have had them for two years, and they do exceedingly well.

"In front of the Chrysanthemums is a collection of Phlox decussata, also from Messrs. Cheal. They represent all colours from white and copper to crimson. The flowering season begins in July, and keeps on until the end of October. As to treatment, I simply put each plant in a good compost, and it comes up year after year, the only artificial assistance given being a single dressing of manure. On the same side as the pergola is a row of dwarf Roses, mixed, such varieties as Betty, Frau Karl Druschki, and John Hopper, pink, white, and crimson."

"I see that you have Roses still in flower."

"Yes, I cut eight blooms this morning, thinking it was going to freeze. The varieties are Betty and Caroline Testout. Like many other people, I find that Caroline Testout does extremely well under every possible condition, and supplies a great quantity of blooms. There is no difficulty whatever in growing Roses here, and when they are once planted we let them alone.

HARDY FRUIT.

"On the right hand side of the pergola all the space up the slope is devoted to fruit trees, which were planted fifteen years ago, when Mr. Wood's father came to reside at Norwood. There are about two hundred trees, comprising Apples, Pears, and Plums, standards and pyramids. The best of the Apples, whether as pyramids or standards, are Blenheim Orange, Wellington, Bismarck, New Hawthornden, Cox's Orange Pippin, Ribston Pippin, King of the Pippins, Frogmore Prolific (which justifies its title by giving us more cooking Apples than any other variety), and Lord Suffield, from which a splendid crop of fruit was obtained this year.

"Pears are not so successful as Apples, but almost invariably we get a good crop of both Apples and Pears on cordons. The varieties of Pears include Charles Ernest, Doyenne du Comice, Glou Morceau, Triomphe de Vienne, Beurre d'Amanlis, Beurre Superfin, Princess—a lovely Pear—and Pitmaston Duchess. As to Plums, Monarch, Victoria, and Princess of Wales give excellent crops, and The Farleigh is a very fine Damson. The Apple crop this year was very fair; the Plum crop pretty good; but the Pear crop distinctly thin.

"Just outside the house in which the Chrysanthemums are flowered, Sweet Peas are grown in separate colours. They are so arranged that anyone can walk in between the rows, and they make a very pretty nook. The flowering season starts in June, and continues far into September.

"Speaking of the house, it may be added that it is thirty feet long and fourteen wide. Though it is the only house, there are two rows of pits the same height heated, and one row of cool pits. All the bedding stuff is grown here, and we never buy anything save seeds and new varieties. In the summer the house is full of Begonias, of which nearly a thousand are grown, some in the frames and others outside. I have shown summer-flowering Begonias at Croydon, and taken two firsts and one second prize.

"The lawn on this side of the house is purposely kept quite plain, and has seats all round. The trees are very old, and include good specimens of the Silver Beech, the Silver Birch, and the common Oak."

SPRING AND SUMMER BEDDING.

"At this time of year," continued Mr. Dyer, when we proceeded to the front of the house, "there is nothing to be seen in the shape of flowers; but all through the summer—in fact, from June till nearly the end of November—a blaze of scarlet was supplied by Salvias Pride of Zurich, with which the borders were planted. Their places are now taken by Wallflowers, two rows of Blood Red and one row of King of the Yellows, with an edging of Myosotis. Of the four raised beds two are filled with Wallflowers Primrose Dame, a primrose variety; and the other two with King of the Yellows. The small bed adjoining is filled with Myosotis.

"There are two fountains, which play during the summer, and, as you see, we are not without a certain amount of colour on the wall at the present time. The red of the Pyracantha berries gives a pleasing dash of brightness to the otherwise monotonous green."

MR. DYER'S EXPERIENCES.

"How long have you been in charge of the garden, and how many years have you been growing Chrysanthemums?"

"I have been at The Tyrol five years, and previously I was gardener to Mr. Peacock, of Croydon, for ten years, during which we showed a great deal, and won upwards of a hundred prizes, chiefly firsts. For five years, groups of Chrysanthemums, which I have been growing almost as long as I can remember, and of Gloxinias, were put up at Croydon Show. The seventeen previous years of my life were spent in the gardens of Haling Park, Croydon. I have been engaged in gardening since childhood. It may interest you to know that in the "Annual" of the transactions of the National Chrysanthemum Society a page picture is assigned to a large vase of Chrysanthemums exhibited by me in 1911. I won the same prize for the same variety this year. I consider it a great honour to have been mentioned in the publication."

"What assistance do you have in this garden?"

"None at all. The garden is an acre in extent, and except the small lawn it is all under cultivation. I have had the pleasure of hearing the front portion described as the prettiest garden in the district. A good deal, it will be admitted, can be done by one man and one house."

ALFRED WILCOX.

Next week's interview will describe a Glorious Sea-side Garden in the Isle of Wight.

CHRYSANTHEMUMS.

Some Attractive Varieties at the National Chrysanthemum Society's December Show.

The season of flowering in the Chrysanthemum world now extends from the end of July till the New Year is well advanced; but perhaps the blooms are best appreciated at Christmas, when nothing but forced flowers are obtainable for indoor decoration. In some seasons the mid-November varieties are still flowering up till Christmas, but this year the weather has been so mild that there are few indeed left, and the December varieties, therefore, hold entire sway.

A WISE DECISION.

The National Chrysanthemum Society have wisely held a show this year in December, with the object of ascertaining the varieties which make the best display in winter. The exhibition was a revelation to many visitors as to the possibilities in this direction. There were some truly wonderful specimens shown, especially by the trade growers—not large, massive blooms, such as are seen in November, but medium in size, shapely in form, and of the most delightful hues imaginable.

The following were particularly attractive: Heston Pink—which took pride of place as the best novelty submitted to the Floral Committee on the day of the show—Manor House Gem, Princess Victoria Bronze, Mrs. Hygate and Yellow Mrs. Hygate, Russet, December Gold, December Pink, Godfrey's Crimson, Black Prince, Mrs. F. Judson, and Mons. T. Pancoucke.

The single-flowering varieties were well displayed for so late in the year in such an advanced season. The honours went to Hubert Williams, Brightness, Caledonia, Kathleen May, Sandown Radiance, Crimson Queen, Cannell's White, and a new one named Commodore.

Perhaps the variety which attracted most attention was Kathleen May, the deepest velvety crimson, with an anemone centre. The petals are stiff and well disposed, and, generally speaking, it is all a Single Chrysanthemum should be.

EXPERT.

Amelanchier canadensis, also known as Mespilus, is a tree that deserves to be planted extensively. It is of the same family as the Medlar, and flowers early in the summer, and fruits in the autumn. But its great attraction is its foliage, which in the autumn assumes a beautifully rich tint. It does well in any ordinary soil.

Digitized by Google Original from CORNELL UNIVERSITY

certainly does not look very promising. The highest score was eleven, obtained by Charles Fidler and Lim Gray, both from Essex. The two samples of Dalmeny Hero both got high figures—from Scotland nine, and from Essex ten. Almost invariably the Potatoes grown in Essex proved better, when cooked, than those grown elsewhere.

April 8th —A few plants with variegated leaves are worth growing, but certainly all that are put on the market are not. One well-known writer on gardening goes so far as to say that none is; he declares that variegation is merely the result of disease. An India-rubber plant with yellow-edged leaves has long been in existence, but is still rather rare. Another variety is shown in the illustration. Whether it is likely to become more popular is doubtful. H. C. Davidson.

Famous Gardeners at Home.

No. 184.—Mr. Herbert Dyson, at the Gardens, Rickmansworth Park.

The gardens at Rickmansworth Park, the attractive residence of Mrs. J. W. Birch, have many interesting features, and have been admirably kept up for a number of years. The present head gardener is Mr. Herbert Dyson, and on the occasion of my visit, during the last week in February, he suggested on my arrival that we should begin our round at the main entrance to the house on the west side of the park. Here, nicely sheltered from the wind, was some spring bedding consisting of Carter's London pink Polyanthus and Kaiser's Kroon Tulips. The trees on this side include a fine pair of Thuja Lobbii, and a striking specimen of Taxodium sinense. Nearer the entrance to the mansion were Crocuses and Daffodils in various spots, planted in the grass, with the idea of making the place look as natural as possible. Directly facing the door is a fine tree of Pavia machostachya, which in August is a mass of flower.

"Rhododendrons," I remarked, "appear to be a considerable feature," and Mr. Dyson rejoined,

"Yes, some of the Rhododendrons were originally used to decorate the Bank of England. They include named varieties of the best kinds, and they do exceedingly well here."

"How long have you had Japanese Pæonies?"

"The bed was planted just three years ago, when we received the Pæonies with the Japanese labels attached to them from Messrs. William Bull and Co., of Chelsea. There are about a dozen varieties. As you may have noticel, the bed of Pæonies, like the bed with Roses and Daffodils, can just be seen through the trees from the windows of the house. I work on that principle wherever I can.'

"Did you plant the Roses?"

"Yes, some were in other beds, and new varieties were bought to make up. The Daffodils include Golden Spur, Orange Phœnix, Grandee, Ornatus, Empress, Incomparable, and Princeps. I had them all up in July, and replanted them. Although there are so many stones in the bed, the Roses, which are standards and dwarfs, flower remarkably well."

"You have standard Roses dotted about the lawn."

"Yes, and Lilacs. A number of the Roses are planted with Tulips."

"What is the nature of the soil?"

"Gravel on chalk. It suits a number of trees and Conifers. The Silver Fir, a hundred and twenty feet high, is a landmark for miles, and the Aucuba flourishes here. Hollies are rather a feature. The first Lord Iddesleigh used to come to Rickmansworth Park, and he greatly admired some of the fine specimens of Ilex."

At this point Mr. Dyson indicated a bed containing a tree of Gloire de Dijon, on which, he mentioned, there were seven hundred flowers open at once last summer.

"And how do you manage it?" I inquired.

"I train the growth. The tree itself is about forty years old. It used to be closely pruned, and under that treatment flowered badly. I had a loop made, and brought the shoots down in umbrella fashion, and the result was surprising. In the bed, where there are now Polyanthus and Hyacinths, I had Begonias last summer two feet high, one mass of flower."

"Do you treat them in a special manner?"

"I put them in an ordinary frame on a slight hotbed, and sift leaf-mould over them. As soon as they start, I give them all the air I can, but do not let them get too forward. By this treatment, the roots take hold of the leaf-mould, and the plants do not feel the shift. In my judgment this system is much better than using either pots or boxes."

Then we strolled past the front of the house—which was altered and improved in 1825, when the estate was purchased by the father of Mrs. Birch—and had a peep at the charming park, with the beautiful herd of deer. In the park also there are many striking specimens of trees, including a Lime with a spread of branches a hundred and twenty yards in circumference. There is an avenue of Limes half a mile long, and a short avenue of splendid Chestnut trees. Close to the windows of the drawing-room, which extends along the whole front of the house, are two beds, one on each side, with Harbinger Wallflowers and Kaiser's Kroon Tulips. The vases are similarly filled."

Mr. H. Dyson.

Rickmansworth Park House.

"But in summer," said Mr. Dyson, "the beds are planted with Echeveria and Henry Jacoby Geraniums, and in the vases we use Cordyline australis for the centre, and fill in with scarlet Geraniums (Ivy-leaves) and Nierembergias, the object always being to get as much colour as we can against the white stone of the house."

"I imagine that your large lawn requires a good deal of attention?"

"Yes; by the way, a portion of it has been taken, in recent years, from the park. On the south-east side the colours of a clump of Wellingtonia, a Copper Beech, and a Cedar of Lebanon blend well together, and further east are several Beeches. When the gardens were laid out by the man responsible for the original Rosherville Gardens, he designed it so as to entirely avoid straight lines, so that everything is on the curve."

"The result being a complete absence of formality, and the preservation of a natural appearance?"

"We do not think that there is any beauty in straight lines. On the east side a croquet lawn was recently added, and views, including one of the lake and river, have been opened out. Here are specimens of Cedrus atlantica, Pinus strobus and other varieties."

"Speaking of straight lines," continued Mr. Dyson, "the only place where we can show them is in the flower garden, where the style of design precludes their absence."

"How long have the Ivy archways been in the flower garden?"

"I can only tell you that they were there be-

fore 1825. The exits to the garden, you see, are so arranged as to be invisible from it."

"That is a very ingenious device. I conclude that the style of the garden is Italian?"

"Entirely. It contains fifty-nine beds (which we do not fill in the spring), as well as vases. There are standard Roses in the main beds, and the garden is well planted by trees and shrubs, which form many nooks for garden seats."

"With what plants do you fill the fifty-nine beds in summer?"

"The centre round bed is filled with sub-tropical plants. In the centre long beds are Geraniums, Henry Jacoby, Madame Crousse, Paul Crampel, Edward the Seventh, Mrs. Turner and Flower of Spring, carpeted with dwarf Ageratums. The latter were raised here some years ago."

"What colour is the flower?"

"A light French-grey. The variety is very floriferous. In the other beds we have Heliotropes, Fuchsias, and Begonias. Quite a feature is made of Carter's Monarch Ten-week Stock, which, being white, and growing nearly three feet high, is used as a dot plant amongst several of the larger beds."

"The two beds in front of the Orangery consist of Roses?"

The Orangery at Rickmansworth Park.

"Entirely. The sheltered position just suits Tea Roses. The principal varieties grown are: Marie Guillott, Prince de Hohenzollern, Caroline Testout, Madame Eugene Rezel, Souvenir de Paul Neyron, Rubens, Kaiserine Frederick, Laurette Messimy, Madame Pernet Ducher, Mrs. J. G. Warren, Comte de Paris, Madame Camille de Rohan, Souvenir de S. A. Prince, Madame J. Schwartz, and Alphonse Kan."

"How long have you had the Orange trees in the Orangery?"

"They were presented to the late Mr. Birch by the Marquis of Garirera, from his own gardens at Los Morados, in 1860. The Marquis sent them over from Spain in tons of earth, and they were planted in this house."

"Some of them are almost getting too high for it?"

"Yes, they are eighteen feet high. They flower freely, and the bloom is very pretty. The varieties are Tangerine, St. Michael's, and Seville, and all fruit freely. The trees require a lot of cleaning."

"You have a number of Arums in the Orangery?"

"We grow about a hundred and fifty, in batches. They are very useful for house decorations. Two varieties of Eupatorium are also grown. There are three dozen. The cultivation is not difficult. We strike them in April, and plant out in the summer, lift them in during the autumn, keep them cut, and they flower in the winter. Each side of the Orangery is a Fernery, containing Ferns and Palms."

Leaving the Orangery, and passing under an archway of great age, which later on is adorned with Clematis, we arrived at a small kitchen garden forming a half-circle, the wall of which is covered with Vinery and Peach houses. Here there is a long herbaceous border, which includes, among other varieties, Stenactis speciosus, Lilium candidum, Pyrethrums, Asphodelus, Oriental Poppies, Achilleas, Gypsophila paniculata, and, in the season, a large quantity of Michaelmas Daisies of the best kinds."

"And your bush fruit?" I inquired.

"Carter's Black Champion yields an abundant crop of Black Currants, and the Gooseberries are Whinham's Industry, Keepsake, and Warrington. In order to keep the birds off, we have to put cotton over the Gooseberry trees. The Pears on the espalier system, and all round the garden on the walls, include Durondeau, Williams's Bon Chrétien, Beurré Hardy, Marie Louise, Pitmaston Duchess, and Duchess d'Angouleme."

"They all seem well set with buds."

"We hope to have a good crop this year. There are more Daffodils here. All our Daffodils come from Tresco, in the Scilly Isles. The varieties in the kitchen garden are Sulphur, Kaiser's Kroon, Poeticus, Obvallaris, Sir Watkin, Rugilobus, and Emperor. Under the shadow of the Orangery we grow all the varieties of Sweet Pea which scorch with the sun, such as Miss Willmott and Scarlet Gem."

"Sweet Peas are rather a feature, I gather?"

"We have about two hundred clumps. The ground is well trenched, and a great quantity of manure is used. I think that the best varieties are Rando Piazzani, Marchioness of Cholmondeley, Jeannie Gordon, Mrs. Fitzgerald, King Edward the Seventh, David R. Williamson, Lady Grisel Hamilton, Black Michael, Mrs. Walter Wright, Miss Willmott, Mrs. Knights Smith, Duchess of Westminster, Countess Spencer, Gladys Unwin, Lord Rosebery, Prince of Wales, Scarlet Gem, Dorothy Eckford, Hon. Mrs. Kenyon, and Lady M. Ormesby-Gore."

Entering the cool Peach house, I observed some fine plants of Agapanthus umbellatus in tubs, and Mr. Dyson said,

"I am working in young Peach trees, and doing away with the old ones which were on the walls before the house was built twenty-four years ago. The varieties of Peaches are Falcon, Late Admirable, Crimson Galande and Nectarine Peach; and Nectarines, Rivers' Orange, Lord Napier, Humboldt and Downton."

"I notice that your Potatoes are all put out, and well sprouted."

"They are all the early varieties; the late ones are grown on the home farm. The early kinds are Duke of York and Harbinger; and the others Sir John Llewellyn, Ninetyfold, Royalty, and Advancer. I disbud them to about two or three shoots, and do not plant them before the first week in April. Then they are not cut off by the frost."

"How long have you had the Malmaison Carnations?"

"This is only the second year. There are about two hundred plants, but only a few varieties, principally Trumpeter, Churchwarden, Lord Rosebery, Sir Charles Fremantle, Mrs. Eric Hambro, and Baldwin. I do not believe in growing a large number of varieties."

"I see that you have in this house some Sweet Peas in pots."

"I grow all the new varieties in pots. With regard to cultivation, I find three good seeds to a clump sufficient. I plant the clumps a yard apart each way, stake them with ordinary Pea-sticks, and tie them together at the top, six feet high. When they are ready to cut, I mulch them with rough straw from the stable, which serves the double purpose of retaining moisture during dry times, and also keeps the feet clean during damp weather. Nothing provides so much cut flower and for such a long season as Sweet Peas. I begin to cut the second week in June, and go on for four months."

"What Grapes do you grow in the late Vinery?"

"Golden Queen, Mrs. Pince, Lady Downe's Seedling, Gros Colman, Alicante, and Muscat of Alexandria. I am making a speciality of herbaceous Calceolarias, and have about twelve dozen of Sutton's strain in this Vinery."

"Do you force many Strawberries?"

"About five hundred Royal Sovereign. We plant Strawberries (Royal Sovereign) in a bed outside after early Potatoes, a foot apart in the row, the rows being a yard apart. The other varieties are Fillbasket, Latest of All, and the Laxton. Also we plant a long bed outside with Peas and Dahlias. The Peas are so planted that Dahlias can be put in between. We bring rafters from the high wall. These enable us to cover the Dahlias and ward off the early frosts in the autumn, which often extends the flowering season quite a month."

"How many Cyclamens are there in the plant-house?"

"About two hundred. They are Carter's strain. We have also about five hundred Freesias (refracta alba), and about a hundred Deutzias (two varieties). In the stove are about two hundred Caladiums, and we get a fine show of Cypripediums insigne and Maleyii. Some of the plants had two dozen flowers."

"Amaryllis appears to be a favourite?"

"There are sixteen varieties, including Clio, Sybil, Rowland, Baron, Mentor, etc. Close to the Amaryllis is a batch of Pancratium fragrans, a beautifully-scented variety. In the winter we fill this house with Begonia Gloire de Lorraine, and Poinsettias, growing as many as fifteen dozen of each. In the Camellia house we have half a dozen varieties, and they are in flower from October to May. The early Tomato house is now filled with Decorative and Regal Pelargoniums, of which we have about three hundred."

"How many varieties?"

"There are Persimmon, Edward Perkins, Duke of Fife, Mrs. Innes Rogers, N. C. Boyes, Pearl, Princess Maud, Madame Thibaut, Venus, Prince Charlie, Triomphe de St. Mande, and Kingston Beauty, making a dozen kinds altogether. In this house we get a splendid crop of Tomatoes, both sides being equally good. We picked by the end of May last year fifty pounds of fruit, and over a thousand pounds altogether. The variety was Duke of York. We grow about two hundred plants of Primula sinensis flore plena, which I am just preparing for propagating."

"Your early Vineries look almost new."

"They were rebuilt last year. We used to have a steel roof, but after seven years' wear it failed, and we replaced it with a wooden one. The varieties are Black Hamburgh and Foster's Seedling. The system of wiring used is my own. The wires run parallel with the rafters, and are twenty inches from the glass."

"Here you have more bedding plants?"

"I suppose that altogether we have twenty thousand bedding plants. They include a thousand Ivy-leaved Geraniums, a thousand Heliotropes, and varieties of Coleus, Iresine, Ageratum, and Perilla."

"How many Chrysanthemums?"

"About six hundred, Japanese, Incurved, and a few singles. Of the bush section, I grow a

Hybrid Isoloma.

few varieties in quantity. Of the hundred and thirty varieties of Chrysanthemums, the following are some of the Japanese:—Alfriston, Brockhampton, Colonel Weatherall, Ernest Penford, Exmouth Crimson, General Hutton, Godfrey's Triumph, Henry Perkins, Hon. Mrs. Ackland, Madame Paolo Radælli, Miss Elsie Fulton, Miss Mildred Ware, Mr. F. S. Vallis, Mrs. F. W. Vallis, Queen Alexandra, Terra-Cotta, W. Duckham, W. R. Church, The Princess, Loveliness, Guy Hamilton, and Mrs. G. Mileham."

At this stage, when I thought that we had finished our inspection, Mr. Dyson said that there was still the Fishery Garden to see, and we made our way thither.

"How large are the whole gardens, then?" I inquired as we proceeded down the side of the hill to this pretty spot.

"They are about fourteen acres, with fifteen houses, pits, and frames. Violets are largely grown in the last."

"What is the extent of the Fishery Garden?"

"Four acres. The river Ches passes through it, and there are, as you perceive, two islands, one forming pleasure grounds, while the other is used as a kitchen garden."

"The kitchen garden has fruit and vegetables."

"Yes, there is on the north side a young plantation of the best varieties of Apples grown on the bush system. I am grubbing up all the old kinds. Apples are the only fruit we can keep. Raspberries are also grown. The vegetables include a fine lot of Celery, Peas in quantity, and seven beds of Asparagus. In the rough pleasure grounds are beds of Delphinium, mixed with the Acer negundo. There are also some beds of Gueldre Roses. This is quite a retreat, and is a quarter of a mile from the house. Formerly it was the garden of a private house, and was laid out as it now is by the man who laid out Rickmansworth, eighty years ago."

"Finally, as to your experience, Mr. Dyson?"

"That is a short story. It was at first intended to make me a schoolmaster, but after a few months the love of gardening asserted itself, and I started under my father, at Belvidere, near Maidstone, where hardy fruits and herbaceous plants were well grown. My next move was to Clare Park, Maidstone, and then to Barnes House, Malling. I was then foreman at Kelsey Manor, Beckenham, and from there I came here as foreman thirteen years ago. It is eight years since I became head gardener."

"Do you show at all?"

"No, I have not done any showing, for there is plenty to do here without. There is a nice bothy for three of the gardening staff. Mrs. Birch is very kind to everyone, and takes a great interest in the gardens. I am a strong advocate of the better training of young gardeners, and during winter evenings I pursue, with some of my young men, studies in elementary chemistry, geometry, arithmetic, and composition, etc—in fact, we have quite a mutual improvement class. I should like to see the standard of education raised, as well as the wages, and I think that head gardeners should realise their responsibilities with regard to those subordinate to them."

Alfred Wilcox.

Letters from a Lady Gardener.

No. 140.—THE LAWN, AND GESNERACEÆ.

Dear Kate,—What is your lawn looking like? Is it free from moss, or weeds? because, if not, you should take it in hand at once, as there is no time to be lost. There are various remedies for a mossy lawn, such as a slight mulch of newly-slaked lime, which kills the moss, but in bad cases requires to be followed by a sprinkling of rich soil, or possibly by sowing seed in bare places. We have used waste salt for the same purpose as the lime during the winter; this is useful, too, to kill the weeds, even Plantains, as well as Daisies, Hawkweeds, and my special enemy, the Blue Bugle (Ajuga repens), all succumbing to it; but there is a danger of overdoing it, and killing the grass, too, if the salt is distributed too thickly, or lumps of it are left about.

Dandelions are the only weeds which cannot be killed by a pinch of salt, unless you cut off their heads first, and push a small lump of salt down the hole thus made, which, resting on the cut root, will destroy it surely. Lawn-sand can be used in the same way, if you prefer it, but it will not kill a tough old Dandelion unless you decapitate it first. Daisies disappear without difficulty under it, but the underground stems of Hieraceum pilosella (the Mouse-ear Hawkweed) and the insidious Blue Bugle appear ever so far from the parent plant, having taken a dive through the matted grass, or the soil, which makes them extremely mischievous, and harder to kill. Still, repeated sprinklings of salt on their tufts of foliage will do it; in fact, one application is enough for each tuft, but, still, you must look out a few weeks later for fresh shoots appearing at a distance from the original plant, and destroy them before they have time to propagate themselves.

My lawn is now very free from weeds of all kinds, but, then, I have been at it for several years, spending many a summer evening at the work of destroying them, and many an hour on fine days, even in the depth of winter, in walking over the lawn in search of a stray enemy. In fact, lawn-weeding becomes a sort of craze, if you indulge in it enough; and you will never have a dull hour if you once make up your mind to have a lawn without a weed, for there is always something to do if you intend to be even with the enemy.

Birds bring fresh seeds of Plantain, no doubt, and the Dandelion is able to fly about in its own little parachute, so that your work will never be absolutely finished; but the pleasure of walking on a green carpet of grass, unspoiled by flat leaves of Plantain, etc., may be had by anyone who chooses to take a little pains to secure it—trouble which soon becomes a pleasure, and repays one in many ways (such as good health and good temper), for the long, quiet hours with Nature in the open air and sunshine—two admirable doctors which send in no bills, but are ever ready to attend us in the garden—refresh and invigorate both mind and body.

Soot (of which we all should have plenty just now, after the spring-cleaning) is an admirable chemical manure for a lawn, but you should mix it with about six times its bulk in finely-sifted, rich soil, and as much burnt vegetable ash as you can obtain; or, failing that, some fine coal ashes, for these help to make a firm sward, although they contain but little nourishment. Superphosphate, too, and various other chemical manures, are useful, but of these I shall be able to tell you more later on, as we are trying some experiments with them on grass. If the grass is weak, do not put on the hood of the machine in cutting it, but let the cut grass lie as a slight mulch on the sward—it will quickly disappear, but still will help the roots of the grass. Seed may still be sown in bare places, covering it with a little fine soil, and making this quite flat and firm.

In the warm Vinery the scent of the Vine-bloom is delicious, and there are many Gesneraceous plants coming on there. Achimenes in baskets lined with moss are charming. They are put in with their heads peeping through the wires when quite small, and in layers, with the compost which suits all Gesneraceous plants (*i.e.*, equal parts of loam, leaf-mould and peat in small lumps, with charcoal, sand and soot in small quantities), keeping the whole very moist by dipping the basket daily in a tank of tepid water. When the first flower opens we add a little rich top-dressing of dried cow-manure and soot on the surface, and then cover it with moss,

Achimenes—Mauve Perfection.

wired down with fine, black wire, to prevent it from coming off; a few days later the basket is a beautiful sight, being covered with hanging blossoms, and we hang it up in a shady corner of the conservatory, for half-shade and plenty of moisture are necessary for all this family of plants. The prettiest of all the Achimenes is, I think, Mauve Queen, with flowers three inches across, in a lovely tint, but there is great variety of colour amongst them, and you can have them
